ASHWORTH AND SMITH (ELECTRICAL SUPPLIES), LTD., wholesale electrical dealers, 27, Blackfriars Street, Manchester. The statutory meeting of creditors was held recently, when Mr. B. H. B. Eldridge, 52, Brown Street, Manchester, the liquidator, submitted a statement of affairs which disclosed liabilities of £3 130, all due to unsecured creditors. The assets were estimated to realise £2 416, from which had to be deducted £17 for preferential claims, leaving net assets of £2 399, or a deficiency, so far as the creditors were concerned, of £731. The assets comprised furniture, £10; motor car, £30; book debts, £2 603, expected to produce £1 708; stock, £700, valued at £466; cash in hand, £9; and cash at bank, £193. The company was registered in January, 1927, when it took over an existing business, the purchase price being £2 325. Shares to the value of £1 500 were issued to the vendors, and the balance of £825 was left on loan by Messrs. Ashworth and Smith, Ltd. With the issued capital of £1 500, there was a deficiency as regarded the shareholders of £2 231, which was accounted for by the following items: trading loss in 1927, £320; trading loss in 1928, £362; loss during 1929, £137; written off book debts, £895; depreciation of stock, £234; written off fixtures, £84; and depreciation of motor car, £62. After a short discussion, a resolution was passed confirming the voluntary liquidation of the company with Mr. Eldridge as liquidator and an advisory committee was appointed of the principal creditors. The following are creditors:—Ashworth and Smith, Ltd., £905; Schlothaver, C. F., £296; Siemens Schuchert, Ltd., £185; Beardsall, W. E., Ltd., £119; Armoduct Cable Co., £102; Credenda Conduits, £101; Nathar, F. J., and Co., £87; General Accessories Co., Ltd., £86; Midland Manufacturing Co., £79; Helzel Bros., £61; Electric Accessories Manufacturing Co., £58; Metro-Vick Supplies, Ltd., £56; Ashley Cables, Ltd., £55; Blackwell, T. and C., Ltd., £53; Stockwell, Williamson and Co., £47; Baxendale and Co., Ltd., £45; L'Appareillage Electric de la Seine, £43; Stella Conduit Co., £42; Scandinavian Cable Co., £40.

MICO, LTD., accumulator manufacturers, etc., Newcastle-on-Tyne. A meeting of the creditors of the above was held recently, when a statement of affairs was submitted which showed gross liabilities of £2 141, made up as follows: Issued capital, £265; first debentures and interest, £361; second debenture, £300; creditors on open accounts, £928; bank overdraft, £201; and preferential claims, £85. The assets comprised book debts, £153; stock, £683; and cash in hand, £40; or a deficiency of £1 265. The total claim of the bank was approximately £500, but they held the second debenture as security. The company was registered in 1904, and for many years was able to carry on successfully. The last accounts were made up to May, 1927, when there was a debit balance on the profit and loss account of £800. For two or three years past the company had carried on business at a loss. Recently a creditor issued a writ, and on March 28th a receiver for the debenture holders was appointed. It was pointed out that the business had been badly affected in the last year or two through the extension of "after sales service" by certain manufacturers. The first debentures were issued in 1924 for cash, and the second debentures in November, 1928. After some discussion it was decided to leave the matter in the hands of a firm of chartered accountants who were acting for the trade creditors.

VALENTINE, Fred, trading as ARTISTIC DECORATIONS, 156, Nethergate, Dundee, electrical dealer, etc. A meeting of the creditors of the above was held recently, when Mr. A. S. Cram, C.A., of 38, Whitehall Street, Dundee, submitted a statement of affairs which showed liabilities of £1 626, and net assets of £442, or a deficiency of £1 184. The estate showed an apparent dividend of about 5s. 5d. in the £, but it was pointed out that there was a contingent liability in respect of claims for damages for breach of contract in the event of certain work not being completed. Mr. Cram reported that a trust deed had been signed in his favour. The debtor had been trading for about 15 months, and, so far as could be ascertained, it had never been a success. The debtor had a free capital of £50 when he commenced, and a friend had since advanced him over £700 at different dates. The debtor had taken contracts in connection with housing schemes, some of which were in course of completion. A resolution was passed confirming the trust deed already signed, and a committee was appointed to act with the trustee. The following are creditors:—Boote, T. and R., Stoke-on-Trent, £82; bankers, £95; Wood and Cairns, Ltd., Edinburgh, £172, Edison Swan Electric Co., Ltd., £23; Cockburn, M., and Co., Dundee, £59; British Thomson-Houston Co., Ltd., £18; Drake, Geo. H., Dundee, £27; General Electric Co., £37.

Receivership.

E. A. MANUFACTURING CO., LTD. Percy H. Stone, F.C.A. of Bank Chambers, 47, Temple Row, Birmingham, was appointed receiver and manager by the debenture holders on April 19th.

London Gazette, etc.

Company Winding-up.

ZONE WIRELESS CO., LTD. Winding-up order, April 15th.

Partnerships Dissolved.

AUTO ELECTRIC SERVICES (Margaret STREETER and George BOYD), electrical engineers, East Street, Petworth, Sussex, by mutual consent as from March 1st, 1929. Debts received and paid by Mrs. Margaret Streeter.

BENTLEY HUNT AND VANSTONE (James Edward BENTLEY-HUNT and Charles Percy VANSTONE), electrical and radio engineers, 4, Wood Street, Bath, as from March 25th, 1929. Debts received and paid by J. E. Bentley-Hunt, who will continue the business, but not under the firm name.

HAVIL MOTOR CO. (William Henry BUTCHER, George Percy HALL and Joseph Albert PHILLIPS), automobile, electrical and radio engineers, battery repairing and recharging depot, dealers in gramophones, gramophone and wireless accessories, and booking agents, 30, High Street, Peckham, S.E.15, and Havil Street, Camberwell, S.E., by mutual consent, as from April 17th, 1929. Debts received and paid by J. A. Phillips, who continues the business.

Notice of Intended Dividend.

NORMAN, George Arthur, 11, Freeman's Yard, Barnsley, electrical engineer. Last day for receiving proofs, May 8th. Trustee, B. S. Briggs, County Chambers, King Street, Wakefield, Official Receiver.

Bankruptcy Proceedings.

COHEN, George, electrical engineer, 49, Newman Street, Oxford Street, London. An adjourned sitting for the public examination of this debtor was held in the London Bankruptcy Court on Wednesday of last week, his statement of affairs showing ranking liabilities £4 445 and net assets £296. Cross-examined by counsel on behalf of the trustee in bankruptcy with reference to cash and goods accounts lodged under an order of the Court the debtor said that the receiving order was made against him in July last. He was then trading in partnership with his son, who was only 17 years of age at the time. He appealed against the receiving order and that appeal came on for hearing in October. The Order was, however, confirmed by the Court and on November 20th he was adjudicated bankrupt. Acting on advice he abandoned the suggestion of a partnership with his son. The goods account showed that he had stock of the value of £1 200 in hand at the beginning of March; between that date and July 15th, 1928, he bought goods for £191 and effected sales amounting to £477, which apparently left stock on hand at the latter date of the value of £913. On July 17th, however, he swore an affidavit to the effect that the stock was worth £1 700. The debtor agreed that £1 700 was a rough valuation, but he would not assent to the suggestion that it was a fictitious figure. It was, in fact given to him by the accountant and he accepted it. Although his wife was, according to his cash account, a creditor for £314 at the date of his failure, she was only returned for an amount of £75 in his amended statement of affairs, and that was explained by the fact that the latter figure was all that she was content to claim. The examination was concluded.

Infringement of

C.M.A. Trade Mark

(Registered Nos. 422219, 422220, and 422221)

Cable Makers Association v. Edward William Knight sued and trading as City Engineers' Supply Company (a firm)—

On January 18th, 1929, in the High Court of Justice, a perpetual injunction was granted restraining the Defendant, his servants or agents from infringing the said trade mark, and the Defendant was ordered upon oath to deliver up to the Plaintiffs or destroy in their presence all infringing articles in his possession or power and to pay the Plaintiff's costs.

The Cable Makers Association are owners of the following Trade Marks:—

C.M.A.	-	Regd. Nos. 422219-20-21.
NONAZO		Regd. No. 458865.
VICMA	-	Regd. No. 486180.
VINAZO	-	Regd. No. 486179.

Licenses to use these are granted to members of the Cable Makers Association only.

Advt. of The Cable Makers Association, Sardinia House, Sardinia Street, London, W.C.2

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

307 523 F. Newton. Electric motors for rotating cans or boxes for spinning or otherwise treating artificial silk or other fibres. (5/11/27.)
307 317 T. G. Allen.
307 318 G. T. Evans. Transmission of signals in printing telegraphy employing for transmission voice-frequency or high-frequency alternating-currents. (26/11/27.)
307 370 Siemens Bros. and Co., Ltd., and W. G. Patterson. Repeaters for telephone systems. (2/12/27.)
293 414 Ideal Werke Akt.-Ges. fur Drahtlose Telephonie. Loud speakers. (6/7/27.)
307 322 General Electric Co., Ltd., and M. Kahn. Control of electric motors (5/12/27.)
307 323 A. Reyrolle and Co., Ltd., and E. W. M. Scott. Electric protective systems. (5/12/27.)
307 377 S. G. S. Dicker (Naamlooze Vennootschap Philips' Gloeilampenfabrieken). X-ray tubes. (5/12/27.)
281 725 F. Merk. Circuit arrangement for automatic telephone exchanges. (4/12/26.)
307 325 Graham Amplion, Ltd., and P. Freedman. Thermionic devices. (5/12/27.)
307 326 Graham Amplion, Ltd., and P. Freedman. Thermionic devices. (5/12/27.)
307 378 Graham Amplion, Ltd., and P. Freedman. Thermionic devices. (5/12/27.)
307 327 Graham Amplion, Ltd., and P. Freedman. Thermionic devices. (5/12/27.)
307 379 A. Reyrolle and Co., Ltd., B. H. Leeson, and O. C. F. King. Electrical remote-control systems. (6/12/27.)
307 383 A. Reyrolle and Co., Ltd., B. H. Leeson, and O. C. F. King. Selective indicating mechanism. (6/12/27.)
307 384 A. Reyrolle and Co., Ltd., B. H. Leeson, and O. C. F. King. Electrical remote-control systems. (6/12/27.)
307 385 A. Reyrolle and Co., Ltd., and O. C. F. King. Electric switches suitable for use in controlling the transmission of signalling or operating currents in an electrical remote-control system. (6/12/27.)
307 443 General Electric Co., Ltd., and H. C. Hannam-Clark. Electrical remote-control systems or the like. (6/12/27.)
307 386 J. Stone and Co., Ltd., and A. H. Darker. Auxiliary lighting of railway and like vehicles. (6/12/27.)
282 064 N.V. Internationaal Octrooibureau. Electric luminous tubes. (10/12/26.)
307 411 J. A. Crabtree and F. Painter. Mounting of switch fuses and similar units or accessories in boxes, cases, or containers. (7/12/27.)
307 446 Standard Telephones and Cables, Ltd. (Western Electric Co., Inc.). Aerial systems. (7/12/27.)
307 452 W. E. Kershaw and J. L. Woodbridge. Electrolytic cells. (8/12/27.)
293 292 Manhattan Electrical Supply Co., Inc. Metal-glass union. (2/7/27.)
307 537 Automatic Telephone Manufacturing Co., Ltd., W. S. Vick, and G. D. Turton. Telephone systems. (9/12/27.)
307 538 Automatic Telephone Manufacturing Co., Ltd., and J. E. Ostline. Telephone systems. (9/12/27.)
307 539 A. Whitaker, C. O. Browne, and Gramophone Co., Ltd. Means for controlling the intensity of a beam of light in accordance with electrical variations for use, for example, in recording sounds. (9/12/27.)
307 543 Standard Telephones and Cables, Ltd. (Materiel Telephonique). Manufacture of lead antimony alloys for use in sheathing electric cables and the like. (10/12/27.)
307 544 W. S. Smith and N. W. McLachlan. Thermionic amplifiers. (10/12/27.)
307 552 A. Avtsine. Electric trolley-heads. (14/12/27.)
307 554 E. Pye and S. J. Healk. Time switch for incandescent electric lights. (15/12/27.)
307 555 Ashley Wireless Telephone Co. (1925), Ltd., and W. A. Brooke. Thermionic-valve holders. (16/12/27.)
307 556 J. A. Crabtree. Electric switches and other electrical devices. (16/12/27.)
294 562 A. G. Hasler, Vorm. Telegraphenwerkstatte Von G. Hasler. Telephone system. (26/7/27.)
307 558 A. H. Midgley. Thermionic valves. (19/12/27.)
307 562 British Thomson-Houston Co., Ltd., and H. C. Heath. Socket contacts and the mounting of the same for use with switchgear or other electrical apparatus. (22/12/27.)
307 563 S. G. S. Dicker (Naamlooze Vennootschap Philips' Gloeilampenfabrieken). Manufacture of glass. (23/12/27.)
307 570 M. Buchholz. Process for preventing explosive gas mixtures from being formed in the casings of electrical apparatus enclosed in an insulating medium. (2/1/28.)
293 293 Elektra-Lack-Werke Ges. System Dr. Kronstein. Insulating material. (2/7/27.)
307 584 A. C. Wynne. Electric switches. (21/1/28.)
284 624 British Thomson-Houston Co., Ltd. Systems of electric distribution. (1/2/27.)
285 455 British Thomson-Houston Co., Ltd. Speed control systems for alternating-current induction motors. (17/2/27.)
307 596 F. E. Bancroft, and Metropolitan-Vickers Electrical Co., Ltd. Means for converting radiant heat energy into mechanical energy. (8/2/28.)
307 611 General Electric Co., Ltd., and P. H. Coales. Electric switchgear). (22/2/28.)
307 617 C. J. Beaver and W. T. Glover and Co., Ltd. Electric cables. (27/2/28.)
307 618 F. B. Dehn (Vesta Battery Corporation). Method and means for pasting battery plates. (27/2/28.)
307 629 Walker, Hunter and Co., Ltd., and J. Walker. Formers for electrical heating-elements. (12/3/28.)
297 312 Siemens and Halske Akt.-Ges. Circuit arrangement for telephone installations with selector working. (17/9/27.)

Applications for Patents.

February 18th.

5 428 Associaifd Telephone and Telegraph Co. Telephone systems. (29/2/28, U.S.)
5 450 Associated Telephone and Telegraph Co. Telephone systems. (29/6/28, U.S.)
5 369 Ateliers J. Carpentier. Radio communication systems. (17/2/28, France.)
5 433 Automatic Telephone Mfg. Co., Ltd. Automatic switches for telephones, etc.
5 306 W. and T. Avery, Ltd. Dashpots.
5 388, 5,389 H. H. Berry. Advertising signs, etc.
5 421, 5 422 British Electric Pari-Mutuel, Ltd. Totalisators.
5 371 C. E. Clemmson. Electric lamp shade.
5 355 H. S. Cowx. Electromagnetic make-and-break movements, etc.
5 363 A. G. Dicker. Electric switch. (25/2/28, U.S.)
5 447 Electrical Research Products, Inc. Treating signalling conductors. (24/2/28, U.S.)
5 448 Electrical Research Products, Inc. Electro-optical image producing systems. (24/2/28, U.S.)
5 449 Electrical Research Products, Inc. Heat treatment of loaded conductors. (24/2/28, U.S.)
5 358 E. Fries. Device for controlling temperature of oil in transformers. (5/12/28, Germany.)
5 340 H. Garde and B. V. Shann. Electric candle fittings.
5 438 General Electric Co., Ltd. Track brakes.
5 403 Imperial Chemical Industries, Ltd., and J. H. Paterson. Electrodes for arc welding.
5 367 International General Electric Co., Inc. Means for taking sound films, etc. (18/2/28, Germany.)
5 394 Kolle and Co., A.G. Production of light-sensitive layers. (16/2/28, Germany.)
5 451 Linke-Hofmann-Busch-Werke A.G. Diesel electric locomotives. (18/2/28, Germany.)
5 391 L. E. Ryall. Thermionic amplifiers.
5 392 L. E. Ryall. Alternating current signal receivers.
5 433 W. Saville. Automatic switches for telephone systems.
5 406 O. Schneider and A. Weiffenbach. Electric switch.
5 379 Siemens-Planiawerke A.G. fur Kohle-Fabrikate. Electric arc lamps. (16/11/28, Germany.)
5 373 Siemens and Halske A.G. Telegraphic installations. (18/2/28, Germany.)
5 378 Siemens and Halske A.G. Signal transmission system. (18/2/28, Germany.)
5 397 A. F. H. S. Simpson. Electrical transmission of pictures, etc.
5 352 W. Stephens. Electric heating and cooking stoves.
5 439 Telefunken Ges. fur Drahtlose Telegraphie. Electric chokes. (16/2/28, Germany.)
5 440, 5 442, 5 443 Telefunken Ges. fur Drahtlose Telegraphie. Wireless signalling systems, etc. (18/2/28, Germany.)
5 414 C. J. R. H. von Wedel. Circuits for discharge tubes. (17/2/28, U.S.)
5 426 Westinghouse Lamp Co. Glow discharge devices. (24/7/28, U.S.)

February 19th.

5 514 A. Allan, and A. Reyrolle and Co., Ltd. Electric couplings.
5 487 P. M. Anderson. Low frequency transformer.
5 500, 5 549 J. L. Baird and Television, Ltd. Television apparatus.
5 527 H. H. Berry. Electric fires, etc.
5 517 British Thomson-Houston Co., Ltd. Motion transmission systems. (/25/2/28, U.S.)
5 538 Ebonestos Insulators, Ltd., J. Holloway, and B. Weaver. Attachments for mouthpieces of telephones.
5 476 F. Foy. Electrical apparatus for heating liquids.
5 464 F. Gray and J. L. Hodgson. Electrical transmission apparatus.
5 541 G. H. Gudgeon. Electric switch.
5 506 A. E. M. van der Meersch and Thermo Path Co., Ltd. Electric soldering irons.
5 492 G. W. Melland and J. H. Runbaken. Electric current indicators.
5 508 Sargent and Lundy, Inc. Electrical switching apparatus. (3/3/28, U.S.)
5 533 Siemens and Halske A.G. Producing insulating masses of high disruptive strength. (27/2/28, Germany.)

February 20th.

5 646 W. E. Beatty (Bell Telephone Laboratories, Inc.). Insulating materials. (15/12/27.)
5 569 F. B. Benson. Signal amplifiers, etc., for wireless apparatus.
5 574 G. B. Burnside. Electric lamps.
5 654 Ceag, Ltd., and R. J. Plummer. Electric fuses.
5 620 J. Christie and A. Reyrolle and Co., Ltd. Oil-jacketed insulators for switchgear, etc.
5 679 R. F. Collinson. Synchronising means for electrical picture receivers, etc.
5 599 E. D. Dobbie. Thermionic valves.
5 579 G. O. and W. Donovan. Cut-outs, etc.
5 685 W. Germershausen. Electric discharge tubes. (12/5/28, Germany.)
5 612 W. G. Hay. Casings for electric cables, etc.
5 587 A. Horstmann and Horstmann Gear Co., Ltd. Electric time switches.
5 640 International General Electric Co., Inc. Operating electric clock installations. (22/2/28, Germany.)
5 567 E. C. Johnson. Trolley pulleys of electrically propelled vehicles.
5 677, 5 678 H. G. A. Kay and Wireless Pictures (1928), Ltd. Apparatus for reception of transmitted pictures, etc.
5 683 B. Lange and A. Schwarz. Electric revolution indicators, etc.
5 660 L. A. Levy and D. W. West. Electrical production of visible images.

COMING EVENTS.

Friday, April 26th.

Birmingham Electric Club.—Grand Hotel, Colmore Row. Paper by Mr. H. Blades on "Electric Cables—Installation and Maintenance." 7 *p.m.*

Institution of Electrical Engineers (London Students' Section).—Institution, Savoy Place, Victoria Embankment, London. Annual general meeting, followed by a paper on "The Manufacturing and Testing of Submarine Cables," by Mr. V. E. Connor. 7 *p.m.*

Institution of Electrical Engineers (Scottish Centre).—University College, Dundee. Paper by Mr. W. Holmes on "Load-levelling Relays and their Application in connection with Future Metering Problems." 7.30 *p.m.*

Monday, April 29th.

Institution of Electrical Engineers (Western Centre).—South Wales Institute of Engineers, Park Place, Cardiff. Kelvin Lecture by Dr. G. C. Simpson on "Lightning."

Architectural Association.—34, Bedford Square, London. Lecture by Mr. G. S. Francis on "Modern Tendencies in Architectural Form." 7 *p.m.*

Tuesday, April 30th.

Illuminating Engineering Society.—Lecture Theatre of Messrs. Holophane, Ltd., Elverton Street, Westminster. Paper by Mr. S. English on "Some Further Properties of Glass and their Application in Illuminating Engineering," followed by a discussion. 7 *p.m.* Demonstration of various novel applications of coloured light, by Mr. R. G. Williams. 8.45 *p.m.*

Wednesday, May 1st.

Electrical Contractors' Association.—(Bath Sub-Branch).—Ordinary meeting.

Electrical Contractors' Association (Cardiff Branch).—Ordinary meeting. 2.30 *p.m.*

Institution of Electrical Engineers (Wireless Section).—Institution, Savoy Place, Victoria Embankment, London. Paper by Dr. J. Hollingworth and Mr. R. Naismith on "A Portable Radio Intensity-Measuring Apparatus for High Frequencies." 6 *p.m.*

Thursday, May 2nd.

Electrical Contractors' Association (Newcastle Branch).—Ordinary meeting 11 *a.m.*

Electrical Contractors' Association (Bristol Branch).—Ordinary meeting. 3.15 *p.m.*

Thursday, May 2nd-Friday, May 3rd.

Iron and Steel Institute.—Institution of Civil Engineers, Great George Street, Westminster. Annual meeting.

Friday, May 3rd.

Institution of Electrical Engineers (Meter and Instrument Section).—Institution, Savoy Place, Victoria Embankment, London. Chairman's address by Mr. G. D. Malcolm. 7 *p.m.*

Saturday, May 4th.

Institution of Electrical Engineers (London Students' Section).—Visit to Mr. R. Borlase Matthews' "all-electric" farm, East Grinstead, Sussex.

Current Topics.

The Battersea Problem.

THE agitation against the Battersea power station project shows no signs of abating. On the contrary, it daily attracts further criticism from quarters which can hardly be ignored. The grounds of complaint are growing, too; the critics are now worrying about Fulham, and people many miles removed from the storm centre are now discovering—and making known—similar smoke problems in various London districts. While it is not our intention or desire to add in any way to the embarrassment of the affected supply authorities in a difficult position, we do feel that the situation is one that must be faced, and that boldly, in a serious attempt to meet the expressed wishes of the public in the Battersea case. The problem of preventing or decreasing the emission of sulphurous fumes is a complex one, and if the subject is to be considered, as it should be, in its national bearing, the scope for inquiry is further increased. The main stations under the national electricity scheme are not all similarly situated; urban, residential, manufacturing or agricultural areas are all affected, and it does not by any means follow that what may be a nuisance of an intolerable character in one case may be admissible in another, and vice versa. Further, localities will differ very materially in their physical character, and in the meteorological conditions to which they are subject, so that identical arrangements for carrying away waste gases may not be universally applicable. For an inquiry to be complete the problems will have to be considered by power station engineers, physicists, chemists, meteorologists and agricultural experts. In the view of a distinguished authority the problem is probably more a matter of bringing existing knowledge to bear on the question than of initiating experimental work. We think, however, that some experimental work will be necessary, particularly in connection with the design of chimney stacks, to which little attention seems to have been paid.

Alternative Sites and Methods.

IN the meantime there is no shortage of suggestions for alternative sites and methods as a means of solving the Battersea trouble. Sir RICHARD REDMAYNE, recalling that a scheme put forward by the London County Council in 1906 for the erection of a power station considerably smaller than the present one, on the Battersea site, was rejected by a Select Committee of the House of Commons, urges the transfer of the station to a site on the Kentish coast, basing his demand on economic as well as æsthetic and health grounds. Sir BASIL BLACKETT is another advocate of a change on economic grounds, and in a letter to "The Times" on Monday, set out to show that the station could be removed, not only without serious loss, but even with profit. He contends that a site much farther down the river would be at least £250 000 cheaper than Battersea, and that to this could be added the estimated capitalised saving in coal costs at 1s. 3d. per ton on sea-borne coal delivered in the lower reaches of the river instead of at Battersea, amounting to some £350 000, thus producing a minimum saving of at least £600 000, which, he claims, would easily cover the cost of transmitting energy from the distant generating point. Mr. A. H. DYKES also favours a Kent coalfield site, but stipulates that such a station should carry only the base load, and that the peak load should be carried on Diesel engine stations situated in London itself. On the whole, the alternatives at the moment seem preferable to remedial action at Battersea, but the whole question is one that should be re-examined without delay.

The Tariff Question.

OF the consideration of electricity supply tariff problems there seems to be no end. But notwithstanding all that has been said and written about this question in the past, we are still not within reach of the ideal tariff; in fact, some who have studied the matter deeply confess that there is no ideal. So that while the tariff committee recently set up by the Electricity Commissioners is regarded by many as being in quest of the unattainable, it has at least the advantage of a voluminous literature on the subject, representing all or nearly all possible points of view. To this committee, and to all interested in the tariff question, we would suggest consideration of the question, put by Mr. RUTHERFORD BLAIKIE on a later page of this issue, "Are we justified in framing load factor tariffs if the cost is really governed by quantity?" Another point worthy of notice is the suggestion that tariff statistics should be compiled on a "per consumer" rather than a "per head of population" basis. In considering the suggestion that a perfect solution of the tariff problem is impossible, the Commissioners' committee might well give careful attention to the views put forward by Mr. C. F. MOUNSDON in our issue of September 9th, 1927. In the domestic tariff which he advocates the fixed charge is a composite

Digitized by Google

one—based on three factors, lighting connections, floor area, and rateable value—so fixed as to give a curve conforming as nearly as possible to actual consumptions for houses of all classes. The adoption of the three factors certainly has the effect of smoothing out most of the existing anomalies, and it may well be that the best approach to the nearly ideal method of charging may eventually be evolved along these lines.

Marine Electricity.

AT one time THE ELECTRICIAN used to publish once a year a special number dealing with the applications of electricity in the marine world, with particular reference to electric propulsion. That we have abandoned the annual event in favour of a regular series of articles, published every month in the year, suggests that we believe there is a sufficiently great future in this field to warrant frequent attention in our pages. We do believe that marine electricity has possibilities, and that they are not generally appreciated in the electrical industry; development is proceeding at such a pace, however, that few electrical men can much longer remain in ignorance. Most of us are aware that electric propulsion is being employed for certain tugs, fruit carrying, and a few other specialist ships, but what is not so well known is that there are now built, or building, no fewer than thirteen electric passenger liners, and that within the next four or five years the total number of large electric passenger ships in service will probably reach at least seventeen. Marine electricity in this country is now definitely on the verge of big developments which will, it is hoped, repay those electrical firms which have for some years past done valuable pioneer work in this direction.

"The Women's Vote."

ALTHOUGH it has no real connection with politics, "The Women's Vote," a new production of the E.D.A., is of real topical interest during the election season. An attractively produced and priced poster, measuring 20 in. by 30 in., it depicts women going to the ballot box to record their vote for "Electricity in Every Home." We hope it will be prominently displayed by supply authorities and electrical installation contractors during the present month. Incidentally, we might point out that the women's interest in the domestic applications of electricity, as exemplified in the remarkable work of the Electrical Association for Women, has already been of practical benefit to the industry, especially in those directions where the potentialities of this consumer-support have been properly appreciated and encouraged. Like the politicians, the electrical industry has much to gain—or lose—from the "women's vote." Let us take steps to ensure that "Electricity in Every Home" shall be a reality and not just a slogan or a politician's electioneering pledge.

"The Incandescent Lamp Jubilee."

OUR disclosure last week of the American scheme for honouring Mr. EDISON for the invention of the incandescent lamp previously discovered by the late Sir JOSEPH SWAN has already provided us with ample evidence that British electrical engineers are particularly alarmed at the possibility that an old misconception may be broadcast to the world and thus deprive the memory of a great British scientist of the honour—which is rightfully his—of an invention which was really the foundation of the modern electrical industry. Already we have received a number of letters of protest, and among the selection which we print on our correspondence page this week is a suggestion which, if adopted, should soon lead to a modification of the N.E.L.A. programme. The suggestion is that as Sir JOSEPH was a president of the Institution of Electrical Engineers it is the plain duty of the Institution to send to the National Electric Light Association of America a formal protest against their proposal. We would suggest that such a protest might well be accompanied by copies of Mr. JAMES SWINBURNE'S address on "Sir Joseph Swan's Electrical Work" delivered before the Institution on December 28th last, and of Dr. J. A. FLEMING'S "Brief Personal Recollections in Connection with the Jubilee of the Invention of the Carbon Incandescent Electric Lamp by Sir Joseph Wilson Swan in 1878," which was published in the I.E.E. Journal of February last. As the great representative body of electrical men, the Institution seems particularly suited to make this protest, and as the celebrations are timed to start on June 1st we hope that no time will be lost in deciding who shall take action and what form it shall take.

The B.I.F. Date.

FOR several years past we have consistently advocated that the date of the British Industries Fair should be changed to one more likely to attract buyers from overseas. We are now glad to hear that the Advisory Committee of the Electrical Section of the Fair, in view of the representations made that the month of May is more suitable than February, have passed a resolution in which they express the opinion that the Department of Overseas Trade and the Birmingham Fair Management Committee should hold an impartial inquiry to consider the question, and that the Birmingham committee should take a referendum of the whole of the exhibitors at the Birmingham section of the 1929 Fair to ascertain their views on this important question. Representations are also to be made regarding facilities for reaching the Fair, parking arrangements, the grouping of trades, etc. So far as it goes this move is distinctly gratifying, but it must be remembered that this is not entirely a matter for exhibitors in the electrical section who form a minority amongst the whole body of exhibitors. Furthermore, we are definitely warned that whatever the result of the recommended action—if taken—no change of date can be made so far as the 1930 Fair is concerned.

A Remarkable Estimate.

USED as we are to the extravagant claims that are so persistently advanced by an industry which claims to be in competition with our own, we can bear with proper fortitude most of the imaginative sallies of the anti-electrical propagandists. In any case the claims are frequently so indefinite as to leave plenty of avenues for retreat in the face of a challenge. In a different category is the statement, made at Tuesday's dinner of the Society of British Gas Industries, that "to-day 90% of the cooking in our homes is done by gas." This is a remarkable estimate and we would like to know how this figure was arrived at. Before this statement was made we thought that quite a fair percentage of houses cooked by the old-fashioned coal-fired range. We were also given to understand that, here and there, one or two adventurous spirits had utilised electricity for cooking. Obviously we were mistaken.

Arterial Road Lighting.

FOLLOWING a fatal accident due to the absence of lighting on an arterial road, part of which is within its area, one of the local authorities in Greater London has accepted responsibility for lighting that portion which goes through its own territory. The urban district council in this case, as in many others, considered that the responsibility for street lighting rested with the county council, and the decision in this case will doubtless lead to an acknowledgment of responsibility by similarly placed urban authorities. The larger question of lighting all the main roadways is one which must sooner or later claim the serious attention of public authorities. The contrasts, even between the well-lighted areas and those contiguous districts where the illumination is not so good, are sufficiently fruitful in the provision of accident risks, but the hazards are tremendously increased on the many miles of important highways which are without lighting of any sort. This is a matter which the electrical industry might well investigate.

ELECTRICITY SUPPLY AND THE CONSUMER.

Work of the Rural Supplies Committee—Tariff Expediency—Load Factor and Quantity Systems—Further Examination of Weir Report Forecasts—Suggested Basis for Statistics.

By J. RUTHERFORD BLAIKIE.

THE newly-appointed Committee, set up by the Electricity Commissioners, to report on rural supply tariffs, etc., recalls the work of the Conference on Electricity Supply in Rural Areas. The report of this Conference, with its two sub-committees, issued in July, 1928, does not appear to have received the attention and recognition that is its due, having regard to the fund of useful information it contained and the really scientific plan of attack. It is a most agreeable contrast to some of its predecessors, but even if the report is on a scientific plane, that is not to say that it is beyond criticism; indeed, a cynic might observe that it is here that the trouble begins. Be that as it may, there is always a prospect of progress when food for thought is provided in good order.

The first comment might be that some of the conclusions are not sufficiently backed by the evidence, or that it is incomplete, but if that is so, the position of the Conference is made good by its first recommendation, viz. :—

" That the Electricity Commissioners be asked to regard the development of electricity supply in rural areas as a special branch of their work to which continuous attention should be devoted; and to consider the advisability of appointing a special officer for this purpose."

Also No. 6 recommendation referring to a special section in the Annual Report.

On the strength of these recommendations it might have been expected that the 8th Annual Report of the Commissioners would have been of exceptional interest. However, it proves to be disappointing in this respect, and the decision to proceed further by committee will be regretted by all who realise how impossible it is for a committee, whose members have usually quite enough to do in their own occupations, to undertake the labours of research work. Another unfortunate aspect of this procedure is that the Commissioners themselves are unwittingly hardening the present difficulties by the narrow limits of the reference so far as tariffs are concerned, such as domestic supplies, rural supplies, etc. It seems to be taken for granted that these classifications are final, and not temporary expediencies to overcome the gradual breakdown of load factor tariffs. Would it not be better to examine the fundamental differences that underlie load factor and quantity (rateable value) tariffs and decide which of the two is better suited for present-day requirements?

In the present instance, however, the Conference finds sufficient reason for applying information derived from supply statistics as a whole, and sees no reason for supposing that any further variety of tariff is desirable for rural areas. I agree that there is no need to create another of these load factor expediency groups, but where the opportunity occurs, in an unspoilt market, it seems to be opportune to consider the logical expansion of the rateable value tariff to a real quantity tariff.

Choice of Principles.

As there appears to be a general lack of understanding of these fundamental differences, perhaps I may be excused for borrowing something from the style of the Weir Report and attempt a " picture."

We have before us the choice of two important principles. The first, which was so brilliantly demonstrated 25–30 years ago, showed how the cost depended on the number of hours of use or, in other words, load factor.

It appeared when the primary interest of electricity supply was lighting, that is comparatively small consumers. Power was regarded as a by-product and there was practically no heating.

The second was born some 15 or 20 years ago in Norwich, and depends on the principle that the size of the consumption of a consumer, or the degree of utilisation of the capital expended (chiefly in mains) has a greater influence on the cost than load factor, within the limits of general experience. It was received with the most bitter and violent hostility that has ever raged round a tariff controversy. The critics of that day failed to see the connection between the kW demand and the rateable value of a consumer, for the very good reason that there isn't any.

And this rather comic situation prevails to a very wide extent to-day. It may be mentioned, at this point, that rateable value is, of course, only a happy expedient for distributing a heavy standing charge per consumer, which in many cases would make the resultant price too high. But there is nothing in that; the load factor school had to compromise in the case of very low load factors in a similar way, otherwise the rate would exceed the statutory limit.

The Quantity Tariff.

With larger consumers in the one case, or longer hour consumers in the other, both systems got over their difficulties, and could charge the correct amount per consumer, or the correct amount per kW demanded. But the load factor system had a long start and was doing very well, so that with the exception of a few important undertakings who charge graded quantity rates for power, the quantity tariff has remained much the same for many years, that is, applied only to small consumers in the rateable value form.

We will now proceed with the " picture " :—

Load Factor.	Quantity.
1. A charge per kW.	1. A charge per consumer graded for size.
(*a*) Installed.	Plus a low unit charge metered graded for size.
(*b*) As indicated by instrument. Graded for size in two or three steps.	(*a*) Rateable value.
Plus a low charge per unit metered; also graded in steps.	(*b*) Graded rates for quantity, large power.
2. Flat rates based on assumed L.F. for different purposes.	
(*a*) Lighting domestic houses.	
(*b*) ,, hotels, etc.	
(*c*) ,, shops.	
(*d*) ,, churches.	
(*e*) ,, factories.	
(*f*) Power lift hoists.	
(*g*) ,, intermittent.	
(*h*) ,, electric furnaces.	
(*i*) Heating cooking	
(*j*) ,, room warming.	
3. Domestic supplies. A charge based upon the demand for lighting, assumed by	
(*a*) Number of rooms wired.	
(*b*) Wattage of lamps installed.	
(*c*) Floor space, plus unit charge 2 (*i*) and (*j*).	
4. Time control with clock switches.	
5. Change circuit system.	

Application.

Special instruments or inspection. In the case of purpose tariffs, a separate circuit and meter required for each purpose.	A single meter for all purposes.

Effect on Consumers.

Charges.

1*a*. Not satisfactory.	1. No opinion.
1*b*. Fairly satisfactory.	1*a*. Satisfactory.
2. Satisfactory.	1*b*. Satisfactory.
3*a* and *b*. Fairly satisfactory; *c* satisfactory.	
4. Fairly satisfactory.	
5. No opinion.	

Expansion.

Mostly neutral.	1. No opinion.
3 *a* and *b*. Retarding. *c* Encouraging.	1*a*. Encouraging.
	1*b*. Encouraging.

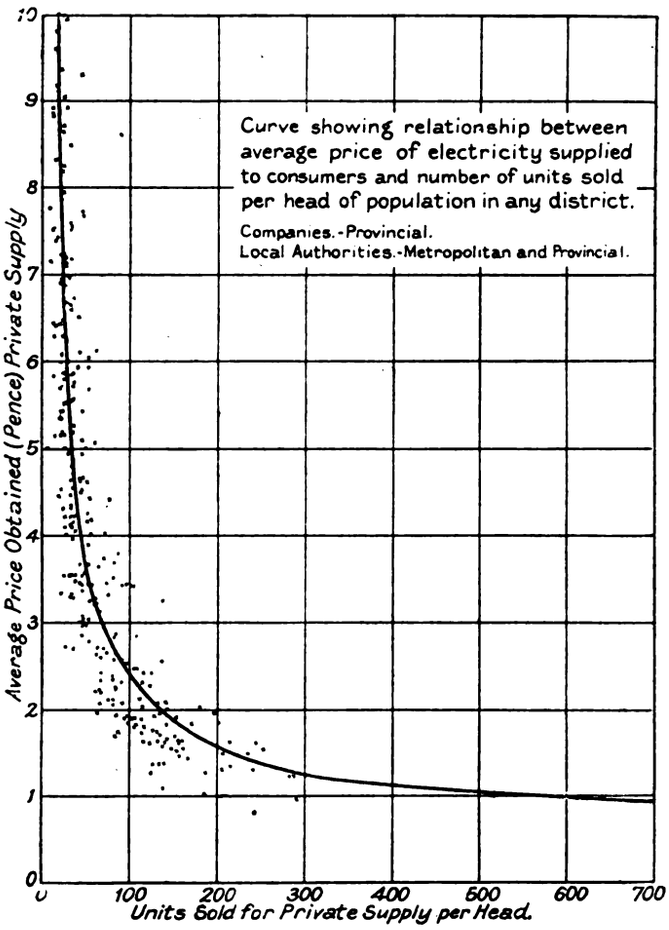
It should be noted that these opinions are merely personal, but are given as a suggestion for a questionnaire or other means of arriving at a conclusion.

With the coming of the Weir Report a curious thing happened. It was publicly announced that the cost per unit would be 1d. when the consumption reached 500 units per head of population, which appears to be correct, as we shall see later. It was not when the load factor reached 40 or 50%, but when the consumption reached a certain quantity per head, or otherwise when the consumption per average consumer reached a certain other quantity. Now if this is

Digitized by Google

so, what becomes of load factor tariffs; are we justified in framing load factor tariffs if the cost is really governed by quantity?

We will now examine the likelihood of this forecast being correct. In the first place we have the curve in the Weir Report* prepared by Mr. J. M. Kennedy from the practical results of a large number of undertakings. This indicates that the price will be 1·05d. per unit at the 500 mark. Since



then we have had the advantage of the Commissioners' statistics showing the units sold, year by year, and the average price obtained, which tend to confirm the curve. The figures are as follows :—

	Population	Units per head — Commissioners basis	Units per head — Weir basis	Price.
Weir Report	36·5 millions	—	110	2·047d.
Commissioners 1923–24 ..	—	117	—	1·87d.
1924–25 ..	—	125	—	1·76d.
1925–26 ..	44 millions	130	157	1·65d.
1926–27 ..	44·18 ,,	155	188	—

From these data the formula can be obtained :—

$$\text{Average price} = \frac{147\text{d.} + \text{units per head} \times 0{\cdot}723\text{d.}}{\text{units per head}}$$

The price in 1926-27 should be 1·505d., and at 500 units per head it works out at 1·01d. It is unfortunate that the Commissioners' 8th Annual Report, dealing with 1926-27 does not appear to contain the average price obtained, such as appeared in the 7th Annual Report at 1·65d., page 19, paragraph 72. Perhaps the Commissioners will repair the omission by publishing this figure in the technical Press.

As a further check, the actual results of two groups of municipal undertakings have been examined for the year 1928.

	Total output units sold.	Average units per head.	Average price obtained.	Price by formula.
10 Municipal undertakings about 200 units per head ..	1 302 millions	206	1·42d.	1·435d.
5 Municipal undertakings about 500 units per head ..	346 ,,	503	1·03d.	1·015d.

* Also see THE ELECTRICIAN, March 5th, 1926, page 260.

I suggest that these results completely vindicate the quantity principle.

To develop the matter further, I would refer again to the curve in the Weir Report. It will be found that the line does not pass through the thickest cluster of points at about 120 units per head, which cluster, by the way, is confirmed by the Commissioners' figures.

Mr. Kennedy evidently tried to make a single straight line law cover the whole range. He apparently got the extremities of this range fairly well, and had to sacrifice a little at the 120 unit mark. It is very remarkable that these results are so nearly a straight line law, but it would probably be nearer the truth if it was a series of such lines changing slightly at certain points to cover different portions of the range. There are obvious reasons for this, one being that at the higher consumptions there is a larger proportion of h.t. and e.h.t. mains, but we must pass over this at the moment. An interesting anticipation of such a change occurs in the Chester tariff, which is described in the Conference Report, page 49, section 41.

"This consists of a fixed charge based upon rateable value of the consumers' premises together with unit charges not exceeding 2½d. per unit for a certain consumption and not exceeding 1½d. per unit for all further units."

As it stands, this is a three-part tariff, a fixed charge, a block at one rate, and further units at another rate. The same result can be expressed in a quantity tariff, assuming, say, £3 for the fixed rate and, say, 300 units to the point of change. The tariff would read :—

For consumption up to 300 units per annum	£3 plus all units at 2½d.
For consumption from 300 to 600 units per annum	£3 18s. 6d. plus all units at 1½d.
For consumption from 600 to 1 000 units per annum ..	£4 11s. 6d. ,, ,, ,, 1½d.
For consumption from 1 000 to 2 000 units per annum ..	£5 1s. 5d. ,, ,, ,, 1½d.

By carefully selecting the steps in the consumption, and the drop in the unit rate, such a tariff can be made to approximate very closely to the ascertained costs. There is no difficulty in dealing with ½d., as ready reckoners are available. Alternatively, of course, the Chester form could be expanded. A further development would be to construct a suitable scale for quarterly quantities.

Small Consumers.

Having regard to this principle of a series of lines in a quantity tariff the question of the unit rate to small consumers becomes of great importance, as if it starts too low the capacity for reducing in progressive sections becomes exhausted. On page 54, section 72, No. 2 Sub-committee says :—

"From the standpoint of the consumer, the great inducement to an extended use of electricity under a two-part tariff is a low rate per unit. On the other hand a high fixed or service charge acts to discourage the voluntary adoption of such a tariff. While a due balance must therefore be observed by a supply authority, the Sub-committee are of the opinion that to secure the general use of electricity in rural areas the aim in view should be a limit of 1½d. or 1d. per unit charge of two-part tariffs."

This low rate was a very favourite argument with load factor tariffs, in the hope of increasing the load factor, but I very much doubt if it had any effect. Consumers would not use electricity for longer hours than they required, no matter how low the rate might be. It is a difficult thing to prove, but so far as consumption per consumer is concerned I give the results in Nottingham and Brighton in 1900 for what they are worth.

	Tariff.	Units per consumer.	Price.
Brighton ..	365 hours at 7d., remainder 1d.	1 230	2·98d.
Nottingham	400 ,, ,, 4d., ,, 2d.	1 310	2·87d.

So far, in reviewing the possibilities of ascertaining the costs on the quantity basis we have had to be content with an imperfect reflection of units per consumer, in units per head of population, as there are no statistics available per consumer. If the Electricity Commissioners could have given us the average units per consumer in addition to the units per head of population, they would have been of very great service.

It has been shown, that taken over very large averages the units per head appear to be very reliable, but in individual cases there are far too many freaks, for example :—

Digitized by Google

1928.	Units sold millions.	Units per head.	Price obtained.	L.F. per cent.
Manchester	353·5	273	1·06d.	33·21
Gravesend	19·7	254	1·17d.	38·27
Darlington	13·8	276	·9	28·11
Luton..	31·4	216	·98	30·55
Maidstone	17·6	374	1·17	34·24
Preston	38	147	1·16	28·78
Wallasey	31	166	1·05	30·53

Early in 1926 (February 26th) a curve similar to that in the Weir Report, but on the basis of units per consumer was published in THE ELECTRICIAN, and used to demonstrate how it happens that some small undertakings are able to sell as cheaply as others of far greater size, load factors being similar. (Such cases appear in the foregoing list; compare Wallasey and Manchester.) It was shown that the price depended on the average consumption per consumer. York and Liverpool, at that time, sold about the same number of units per consumer at exactly the same price, though the output of Liverpool was ten times that of York. This disposed of the big undertaking fallacy. It could not have been done on the basis of units per head, or load factor.

The Conference has something to say about large consumers and units per head (page 19, section 10, No. 1 Subcommittee) :—

" The preceding figures as a whole emphasise the value of large individual loads in the development of an undertaking in rural areas, and serve to indicate that the extent and character of the demand in different rural areas vary somewhat widely. They also point to the conclusion that the basis of units sold per head of population does not afford a reliable criterion as to the general consumption of electricity in cases where large individual loads predominate, or as to the ability of occupants of residences to use electricity for domestic purposes."

In several places the Conference emphasises the importance and effect of the large consumer, and it will be noted that several engineers arrange their statistics on the basis of per consumer, capital, consumption, revenue, etc., as well as per head of population. Is it not most desirable that all statistics should be on the basis of per consumer (and any other if necessary) more especially when rateable value tariffs are contemplated ? I suggest that this is one of the most urgent points for any tariff committee to consider.

In developing rural areas there is an opportunity of escaping from the melancholy confusion of 30 years of load factor. Rateable value tariffs are tried and tested, and available for small consumers, and there is the logical expansion to a pure quantity tariff for really large consumers.

This market has not been spoilt by thoughtless offers of power at 1d. per unit for any trivial quantity. The Conference has already done an excellent service in studying and defining the upper limits at which electricity may be saleable in competition with other agencies. It is to be hoped that the new committee will "carry on" and that their recommendations will be at least consistent in principle, and not selections from load factor expediencies with rateable value trimmings.

BOOK REVIEWS.

Centrales Eléctriques (Electrical Central Stations).

By F. DROUIN. Pp. 580. (Paris: J. B. Baillière et Fils, 19, Rue Hautefeuille.) Paper cover, 85 Frs.; bound, 97 Frs.

This is one of the series of works in the " Encyclopedie D'Electricité Industrielle " organised with the co-operation of the French Institution of Civil Engineers, and prepared by M. F. Drouin, technical director of the Cie Générale D'Électricité with the co-operation of the leading French electrical societies.

The first chapter, after a short historical résumé, deals with the ratio of maximum demand to connected load. Diversity factors are dealt with, and a series of curves are given showing daily load variations on French stations; the long dinner hour from 12 to 2 has a marked influence, also " summer time." It is evident also that the so called " Semaine Anglaise " with Saturday afternoon " off," is getting popular. The system of representing load curves with the aid of a series of cut out cards is described, and interconnection discussed.

When dealing with distribution tensions it is pointed out that there have not been as many accidents as might be anticipated. Owing to the lower distribution pressure usual in France (115/200 V) a material proportion of power customers take current at h.t. The effect of h.t. distribution voltages on minimum transformer capacity and transformer light load losses is emphasised. Generator voltages are discussed. The supply of power as a by-product of coke-ovens, blast furnaces, metallurgical furnaces, and so on, is dealt with.

Chapter II deals with lay-out and buildings. The choice of the site, size and number of units. The desirability of having a single unit large enough to supply the charging current to the line is emphasised. The proportion of spare plant is examined. As with us the longitudinal arrangement of turbines seems to be the vogue with very large units; the use of a separate pump house between boiler and turbine sections, the importance of questions of floods, ash disposal and facilities for labour supply or housing for employees in matters relating to station sites are indicated; the importance of heating and ventilation during very cold weather is also pointed out.

Chapter III deals with matters relating to water circulation and supply. Spray ponds and chimney coolers are discussed, and feed water, its measurement, purification, distillation and de-aeration complete the chapter.

Fuels, coal and its storage, lignite, coke, peat, liquid fuels, natural and coke-oven gas and the weighing and handling of liquid and solid fuels are dealt with in Chapter IV. At St. Ouen, steel coal trucks are placed on a side slope and cleared through the doors in three minutes by means of a big water jet operated by a centrifugal pump. Ash handling and disposal is then discussed, followed by remarks on conveyor construction and upkeep, and water trough ash conveyors.

In Chapter V steam and its characteristics, boiler sizes and types, superheaters, economisers, air pre-heaters, furnaces and the smoke problem, the influence of combustion chamber volume, fire brick arches, sprinklers, chain grates and underfeed stokers, liquid fuel and gas furnaces and pulverisers are dealt with, then flue cleaning, chimneys of brick, boiler plates, and moulded concrete, artificial draught, with which the name of M. Prat is so closely connected; then follow additions to notes on boiler efficiency, boiler feed pumps and feed regulators.

Chapter VI deals with thermal prime movers, steam engines, Diesel engines and then steam turbines, their consumption, lubrication, re-heating, high pressures and bleeding, followed by condenser problems, air extraction, tube corrosion and the question of busbar, auxiliary electric, and the steam driving of auxiliaries are looked into.

Chapter VII is devoted to pipework and valves for steam and water, with notes on pipe insulation.

Chapter VIII deals with certain salient points relating to electric generators, choice of tension, cooling arrangements, frequency changers, synchronous condensers, boosters and station auxiliary services.

Chapter IX, of over 100 pages, deals with switchboards and their apparatus and connections, including voltage regulation, synchronisation, busbars, choke coils, relays, switchgear, including the Reyrolle compound-filled system; the chapter is concluded by some notes on transformer operation.

The last chapter gives a number of points on operation, including useful notes regarding upkeep of boilers, turbines, condensers, generators and switchgear, fire services, combustion, flue gas analysis, coal calorific values, central station efficiency, depreciation, construction factors and electricity tariffs.

The book should be very useful for students, and owing to the numerous practical points in it is worthy of study by many past that stage. The author has concentrated mainly on the steam side. He has not attempted to discuss electrical theories in a chapter or so; he assumes that his readers know such matters already. Each chapter has a good bibliography, and it is with pleasure that one notes that the author has been very broadminded in his treatment, giving credit in many cases to English engineers and constructors.

The arguments used are clear, graphs are freely adopted, and from cover to cover the work bears the imprint of a practical man.

A GENERALISED COSTS ALIGNMENT CHART.

A Simple Scheme for Facilitating Comparison of Electricity Charges which is Applicable to any System of Rating—A Useful Refinement—Employment of the Scales—A Hypothetical Example.

By W. A. BARCLAY, M.A.

IN THE ELECTRICIAN of March 1st, 1929, the writer submitted an example of a type of alignment chart designed to give a rapid means of comparing the cost to the consumer of two specified modes of charging for current. Other and different charts could, of course, be constructed to illustrate other particular methods, and when once these are drawn out they afford a very convenient means of reckoning costs.

As pointed out in the article, other scales corresponding to other systems of charging can be drawn in for additional cases of special interest. The multiplication of such scales, while undoubtedly convenient for certain purposes, unfortunately complicates the diagram, which may get "crowded." It is, therefore, thought that a more general process, by which *costs on any system of rating can be compared*, may usefully supplement the former chart, which dealt with two systems only.

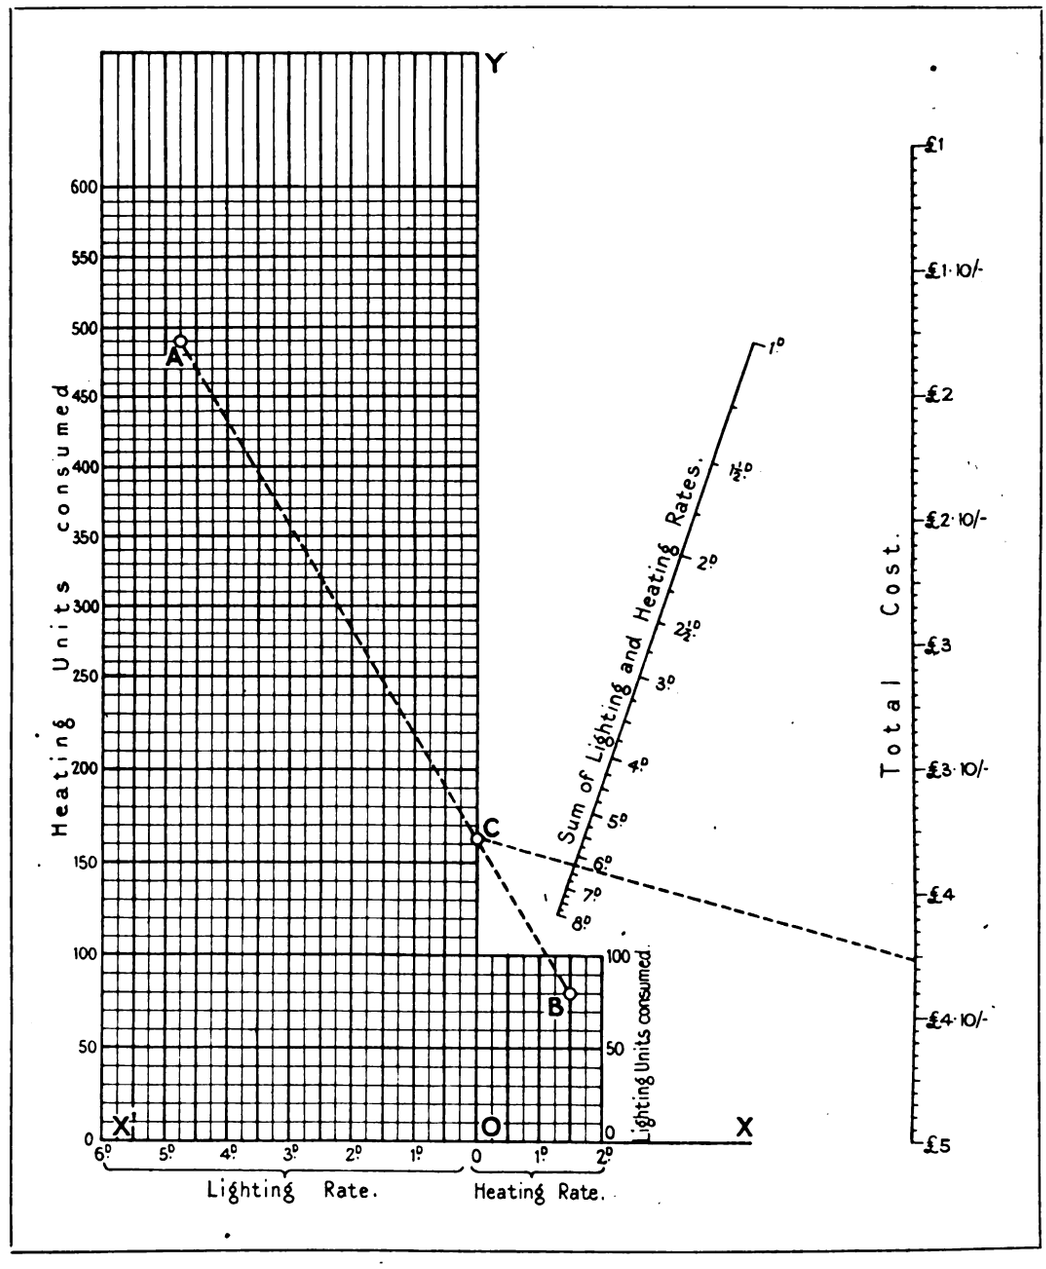
Let us suppose that current is supplied for lighting purposes at r_l pence per unit, and for heating at r_h pence per unit. Then, if a consumer takes l units for lighting and h units for heating, we shall have for P, the total costs in pounds,

$$240\,P = (l \times r_l) + (h \times r_h).$$

The chart which is reproduced herewith, is designed to solve this equation at sight for all values of the variables. It comprises an ordinary cartesian network XOY, in which the horizontal axis XOX^1 is graduated on either side of the origin for values of r_l and r_h, taken at intervals for every farthing. The vertical axis OY is graduated in units consumed.

The procedure in use is as follows. First find a point A whose abscissa, taken to the *left* of O is equal to r_l while its ordinate is h. Next, find B whose abscissa, this time to the *right* of O, is equal to r_h while its ordinate is l. Join AB, and let it meet OY in C. Now find on the slanting scale the graduation which represents the sum of the two rates r_l and r_h. If a line be now taken from C through this point and produced to meet the right-hand scale, the resulting point gives the total amount of the cost sought.

In practice there is no need to draw the lines indicated in the above construction. The positions of the necessary points may be found quite well by means of a ruler placed in position over the diagram, or even more conveniently by a piece of thread. It will be noted that the required cost is obtained by two applications of the index line. This is due to the fact that the present chart is more general in its scope than the previous diagram, which entailed but one setting of the index.



A refinement of which the diagram is capable may here be noted. It is the practice of some supply authorities to reduce the rate charged per unit after a certain number of units have been consumed. Thus, if after 250 units have been consumed for heating at rate r_h, any excess is charged for at the reduced rate r_h^1. This circumstance has been allowed for on the present chart, which has been constructed on the assumption that for all heating units over 250, the charge is three-quarters of the original rate. It will be seen that the scale of heating units has been reduced in this proportion above 250 on the diagram.

An example of the use of the chart will make the matter more clear. If lighting costs 4¾d. per unit, and heating 1½d. per unit for the first 250 units, and thereafter three-quarters rate, or 1⅛d. per unit, what is the cost of 80 lighting and 490 heating units?

The dotted lines on the diagram show the points A and B for these values. The point of intersection C of AB with the axis OY is joined to 6½d. on the slanting scale, this being the sum of the two rates. The cost is found to be slightly over £4 5s.

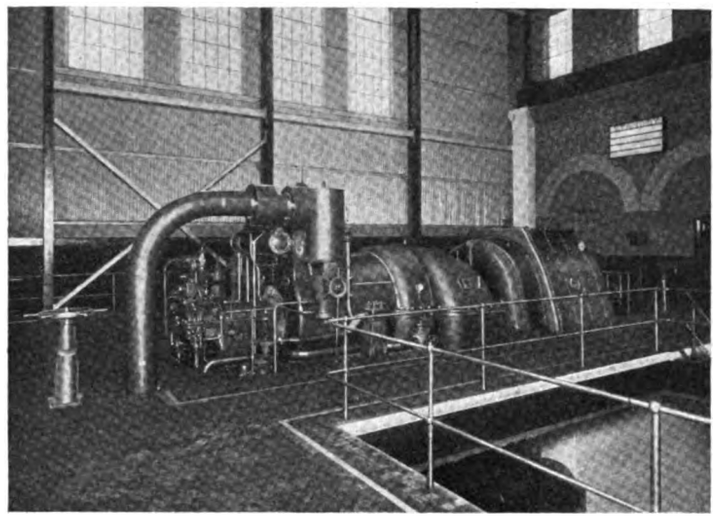
EXTENSIONS AT TORQUAY.

Official Inauguration of New Plant at Newton Abbot Station—The Latest Extensions Described—Special Provision for Overhead Circulating Water Delivery Pipe—Sandwich Firing with Coal and Coke Dust—The Control Gear.

IN view of the proximity of the I.M.E.A. Convention at Torquay, particular interest attaches to the latest extensions to the Newton Abbot power station of the Torquay Corporation, which were officially opened by the Mayoress of Torquay on Wednesday.

The extensions comprise a 7 500 kW turbo-alternator with surface condensing plant, a 50-ton electrically-driven travelling engine-room crane, two high pressure boilers with economisers, induced draught and other auxiliary plant, additional riverside works for the provision of circulating water for the condensers, a new railway siding for receiving supplies of coal from the G.W.R. Moretonhampstead branch line and an interesting system of coal handling and conveying plant.



The latest engine-room extensions at Newton Abbot, showing the new 7 500 kW B.T.-H. turbo-alternator.

The new engine room extensions occupy the site upon which the boiler house of the old Electric Supply Co.'s station was formerly situated, while the new boiler house extensions are erected upon the site of some disused clay pits, formerly utilised by the company as cooling ponds for condensing water.

These old ponds had been filled up with tipped material since the acquisition of the site by the Corporation, and owing to the uncertain bearing capacity of the ground the foundations of the new boiler house and other coal conveying plant had to be carried upon a system of reinforced concrete piles 14 in. square and ranging in length from 35 to 80 ft.

Piles for a further extension of the boiler house similar to that recently completed have already been driven, and a pile-supported reinforced concrete platform has also been completed beyond the new engine room in readiness for the accommodation of the next contemplated extensions of 10 000 kW.

The only portion of the old company's buildings now surviving is the corner of the station behind the ivy-covered frontage immediately adjoining the main entrance gates. These buildings accommodate the two 1 250 kW B.T.-H. turbo-alternators which were transferred from the old Torquay station at Beacon Quay. With reservations as to the Central Electricity Board's Scheme for South West England, these old sets will be removed and their site occupied by a new 10 000 kW or 12 500 kW turbo-alternator when occasion demands.

After the completion of the recent alterations and extensions, the station now contains generating plant of some 18 000 kW total maximum continuous rating.

All the old company's original plant has now been removed, with the exception of the 600 Ah D.P. battery which is still used with rotary converters in connection with the works power supply.

The original office buildings, which have been slightly extended, now provide accommodation for the fuel, oil and water testing laboratory, and for the local distribution staff.

The New Engine Room.

The new engine room behind the old building contains two 3 750 kW B.T.-H. turbo-alternators, the e.h.t. and l.t. switchgear and control room, and two B.T.-H. rotary convertors, each of 400 kW rating, for supplying the works power and a portion of the Newton Abbot town d.c. network.

The first section of the new boiler house parallel to the engine room contains four Stirling boilers with Green's economisers, induced draught plant, coal bunkers, elevator, etc.

The working steam pressure for this first section of the new station was fixed at 150 lb. per sq. in., with a superheat of 150° F., in order to obtain the benefit of the considerable saving in capital charges effected by the use of the old Torquay generating plant and the existing Newton Abbot boilers.

The latest extensions of both boiler house and engine room are laid out at right angles to the original engine room, and the steam conditions have been raised to 250 lb. and 650°

The h.p. and l.p. steam ranges are coupled by means of a Crosby reducing valve. The 3 750 kW turbo-alternators were originally designed for the higher working steam temperature, and the two smaller machines, transferred from Beacon Quay, are supplied through a British Arca desuperheating plant, which reduces the steam temperature to 500° F.

The latest generating unit is of 7 500 kW capacity, and, as in the case of the 3 750 kW machines, generates direct at the transmission pressure of 11 000 V at 50 periods. The pressure of the two smaller machines is stepped up from 2 200 V to the transmission pressure.

Circulating water is drawn from and returned to the River Teign by vertical spindle pumps situated in two pump houses on the river bank. Coal, which is obtained chiefly from the Forest of Dean, is delivered in trucks to the new railway siding, from which it is transferred to stock, or alternatively to the overhead bunkers in the boiler house by means of the recently installed mechanical coal handling plant.

Water Treatment Avoided.

The boiler make-up water, which is obtained from the Torquay Corporation Water Department, contains no scale-forming or corrosive constituents, and is, therefore, used direct without any treatment other than the preliminary "boiling" which it receives in the exhaust steam-heated feed tanks.

The whole of the boiler house plant was supplied by the Stirling Boiler Co., Ltd., and comprises six Stirling boilers of the five-drum type. The latest additions to the plant consist of two boilers each of 7 437 sq. ft. heating surface, evaporating upwards of 40 000 lb. of water from feed water entering the economisers at 100° F. to steam at 265 lb. per sq. in. superheated to a final temperature of 650° F.

Each boiler is fitted with a pair of Babcock and Wilcox chain grate stokers of 16 ft. long by 6 ft. wide, fitted with special narrow lap links for burning small coal and coke dust, of which latter fuel a considerable quantity is used. The superheaters are of the standard Stirling design.

The furnace arches are of the flat suspended "Liptak" type and each boiler is provided throughout with steam jet soot blowers of the Diamond power pattern for the purpose of keeping the heating surfaces free from external deposit.

A Green economiser is fitted immediately behind and adjoining each boiler. Mechanically-operated tube scrapers are fitted to each group, the soot falling down into hoppers in the basement below. Each boiler is fitted with a Sirocco induced draught fan mounted upon a platform situated above and behind the economiser.

The gases discharged from the fan are passed through a Sirocco grit arrestor, and thence into a short steel stack 60 ft. high above the firing floor level, and 4 ft. 9 in. internal diameter.

The steel framed coal bunkers arranged above and between the two boilers are designed to contain 50 tons of coal when full, and are divided into two compartments with a view to keeping coke dust separate from coal.

Each class of fuel is delivered through a separate travelling cylindrical chute into the boiler hoppers, which are divided to enable the fuel to be fired on the "sandwich" system.

Soot, ashes, riddlings and grit are delivered into their respective hoppers below the firing floor, and are removed from the basement in steel wagons.

Digitized by Google

A special instrument panel equipped with a Bailey boiler meter, distance thermometers and draught gauges is provided in connection with each boiler, and each boiler is provided with an automatic feed water regulator of the Crosby pattern.

The feed pumphouse, which is situated in a bay between the boiler house and the latest engine room extension, contains two sets of feed pumps and feed tanks for serving respectively the high and low pressure boilers. The feed tanks are arranged above the pumps to give a head of 15 ft. upon the suction side. The tanks are in two groups, each of two compartments, and are heated by exhaust steam from the turbine driven feed pumps.

The two turbine pumps which serve the high pressure boilers are of J. P. Hall and Co.'s manufacture, and each designed to deliver upwards of 120 000 lb. of hot water per hour. The two low pressure turbine pumps are of J. and G. Weir and Co.'s manufacture, and each designed to deliver upwards of 100 000 lb. of hot water per hour. A three-phase motor driven pump by Mather and Platt, designed to deliver up to 80 000 lb. per hour is so arranged as to be interchangeable between the high and low pressure feed ranges.

The New Turbo-Alternator.

The new turbo-alternator, which was manufactured by the British Thomson-Houston Co. has a maximum continuous rating of 7 500 kW at 90% power factor. The machine runs at 3 000 r.p.m., and delivers three-phase electrical energy at 11 000 V 50 cycles.

For the purpose of withstanding accidental short circuit, the alternator has been designed to have an inherent protective reactance of 15%. The inherent regulation of the machine at 90% power factor is 35%, and at unit power factor 24%. The voltage of the alternator is maintained constant within 1·0% variation by means of an automatic voltage regulator of the Tirrill type.

The turbine is of the B.T.-H. Co.'s super-efficiency Curtis impulse type. The alternator is of the closed circuit air-cooled type, in which the ventilating air is circulated by means of fans on the electrical rotor, and cooled by passing over a cooler of the surface type supplied with cold water from the condenser circulating system.

The exciter, which is of the shunt connected commutating pole type, is directly coupled to the end of the alternator shaft by a flexible disc coupling.

The two 3 750 kW turbo-alternators which were installed respectively in 1924 and 1926, as well as the two earlier 1 250 kW machines, are also of the B.T.-H. Co.'s manufacture.

The condensing plant in connection with the new 7 500 kW machine is of the horizontal surface type, and was manufactured by Hick, Hargreaves and Co., Ltd., as sub-contractors to the B.T.-H. Co. The air extraction is performed by the Hick-Breguet ejectair, which is fitted with a special stabilising valve which automatically prevents the ejectors from becoming unstable at light loads. Extraction pumps are in duplicate and of the centrifugal type. They are direct coupled to direct current electric motors.

The condensing plant in connection with the 3 750 kW machines was manufactured by Cole, Marchent and Morley, Ltd., Bradford, as sub-contractors to the B.T.-H. Co. The air ejectors are of the Delas jet type, and extraction pumps are also provided in duplicate. The condensers of the two smallest machines are by the Mirrlees Watson Co., and the air ejectors are of the Delas jet type.

Circulating water is drawn from and returned to the River Teign. The design of the circulating system presented considerable difficulty, on account of the great seasonal variation of the depth of water in the river (amounting, according to flood, drought and tide, to as much as 17 ft.), and also to the intervention of the confluent river Lemon between the main river and the power station.

Two pumphouses situated on the river bank deliver circulating water to the condensers. No. 1 pumphouse, put into commission in July, 1924, contains three vertical spindle pumps by Mather and Platt. These pumps are so installed as to be 3 ft. below the deepest part of the river bed, so ensuring a pressure head upon them at all states of flood and tide. Each pump is designed to deliver upwards of 150 000 gallons per hour against a head of 30 ft., and is driven by a 40 H.P. variable speed d.c. motor, mounted on the motor floor, which is situated approximately 22 ft. above the basement floor.

The circulating water system operates as a closed syphon, and the motors are automatically controlled from the switch board in the station control room.

The river water is passed through rotating band screens of Brackett and Co.'s manufacture at the intake, for removing floating debris and preventing the passage of salmon fry through the pumps.

The flow and return pipes between No. 1 pumphouse, the power station and the river are of cast iron, 22 in. bore, embedded throughout their length in concrete. Barge traffic in the Lemon necessitated the sinking of these pipes below the bed of that river, and considerable engineering difficulty was encountered in the course of carrying out that portion of the work.

After passing through the condensers the circulating water is returned into the river Lemon, whence it flows back into the Teign. Special powers to do this were obtained by the Torquay Corporation Act (1027), and by virtue of that Act also the delivery pipe crosses the Lemon overhead on a lattice steel bridge, instead of underground as in the case of the pipeline from pumphouse No. 1.

The railway siding and coal handling and conveying plant also form part of the recently completed extensions. A railway siding branching from the Great Western Railway Co.'s Moretonhampstead branch line has been constructed upon a piece of land between the rivers Lemon and Whitelake, which was acquired for that purpose. The siding consists of a single track line, carried upon a reinforced concrete gantry construction. Coal wagons are delivered to the entrance to the siding by the railway company's locomotives, and thence hauled over a 30-ton weighbridge by an electrically-driven capstan.

After weighing, the loaded trucks are passed over a rotary tipper, which discharges the coal into a reinforced concrete hopper below the siding. The empty trucks are then passed on to the other end of the siding.

The coal is then hoisted by a continuous conveyor of the "drag link" type to the top of the reinforced concrete storage silo which has been constructed on the power station side of the river Lemon.

The silo, which provides the working storage of the station, has a full capacity of 1 000 tons. The conveyor passes over the top of the silo, and is so arranged as either to drop the coal into storage or to carry it on to a second "drag link" conveyor, which conveys it directly to the service bunkers in the boiler house. A third conveyor of the bucket type is arranged to receive coal discharged from the bottom of the silo and hoist it to No. 2 conveyor, which delivers it to the boiler house. The whole of the coal handling plant was supplied by E. Bennis and Co.

Switchgear.

The e.h.t. switchgear is of the cellular type designed and manufactured by the B.T.-H. Co., and is mounted in moulded stone cubicles erected on the engine room basement floor, with sheet steel hinged doors giving access at both front and back. Duplicate busbars mounted on compression type insulators are provided, and the oil circuit breakers, which are fitted with welded boiler plate tanks for each phase, are electrically operated from a vertical type control board installed on the control room gallery above. Each circuit equipment is provided with the usual isolating devices, instrument transformers, and instruments. The generator equipments include circulating current protective gear together with definite time limit overload relays, also automatic field suppression switches.

The two main outgoing feeders, to Torquay, are fitted with the latest form of B.T.-H. balanced current parallel feeder protective gear with definite time limit overload relays.

The neutral of the system is earthed through limiting resistances of the cast grid type mounted on suitable porcelain insulators and enclosed in expanded metal housings. These resistances can be isolated by means of oil circuit breakers which are electrically operated from the main control board.

The d.c. switchboard is of the B.T.-H. vertical flat back type, and is installed on the same gallery as the e.h.t. control board. It is arranged to control the d.c. side of the rotary converters, the 250 kW generator, the Newton Abbot town supply, and the various auxiliary circuits of the power station.

An illuminated diagram board at one end of the control room shows diagramatically the e.h.t. system supplied from the power station, and the switching at all sub-stations served by the system.

The whole of the scheme was initiated by and carried out in accordance with plans and specifications prepared by Mr. H. F. G. Woods, the borough electrical engineer.

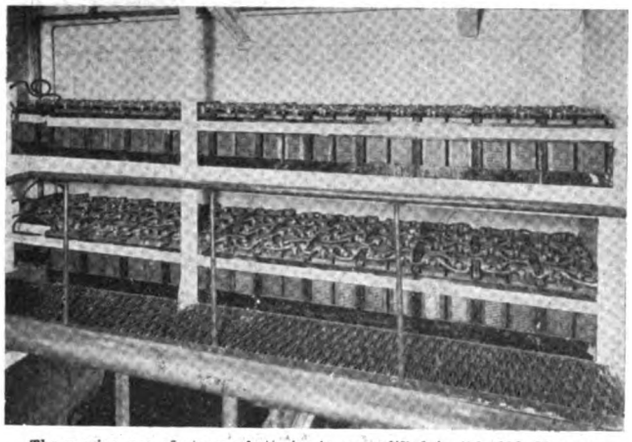
MARINE ELECTRICITY.

Further Sidelights on Electric Propulsion—Shipowners Now Considering Electric Liners for Important Routes—A Small Ship's Power Plant—The Increasing Use of Storage Batteries to Relieve the Main Generator Sets.

By A. C. HARDY, B.Sc., A.M.I.M.E. (Author of "Motor Shipping," "Merchant Ship Types," etc.).

IN shipping circles, electricity for propulsion is being discussed for an increasing range of ship types. Last week, during a demonstration run of the new, and first, cross-Channel motorship "Ulster Monarch," an important official of a railway company operating fast small cross-Channel ships out of the Channel ports suggested that the principal factor



The marine use of storage batteries is exemplified in this 900 Ah group installed on a large yacht.

debarring his own company from using Diesel motors on some of their services was not any lack of realisation of their undoubted economy. Neither was it, he suggested, for physical reasons—of being unable to get the power within the allotted space. Rather was it a question of the improbability of the Diesel engine standing up to the severe manœuvring conditions imposed on it. These conditions comprise a certain amount of astern running at high speed and a great deal of "backing and filling" in order to bring the ship alongside a quay at all states of the tide with a ship ahead of her tied up, and another one astern.

Whether his opinion on the Diesel engine was a correct one does not concern us here. It does serve as a very definite point at which to say that if the economy of the Diesel is well proved and if the right type of Diesel engine is available, could not its sterling qualities be transmitted to the propellers through the medium of electric motors? With pilot house control, maximum manœuvrability is assured because the ship virtually becomes a tramcar of the sea, in the same way that a tug or a train ferry does. It may, perhaps, seem rather like over-emphasis that this point should be continually stressed. One does so, however, in order to emphasise the point that if excessive manœuvring is required, then it is through the medium of electric transmission that this can best be accomplished. Electric manœuvring at least ensures a positive reply to all telegraph signals from the bridge, which no direct drive, however skilful the engineer on watch, can ever hope to give.

As there is only as yet a dawning recognition of the possibilities of electric propelling machinery for certain types of ships it seems quite desirable to emphasise this point. If, as is commonly supposed, the new mammoth White Star liner is to be Diesel-electrically powered, then you have an altogether different aspect to the question. In this case, electricity is very definitely being used as a means whereby the economy of the Diesel engine can be applied to the propeller shafts, when otherwise such application would be impossible for purely physical reasons. Criticism has been advanced against electric propulsion on account of the transmission losses incurred, but this, one submits, is not the correct way of looking at the matter. You cannot make an omelette without breaking eggs. In fact, if you want the omelette you've got to break eggs. And the omelette, in certain cases, is well worth eating.

Thirteen Big Electric Passenger Liners.

Whether it is worth eating, in the case of ships engaged in round-the-world service, or in long ocean hauls generally is a point worth consideration. This should not, however, prevent a feeling of gratification at the fact that one large shipowner with world-wide interests should have decided to build no fewer than six large electrically-propelled passenger liners. When these ships are complete, not allowing for others ordered after, there will be a total of 13 big electric first-class passenger liners built, building, or in service. This latest order is for six ships for the American Dollar Line. The new vessels will be, it is announced, of very up-to-date type and will cost about £1 400 000 each. Detailed particulars have not yet been published, but it has been announced that they will be about 650 ft. in length and will have a speed of about 20 knots. Passenger quarters for about 350 people will be provided, and it is even suggested that aeroplanes may be carried. Total power is given as 26 500 H.P.

An Important Order.

This order is an important one because it definitely shows that the electric liner has arrived. And remember that only a few years ago an electrically-propelled ship was, in this country at any rate, regarded somewhat in the nature of an experiment. The "California," completed last year for the International Mercantile Marine Corporation for service between New York and San Francisco via Panama marked the commencement of an awakening interest in this type of propulsion. Her trials were attended by a number of important marine men from both sides of the Atlantic, and her subsequent performance demonstrated the successful economy of operation of this type of ship. She has since been followed by a sister ship, the "Virginia," and a third vessel for similar service is now under construction at the Newport News shipyard at Newport News, Va. This ship, the "Pennsylvania," is to be ready for service in December. The "Pennsylvania" will be larger than her two sisters, and the importance of this 3-unit fleet lies not so much in its present duties, but in the fact that it is capable of operating on almost any first class passenger-cargo routes throughout the world.

On this side of the Atlantic our own "Viceroy of India" has started an interest in electric propulsion for large passenger liners which may very soon result in the placing of further orders, and there are strong rumours that an electric liner is being designed for one of the big shipping companies. We know definitely that when the new White Star liner is built she will be an electric ship and, at that, the largest electric ship in the world—unless the Cunard Line goes one better. At present it would seem, however, that like skilful chess players, the Cunard and the White Star Line are watching each other's moves, and each, further, is watching the Hamburg American Line. All three, perhaps, before putting their cards definitely on the table are watching the Norddeutcher Lloyd's new mammoths, "Bremen" and "Europa," one of which is now unfortunately very much out of action—so much so that her eventual completion is, according to some accounts, problematical. It is certain, however, that new luxury tonnage will have to be laid down shortly for transatlantic trade. When this is done, electricity has a very good chance of getting a large share of the work. Meanwhile, the situation as regards the 15 000-30 000 H.P. electric liner is by no means an unsatisfactory one. The "Viceroy of India" is operating successfully in service. Three "California"-type ships are built or on order, and the addition of a further three similar ships is contemplated. The Ward Line is building two ships, discussed in my article on "Marine Electricity" in THE ELECTRICIAN of March 1st. The Grace Line is building one electric liner for service between New York and the West Coast of South America. The Dollar Line has six big electric ships on order, and the White Star Line is to build one. This actually means a total of 17 "possible" electric liners, all of large type, which may be in service within the next four or five years.

So much for the big ships. We may return now to deal in somewhat more detail with one of the most electrical of small ships at present afloat. She is noteworthy in that her electrical generator sets, or power station, is sufficiently large to require a separate compartment forward of the main engine room. This power station contains three Diesel-driven generators, each of 110 kW, two of which are running when the ship is at sea. These generators are required to drive the

Digitized by Google

whole of the auxiliary machinery in the main engine room, comprising cooling water pumps, fuel and lubricating oil pumps, fuel and lubricating oil centrifugal separators, bilge and ballast pumps and two large manœuvring air compressors, each driven by a 95 H.P. motor and arranged in the wings of the power station, where also is located the main switchboard.

Then, as far as deck gear is concerned, cargo winches, windlass, capstans, and steering gear are all electrically driven, the capstans and the windlass being controlled by motors of approximately 100 H.P. each, operated on the Ward-Leonard system. In addition, the steering gear is of electric-hydraulic type with two motors, one running and one standby. The water-tight doors are electrically operated. The engine room telegraphs are of Siemens electric type and so are the pyrometers for reading the temperature of the exhaust gases from the main engine manifolds. On the bridge there is an electrically operated cabinet for fire detection purposes, electrically operated clear-view screens which fling off rain and spray drops centrifugally, and electrically operated helm and revolution indicators. In addition, of course, there is a complete ship's telephone system.

The operating side of the ship, it will thus be seen, is almost amazingly electric for a small ship 345 ft. by 46 ft. by 19 ft. moulded. And one cannot help contrasting the difference between this ship and a corresponding steamer of, say, ten years ago, when the principal use on board ship for electricity was for lighting purposes only. The " Ulster Monarch," which is the ship we are considering at present, has an unusually elaborate electric lighting system for a cross-Channel vessel. In particular this applies to the cabins, where special lighting is arranged over the bunks. The lighting arrangement generally is in line with modern practice and is a great improvement on anything that has gone before. Lighting is even extended in a rather novel manner to the bell system for the cabins—an idea which may or may not be an advantage. When the passenger rings the bell the system is so arranged that luminous indicators direct the steward right to the door of the cabin. These lights can only be extinguished by the steward giving attention to that cabin, and a tell-tale indicator shows the chief steward if proper attention is being given in each section. The idea of this is to eliminate any disturbance to passengers through continuous ringing of bells.

Electricity is used extensively for cooking—also an unusual feature on cross-Channel ships—and is applied to the ranges, toasters, hot plates, and hot cupboards. In addition, there are electric hot water boilers in the deck pantries, and the hot running water in the passenger cabins is electrically heated. Electric heaters are fitted throughout the quarters, and the ventilation depends upon the circulation of air, whose temperature can be controlled, through special ducts, by electric fans. An emergency supply of electricity is provided by a 7½ kW generating set on deck.

Shaft-driven Generators and Storage Batteries.

These few items give, perhaps, a definite idea of the call of the shipbuilding industry upon the electrical industry in the building of a modern ship. Fundamentally it depends upon the fact that with Diesel generators shipboard electricity can be generated cheaply and used flexibly. Purposes such as those listed above would have been considered quite outside the scope of electricity in the ship of, say, ten years ago—largely because of the difficulty of generating the current to supply them. It is only actually within the last few years that electricity for cooking has been regarded at all favourably in marine circles. Remember that developments in shipboard electrical technique, while in general they parallel the land developments, are always circumscribed by the fact that a ship is a floating isolated body. In other words, nearly all the conditions are different from land conditions.

The " Ulster Monarch " has, in her upper casings, a storage battery set for use in connection with the electric-hydraulic steering gear, in the event of a complete shut down of the main generator sets in the power station below. The use of storage batteries on board ships seems to be developing into a definite technique which is probably capable of considerable development. One has noticed it applied to several recent modern motor yachts ; in this case, in conjunction with a shaft driven generator set. The use of shaft generated power is a point which often seems to escape the notice of shipping men, and yet after all it is merely a question of railway train lighting all over again, with the difference that whereas the train runs at the longest only seven or eight hours without a stop, the ship may run as long as seven or eight days without stopping. Storage batteries, moreover, take up very little space, and may be conveniently stowed away in an odd corner of the engine room.

An interesting case in point which shows the use to which storage batteries may be put on board ship, may be cited by quoting the work performed by a storage battery set on a ship designed for carrying steel plates. For cargo handling the ship has two 5-ton electric cranes, each driven by a 65 H.P. motor. The ship has a deadweight capacity of 2 078 tons and has 750 H.P. for main propulsion. Electric power for the ship is supplied by three 60 kW 240 V compound wound generators. Before the storage battery was fitted, the two generator sets had to be paralleled when the two cranes were in operation, and when the cranes started to lift the load ran up from 50 to 500 A. This caused the generator engines to smoke and knock (they were of Diesel type) ; they slowed down and the governors flew open. Two banks of Exide Ironclad batteries were fitted, and under this new system one generator set can be cut out entirely during crane operation, the other being quite sufficient, with the batteries floating on the main bus. Furthermore, when the ship is in port the generators can be released for overhaul, or the whole of the heating, lighting, and cooking can be run off the batteries. During peak loads on the cranes the batteries feed into the line, preventing overloading of the generator. When the hoist is finished, the procedure is reversed, and the generator charges the batteries. The generator engine operates at constant speed without overload, and there is no smoking or knocking.

With the exception of the example quoted above and of an increasing number of yachts, " battery " electricity is only making slow progress for active work on shipboard on cargo vessels. Its use for standby purposes on ships like the " Ulster Monarch " however, does definitely indicate an awakening interest in a form of power generation which is as cheap as it is reliable and flexible.

STATION AUXILIARIES.

The Determination of the Most Suitable Type of Drive.

By F. GEOFFREY MARSHALL.

IN the modern power station the reliability of the auxiliaries is as important as that of the turbo-alternator itself. It is therefore essential to take precautions to eliminate all possibility of a breakdown.

To attain this state of reliability, we, of course, only use machines of recognised and tested dependability ; we place them in accessible places to facilitate easy removal for exchange ; we keep duplicate parts handy ; and we aim for interchangeability of parts as much as is possible.

On the above points all agree. But on the question of types of drive we are all at " loggerheads."

For boiler feed pumps it is often customary to use high-speed turbines, but it is with the type of electrical drive that we are chiefly concerned, for this type of drive is generally used for circulating pumps, mechanical stokers and other main auxiliaries.

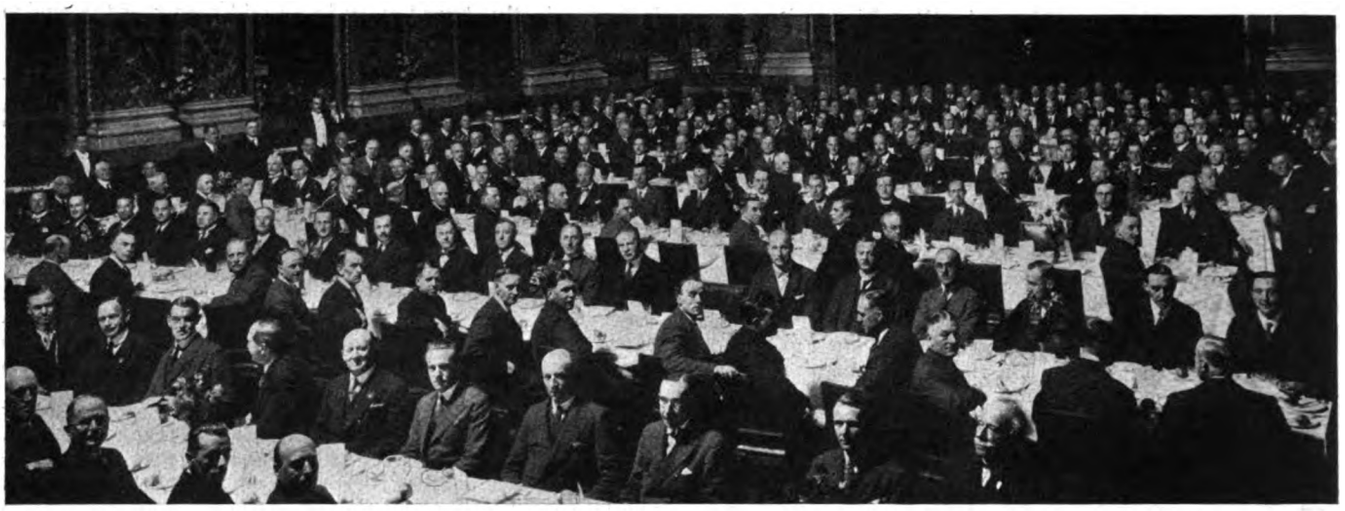
The question now arises : Should we use d.c. or a.c. for our power ? It is astonishing the amount of controversy that this question has entailed among station engineers.

Consider the various functions separately. Let us first consider the question of starting. For the d.c. motor we use the usual form of rheostatic startor. Small induction motors on a.c. work, as used for driving chain grate stokers, can be started up with a simple knife switch, but with large motors, such as those necessary to operate circulating pumps, this method cannot be used.

Here, then, is a disadvantage in using a.c. motors, as we need a special type of star-delta startor, or pole-changing device, to bring the induction motor up to speed. These types of startors are not so efficient as the rheostatic d.c. startors. The former only have two sets of speeds (i.e., in the case of the pole changing startors we have the two speeds corresponding to the two sets of poles, and in the other we simply have the star and delta speeds), while the latter have as many speeds as there are notches on the startor. Consequently the wear on the d.c. type which gradually brings the motor up to speed is considerably less than that of the a.c. startor.

As regards the question of motor performance, we can say that both types have been tried many times and have proved themselves to be perfectly satisfactory in this respect. In some cases the absence of commutator in the case of the a.c.

Digitized by Google



There was a record assembly of some 330 members of the Batti-Wallahs' Society and their friends at the Society's luncheon on April 25th, when Sir Hugo Hirst was the guest of honour.

induction motor has been sufficient to turn the scale in favour of this type. Twenty years ago this would have counted as an important point, but to-day commutators have been improved to such an extent that the point is hardly worthy of consideration.

Then we have the question of convenience of supply. In the modern power house it is, of course, comparatively easy to obtain either type. An a.c. supply is easily obtainable by using an additional transformer, or else separate tappings from another transformer, where a step-down type is used, whilst a d.c. supply needs a rotary convertor in addition to the above.

But against this we have the important question of a battery supply, and this is another big advantage that d.c. holds. If we are installing a battery set we need a d.c. system to keep it charged, and consequently the rotary convertor is already necessary. Moreover, in the case of a shut-down we have an immediate supply for the auxiliaries from the battery.

Sometimes it is customary to instal a small d.c. turbine specially for the purpose of feeding the auxiliaries. Here the direct current can feed through the batteries, and a convenient type of floating booster can be economically installed.

Power stations fitted with a.c. auxiliaries and using a battery, sometimes make the battery feed back through the rotary convertor to give an a.c. supply on to the busbars and hence provide an initial a.c. current in the case of a break-down, but this adds greatly to the complication of a system where a d.c. system of auxiliaries is just as economical.

Consequently the station engineer of to-day is realising that for auxiliaries the d.c. is to be preferred to the a.c. system.

AUSTRALIAN TRADE.

Sir Hugo Hirst's Impressions of Conditions and Prospects.

THERE was a record attendance of members of the Batti-Wallahs' Society and their friends at the luncheon, held at the Hotel Cecil, London, on April 25th, in celebration of the recent return from his mission to Australia of Sir Hugo Hirst. Mr. H. L. Howard, the president of the Society, was in the chair, and among those present were Sir John Snell, Sir John Brooke, Col. R. E. Crompton, Lt.-Col. K. Edgcumbe, Sir Harry Howard, Mr. W. W. Lackie, Mr. J. S. Highfield, Sir T. F. Purves, and Dr. S. L. Pearce.

Sir HUGO HIRST gave a most interesting account of his experiences in Australia as a member of the Government mission, and of the impressions which he had formed as the result of that visit. He had been greatly impressed by the difference between our view of conditions in Australia and those which actually existed. It was imperative that we should study those differences, and endeavour to supply the Australian market with what it wants rather than with what we have to spare.

Although Australia only had about 6 500 000 inhabitants, the purchasing power of that population was equal to that of approximately 16 000 000 in this country. Furthermore, some two-thirds of that population lived in four or five towns.

There was room in Australia for certain manufacturing activities and the question was being investigated from the point of view of what Australia was best fitted to produce. For the requirements which they did not themselves produce, the Australians would prefer to look to England in preference to any other source.

We did not always appreciate as we should that Australia was British and intended to remain British, and instead of regarding it as a foreign country we should look at it in much the same way as one of our own counties. Wherever he went in Australia he found an astonishing lack of knowledge of the achievements of the Mother Country, particularly of the progress made by our electrical manufacturing firms. The possibilities for reciprocity between England and Australia were immense, but they could only be based upon sound knowledge of Australian requirements. Australia wanted to take a more intimate part in developing the prestige of the British Empire.

Mr. HENRY S. HORNE, in proposing a vote of thanks to Sir Hugo, said there was nothing so vital to improved relations as closer contact between Australia and this country. In fact, the whole of the British Empire countries still held immense possibilities. He thought that while all present would appreciate the extent to which the electrical industry was indebted to Sir Hugo Hirst, the country's debt was almost immeasurable.

PHOTOMETRIC INTEGRATORS.

Issue of British Standard Specification.

THE British Engineering Standards Association has issued a British Standard Specification for Photometric Integrators. The specification deals with photometric integrators of either spherical or cubical shape. The integrator may be used for the measurement of the light output of tungsten filament electric lamps or for ascertaining the efficiency of translucent or dispersive reflector fittings, particulars for these fittings being dealt with in the B.S. Specification No. 324 and 232 respectively. The necessary constructional details are given for integrators of 24 in. and upwards in size and the requirements for the interior coating are defined.

Copies of this Specification (No. 354, 1929) may be obtained from the British Engineering Standards Association, Publications Department, 28, Victoria Street, S.W.1, price 2s. 2d., post free.

WIRELESS PICTURES.

It is not perhaps generally known that the Vienna transmissions of still pictures by the Fultograph method on 520 metres are often relayed by Linz on 350 metres. When Vienna is jammed this station is frequently to be found coming through well. In addition to the Koenigswusterhausen transmissions of still pictures, Berlin (Witzleben) has lately been conducting a transmission at eight o'clock on several evenings during the week, and sometimes this is relayed by other German stations.

Mr. J. A. Breen, an engineer on the staff of Wireless Pictures, Ltd., is conveying the first wireless picture transmitting and receiving apparatus to Australia. On his way he will stay for a week at Colombo, where the apparatus will be demonstrated to the Ceylon Government. At Sydney he will meet the Australian agent of the company, Mr. W. Blogg, who is well known in this country as the late managing director of Amplion (Australasia), Ltd. It is anticipated that Sydney (2FC) and Melbourne (3LO) will shortly arrange transmissions.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

"The Incandescent Lamp Jubilee."

[To the Editor.]

Sir,—As one who likes to see credit given where credit is due, I was very glad to read the "Current Topic" in your April 26th issue drawing attention to the American scheme for celebrating—as American—the jubilee of an invention which is not American, but British.

The late Sir Joseph Swan's claim to have produced the first practical incandescent electric lamp is unassailable, and as the facts are now recorded in the proceedings of the I.E.E., it is surprising that the N.E.L.A. of America should be ignorant of the true facts. The forthcoming celebration will, in America, if allowed to proceed as planned, do great harm to the reputation of a British electrical pioneer, but a modification of the scheme, giving rightful credit to Swan, need not abate American pride in the many other remarkable achievements of Mr. Edison. Unless some definite step is taken to establish Swan's claim the world will naturally believe that the incandescent electric lamp was an American invention.—I am, etc.,

Birmingham. J. Perrott.
April 27th.

[To the Editor.]

Sir,—As Sir Joseph Swan's invention of the incandescent electric lamp was virtually the foundation of the modern electrical industry, and as this distinguished man of science was a president of the Institution of Electrical Engineers, it seems to be nothing less than the duty of the Institution to send to the National Electric Light Association of America a formal protest against their proposal, to which you refer in a leading article, to honour Mr. Edison for a British discovery which definitely preceded the Edison lamp.—I am, etc.,

London, S.W.1. "Veritas."
April 29th.

Ex-Siemens' Men.

[To the Editor.]

Sir,—At an enthusiastic meeting held at the Hotel Cecil on April 27th, it was decided to form The Association of Ex-Siemens' Men. At this meeting a portion of the committee and the officers were elected. The qualification for membership is that applicants should be ex-members of the Siemens' organisations, and should have served at least one year on the staff of such organisations.

Although it is somewhat late in the season to hold a re-union, it is hoped that there will be a good muster at the dinner to be held at the Hotel Cecil on Wednesday, May 29th next.

The undersigned has been appointed hon. secretary and treasurer and will be pleased to forward full particulars of the Association and also of the dinner re-union to any intending members.—I am, etc.,

Dagenham Dock, Essex. J. Snow Huddleston.
April 30th.

A Fuel Policy.

[To The Editor.]

Sir,—May I be permitted to express the hope that a comprehensive and practical programme of fuel reform will be one of the chief aims of our next Government?

Statesmen, scientists and economists are agreed that coal must for many generations continue to be the foundation of British industry; but no one seems yet to have evolved a really comprehensive policy for the scientific utilisation of coal and the co-ordination of the various new fuel industries to which it would give rise.

I venture to suggest that a properly co-ordinated plan of financial encouragement of fuel reform, in the shape of an oil subsidy or guaranteed loans for carbonisation plants would ensure the simultaneous development of (*a*) a great smokeless fuel industry; (*b*) a British coal petrol industry; and (*c*) the use of oil-electric transport by road and rail, and of British-made bunker oils in ships.—I am, etc.,

W. A. Bristow.

London, S.W.1.
April 22nd.

The Battersea Problem.

[To the Editor.]

Sir,—Mr. Brownlie states in his letter published in your April 26th issue, that "no one in the world has yet attempted to tackle the question of the elimination of sulphur in flue gases."

We would like to point out that Messrs. Siemens-Schuckert have installed, on the Continent, a large number of electric filter plants which successfully deal with the filtration of flue gases from large boiler plants, and with the precipitation of dust from gases emitted during various industrial processes.—We are, etc.,

Siemens-Schuckert (Great Britain), Ltd.

London, E.C.4.
April 30th.

FURTHER EXAMPLES OF SHODDY WIRING.

THE many examples of shoddy wiring which we have published of late should serve as a warning to supply engineers of the class of wiring work, done by unqualified contractors, which is still being found connected to the mains. The photograph, reproduced above by the courtesy of Mr. H. Moss, shows a bundle of wires where the metal sheathing had been ripped open and all kinds of connections made, one layer of black tape being then put on the wires. No bonding of any kind was carried out, no junction boxes were used, the wires were terribly overloaded, and a horrible mess resulted.

NEWS IN BRIEF.

Canadian Import Duties—Retford School Lighting—Appointments Vacant—Societies' Meetings—Guildford Electrical Exhibition.

THE lighting of Marazion Church by electricity is under consideration.

Exeter has installed a new system of automatic signals for the control of street traffic.

Manchester's electric automatic signal devices and one-way traffic system were recently inspected by the Royal Commission on Transport.

Leicester Electricity Committee is to purchase land and premises for office accommodation for the electricity department.

At a meeting of the Physical Society on May 10th, at the Imperial College of Science, London, Dr. W. E. Sumpner will give a paper entitled "Heaviside's Fractional Differentiator."

Engineers of the Ontario Hydro-Electric Power Commission anticipate that within seven years all rural homes in old Ontario which can be economically served will have an electricity supply.

The Scottish Education Department has issued a circular containing the arrangements and conditions for the award of the national certificates and diplomas of the I.E.E. in conjunction with the department.

The recent decision of the Canadian Government that goods, in order to qualify for the British preferential tariff, should represent British labour and materials to the extent of 50%, is not at the moment being rigidly enforced, pending the settlement of details with the British Government, with regard to raw materials which are unobtainable in large quantities in the United Kingdom.

Hammersmith (London) B.C. requires a borough electrical engineer and manager.

An electrical exhibition is being held at the Village Hall, Guildford, during this week.

The Lord Mayor of Leeds is to be invited to lay a foundation stone in connection with the erection of the Kirkstall generating station.

St. Helens Corporation invites applications for the position of engineer and manager of the electricity undertaking.

Ilford Electricity Committee seeks sanction for a further loan of £5 000 for apparatus to be let out on hire to consumers.

It is claimed that Ontario has a greater density of h.t. power lines than any other country or state in the world.

Sheffield Electricity Department has been authorised to purchase, in consultation with the chairman of the Committee, 100 tons of electrolytic copper wire bars to be used in the manufacture of cables.

Poplar (London) Baths Committee proposes to make experiments in heating the baths establishments electrically, and to discard the transfer of steam, provided the change would not involve increased cost.

At a meeting of the Leeds and West Riding Branch of the Electrical Association for Women on April 24th, Mr. Harry Moss delivered a lecture entitled "Electrical Appliances in the Home." At a recent meeting of the Mid-Gloucestershire Branch, Mr. G. S. Francis delivered a lantern lecture dealing with electric lighting in modern, civic and commercial buildings.

LOOKING BACKWARD.

FIFTY years ago THE ELECTRICIAN *of May 3rd, 1879, recorded that:—*

Edison's loud-speaking telephone was demonstrated at the Royal Institution.

Mr. W. H. Preece recalled that the early telegraph lines were insulated with pitch and goose quills.

The "Patrick Stuart," a new cable repairing ship for the Persian Gulf cable, was inspected in London.

French 'bus horses were broken in by passing a weak electric current through the animals' mouths whenever they showed restiveness.

* * *

TWENTY-FIVE years ago, according to THE ELECTRICIAN *of May 6th, 1904:—*

It was stated that capital costs at many power stations were as high as £40, or even more, per kilowatt.

An employee of the Bristol Tramways Co. was summoned for furiously driving an electric trolley repairing wagon.

The County of London Electric Supply Co. abandoned its old title of County of London and Brush Provincial Electric Lighting Co.

* * *

TEN years ago it was reported in THE ELECTRICIAN, *dated May 2nd, 1919, that:—*

The American cables, taken over as a war measure, were handed back to the owners.

Mr. (now Sir) Arnold Gridley resigned his position as director of Electric Power Supply.

Mr. A. D. Hunter, secretary of Siemens Bros. Dynamo Works, Ltd., died after a short illness.

Notts Education Committee has decided to adopt electric light at King Edward VI Grammar School, Retford, at an estimated cost of £250.

Plymouth Hoe and Parks Committee has approved a scheme for the electrical illumination of Plymouth Hoe and Devonport Park, at a cost of £300.

The wireless telephone service between the Nauen (Germany) wireless station and Siam was opened on April 26th. A wavelength of 16.9 metres was used.

Tenders have recently been invited by the Commissioners of H.M. Works, etc., for the erection of a telephone exchange at Staines and the "Silverthorne" exchange at Chingford.

Members of Newcastle Junior Chamber of Commerce paid a visit to the Carville power station of the Newcastle Electric Supply Co., Ltd., last week, under the guidance of Mr. T. W. Todd, assistant station superintendent, and Mr. V. H. Wood, control engineer.

As from May 1st, the Great Northern Telegraph Co.'s rates for telegrams from Great Britain to Japan, Chosen, and Formosa, are as follows:—Ordinary telegrams, 2s. 9d. per word (reduced from 3s. 4d.); deferred telegrams, 1s. 4½d. per word (instead of 1s. 8d.); press telegrams, 8d. per word (instead of 9½d.).

The Scottish section of the Institution of Electrical Engineers met in the hall of the Technical College, Dundee, on April 26th, under the chairmanship of Mr. D. S. Munro, Glasgow. Mr. W. Holmes read a paper on "Load Levelling Relays and their Application in connection with Future Metering Problems," and Mr. H. C. Babb read a paper on the "Lothians Protection Gear."

Suitable land in Wood Lane, Chapel Allerton, has been procured by Leeds Electricity Committee, for the erection of a sub-station.

Hull Bridges Committee is considering the possibilities of operating the Scott Street bridge as well as the Drypool Bridge by electricity.

A junior scientific officer is required for the Admiralty Pool. He should have an honours degree, or the equivalent, in physics or electrical engineering.

Hull Electricity Committee recommends that the City Electrical Engineer be given authority to purchase selected type of apparatus and loan them to members of his staff for trial.

A special general meeting of the Institution of Mechanical Engineers will be held on May 10th, at 6 p.m., with a view to considering, and if thought fit, passing resolutions as to a Petition for a Royal Charter.

Changes in the method of charging for trunk telephone calls are announced. As hitherto, the minimum call will be three minutes, but, instead of all excess time being charged by multiples of three minutes, the excess time on calls for distances exceeding 35 miles will be charged *pro rata* at so much per minute.

The South Wales and Monmouthshire branch of the Electrical Association for Women commenced their spring programme last week with a visit to the cigar factory and welfare department of Messrs. J. R. Freeman and Sons, Ltd., Cardiff. The next fixture will be a cookery lecture and demonstration by Miss C. M. Burrows. On May 22nd a visit will be paid to the Cardiff Docks. On June 19th, there will be a visit to a Cardiff electrical firm, and the summer outing, also held in June, will include the Edison Swan Cable works at Lydbrook.

PERSONAL.

BRIG.-GENERAL Everard Baring has joined the board of the London Electric Supply Corporation, Ltd.

Col. and Mrs. Kenelm Edgcumbe have arrived at 26, Lowndes Square, London, for the season.

Mr. P. W. Petter sailed to-day (Friday) on the s.s. "Berengaria" for a short trip to America and Canada.

Coun. E. Hartley, chairman of Kirkham Electricity Committee, has been appointed chairman of the Council.

Mr. B. C. Garman has been elected chairman of the Association of Supervising Electrical Engineers. See page 539.

Mr. W. Chamberlain, general manager of the tramways, was received into membership of the Belfast Rotary Club, last week.

Mr. Allan Grant has been appointed district engineer for that part of the Grampian Electricity Scheme, north of Perth but within the boundary of Perthshire.

Hebden Bridge Urban Council has adopted a recommendation by the Electricity Committee to stabilise the salary of the electrical engineer at £425 per annum.

During a visit to Brighton last week H.M. the Queen received the Mayor of Brighton, Ald. H. J. Galliers, the well-known Sussex electrical installation contractor.

Mr. G. A. Vowles, power house superintendent, Stoke-on-Trent, has intimated his intention of taking up a position in Hull. Mr. F. Favell has been appointed his successor.

Sir Oliver Lodge, F.R.S., is to deliver the nineteenth annual May lecture before the Institute of Metals on May 7th, the title of his lecture being "Some Ideas about Metals."

Mr. C. A. Hopkins, engineer and manager of Sunderland tramways, was last week presented with a gold hunter watch by members of the Wigan Old Boys' Rugby Union Club.

Mr. A. Behr, export manager of Petter's, Ltd., has left Yeovil on a visit to Paris, Nantes, Bilbao, Madrid, Lyons, Milan, Zurich, Langenthal, Brussels, Antwerp, and Rotterdam.

Sir Andrew Duncan and Mr. Archibald Page sailed on April 26th for Canada by the s.s. "Mount Royal," from Liverpool. They are expected to return to this country in June.

Coun. G. Caine, chairman of Rhyl Electricity Committee has been nominated to represent Rhyl for a period of three years on the North Wales and South Cheshire Joint Electricity Authority.

Prof. E. V. Appleton, Wheatstone professor of physics at King's College, London, has been awarded the Morris Liebmann Memorial Prize for 1929 by the American Institute of Radio Engineers.

Estate of the gross value of £237 503, with net personalty £210 131, was left by the late Sir John Denison-Pender, chairman of the Eastern and Associated Cable Companies, who died on March 6th, aged 73 years.

Mr. James C. Besly has been appointed electrician-in-chief to the Eastern Telegraph Co., in succession to the late Mr. C. W. Schaefer. The vacancy caused by Mr. Besly's promotion has been filled by Mr. K. L. Wood.

Sir J. A. Ewing, F.R.S., principal and vice-chancellor of Edinburgh University, was last week presented with the freedom of Edinburgh. Sir Alfred has also been elected an honorary member of the Institution of Civil Engineers.

Mr. J. W. Thomas, assistant general secretary of the Electrical Power Engineers' Association for the past nine years, has resigned in order to practise at the bar. Mr. Thomas has joined the Northern Circuit, and his chambers are at 60, King Street, Manchester.

In recognition of his 34 years' service with the Southport Electricity Department, Mr. C. Almond has been presented by his colleagues with a gold watch-chain with seal, and a pipe. The presentation was made by Mr. E. Moxon, borough electrical engineer, at a meeting of the Welfare Club. Mr. Moxon also presented Mr. W. Lymath with a case containing a fountain pen and pencil and a pocket wallet as a farewell gift. Mr. Lymath is taking up a position with the Post Office. Mr. A. W. N. Brown, who has secured an appointment at Bury St. Edmunds, was presented with an attaché case and pocket wallet.

Obituary.

VISCOUNT YOUNGER OF LECKIE, on Monday, aged 77 years. He was chairman of the Select Committee of the House of Lords, considering the Grampian electricity scheme.

MR. G. D. MALCOLM, on Monday, aged 39 years. He was meter superintendent of Stepney Electricity Department and chairman of the Meter and Instrument Section of the Institution of Electrical Engineers. See page 546.

IN PARLIAMENT.

Grampian Power Scheme Considered by House of Lords Committee.

THE Bill to authorise the use of the water power of certain streams in the Highlands, promoted by the Grampian Electricity Supply Co., came before a Select Committee of the House of Lords last week.

Mr. Tyldesley Jones, K.C., for the promoters, said this was one of a group of proposals which had come before that Committee from Scotland, but differed from those previously submitted. The Grampian Electricity Supply Co. was now supplying in the counties of Perth, Forfar, Inverness, and Stirling. It was proposed to extend by taking in the whole of Aberdeenshire, Banffshire, Elginshire, Nairnshire and Ross and Cromarty, as far as Dornoch Firth, and to erect hydro-electric stations.

Mr. Wm. M'Gill, a director of the company, said it was a part of their agreement with the Central Electricity Board that the company undertook to construct a 132 000 V transmission line, from the stations at Bannoch and Tummel to Abernethy. With a view to assisting this preliminary development, they had acquired the station at Arbroath in March, 1928.

Mr. Tyldesley Jones said the Bill contained proposals for the compulsory laying of distribution mains. When proposals were submitted to the Electricity Commissioners they would be given also to the local authorities.

Mr. Wm. McGill said the company anticipated a load, without new industries, of 12 000 kW. They had made a contract for the supply of 12 000 kW, as an interim measure, with the Central Electricity Board. This made a total demand of 24 000 kW without any further development.

Mr. Ian Murray said he was a director of the Scottish Power Co., which owns the capital of the statutory Grampian Co. The Scottish Power Co. had an authorised capital of £2 500 000 and an issued and paid-up capital of £485 000. The whole of the finance in connection with the present scheme could be provided by that company. The Grampian Co. now owned or controlled all the authorised company undertakings in their existing area. At present its plant capacity was 39 000 kW. If the load factor were 50%, the cost per kWh delivered on the grid at Abernethy would be 0·199d. The immediate demand from the new area was 10 000 kW, which would rapidly increase to 30 000 or 40 000 kW.

Mr. W. T. Halcrow, civil engineer, said, by a dam at Kilmorack Falls the height of the falls would be raised from about 70 to 114 ft. The five new power stations would produce on continuous load 59 190 kW, or 509 700 000 kWh per annum. The total estimated cost was £3 434 080.

Mr. W. J. E. Binnie gave particulars of the syphonic system, by which the head waters would be regulated.

Mr. Harry Richardson, general manager of the Metropolitan Electric Supply Co., estimated that by 1940 the Central Electricity Board would require for Central Scotland 481 250 kW in excess of plant existing to-day, and 50 000 kW for other parts of Scotland. If the Galloway scheme, the existing Grampian scheme and the new Strathglass scheme were developed to the limits of their capacity they would fall short of the demand in 1940 by 624 000 000 kWh per annum. The anticipated demand in Central Soctland in 1934 was 1 417 000 000 kWh.

Mr. W. Ormistead, fishery expert, gave details of an electric lift which it was proposed to instal to hoist the salmon over the dam on the river Farrar. The model of the lift, made by Mr. V. G. New, was shown, and it was stated that the dimensions of the proposed lift would be 16 ft. by 8 ft., and 2 ft. deep. The fish would swim into it and be tipped out at the top of the dam. The lift would operate automatically at any pre-arranged interval. See page 539.

Galloway Water Bill.

In the House of Commons on April 25th, Lt.-Col. Moore moved that the second reading of this Bill be deferred for six months. He opposed the Bill on behalf of miners and collieries and proprietors and tenants of land in Ayrshire, and fishing interests.

Brig.-Gen. Charteris said evidence given before the House of Lords Committee led to the conclusion that £47 000 a year would be saved in the provision of electricity if the Bill were passed in its original form.

Mr. W. Bennett suggested that the Company should be compelled to establish a sinking fund.

The Bill was read a second time.

LEGAL INTELLIGENCE.

Appeal by Marconi Co. Concerning Patents Rights and Royalties.

IN the Chancery Division, on April 24th-25th, Mr. Justice Luxmoore had before him two appeals by the Marconi's Wireless Telegraph Company from a decision of Mr. W. S. Jarratt, Comptroller-General of the Patent Office, and his assistant, Mr. H. C. Haycroft, in favour of the applications of the Brownie Wireless Company and the Loewe Radio Company with respect to royalties payable to the Marconi Company on wireless receiving sets.

Sir Duncan Kerly, K.C., and Mr. Trevor Watson appeared for the appellants; Mr. R. Moritz, K.C., and Mr. Shelley for the Brownie Company; the Hon. R. Stafford Cripps, K.C., and Mr. McEwen for the Loewe Company; and Mr. Stafford Crossman for the Attorney-General.

Sir Duncan Kerly said there were common elements in the two appeals, but they would have to be taken separately, and he would deal with the Brownie case first. The Brownie Company was in effect a Mr. Barber, who had been engaged for two or three years in making crystal sets which did not infringe the patents. He also manufactured an apparatus called a two-valve amplifier, which if used with crystal sets was outside the patents, but which if used with a valve receiver might infringe the patents. Counsel, continuing, said Mr. Barber applied to the Marconi Company for a licence, and was told he could have one in the usual form, but he wanted a different one. Incidentally, he said he would have been satisfied with the usual licence but for the fact that he would have had to pay royalties on his amplifier set, because the royalty was payable on all valve holders. He then made his application for a compulsory licence. The Comptroller had come to the conclusion that the original licence was unreasonable, without one tittle of evidence as to its commercial working and as to the profits the manufacturers had made. He had reduced the royalty on certain Marconi valve holders from 12s. 6d. each to 10% on the wholesale selling price, subject to a minimum charge of 5s. on the first valve holder and 2s. 6d. on each additional valve holder.

His Lordship asked when the two patents expired.

Sir Duncan said they expired in June and October next, but the appellants had 13 patents altogether, one of which had eleven years to run. Their policy had been to impose a royalty of 12s. 6d. on each valve holder, whether the apparatus was going to infringe the patents or not. They pursued the course of making the licensee pay upon all goods of the class for which the invention was made. The policy of the Marconi Company, said counsel, had been to insist on goods for this country being British made.

Mr. Moritz said it was disputed that the Marconi Company did not grant licences to foreign firms, and it was said there were foreign corporations which appellants had licensed to bring apparatus into this country.

Evidence given by the Comptroller was read by counsels. The hearing was adjourned.

Local Authorities and War Bonuses.

Mr. Justice Eve in the Chancery Division, on April 26th, dismissed an action in which Mr. H. A. Stevens, a fitter employed by Hampstead Electricity Department, claimed a declaration that having enlisted in 1914, he was entitled under the terms of a resolution made by the Council, to certain war bonuses and increases of pay, which he would have received if he had remained in the employment of the Council.

The defendants counter-claimed that the words of the resolution meant the "full regular pay" at the time of enlistment and did not include war bonuses or increment of pay made after the date of enlistment.

Spurious "Osram" Lamps.

At Hull Police Court on April 22nd, the General Electric Co., Ltd., prosecuted Mr. T. L. Bower, trading as the Oakenshaw Trading Co., 5, South Street, Oakenshaw, Bradford, for trading in lamps bearing a false trade mark. Mr. L. A. Byrne prosecuted and Mr. J. A. Lee, of Bradford, defended.

Counsel for the prosecuting company said the lamps in this case were marked "Osram gasfilled"—"Made in France," whereas the General Electric Co.'s "Osram" lamps were made at the company's Hammersmith factory. The evidence showed that the defendant offered to supply Messrs. Miller and Garness, electrical contractors of Hull, with lamps marked "Osram gasfilled, Made in France" and that he supplied them with 50 lamps against a cheque for which a receipt was given Within a week or two the purchasing firm received complaint of lamp failure and communicated with the Hull Branch of the General Electric Co., Ltd., with the result that the fraud was discovered.

A certificate of the registered trade mark held by the company was produced, while a factory superintendent of the Osram Lamp Works gave evidence that the offending lamps were not made at these works and were spurious imitations.

Defendant said he had been in the lamp business since 1922 and admitted the sale of 50 lamps as alleged by the prosecution, but denied that he knew they bore the offending mark.

The Stipendiary found the defendant guilty of selling lamps improperly marked and fined him £15 and £15 15s. costs or 51 days' imprisonment. Two remaining summonses by the prosecutors against the defendant were withdrawn.

Lamp Patents.

In the Chancery Division, before Mr. Justice Romer, on April 23rd, Mr. Trevor Watson, on behalf of the British Thomson-Houston Co., Ltd., moved for an injunction against the Unity Manufacturing Co, of Water Street, Liverpool, to restrain infringement of the plaintiffs' patent relating to gasfilled electric lamps. Counsel said the defendants were willing to treat the motion as the trial of the action, and to submit to the usual order for an injunction and delivery up of the infringing articles.

Mr. Watson also moved in two similar cases by the same plaintiffs against the Zenith Electrical Supplies Co., of South Castle Street, Liverpool, and the Harwol Specialities Co., of Strand Street, Liverpool. In each case the defendants consented to a similar order.

Counsel for the Harwol Co. said the costs of the inquiry as to damages would be reserved.

Mr. Justice Romer: In each of the three cases there will be a consent order.

ILLUMINATION DESIGN COURSE.

Preliminary Details of the Programme—Many New Subjects Included.

THE nineteenth illumination design course, which is being organised by the E.L.M.A. Lighting Service Bureau, will be held from June 10th to 14th. This course will be in many ways new, and will include a number of subjects not dealt with in previous courses. In addition, since the Lighting Service Bureau has been to a great extent redesigned, greater facilities are available for the demonstrations accompanying the lectures.

The details for the different days are as follows, the figures in parentheses representing the time.

JUNE 10TH.—(9.45 a.m.) registration; (10.15 a.m.) reception by Director of E.L.M.A.; (10.30 a.m.) a review of lighting progress; (11.15 a.m.) an explanation of lighting units; (12 noon) light measurement; (2 p.m.) light and visibility; (2.45 p.m.) theory and characteristics of electric lamps; (4 p.m.) illumination design. JUNE 11TH.—(9.45 a.m.) characteristics and development of lighting equipment; (10.45 a.m.) business opportunities in shop window lighting; (11.45 a.m.) modern lighting for shop interiors; (2 p.m.) office and school lighting; (2.45 p.m.) economics of industrial lighting; (4 p.m.) electrical advertising. JUNE 11TH.—(9.45 a.m.) industrial lighting designs; (10.45 a.m.) the advantages of glareless lamps; (11.15 a.m.) marketing E.L.M.A. lamps; (11.45 a.m.) floodlighting; (2 p.m.) the application of colour in lighting; (3 p.m.) street lighting and traffic control; (4.15 p.m.) special lighting problems. JUNE 13TH.—(9.45 a.m.) possibilities in residential lighting; (11.15 a.m.) modern developments in lighting; (2 p.m.) sports lighting; (2.45 p.m.) salesmanship; (3.45 p.m.) lighting service and general discussion; (7 p.m.) dinner. JUNE 14TH.—Arrangements will be made during this day for visits to interesting lighting installations, electricity showrooms, etc.

I.E.E. WIRELESS SECTION COMMITTEE, 1929-30.

The following have been nominated by the Wireless Section Committee to serve on the Committee from October 1st, 1929:—CHAIRMAN: Capt. C. E. Kennedy-Purvis; ORDINARY MEMBERS: Messrs. R. H. Barfield, A. J. Gill, L. C. Pocock, Prof. E. Mallett, and Comdr. J. A. Slee. The following will continue to serve as members of the Committee:—The President of the Institution; the Chairman of the Papers Committee; a nominee of the Council; a nominee of the General Purposes Committee; Mr. F. W. Davey; Mr. J. Hollingworth; Lt.-Col. A. G. Lee; Mr. E. B. Moullin; Mr. G. H. Nash; Mr. C. E. Rickard; and Mr. P. K. Turner, together with one representative each to be nominated by:—The Admiralty, the Air Ministry, the General Post Office, and the War Office.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, when available.

CONGREGATIONAL CHURCH, SUMMIT, LITTLEBOROUGH.—Electric wiring and fitting of Church and Sunday school. Particulars from Mr. A. Fielden, 10, Deanhead, Littleborough.

STOCKPORT CORPORATION.—Twelve months' supply of electric lamps. Forms of tender, etc., from the Secretary, Electricity Offices, 23, Teviot Dale, Stockport.

STOKE-ON-TRENT CORPORATION.—Overhead wiring and services to 257 houses. Specification, etc., from the City Electrical Engineer, St. George's Chambers, Kingsway, Stoke-on-Trent; deposit £2.

Overhead Lines.

GRIMSBY CORPORATION, May 3rd.—Supply and erection of about 10 miles of 33 000 V overhead line. Specification (No. 260) from Mr. S. R. Windle, borough electrical engineer, Grimsby.

MANCHESTER CORPORATION, May 3rd.—Supply, during twelve months, of electric kettles (specification 236), electricity meters (237), air-break circuit breakers (244), star delta switch startors (245), a.c. industrial electric motors (246), potential and current transformers (247), cables (248) and time switches (249). Specifications, etc., from Mr. H. C. Lamb, Electricity Department, Town Hall, Manchester; deposit £1 1s. for each.

SWANAGE URBAN DISTRICT COUNCIL, May 3rd.—Electric light installation in town hall. Specification, etc., from the Surveyor, Town Hall, Swanage.

WALTHAMSTOW EDUCATION COMMITTEE, May 3rd.—Electrical installation in Billet Road School, Walthamstow. Specification, etc., from Mr. G. R. Spurr, Electricity Works, Exeter Road, Walthamstow, London, E.17; deposit £1.

CENTRAL ELECTRICITY BOARD, May 4th.—Supply and erection of 33 000 V and lower voltage cables, under the South-East England electricity scheme. Specification (No. S.E.E.-G.C.1) and form of tender from Mr. Richard H. Fox, secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

SOWERBY EDUCATION AUTHORITY, May 4th.—Electric light installation at Sowerby New Road Council School. Specifications, etc., from Mr. A. Beilby, Education Offices, Sowerby Bridge.

WEST RIDING EDUCATION COMMITTEE, May 4th.—Electric light installation in Ardsley (E. and W.) Westerton Council School. Specification, etc., from Mr. P. Beaumont, 8, St. John's North, Wakefield.

BELFAST CORPORATION, May 6th.—Supply of 12 sets of electrical equipment for tramcars. Specification, etc., from the General Manager, Corporation Tramways, Sandy Row, Belfast.

EDINBURGH EDUCATION AUTHORITY, May 6th.—Electric lighting installation in Gorgie New Special School and Annexe to Trinity Academy, Bangholm Recreation ground. Schedules etc., from the Education Offices, Castle Terrace, Edinburgh.

ISLINGTON (LONDON) BOROUGH COUNCIL, May 6th.—Supply and installation of two lead batteries for Edison refuse collecting vehicles, having carrying capacity of 3½ to 4 tons. Further particulars from the Cleansing Superintendent, Liverpool Road, N.1.

MARYLEBONE (LONDON) BOROUGH COUNCIL, May 6th.—Supplies of l.t. and e.h.t. underground cables during 12 months from June 1st. Specification, etc., from the Chief Electrical Engineer, Electricity Department, Town Hall, Marylebone, W.1.

WEST RIDING EDUCATION COMMITTEE, May 6th.—Electric light installation in Mexborough Secondary School extensions. Specification, etc., from Education Officer, County Hall, Wakefield.

GRIMSBY CORPORATION, May 8th.—Extra high pressure and pilot cables. Specification (No. 261) from Mr. S. R. Windle, borough electrical engineer.

ST. HELENS (ISLE OF WIGHT) URBAN DISTRICT COUNCIL, May 8th.—Electric light installation at Puckpool Park. Specifications, etc., from the Clerk, Council Offices, High Park, Ryde.

WALTHAMSTOW URBAN DISTRICT COUNCIL, May 8th.—Supply of (*a*) l.t. distributor and service cables, and (*b*) e.h.t. and l.t. feeder cables to contract No. 66. Specifications from Mr. G. R. Spurr, Electricity Works, Exeter Road, London, E.17; deposit £1 for each.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, May 10th.—(a) Main 33 000 V switchgear, each circuit breaker having rupturing capacity of not less than 1 500 000 kVA; (b) auxiliary 33 000 V switchgear, each circuit breaker having rupturing capacity of not less than 500 000 kVA, with group feeder reactors, for Ironbridge power station. Specification (No. 4) and form of tender from Mr. E. F. Hetherington, chief engineer and manager, Phœnix Buildings, Dudley Road, Wolverhampton; deposit £2 2s.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, May 10th.—(1) One 50 000 kW turbo-alternator, with step-up transformers, etc.; (2) condensing plant, boiler-feed pumps, evaporators, etc.; (3) circulating water pumps, etc., for Ironbridge power station. Specifications (No. 2) and form of tender from Mr. E. F. Hetherington, chief engineer and manager, Phœnix Buildings, Dudley Road, Wolverhampton; deposit £2 2s.

STOCKPORT CORPORATION, May 11th.—Supply of two wireless sets, for elementary schools. Specification can be seen at the Education Offices, Town Hall, Stockport.

GLASGOW CORPORATION, May 16th.—Supply of (2) l.t., paper insulated, one, two, three and four core and e.h.t. cables; (3) small i.r. insulated cables and flexibles; (4) electric cookers; (5) meters; (6) arc lamp carbons; (12) electric kettles, for 12 months. Specifications from the General Manager, Electricity Department, 75, Waterloo Street, Glasgow, C.2. State whether cable schedule (2) or (3) is required.

HULL CORPORATION, May 16th.—Supply and laying of underground cables. Specifications, etc., from Mr. J. N. Waite, city electrical engineer and manager, Electricity Works, Sculcoates Lane, Hull; deposit £2 2s.

CHERTSEY GUARDIANS, May 18th.—Electric lighting installation at the Institution, Ottershaw, near Chertsey. Specifications from Mr. F. J. Wareham, clerk, Council Offices, West Byfleet, Surrey.

EDINBURGH DISTRICT BOARD OF CONTROL, May 21st.—Electrical work in connection with erection of two higher grade blocks and mortuary, at Gogarburn, Edinburgh. Schedules from Mr. S. Kaye, 14, Hill Street, Edinburgh, not later than to-day (May 3rd).

BETHNAL GREEN (LONDON) BOROUGH COUNCIL, May 22nd.—Electric lighting installations in two blocks of tenement buildings. Specification, etc., from Mr. H. W. Couzens, 9, Old Queen Street, London, S.W.1; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, May 25th.—Supply and erection of 33 000 V metal clad switchgear, in connection with South-East England Electricity Scheme. Specification (No. S.E.E.—G.S.1) from Mr. Richard H. Fox, secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

SUTTON AND CHEAM URBAN DISTRICT COUNCIL, June 7th.—Installation of fire alarm system, connected with the fire station. Plans showing positions of fire alarm boxes, etc., from the Engineer and Surveyor.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

LOURENÇO MARQUES PORT AND RAILWAYS BOARD, May 3rd (extension of time).—Diesel driven generating set of 50 kVA and electrically driven water pumping set. (Reference B 5 264).

LOURENCO MARQUES PORT AND RAILWAYS BOARD, May 6th.—Supply of electric motors, turntables, drilling machine, etc. (Reference A.X. 7 765.)

STATE ELECTRICITY WORKS, MONTEVIDEO, May 6th.—Supply of electric cables and accessories. (Reference B.X. 5 178.)

WINNIPEG MUNICIPALITY, May 6th.—Supply of switching equipment at Slave Falls. (Reference B.X. 5 250.)

BRAY URBAN DISTRICT COUNCIL, May 7th.—Supply and erection of (*a*) steam crane, and (*b*) electric crane, to lift three tons,

Digitized by Google

at Bray Harbour. Further particulars from Mr. E. M. Murphy, 27, Molesworth Street, Dublin.

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 7th.—Supply of two electric motor-driven centrifugal pumps. (Reference A.X. 7 738.)

ASSAM-BENGAL RAILWAY CO., LTD., May 8th.—Supply of turbo-alternator set for Pahartali. Specification (£1 1s., not returnable) from the Company's Offices, 80, Bishopsgate, London, E.C.2.

MELBOURNE METROPOLITAN TRAMWAYS BOARD, May 9th.—Air brake equipment (contract No. 690). (Reference A.X. 7 862.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, May 15th.—Supply and erection at Government Printing Office, Cairo, of 120 kW d.c. Diesel electric generating set, with foundations, artesian well, electrically-driven water cooling pump, etc. Forms of tender, etc. (10s. 6d.) from Chief Inspecting Engineer, 41, Tothill Street, London, S.W.1.

VICTORIAN RAILWAY COMMISSION, May 15th.—Supply of one geared, three-phase, electric winding engine (contract No. C.M. 778). (Reference A.X. 760.)

SOUTH AFRICAN POSTS AND TELEGRAPHS, May 23rd.—Supply of rubber covered wire and telephone cable (contract No. 153). (Reference B.X. 5 229.)

CLUJ (ROUMANIA) MUNICIPALITY, May 30th.—Compressor for cooling plant of ammonia system, with air-cooling coils, and a.c. motor and condenser, at the Slaughter House. (Reference A.X. 7 838.)

SOUTH AFRICAN POSTS AND TELEGRAPHS, May 30th.—Supply of telegraph materials, tubular arms, crossheads, bases, stay plates, etc. (tender No. 152). (Reference A.X. 7 767.)

TANGANYIKA GOVERNMENT, June 1st.—Concession for utilisation of Pangani River Falls for the development of electric power. Copies of the draft concession may be obtained from the Crown Agents for the Colonies, 4, Millbank, London, S.W.1.

MOROCCAN POSTS, TELEGRAPHS AND TELEPHONES, June 6th.—Supply of copper and bronze wire. Application for permission to submit quotations must be made by May 6th. (Reference A.X. 7 800.)

NEW ZEALAND POSTS AND TELEGRAPHS, June 18th.—Supply of telephone cords (No. P. and T. 151/1425). (Reference B.X. 5 251.)

POSTMASTER-GENERAL'S DEPARTMENT, Melbourne, June 18th.—Supply of switchboard cable (contract C. 427). (Reference B.X. 5 228.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, June 20th.—Two 5-ton electrically-driven hoist blocks, with overhead conductors, runway girders and switches (tender No. 1 446). (Reference T/A.X. 7 867.)

Electric Cranes for South Africa.

SOUTH AFRICAN RAILWAYS AND HARBOURS, June 20th.—Supply of one 10-ton and three 4-ton, electric level luffing cranes (tender No. 1 437). (Reference A.X. 7 828.)

NEW SOUTH WALES PUBLIC WORKS DEPARTMENT, June 22nd.—Supply and erection of transformers, with certain spares, for Burrinjuck hydro-electric development (contract No. 29/29). (Reference B.X. 5 230.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, June 25th.—Supply of protected type, telephone cable terminal boxes (schedule C.430). (Reference B.X. 5 231.)

STATE ELECTRICITY WORKS, MONTEVIDEO, July 8th.—Construction and equipment of 50 000 kW power station.

NEW ZEALAND PUBLIC WORKS DEPARTMENT, July 16th.—Supply of 250 galvanised steel transmission line towers to carry copper conductors, or 190 towers to carry steel-core aluminium conductors. (Reference A.X 7 735.)

Tenders Accepted.

WAR OFFICE.—Edison Swan Electric Co., Ltd., supply of zinc plates.

ROTHERHAM CORPORATION.—General Electric Co., Ltd., supply of transformers for 12 months.

ST. PANCRAS (LONDON) BOROUGH COUNCIL.—Siemens Bros. and Co., Ltd., supply of l.t. cable, £1 208 13s. 8d.

METROPOLITAN ELECTRIC TRAMWAYS, LTD.—British Thomson-Houston Co., Ltd., supply of 140 " B.-T.H. 509 " traction motors.

LONDON AND NORTH EASTERN RAILWAY.—Siemens Electric Lamps and Supplies, Ltd., 12 months' supply of Siemens standard lighting lamps, carbon filament lamps and train lighting lamps; Metro-Vick Supplies, part contract for Cosmos vacuum and gas-filled lamps for 12 months; Edison Swan Electric Co., Ltd., supply of electric lamps.

LEEDS CORPORATION.—Hackbridge Electric Construction Co., Ltd., supply of three 10 500 kVA transformers at Kirkstall power station, with spare transformer and other requirements, £11 680; British Electric Transformer Co., Ltd., supply of four 1 000 kVA sub-station transformers, £777 per set, and additional transformers over a period of two years at special prices; W. T. Henley's Telegraph Works Co., Ltd. (£1 194), Enfield Cable Works, Ltd. (£2 556), and Macintosh Cable Co., Ltd. (£3 110), cables.

MARYLEBONE (LONDON) BOROUGH COUNCIL.—British Thomson-Houston Co., Ltd., supply of 2-bearing motor-convertor set, for installation at Council's generating station, £9 429 11s. 3d.; A. Reyrolle and Co., Ltd., supply of switchgear for Blandford Street sub-station, £4 110 9s.; British Brown-Boveri, Ltd., supply of two rectifier sets for installation at Blandford Street sub-station, £17 412; Ferguson, Pailin, Ltd., supply of switchgear for generating station, Aberdeen Place, £1 996. (All recommended.)

MANCHESTER CORPORATION.—Harland Engineering Co., Ltd., conversion of automatic rotary convertor plant; Electro-Mechanical Brake Co., Ltd., supply of maximum traction trucks. Additional plant at Lostock booster station—Metropolitan-Vickers Electrical Co., Ltd., transformer; Ferguson, Pailin and Co., switchgear; Whipp and Bourne, d.c. circuit breakers and field regulator; Brookhirst Switchgear, Ltd., electric for motor starting and control gear. Annual supplies of tramways stores—Metropolitan-Vickers Electrical Co., Ltd., automatic circuit breakers; electro-mechanical brake parts; lightning arresters, etc.; Edison Swan Electric Co., Ltd., cables, electric handlamps, bell wire, etc.; Metro-Vick Supplies, Ltd., cells for bell circuits; General Electric Co., Ltd., circuit tubing fuses, switches, magnet coils, etc.; British Insulated Cables, Ltd., insulated bolts and bolts for bridge hangers.

MEMBERS of the Electrical Association for Women on the occasion of their visit to the works of M. K. Electric, Ltd., at Edmonton, London, N., and the Enfield works of Belling and Co. on April 16th. A brief description of the tour was given in last week's issue.

WORK IN PROSPECT.

BARNES.—School, Castlenau, to cost £18 320, for Surrey Education Committee. Particulars from the secretary, Mr. W. Finny, Kingston-on-Thames.

BRANSTONE.—Development of estate for 1 000 houses. Particulars from Mr. Frank Rist, Branstone Road, Burton-on-Trent.

BURY (LANCS).—Housing scheme (32), for Town Council. Particulars, the borough engineer, Mr. J. Ainsworth Settle.

CHERTSEY.—Additional housing scheme (100), for the Urban Council. Particulars from the Surveyor.

EYNESBURY.—Primitive Methodist Church. Particulars from George Wrycroft and Sons, St. Neots, Hunts.

HITCHIN.—Extensions, boys' grammar school, to cost £34 000. Particulars from the Director of Education, Hertford.

HULL.—Extensions, Royal Infirmary, to cost £24 000, for the Board of Management. Particulars from the Secretary.

HYTHE (KENT).—Additional housing scheme. Particulars from the Borough Surveyor.

LIVERPOOL.—Bus garage, for the Ribble Motor Services, Ltd.

MARKFIELD.—Isolation hospital, to cost £120 000, for Leicestershire County Council. Particulars from the Clerk, Leicester.

MILTON REGIS.—Houses (92). Contractors, Blackwell and Meyer, Bexleyheath.

PURFLEET.—Houses. Contractors, Falkus (Public Works), Ltd., (14), and Pavitt Bros., Ltd. (20).

REPTON.—Extensions, Repton School Chapel, to cost £10 000. Particulars from the Clerk to the Governors.

SEDGEFIELD.—Housing scheme (56), for the Rural Council. Particulars from the surveyor, Mr. James Stones.

SHEFFIELD.—Modern store, for Roberts Bros., Ltd., Rockingham House, The Moor.

SKELMANTHORPE.—School (470 places), for West Riding Education Committee. Particulars from the clerk, Mr. F. A. Darwin, County Hall, Wakefield.

SPENBOROUGH.—Shelters and public conveniences for the Urban Council. Particulars from the surveyor, Mr. A. Rothera, Cleckheaton.

ST. ALBANS.—Fire station, for the City Council. Particulars from the City Surveyor.

ST. HELENS.—Houses (158), Grange Park Estate, for the Town Council. Particulars from the contractors, William Chappell and Sons, Ltd., Sheffield.

STOURBRIDGE.—School, Enville Street, for Worcestershire Education Committee. Particulars from the architect, Mr. A. V. Rowe, 38, Foregate Street, Worcester.—Cinema theatre, High Street, for Messrs. W. Lloyd and C. Bray, Dudley. Particulars from Mr. George Frederick Webb, Dudley.

SWINDON.—Police station, Gorse Hill, to cost £15 495, for Wilts County Council. Particulars from the contractors, Blackford and Son, Colne.

TWICKENHAM.—Housing scheme (2 500), and shops, Jubilee Farm Estate, for Messrs. Barkers.

UDDINGSTON.—Housing scheme (28), Muiredge, for Lanarkshire County Council. Particulars from Mr. P. C. Smith, District Offices, Hamilton.

UPMINSTER (ESSEX).—Extensions to parish church to cost £5 000. Particulars from the contractors, William Bell and Sons, Saffron Walden.

WATFORD.—Extensions to Grammar Schools. Particulars from the clerk, Mr. F. Wilson, 7, Church Street.

WELLINGBOROUGH.—Houses for the Urban Council. Particulars from the contractors, Mr. R. Marriott, Rushden, C. Adams and Co., and Stevens and Co.

WINDSOR.—School (820 places), for the Borough Education Committee. Particulars from the architects, Leathart and Granger.

Further Housing Schemes.

WIVELISCOMBE.—Housing scheme, for the Urban Council. Particulars from the architects, Roberts and Willman, 2, Hammet Street, Taunton.

WOLVERHAMPTON.—Houses (128), for the Town Council. Particulars from the contractor, Mr. A. Powell.

WOODSTOCK.—Housing scheme (18), Tidlington, for the Rural Council. Particulars from Mr. C. W. Page, Horse Fair.

WORCESTER.—Houses (34), for the City Council. Particulars from the contractors, W. J. Simms, Sons and Cooke, Ltd., Nottingham.

REDUCTION OF CHARGES.

THE following reduced charges for electricity are announced. Figures in parentheses indicate the former rates:—*Torquay*, ¾d. per kWh (⅞d. in borough and 1d. in Newton Abbot, Abbots Kerswell, Coffinswell and King's Kerswell), 1¼d. in remainder of area of supply (1⅝d.); power rates revised, lowest rate ¾d. (1d.). *Willesden*, "all-in" rate, 3s. 6d. per lamp per annum, plus ⅝d. per kWh, for all purposes, or 2½% per quarter of rateable value, plus ⅝d. per kWh; or flat rate, lighting, 4d., heating or power (domestic), 0·9d.; long hour lighting of signs, business premises, etc., ½d. per quarter for every watt of lighting installed, plus 1d. per kWh; power or heating, 0·9d. per kWh (not applying to motor generators used for lighting); in factories using electricity for lighting and power 10% of quantity used for power may be allowed for lighting at 1d. on application; picture palaces and theatres, flat rate 2½d., or bulk supply tariff; bulk supply, 20s. per quarter per kWh demand, plus 0·7d. per kWh for consumption not exceeding 10 000 kWh per quarter, 0·65d. per kWh between 10 000 and 50 000 kWh, 0·6d. between 50 000 and 200 000, 0·55d. between 200 000 and 500 000, all in excess 0·5d.

Reductions at Oswestry.

Oswestry Electric Lighting and Power Co., lighting, 8d. (10d.); power, 3d. (6d). *Chesterfield*, supplies to cinemas and theatres, between April and September, inclusive, 2d. per kWh. *Eastbourne*, domestic rate under "all-in" tariff, ½d. (¾d.), no meter rents chargeable; flat rate for power, heating, cooking, etc., ¾d. (1d.); flat rate for lighting, 4d. per kWh for first 2 500 kWh per quarter, 3¾d. for second 2 500, 3d. for third 2 500, all over 7 500 2½d. *Leeds*, alternative charge to consumers requiring large quantities of electricity for lighting purposes, £10 per kW of maximum demand, plus 5d. per kWh provided annual requirements for lighting are not less than 100 000 kWh, and that suitable accommodation for transformers and switchgear is provided by consumer, which plant may also be used by corporation for supplying other consumers. *Birkenhead*, lighting, 4½d. per kWh (4¾d.), reduction of 1s. 5d. per kWh, large industrial consumers in cases where the consumption exceeds 25 000 kWh per annum. *Formby*, lighting, 6½d.; power, 1½d., consumers having option of alternative charge of 5% on the rateable value up to £60, plus 1d. per kWh for all purposes. *Thames Valley Electric Supply Co., Ltd.*, lighting, 8½d. first 100 kWh; 7½d. per kWh for remainder; heating, 1¾d.; power, 2¾d. per kWh for first 1 000, 1¾d. per kWh for remainder. *Padiham*, where rateable value is under £15, lighting, 2d. per kWh (6d.) for all in excess of 60 kWh during December and March quarters, and all in excess of 20 in quarters ending in June and September. Same reduction where rateable value exceeds £15 but under £25 for units in excess of 80 in December and March quarters and 30 in June and September quarters; where rateable value is over £25 reduction will apply to consumption in excess of 140 kWh in December and March quarters and 50 in June and September quarters; domestic heating and power reduced in similar ratio. *Bolton*, heating and cooking on business premises, ¾d. (1d.); domestic and lighting, 4½d. less 2½%, (4¾d.); industrial power, reduction about 3%. *Wallasey*, lighting, 3¾d. (4¼d.) with 5% discount for payment within 21 days. *Godalming Urban Electric Supply Co., Ltd.*, lighting, 9d. (10d.) per unit; flat rate of 3½d. for power and heating. *Heckmondwike*, heating and cooking, 1d. per kWh, less 2½% for prompt payment. *Hawkhurst* (*Weald Electricity Supply Co., Ltd.*), lighting, 10½d. (11d.) *St. Helens*, domestic supplies on rateable value system, 5% per quarter on rateable value, plus 1d. per kWh or fixed charge at 5% per quarter on rateable value; or £1 per quarter, whichever is the greater, plus §d. per kWh, or flat rates of 4d. for lighting and 1d. for heating, cooking, and domestic power, plus 2s. 6d. per annum meter rent. *Calne*, lighting, 7½d. with minimum charge of 10s. per quarter, power up to 100 kWh per quarter 3½d.; 100 to 200, 3¼d.; 200 to 300, 3d.; 300 to 400, 2¾d.; beyond, 2½d., minimum charge 10s. per quarter. *Canterbury*, heating, cooking and domestic purposes, other than lighting, 1¼d. (1½d.); large power consumers supplied with a.c. extra high pressure current, £6 per annum per kVA, plus ½d. per kWh, electricity used for lighting not to be more than 10% of total. *Beckenham*, "all-in" tariffs, 8% on the first £75 of rateable value (10%), 3% on rateable value above £75 (4%). Consumers not using an electric cooker to have price of electricity for the summer quarters reduced to 1d. (1½d.), and those using cookers to ¾d. (1d.). *Reigate*, lighting, 5½d. (6d.); heating, 1d. (2d.); cooking and power, 1d. (1½d.).

ELECTRICITY SUPPLY.

Walsall and Unemployment Relief—Extensions of Mains at Tynemouth—Additions to Manchester Undertaking—Dartford and Assisted Wiring—Wicklow and the Shannon Scheme—Prepayment Meters for Battersea.

ASHFORD (Kent) U.D.C. is to apply for an Order to supply additional parishes.

Walsall Electricity Committee proposes to carry out extensions of mains as an unemployment relief scheme, at a cost of £7 000.

Tynemouth Electricity Committee has obtained sanction to borrow £11 000 for mains, services, transformers, and switchgear.

Battersea Electricity Committee has obtained sanction to borrow £200 831 for extension of the borough council's generating station.

Barnes U.D.C. electricity department is about to lay a feeder from East Sheen sub-station to Sheen Lane at York Avenue, at a cost of about £2 000.

The Kent Electric Power Co. proposes to lay underground cables through Faversham for the purpose of connecting up the rural district.

Barnsley Electricity Committee recommends the purchase of three transformers at an estimated cost of £670. The Committee seeks sanction to borrow £6 693 for the extension of h.t. and l.t. mains.

Southend T.C. has applied for a loan of £48 516 for e.h.t. ring mains, to permit of a.c. distribution in the North Eastern, North Western, and Western areas of the borough. A partial supply in bulk is to be taken from the County of London Electric Supply Co.

Poplar (London) Electricity Committee seeks sanction to borrow £2 750 for cable extensions at West India Docks, and £2 023 for cable extension from Wick Lane sub-station.—The Committee is to convert the remaining 88 gas lamps to electricity, at a cost of £345.

Croydon Lighting and Electricity Committee recommends an expenditure of £1 400 on switchgear, transformers, and e.h.t. cable in connection with the Thornton Heath (tramway depôt) sub-station. Tenders have been accepted for the erection of five sub-stations.

It will be necessary to increase the supply of electricity in Faversham before the autumn. The T.C. has decided to appoint a deputation to seek an interview with the Commissioners in order to explain the position and obtain information as to the steps that can be taken in the matter.

The annual estimates of Manchester Electricity Committee make provision for an expenditure of £124 000 on land, buildings, and machinery for generating stations; £80 000 for transformer stations, stores, depots, etc.; £357 000 for mains and services; and £8 000 for street lighting.

Apparatus for the elimination of smoke, etc., has had an extended trial at St. Pancras (London) Council's King's Road power station. The Electricity Committee reports that the apparatus has not proved successful in remedying the conditions, in respect of which complaints are continually being received from the L.C.C.

A Special Order has been secured by the West Cornwall Electricity Supply Co. for the boroughs of Helston, St. Ives, and Penryn, the urban districts of St. Just, Madron, Paul, Ludgvan, Hayle, Phillack, Padstow and Wadebridge, the rural districts of West Penwith, Helston, East Kerrier, Truro, and St. Columb Major, and part of the rural district of Redruth.

Ealing Electricity Committee is to instal a 1 500 kW Scott-connected three-phase super-tension transformer set, with booster regulator. It has also been decided to instal a spare set of the same capacity by September next. Super-tension mains between the transformer cubicle, the operating chamber and the coupler switches are also to be provided.

Penge U.D.C. has adopted a recommendation by the Works Committee that the time has arrived when the increase of 33⅓% in the charges for electricity made in 1920 by the South Metropolitan Electric Light and Power Co. is no longer justifiable, and that the company be informed that the Council is no longer prepared to pay the increase.

An Order to supply premises at Pitses, in Limehurst rural district, has been obtained by Oldham Electricity Committee. The profit on the electricity undertaking for the past year, £29 570, is to be transferred to reserve fund.—The Electricity Committee seeks sanction to borrow £7 048 for equipment for the new generating station at Chadderton.

A special sub-committee of Plymouth Electricity Committee has drawn up a scale of special discounts for consumers who repay the balance of the cost of their installations, at the termination of any year up to the fourth year of rental. The sub-committee also recommends the adoption of a scheme for the hire-purchase of radiators in hotels and boarding houses.

Brighton Lighting Committee is to supply the factory of Messrs. Gigins, Ltd., bakers, Portslade, at 12½% above the price for the time being in force to ordinary consumers in Brighton for power and lighting purposes respectively. The Committee has decided to expend a sum not exceeding £750 on festoon lighting northwards around the Valley Gardens and the Level during the current year.

Application is being made by Lancaster Corporation for a Special Order to give a supply in the district of the Lunesdale and Lancaster Unions. Mr. G. C. Milnes, borough electrical engineer, reports that to supply the villages of Slyne and Hest Bank would cost £8 895. The capital charges on mains and cost of generation are about £1 134, while the estimated revenue in the first full year's working would be only £1 083.

Stretford Electricity Committee has adopted an "all-in" tariff for supplies to private houses, as an alternative to the present flat rate. For houses up to £50 rateable value the charge will be 15% on the rateable value, plus ½d. per kW. In the case of rateable values over £50 the fixed charge will be 15% up to £50, and 7½% on the remainder. These rates are contingent upon the use of electrical appliances other than lamps.

At the Stoke-on-Trent Corporation Hospital, during the half-year ended December 31st, the substitution of Corporation electricity supply for steam-driven dynamos has resulted in a net saving of £50.—Mains are to be laid at a cost of £1 500 to give a supply of electricity to 230 houses proposed to be erected by the Housing Committee between Vivian Road and Warrington Street, Fenton. The charge for current is to be 1s. per lamp per week.

Dartford U.D.C. has adopted schemes for the assisted wiring of private houses. In one case the consumer is to be debited with the cost plus 15%, 20% to be paid as deposit, and the balance to be spread over three, four, and five years as desired. In the other case the consumer is to be debited with the cost plus 15% and pay 2d. per kWh in addition to the ordinary charge, the minimum annual repayment to be 16s. 8d. for each £5 expended in providing the installation.

Wicklow U.D.C. wants to know what its electricity is to cost under the Shannon scheme. The Electricity Supply Board said that it should get current cheaper than any other town, as it was handing over to the Supply Board, power house, new overhead mains and wires, iron standards, modern machinery and equipment, etc., which the Board had to furnish in other towns. Mr. Lalor said, at a recent meeting of the Council, that they had handed over too easily, and they should have a representative of the Board with them to go into the question of cheaper current.

Battersea (London) Electricity Committee has decided to instal prepayment meters, when desired, in connection with the rental wiring scheme, and to charge a flat rate of 6d. per unit to cover both the fixed quarterly charge and the unit charge for electricity consumed, the consumer to guarantee such annual consumption of electricity as will ensure the repayment of installation charges, etc., within ten years or less; or a consumer may pay the fixed charge for the installation, etc., quarterly, and pay for the electricity consumed through a prepayment meter at the ordinary rates.

The Antrim Electricity Supply Co. expects to be in a position to supply power to users in a large part of Co. Antrim and a portion of Co. Derry by October of this year. The first part of the overhead transmission lines will be 35 miles long, and will extend from a point near Monkstown to Cullybackey, north of Ballymena. It is stated that steps will be taken to ensure that the line and the poles on which it will be carried will not mar the scenery of the countryside. At a later stage, the transmission line will be extended as far north as Coleraine. The hydro-electric plant will be situated at Caronroe.

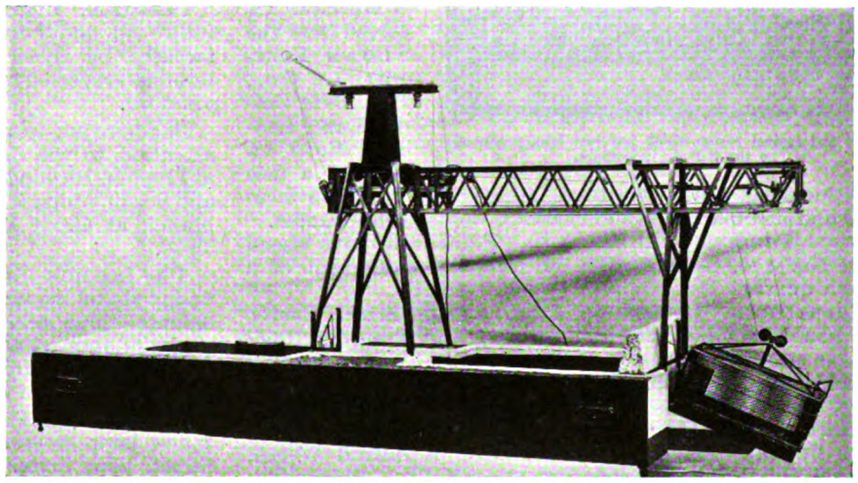
ELECTRICAL NEWS OF THE WEEK IN PICTURES.

The window of Edward Dewhurst, Ltd., of Preston, which was awarded 1st prize in the "Hoover Week" window display competition. This contest gains in popularity every year, and, just as it should be, electrical contractors and electricity supply departments are always awarded a number of the prizes. This year's competition was no exception, and the names of the successful electrical entrants are given on page 540.

Electrical voice reproduction is to play a big part in the campaign for the forthcoming election. Broadcasting, and the relaying by land line of speeches to different halls have already been used, and now Mr. Baldwin has made a special "talkie" for distribution throughout the country. This photograph, taken in the grounds at 10, Downing Street, shows the microphone suspended above the head of the speaker.

Mr. B. C. Garman, who has been elected chairman of the Association of Supervising Electrical Engineers. It will be remembered that Mr. Garman was awarded 1st prize in last year's W. E. Highfield Shield Competition.



A model of the electric "lift" which, it is suggested, should be used on the River Farrar, in connection with the Grampian electricity scheme, now under consideration by a House of Lords Committee. The apparatus has been designed to meet the objection to the suggested 100-ft. dam, enabling the salmon in the river still to make their way upstream. If the scheme is adopted, the fish will enter a pool by leaping, and then swim through a bottle neck passage into a cage containing two feet of water. See page 533.

The new showrooms and offices of the Eastbourne Electricity Department, in Grove Road, showing, on the left, a corner of the interior, and, right, a general view of the 90-ft. frontage. In co-operation with Mr. J. K. Brydges, borough electri al engineer, the Eastbourne Branch of the Electrical Contractors' Association has arranged for part of the showrooms to be stocked by local members. A portion of the basement of the building has been set out as demonstration rooms, in the form of kitchen, scullery, and bathroom, fitted with all the modern appliances, while the remaining portion of the same floor is used for storing cookers, etc.

TRADE PUBLICATIONS.

A SPECIAL leaflet devoted to lamps has been published by the OMEGA LAMPWORKS, LTD., Rodney Place, London, S.W19.

BIRMINGHAM ELECTRIC FURNACES, LTD., 55, George Street, Birmingham, have issued a new brochure relative to their products.

A new and topical poster which has just been produced by the E.D.A., in colours.

The current issue of the "Standard News," published by Standard Electric Stove Co., of Toledo, Ohio, has been received.

GENT AND CO., LTD., Faraday Works, Leicester, have published Book 5, section 4, dealing with observatory time transmission.

We have received from the SLOAN ELECTRICAL CO., LTD., 8–12, Golden Lane, London, E.C.1, a copy of a new catalogue dealing with electrical accessories, porcelain insulators and line materials, and electrical domestic appliances.

BRUCE PEEBLES AND CO., LTD., Edinburgh, have issued leaflet No. 170, dealing with the electrical equipment of a modern quarry.

CAMPBELL AND ISHERWOOD, LTD., Raleigh Street, Bootle, have issued leaflet E.P.T. 9, illustrating and describing their portable electric hand drills, etc.

Booklet No. 20, giving net prices of C.M.A. and Nonanzo cables, has been issued by W. T. HENLEY'S TELEGRAPH WORKS CO., LTD., Holborn Viaduct, London, E.C.1.

The FULLER ACCUMULATOR CO., LTD., Woodland Works, Chadwell Heath, Essex, has published list No. 103, which gives a complete list of new types of automobile batteries.

A new booklet relating to "Philiray" shop window reflectors has been published by PHILIPS LAMPS, LTD., of 145, Charing Cross Road, London, W.C.2. The reference is No. 403.

"Control of Synchronous Motors and the Problem of Power Factor Correction" is the title given to a new publication by BROOKHIRST SWITCHGEAR, LTD., of Northgate Works, Chester.

Leaflet No. X243, dealing with standard leakage relays, d.c. type, for tripping circuit breakers has been published by J. G. STATTER AND CO., Queen Anne's Chambers, Westminster, London, S.W.1.

A new leaflet illustrating and describing the "Type Two" electric iron has been published by the TELEPHONE MANUFACTURING CO., LTD., Hollingsworth Works, West Dulwich, London, S.E.21.

The WHOLESALE FITTINGS CO., LTD., 23-27, Commercial Street, London, E.1, has published catalogue No. W. 195, dealing with radio components, loud speakers and accessories. The issue comprises some 150 pages and is profusely illustrated.

BRITISH INSULATED CABLES LTD., Prescot, Lancs, have issued a leaflet dealing with rust-proof rubber insulated wires and cables, which replaces H. 95, and leaflet P.F. 51, replacing P. 63, and describing demand indicators has also been published.

List No. 5 281, dealing with auto-transformer starting equipments for squirrel cage motors, salient pole synchronous motors and condensers, has been published by the BRITISH THOMSON-HOUSTON CO., LTD., Rugby. List No. 2420 C*, dealing with rotary convertors and cancelling list No. 2 420 B, has also been published.

BUSINESS ITEMS.

THE address of the DIAMOND FIBRE CO., LTD., has been changed to 79, Knightrider Street, London, E.C.4.

The address of ALLOY WELDING PROCESSES, LTD., has been changed to Ferry Lane Works, Forest Road, London, E.17.

The business hitherto carried on as Langham Radio has been acquired by LANGHAM RADIO, LTD., of Exhibition Works, Wembley.

Messrs. BRAYSHAW, electrical contractors, of Colton Street, Bolsover, have opened new premises at Devonshire House, Holywell Street, Chesterfield.

On and after May 6th the permanent offices of the Central England Area, of the Central Electricity Board, will be situated at 53, Wake Green Road, Moseley, Birmingham.

I. GROVES AND CO., electrical engineers, 5, Cranbury Place, and J. W. SCOTT AND CO., LTD., electrical engineers, Java Road, Docks, have been elected members of the Southampton Chamber of Commerce.

J. DYSON AND CO., LTD., announce the transference of the Hull branch to premises, complete with radio and electrical showrooms, at 39, Beverley Road, Hull. This is immediately opposite the old address.

A new company has been registered under the title of PARKER FOUNDRY (1929) LTD., Derby, to take over the Parker Foundry Co., Ltd. The managing director of the new company is Mr. T. McLean.

Mr. H. E. DRABBLE, electrical contractor, of Staveley, Chesterfield, has removed his retail department from 1, Market Street, to 4, Ponten Street. In future, the former address will be used as a battery service depot only.

FERRANTI, LTD., Hollinwood, Lancs, announce that in future all audio frequency and output transformers manufactured by them will have their primary and secondary terminals reversed from what have hitherto been their standard positions.

BLACKSTONE AND CO., LTD., Stamford, have drawn our attention to the fact that in addition to existing branches at London, Birmingham, Bristol, Dublin, Glasgow, Manchester and South Wales, it has been found necessary to open a further branch at Groat House, Collingwood Street, Newcastle-on-Tyne.

The LONDON ELECTRIC FIRM, of Croydon, has recently designed and manufactured for a Continental state, for frontier defence, three searchlights 7 ft. in diameter, with a candle power of approximately 3 500 million. The lights are electrically controlled from a distance and arranged for working up to an elevation of 90°.

The BRITISH THOMSON-HOUSTON CO., LTD., has opened a new lamp stores in Blackburn at "Old Bank," Old Bank Street, King Street, which is associated with the Manchester branch of the company. A Norwich stores has also been opened at Cambridge House, 26, Tombland. It is understood that another "Mazda" lamp stores will be opened in Derby shortly.

Marconiphone public address amplifiers were installed at Godstone Church on April 24th, for relaying the whole of a marriage service to the bedside of the bride's mother, an invalid. A similar installation was carried out a year ago, and the two ceremonies are believed to be without counterpart. To ensure that no detail should be lost, five Marconi-Reisz microphones were placed at strategic points, and the Post Office cleared the line for a distance of five miles for the relay.

As usual a number of electricity supply departments and electrical contractors entered for this year's "Hoover Week" window display contest, the first and third prizes being won by EDWARD DEWHURST, LTD., of Preston, and PARKER, WINDER AND ACHURCH, LTD., of Birmingham, respectively. The window which was awarded the first prize is illustrated on page 539, and was arranged at the top with a large sign in pelmet form bearing the words, "Free gifts for all who purchase a Hoover." These free gifts were health, comfort, beauty, cleanliness, leisure and happiness. Cut-out figures, symbolical of the gifts, were arranged in suitable positions in the window and connected to the "Hoover" by ribbons. The floor was covered in shades of rich purple, whilst the cleaner was set on a dais on orange satin. The background of the window was also in purple. Flowers of yellow and purple were used to provide a spring-like atmosphere. Consolation prizes were awarded to the Borough of Southport, the West Hampshire Electricity Co., Ltd., and the Corporation of Burton-on-Trent.

MERCHANDISE MARKS.

Hearing of Evidence with Respect to Imported Glassware.

A BOARD of Trade Committee under the Merchandise Marks Act, 1926, began an Inquiry on Monday, at the offices of the Board, into an application for the marking with an indication of origin of domestic, fancy, and illuminating blown glassware of all descriptions (other than electric lamp bulbs); pressed glassware of all descriptions; bottles, jars and other containers of glass. The Committee consisted of Sir H. Llewellyn Smith (chairman), Mr. F. N. Barnes, and Mr. F. R. Davenport.

The original application included lamp-blown ware and scientific glassware, including tubing and rod, but these will be dealt with as a separate application, the date of the hearing of which, however, has not yet been fixed. The applicants were the Glass Manufacturers' Federation; the British Flint Glass Manufacturers' Association and the Northern Association of Pressed Glass Manufacturers, supported by other trade associations, as well as a number of firms. Mr. Wethered (barrister) appeared for the applicants.

The principal opponents were the China and Glass Ware Section of the London Chamber of Commerce, supported by the Electrical Importers and Traders' Association, the Chloride Electrical Storage Co., Ltd., and other British manufacturers, represented by Mr. A. Comyns Carr, K.C., Mr. L. Macaskie and Mr. Horace Samuel.

Mr. Wethered, dealing with domestic, fancy and illuminating blown glassware—other than electric lamp bulbs—said the application in this case was made by the British Flint Glass Manufacturers Association, consisting of eight firms, supported by James Powell and Sons (Whitefriars) Ltd., the Stourbridge Glass Co., Ltd., and the New English Glass Manufacturers, Ltd., although these latter were not members of the Association. The trade unions also supported the application. Imports had increased from a value of £1 768 985 in 1921, to £2 247 939 in 1927, and the complaint was made that foreign makers so copied British designs and trade names that it was practically impossible to distinguish the foreign from the British. It was often found also, that the foreign articles were mixed with British-made goods. It was suggested that an indication of origin could be given by means of an acid transfer or sand blasting, as had been the practice for some years by some British firms. In reply to an allegation by the opponents that there is practically no illuminating glass made in this country, it was pointed out that there were 11 firms engaged in this branch of the trade, and the output of six of them last year reached £65 000. Taking the Board of Trade figures, it appeared that British firms made 25 % of the lighting glass required in this country.

The chairman, referring to the request for an importation Order, said that a Sales Order did not necessarily mean fixing a label.

Manufacturers' Views.

Mr. Wethered agreed, but said it seemed that resort would have to be made to a label, and, in the opinion of British manufacturers, it was not a good thing to do.

Mr. W. G. Riley (John Walsh, Walsh, Ltd., Birmingham) said his firm had a turnover of £10 000 per annum in illuminating glassware, most of which was made to special order and no catalogue was issued.

Mr. Macaskie, in cross-examination, put it to witness that if lighting shades were marked on the upper neck, as had been suggested by one of the samples exhibited, the mark would be covered up when the shade was attached to the fitting and therefore the ultimate purchaser would never see the mark, yet the Act said the mark should be conspicuous.

Witness replied that shades were sold by manufacturers to wholesalers without fittings and therefore the mark would be seen.

Counsel also suggested that a mark in any other part would disfigure the articles and also give the impression, when a foreign marked globe or shade was attached to British-made fittings, that the whole thing was foreign.

Witness would not agree.

Mr. John Northwood (Stevens and Williams, Ltd., Brierley Hill) said his firm had an output of £20 000 per annum in illuminating glassware, the output consisting of all kinds of lighting glass except heat resisting glass. He submitted samples of illuminating glassware marked on the upper neck and, together with the previous witness, contended that as shades were sold separately from the fittings the mark would be seen, and in his opinion it would not matter whether the mark was covered subsequently.

Mr. Comyns Carr suggested that it was a common practice for lighting contractors to send individual customers to select lighting fittings from manufacturers' showrooms, and that as these fittings were invariably in position, the ultimate customer would not see a mark placed as suggested.

Witness said that the ultimate purchaser would inspect the glassware in his house before it was attached to the fittings and he would then see the mark.

Mr. Comyns Carr suggested that a stick-on label would be better, because, as witness had no objection to the mark being covered up, subsequently to purchase, it would not matter if the stick-on label came off in time. Witness objected.

Mr. Comyns Carr continued that as the Act specifically stated that the mark should be on the goods at the time of sale, it did not matter whether the mark came off after the purchaser had bought the goods and knew what he had bought.

The chairman also pointed out that the Merchandise Marks Act was concerned only with the goods as sold and that so far as the Act was concerned it did not matter what the purchaser did to the goods after he had bought them.

Mr. Northwood insisted that any marking should be permanent.

The inquiry was adjourned until May 6th.

"THE ELECTRICIAN" TABLES.

Details of British, Colonial, and Foreign Electricity Supply Undertakings.

THE forty-second edition of THE ELECTRICIAN Annual Tables of Electricity Undertakings was issued last week by Ernest Benn, Ltd., Bouverie House, Fleet Street, E.C.4, at the usual price of 10s. net, plus 9d. and 1s. for postage to addresses in the U.K. and abroad, respectively. The matter contained in the tables has been revised up to the last possible moment, and details are given of many new undertakings, as well as information of projected schemes. The tables contain information relating to British electricity supply undertakings, smaller British undertakings, schemes projected, etc., British electric power companies, dominion and colonial electricity supply undertakings, smaller dominion and colonial undertakings, grouped geographically, foreign electricity supply undertakings, smaller foreign undertakings, also arranged geographically, and dominion and colonial and foreign electric railways and tramways.

A new index, includes, in alphabetical order, not only all the British undertakings and power companies dealt with in tables A. B. and C., but also the towns and parishes receiving supply in bulk.

The particulars of the electricity supply undertakings include the district supplied; its population; the owners of the undertaking; the name of the chief engineer; the system of generation, transmission, and distribution; generation, transmission, and consumers' voltages; the numbers and types of public lamps in use; aggregate horse-power of motors connected to the system; total connections and maximum load in kW; the prices charged for lighting, power, heating, and cooking; and, in most cases, details of the steam raising and generating plant, the fuel used, and its price; the output of electricity for the past year, the number of showrooms, motor, cooker and heater hire and hire purchase, and assisted wiring schemes; the price of gas in the district, etc.

In the case of the colonial and foreign electric railways and tramways, the names of the owners of the systems and the chief officials are given; also particulars of power house plant; rolling stock; brakes; gauge and length of track; weight of rails; line equipment; line voltage; the bonding of rails, etc.

The tables relate to 800 British and over 1 300 colonial and foreign undertakings, and contain 220 pages of information arranged in a compact and handy form. The publication is the only one of its kind.

E.C.A. CONFERENCE.

Supplementing the particulars already given of the provisional arrangements made for the fourth annual conference of the Electrical Contractors' Association, to be held at Bournemouth on June 26th, 27th, and 28th, we are informed that the following papers will be read and discussed:—"The Mutual Responsibility of Contractors, Manufacturers and Supply Undertakings—(*a*) to the Electrical Industry, and (*b*) to the Public," by Mr. A. G. Bruty; and "Possibilities for Contractors in Rural Electrification," by Mr. H. R. Taunton.

COMPANY NEWS.

Terms of Acquisition of Shares in Cables and Wireless, Ltd.—Associated Electrical Industries' Report—Philips Glowlampworks Expansion—Electricity Supply in South Wales—Shropshire, Worcestershire and Staffs Co.'s Meeting.

GENERAL ELECTRIC ordinary shares have relapsed, rather more than losing last week's advance in price. English Electric 6% preference have fallen 1s. 3d., to nearly 8s., and Thomson-Houston debentures are a couple of points down. Brush Electrical shares, on the other hand, are slightly better. Shropshire, Worcestershire and Staffordshire Power "B" ordinary shares have risen half-a-crown and are now quoted £2. Eastern Telegraph Stock is unchanged at 28o, but Marconi's Wireless shares are up 1s. 2d., and Marconi's International Marine have retained last week's improvement. London United Trams 1st deb. stock is a point up.

READING ELECTRIC SUPPLY CO., LTD.—Div. 10% for past year (same).

CONSTANTINOPLE TELEPHONE CO.—Int. at rate of 3½% (3/6 p. sh.) is payable on sh. cap.

QUEBEC POWER CO.—Div. of $½ p. sh on common shs. for qrter. ended March 31 is announced.

S. SMITH AND SONS (MOTOR ACCESSORIES), LTD.—Intm. div. 5% on pfd. ord. shs. is recommended.

AMERICAN ELECTRIC POWER CORPORATION.—Qrtrly. divs. declared: $1·50 on $ pfd. and $1·75 on $7 pfd. stk.

MONTREAL LIGHT, HEAT AND POWER CONSOLIDATED.—Div. on common shs. of 60 cents p. sh. for qrtr. endg. March 31.

HENGELO ELECTRICAL AND MECHANICAL APPARATUS FACTORY (HOLLAND).—Divs. of 5% on ord. and 7½% on pref. shs. (same as last year) are announced.

MALACCA ELECTRIC LIGHTING CO.—Net pft. for 1928, after provisn. for depreciatn., reserve ($20 000), etc., $107 999. Fin. div., 7½%, makg. 12½% for year. Fwd., $14 249.

ANGLO-PORTUGUESE TELEPHONE CO., LTD.—Fin. div. of 5%, less tax, on ord. shs., makg. 8% for year, and div. of 8%, less tax, on fully-paid "A" ord. shs., are notified.

CRAIGPARK ELECTRIC CABLE CO., LTD.—After writing off £3 000 for depreciation and placing £9 000 to res., div. of 5% has been declared on ord. shs. for year ended March 30 last, agst. 4%.

ORIENTAL TELEPHONE AND ELECTRIC CO., LTD.—Fin. divs. recmmdd. for year ended Dec. 31, 1928, 3½% on pref. shs., less tax, makg. 7% for year, and 8% on ord. shs., tax free, makg. 12% for year.

A. RIST (1927), LTD.—Net pft. for 1928, after makg. provisn. for depreciatn. and taxatn., £3 605, out of which fixed div. of 8% on cum. participatg. pfd. ord. shrs. for 13 months to Dec. 31, 1928, has been paid. Fwd. £572.

MEXICAN LIGHT AND POWER CO., LTD.—Divs. at rate of 7% p.a. for half-year endg. Apl. 30, 1929, on 7% cum. pref. shs., and at rate of 4% p.a. for half-year endg. Apl. 30 on 4% cum. red. 2nd pref. shs., are announced.

CANADA POWER AND PAPER CORPORATION.—First annual rpt. (for 1928) shows gross rev. $5 376 585. Bond and deb. int. $2 813 088. To depreciatn. and depletn. res., $1 322 405. After mtg. pfd. and common divs. of subsidiary cos., $1 050 440 surplus is $180 648.

ASSOCIATED GAS AND ELECTRIC SYSTEM.—Earngs. for 1928, $42 163 550, agst. $35 296 741; net earngs., $19 170 637, agst. $17 032 086. After provisn. for pfd. divs., int. charges and depreciatn. ($2 439 874), amt. left for divs. and surplus is $6 495 592, agst. $6 258 653.

RADIO VICTOR CORPORATION OF AMERICA.—The Radio Corporatn. of America announces the formatn. of the Radio Victor Corporatn. of America, a subsidiary to the Radio Corporatn., which will take over the sales activities of the R.C.A. and the Victor Talking Machine Co.

EVER READY CO. (GREAT BRITAIN), LTD.—Directors recmmd. paymt. of fin. div. for year ended Mar. 31., 1929, on pref. shs. 5%, makg. maximum of 10% for year; on old ord. shs. 25%, makg. 35% for year (same); and on 296 000 ord. shs. issued fully paid as bonus in Jan., 1929, 25%.

MEXICAN TELEPHONE CO. ERICSSON.—This co., affiliated with L. M. Ericsson Telephone Co., of Stockholm, has taken up a loan of 10 800 000 Swedish kr., with int. of 6%, and issued at par. Loan is to be redeemed durg. period 1939–1949, but with right to convert same from year 1934 at a redemptn. rate of 105% and downwards.

RICHMOND (SURREY) ELECTRIC LIGHT AND POWER CO., LTD.—Blce. from rev. acct., £46 486, after provisn. for all exes., total amt. available being £48 677, includg. £2 190 brt. in. To sinkg. fund, £1 395; res. for depreciatn., etc., £8 000; res. for taxatn., £3 000, gen. res. £10 000, leavg. £26 281. Fin. div. 7% on ord. shs., makg. 11% for year. Fwd. £4 281.

CITY ELECTRIC LIGHT CO., LTD. (BRISBANE).—Accts. for year ended Jan. 31, 1929, show credit blce., after provisn. for sinkg. fund, renewals acct., res. fund, and employees' providt. fund, of £120 308. Intm. div., amtg. to £59 138, paid in Sept. last. Further div. of 3% has since bn. paid on 6% pref. shs., 3½% on 7% pref. shs., and 5% on ord. shs., State tax free. Fwd. £39.

NIGERIAN ELECTRICITY SUPPLY CORPORATION, LTD.—Subscriptions were invited recently for an issue of 450 000 £1 pfd. ord. shs. at par. Co. was formed to acquire and comple. the constructn. and equipmt. of a hydro-electc. installatn. to supply electy. to cos. engaged in tin mining on the Bauchi Plateau of Northern Nigeria. Three generatg. units of 2 000 H.P. each are under constructn., and the plant will be increased later to 10 000 H.P.

CABLES AND WIRELESS, LTD.—It is anticipated that circulars will be posted by the Bank of England on May 17 to ordinary stkhldrs. of the Eastern Telegraph Co., Ltd., ord. shhldrs. of the Eastern Extension Australasia and China Telegraph Co., Ltd., and the Western Telegraph Co., Ltd., and £1 pref., £1 ord. and 10s. ord. shhldrs. of Marconi's Wireless Telegraph Co., Ltd., giving terms of the offer of exchange of their respective hldgs. for shs. in Cables and Wireless, Ltd.

BOURNEMOUTH AND POOLE ELECTRICITY SUPPLY CO., LTD.—Rev. for 1928, £272 477, agst. £261 005 in 1927, blce. to net rev. acct. £170 382, agst. £261 005, plus £7 290 brt. in. Int. on deb. stk. to Dec. 1928, less tax, £6 750; leasehold and spl. redemptn. funds and int., £1 154, to res. for depreciatn., renewals, etc., £35 000; to res. for taxatn., £6 000; to gen. res. £25 000. Intm. and fin. divs. on 4½% and 6% pref. shs. and intm. div. at 6% on ord. shs. have been paid. Fin. div. at 9%. less tax, on ord. shs. is recommended, makg. 15% for year, Fwd. £6 268.

ASSOCIATED ELECTRICAL INDUSTRIES, LTD.— Rpt. for 1928 shows pfts. £258 772, against £254 749. Int. on deb. stk. £41 454 (same), written off works, machinery, plant, etc., £56 655, agst. £53 181, to gen. res. £25 000 (same). Div. on 8% cum. pref. shs. absorbs £78 915, and div. on ord. shs. 6% (same), £54 573. Fwd. £101 850, compared with £99 676. In Nov. last co. acquired issued ord. shs. of British Thomson-Houston Co., great majority of issued ord. shs. of Edison Swan Electric Co. and practically all issued share cap. of Ferguson, Pailin, Ltd. No divs. from these cos. have been taken into accts. for 1928.

PHILIPS' GLOWLAMPWORKS, LTD. (EINDHOVEN).—Gross pft. for 1928, £2 434 000, agst. £1 175 000. After writing off a sum for blds. and machinery, blce. is £1 560 000, agst. £963 000. Divs., 21% on ord. and 9% on pref. shs. (same as last year). A new issue is to be made during this month of £1 367 000 ord. shs. at 250% and £440 000 cum. pref. shs. at 130% in proportion of two new shs. to each one held. Factories at home and abroad have worked at full capacity and output has largely increased. Considerable additns. have been made to bldgs. and plant, and a further large extensn. to Eindhoven factory is to be made during current year. It is also intended to extend the factories elsewhere in Holland and in foreign countries.

BRITISH THOMSON-HOUSTON CO., LTD.—Pft. for 1928, before charging int. on debs. and loans, £422 729, agst. £462 444 plus £200 513 brt. in. Int. on debs., £152 225; to depreciation, etc., £119 951. After paying pref. div., a div. of 4%, less tax, on ord. shs. is recommended. Fwd., £203 066. Rpt. states that volume of factory output was comparable with that of preceding year, but pfts. remain unsatisfactory. Ref. is also made to the acquisition by Associated Electrical Industries, Ltd., of all the ord. shs. of the B.T.H. Co. and all the shares owned by the latter co. in the Edison Swan Electric Co., Ltd., and Ferguson, Pailin, Ltd., and it is stated that steps are being taken to put into effect as rapidly as possible the economies and co-operative efforts which are the object of the arrangements. Loans which at Dec. 31, 1927, stood at £1 310 000, have now been reduced to £335 000.

Company Meetings.

WORMIT ELECTRIC LIGHT CO., LTD.—At the meeting on April 25th, the report, which was adopted, showed that a dividend of 7½% had been declared. An extraordinary general meeting was held subsequently to consider the offer of the Fife Power Co. to buy out the Wormit Electric Co. at £2 000, which entitles the shareholders to receive 20s. for every 15s. subscribed. In addition to the £2 000, the directors are to be given £500 for their services. After discussion it was decided to accept the offer, and that the company be wound up voluntarily.

HOPKINSONS, LTD.—Mr. R. A. Hopkinson, presiding at the meeting on April 26th, said with the improvement in the coal trade there was an increasing interest in their patent mechanical and electrical mine signal indicators, and when colliery company funds were fuller, no doubt they would receive a share of orders for these instruments. During the past year they had been occupied in the manufacture of their patent electric valve controls, for which they had several months' orders still in front of them. After referring to other figures in the report, the chairman said they proposed to pay a final dividend of 5%, less tax, making 10% for the year.

BABCOCK AND WILCOX, LTD.—Sir John Dewrance, presiding at the meeting last week, said during the past year the company had spent on bringing its plant up to date a sum of money which was in excess of the capital of the company at the time he was appointed chairman thirty years ago. The result of that was that the company was in a good position to execute all the orders that it had in hand or could book immediately. The associated companies had been very successful during the year, particularly the Spanish company. During the year competition seemed to have been extremely great, but there were signs that the trade of the country was improving. This year they were not able to make the shareholders quite the same return as last year. The difference, £8 000, was due to circumstances which the directors hoped would not recur.

Regenerators on Indo-European Telegraph Line.

INDO-EUROPEAN TELEGRAPH CO., LTD.—Mr. H. L. M. Tritton, presiding at the meeting on April 25th, said the company's relations with the various governments, through whose territory their line passed, continued to be satisfactory. During the year arrangements were made, in co-operation with the Indo-European Telegraph Department, for the installation of regenerators at various points on the line. The system was in operation on one line, in both directions, between London and Karachi, and had produced a very material increase in speed. Steps had been taken to improve still further the service between the Continent and Persia and India, for which purpose there existed a special line from Berlin. He asked shareholders last year to bear in mind that the company's revenue during the year under review would be bound to show a diminution by reason of the beam wireless competition. The falling off in revenue, whether owing to this competition or whether to the reduced rate, would have been still more apparent, but for a certain expansion of traffic following on the reductions and an increase in the company's subsidiary traffics. The company was not included in the merger, but shareholders might rest assured that their interests were protected under the terms of the joint purse agreements. The report was adopted and the dividend and bonus, making a total distribution of 10% for the year, were approved.

SOUTH WALES POWER CO., LTD.—Mr. W. North Lewis, presiding at the meeting on April 26th, said the interests of the South Wales Power Co. and the South Wales Electrical Power Distribution Co. (the Parliamentary company) were identical and the particulars which he would give referred to the latter. The profit for the past year was £89 060, against £125 068 in the previous year, and the balance handed over to the South Wales Power Co. enabled it to meet in full its 1st mortgage debenture interest and sinking fund and its preference dividend and to carry forward £477, increasing the balance forward to £21 182. The year through which they had just passed was one of the worst ever experienced in the coal trade of South Wales. This meant a serious curtailment of demand from some of their largest consumers. The directors had adopted a policy of lower prices and simpler tariffs, and by this means had retained business in danger of being lost and secured new business. The fall in output as compared with 1927 only amounted to 7%. Since the beginning of the year there had been an improvement in the coal trade, and this was reflected in their output. Bulk supplies to public authority and company distributors showed an increase of 4%. In the Power Co.'s Electric Lighting Order areas the aggregated results had been much better. On this side the number of consumers had increased by 18%, units sold by 11%. In 1928 the weight of coal used per kW fell from 1.701 lb. to 1.61 or 5½%, and almost every other item of cost showed some reduction. The average price received fell from 1.013d. to 0.906d., or a reduction of 10%. He mentioned last year that the company had placed an order for a 25 000 kW turbine. The erection of this plant was practically complete, and they anticipated that it would enable them to still further improve cost of production. Mr. J. W. Beauchamp, Mr. Chamen's successor in the office of engineer and general manager, had entered upon his duties at a time of great difficulty, and the Board had pleasure in acknowledging the able and strenuous manner in which he had set about the task of extending and consolidating the business of the company.

SHROPSHIRE, WORCESTERSHIRE AND STAFFORDSHIRE POWER CO.

Mr. E. Garcke on Company's Good Prospects—Financial Position Satisfactory—Arrangements for Inter-connection with Other Supply Undertakings.

THE ordinary general meeting of the Shropshire, Worcestershire and Staffordshire Electric Power Co. was held on Tuesday at 88, Kingsway, London, W.C., Mr. E. Garcke (chairman of the company) presiding.

The Chairman, in moving the adoption of the report and accounts, said that the revenue account showed a total credit of close on £350 000 for 1928, as compared with £322 000 for the preceding year. The debits were £161 000 compared with £146 000. They were proposing to pay a dividend on the "B" ordinary shares of 7½% for the year 1928, compared with 7% for 1927, and, the capital having been increased during the past year, the total dividend charges amounted to £96 000, or an increase of £16 000 on the preceding year. They carried to the reserve appropriation account the balance of £92 621, to which was added the premium received on shares issued last year, £54 125, sundry other items, £3 519, or a total at the credit of the appropriation account of £150 265. From that total they wrote off the balance of £18 936, commission and discount paid on previous issues of capital. They placed £50 000 to reserve account, the same amount as in the preceding year, and after adding the charge in respect of the Endowment Fund of £2 392, there remained a balance to be carried forward to next year of £78 937, compared with £45 628 which was brought in from the preceding year.

It was natural to expect the general development of their business to cause an increase in their expenses, but he must draw the shareholders' attention to the large increase in the amount paid in rates. In 1928 they paid £24 156, against £16 178 in the previous year, and £14 103 the year before.

Turning to the balance sheet, at December 31st last the issued share capital appeared at £1 705 000, an increase of £555 000 during the year. Their loan capital and other forms of indebtedness showed a total of £1 590 000, a reduction of £35 000. The general financial position was satisfactory and the prospects were good.

The real inwardness of their present position was the conviction they hoped to justify that a large part of the capital spent represented assets the value of which was on the upgrade. It was not so much a question of making provisions for wasting assets as of assessing the fruitful potentialities of their enterprise. Their chief concern at the present time was the tendency for capital expansion to exceed the revenue-earning power in the initial period of expenditure. To express it quite tersely, it meant that as a result of highly efficient propaganda and publicity organisation, which the company had developed, the number of intending consumers connected to their mains was large, and the necessary interest charges on capital had to be borne before the expenditure on mains and equipment was remunerative. With even a small revival of trade their revenue was likely to improve considerably.

Arrangements for inter-connection of supply had been made with the City of Birmingham on the east of their area and with the West Gloucester Power Co. and Wessex Electricity Co. on the South. Negotiations with similar objects were proceeding with the Hereford Corporation on the west, and with the West Midlands Joint Electricity Authority on the north. They were also supplying current in bulk to the Corporation of Cheltenham. Their distribution area covered nearly the whole of the County of Worcestershire, considerable portions of Staffordshire, Shropshire, Gloucestershire, Warwickshire, Herefordshire and Oxfordshire, giving a total area of approximately 1 800 sq. miles in parts of seven counties. Within that area they had a number of separate electricity undertakings. In addition to those previously reported were Banbury, in Oxfordshire, Ledbury, in Herefordshire, Stratford-on-Avon, in Warwickshire, Shipston-on-Stour, in Gloucestershire, and Church Stretton, in Shropshire.

The company's area offered many exceptional features which might claim favourable attention of industrialists, for it was well served by railways, good roads and a network of canals. The company had established an estates department, which was in a position to provide information concerning sites, and availability of labour to industrialists in search of the most economic conditions for enterprise, including the supply of cheap electric power.

The report and accounts were adopted, and a resolution was passed creating 350 000 new shares of £1 each to be called 6% cumulative preference shares.

Private Meetings, etc.

[Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.]

ALLAN (WILLIAM) AND CO. (LIVERPOOL), LTD., 62, Dale Street, Liverpool, electrical factors. The statutory meeting of creditors in this voluntary winding-up was held last week at the Law Association Rooms, Liverpool. The liquidators submitted a statement of affairs which showed ranking liabilities of £5 187, of which £5 111 was due to the trade, and £76 in respect of instalments on a car. The assets were estimated to realise £3 000, from which had to be deducted £108 for preferential claims, leaving net assets of £2 952, or a deficiency of £2 235. The assets included stocks £2 018, estimated to realise £1 500, and book debts £1 400, expected to produce £1 300. The company was registered in January 1928, with a nominal capital of £3 000, of which £2 000 has been issued. Shares to the value of £1 500 were issued for cash, and the balance of £500 were allotted for consideration other than cash. The deficiency, so far as the shareholders were concerned, was £4 235, accounted for by losses on trading totalling approximately £2 800, and the depreciation of the assets. Voluntary liquidation was decided upon as proceedings had been commenced by certain creditors. According to the balance sheet last December there was an amount due to the bank in respect of which third party guarantees had been given. The claim of the bank had, however, since been discharged. During the year to December 31st last, the sales were £16 420, with a gross profit of £1 180; but expenses totalled £3 479, and there was a net loss of £2 299. During the present year, the sales had been £3 347, with a gross profit of £107, and a net loss of £538. During the discussion, it was stated that one of the two liquidators had been a director of the company. A resolution was passed in favour of an application being made to the Court for the appointment of Mr. J. Airey (who had been elected to the chair by the meeting) as liquidator, together with a committee of inspection consisting of Mr. Parkin S. Booth, Liverpool, and the representatives of Siemens Electric Co., London, and Ferranti's, Ltd., London.

The principal creditors are :—Philips Lamps, Ltd., London, £387; Pye, W. G., and Co., London, £283; General Electric Co., Ltd., Liverpool, £364; Siemens Electric Co., London, £790; Cossor, A. C., Ltd., Manchester, £295; Ferranti Ltd., London, £237; McMichael, Ltd., London, £183; Mullard's Wireless Co., London, £175; Ferodo, Ltd., Manchester, £169; Watson, W., and Co., Ltd., Liverpool, £105; Marconiphone Co., London, £102.

INTERNATIONAL ELECTRIC CO., LTD., Ashley Road, Tottenham, N., telephone manufacturers. A meeting of the creditors of this company, convened by Messrs. Stoneham and Sons, solicitors, of 108a, Cannon Street, E.C., was held last week at the Midland Hotel, St. Pancras. A large number of creditors were in attendance, and the chair was occupied by Col. Simpson who was stated to be the largest shareholder and a director. Mr. Stoneham said that the company had been registered in 1911 and in 1927 Col. Simpson took a hand in the management. He (Mr. Stoneham) was called in in the autumn of 1927 and he found that Col. Simpson had advanced without any security a sum of £10 000. There was a prior charge on the company's assets of not less than £90,000 and the amount might ultimately be found to be nearer £100 000. In 1927 the debenture holders expressed themselves willing to stand aside and not take any immediate steps for the protection of their interests. An agreement was entered into under which Col. Simpson was given a certain amount of authority in regard to the affairs of the company but he was given no security whatever. Col. Simpson had found for this company no less than £44 800. Certain negotiations had taken place recently and he thought there was a possibility of a reconstruction on sound lines, and that the company could then attain a new lease of life. It was quite evident that on the basis of the figures he had submitted to them there was not the slightest chance of the trade creditors receiving one penny piece if a liquidation were to ensue. He appealed to the creditors to grant a moratorium, because under this scheme there was a prospect of some kind. He was empowered to put before the creditors the suggestion that had been made and if they would grant this moratorium for six months the debenture holders (Williams Deacon's Bank) would give their support and creditors would, he hoped, support the company to the extent of supplying raw material, and goods at competitive prices, against cash or guaranteed payment. It was also undertaken that if a receiver were appointed and this resulted in a realisation then the creditors would be guaranteed to be paid ten per cent. on the amount of their present debts. Mr. Stoneham said that three creditors had taken action but it was hoped that these would fall in with the scheme. The total unsecured claims at the present time so far as trade creditors were concerned were £10 251. A long discussion ensued, in the course of which many creditors expressed their views, and the representative of Mansell Booth and Co., the second largest creditors, and who had taken proceedings, stated that he could not at present undertake to fall in with the proposal made. Eventually a resolution was proposed that the trade creditors should agree to grant a moratorium for six months from the 18th instant on such terms, being not less than 10 per cent., as the committee representing three of the principal creditors agreed to. This resolution was seconded and carried.

E.A. MANUFACTURING CO., LTD. This Birmingham company, manufacturing electrical accessories, was registered in November, 1926, with a capital of £1 500, increased a year later to £3 000, in £1 shares, all of which have been issued for cash. The directors at the end of 1928 were Harold Seymore Scott, with 1 000 shares; Henry Ravely Guest, 400 shares; Frank Ernest Hands, 200 shares; Ernest Everton, 1 000 shares; and Dora Everton, 400 shares. Messrs. Scott and Everton, as debenture holders, have appointed a receiver.

London Gazette, etc.

Company Winding-up Voluntarily.

BEASLEY'S, LTD. By reason of its liabilities, April 23rd. E. C. Williams, incorporated accountant, 65, Oxford Street, Whitstable, appointed as liquidator. Meeting of creditors at 65, Oxford Street, Whitstable, Thursday, May 9th, at 2.30 p.m.

Notices of Dividends.

POWELL, Hector Baden, 10, Union Street, Hereford, wireless dealer. Second and final dividend. 1¼d. per £, payable, May 10th' Official Receiver's Office, 133, Saint Owen Street, Hereford.

SCOTT, Montagu James, 134, Regent Street, trading as MONTAGU J. SCOTT AND CO., electrical engineer and contractor. Supplemental dividend, 2s. 1½d. per £, payable Bankruptcy Buildings, Carey Street, London, W.C.2.

TEMPLE, Edward and BURKETT, Jane Eva, Mrs., trading as THE WESTOE ELECTRICAL CO., 105, Canterbury Street, South Shields, Durham, wireless dealers and electrical contractors. First and final dividend, 2s. 8d. per £, payable, May 8th, Trustee's Office, 48, Pilgrim Street, Newcastle-upon-Tyne.

Partnership Dissolved.

H. G. WESTLAKE (Henry George WESTLAKE and Albert Sidney WATERTON), electrical and wireless engineers, 16, Fountain Street, Halifax, by mutual consent as from April 1st, 1929. Debts received and paid by A. S. Waterton, who will continue the business.

Bankruptcy Proceedings.

JOLIVARD, Kenneth Paul James, electrical engineer, 66, Victoria Street, Westminster, London, S.W. This debtor attended before Mr. Registrar Francke in the London Bankruptcy Court last week for his public examination. His liabilities, according to his statement of affairs, amount to £1 486, of which £1 469 are unsecured, and his assets are valued at £68 net. It appeared that before June, 1924, the debtor was in employment. He then began business on his own account as an electrical contractor at the above address. He had no capital. He traded under the style of K. Jolivard and Co. and the business proved a success until 1927. Since then, however, it had gradually declined and in July last, in consequence of keen competition and pressure by creditors, he was obliged to discontinue. He was afterwards without occupation, and he attributed his insolvency to lack of capital, to bad trade, and to keen competition.

The examination was concluded.

METAL AND CHEMICAL PRICES.

TUESDAY, April 30th.

		Price.	Inc.	Dec.
Copper—				
Best Selected	per ton	£78 5 0	—	£2 15 0
Electro Wirebars	,,	£84 0 0	—	—
H.C. Wires, basis	per lb.	11⅛d.	—	—
Sheet	,,	1s. 0d.	—	—
Phosphor Bronze—				
Wire (Telephone) basis	per lb.	1s. 2⅛d.	—	—
Brass 60/40—				
Rod, basis	per lb.	9d.	—	—
Sheet ,,	,,	10⅛d.	—	—
Wire ,,	,,	11⅛d.	—	—
Pig Iron—				
Cleveland Warrants	per ton	£3 11 0	—	—
Galvanised Steel Wire, basis 8 S.W.G.	,,	£14 15 0	—	—
Lead Pig—				
English	per ton	£26 0 0	—	5s. 0d.
Foreign or Colonial	,,	£24 7 6	—	10s. 0d.
Tin—				
Ingot	per ton	£198 15 0	5s. 0d.	—
Wire, basis	per lb.	2s. 7¼d.	—	—
Aluminium Ingots	per ton	£95 0 0	—	—
Spelter	,,	£26 15 0	—	—
Mercury	per bottle	£22 5 0	—	—

Sulphur—Flowers, Ton £12 0 0 *Copper Sulphate*—Ton £25 to £25 10 0
,, Roll, ,, £10 10 0 *Boric Acid* (Crystals) ,, £30
Sulphuric Acid (Pyrites, 168°) Ton £6 15 0 *Sodium Chlorate*—Per lb. 2⅛d.
Sodium Bichromate—Per lb. 3½d.
Rubber—Para fine, 11d.; plantation, 1st latex, 9⅛d.
∴ The metal prices are supplied by British Insulated Cables Ltd.

THE LEAD MARKET.

The lead market last week opened a little firmer, but according to James Forster and Co. prices since then lost ground daily. The backwardation has also contracted slightly. The American market is steady but quiet with the official price unchanged at 7 cents. per lb.

Closing prices on April 26th were £24 7s. 6d. for April, £24 5s. for May, £24 1s. 3d. for June, and £23 18s. 9d. for July, 8s. 9d. to 6s. 3d. lower on the week.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents, by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

289 374 LANDIS AND GYR SOC. ANON. Driving system for electric induction meters. (25/4/27.)
307 647 J. E. POLLAK (HERMSDORF-SCHOMBURG-ISOLATOREN GES.). Lead-through insulators. (5/4/28.)
307 648 A. F. BURGESS (J. H. GRAVELL). Method of and apparatus for electric resistance welding. (13/4/28.)
307 651 J. MCCALLUM. Electrical conductors. (18/4/28.)
291 373 E. JAEGER ETABLISSEMENTS. Electric contacts, particularly for electrically actuated clockwork. (31/5/27.)
289 809 BRITISH THOMSON-HOUSTON CO., LTD. Cutters for electric fuses. (2/5/27.)
290 176 G. SOMAJNI. Electrodynamic braking-apparatus for use in electric vehicles. (7/5/27.)
290 678 INTERNATIONAL GENERAL ELECTRIC CO., INC. Electric braking systems. (19/5/27.)
292 945 G. MAAG-ECKENFELDER. Contact pins for electric plugs. (27/6/27.)
300 252 E. REISZ. Circuit arrangements suitable for biassing electrostatic loud speakers. (10/11/27.)
292 996 W. E. DATE. Electric motor control systems. (29/6/27.)
298 598 F. DWORZAK. Electric welding. (12/10/27.)
292 537 SIEMENS-SCHUCKERTWERKE AKT.-GES. Circuit connection for direct-current electric machines with two shunt windings. (21/6/27.)
307 673 GENERAL ELECTRIC CO., LTD., and H. W. CRON. Fastenings for cables and casings. (22/6/28.)
307 684 A. H. MARKS and P. RUSSELL (legal representatives of E. C. R. MARKS, deceased). (BATTERIEN-UND ELEMENTE-FABRIK SYSTEM ZEILER AKT.-GES.). Soldering of conductors to small electric batteries. (16/7/28.)
307 389 F. MERK. Circuit arrangement for automatic telephone exchanges. (5/12/27.)
307 390 W. S. SMITH, H. J. GARNETT, and H. C. CHANNON. Electrical insulating materials. (2/9/27.)
300 618 BASTIAN-MORLEY CO. Heating-apparatus. (13/4/27.)
307 534 GENERAL ELECTRIC CO., LTD., and N. E. BARBER. Refrigerating apparatus. (9/12/27.)
307 545 A. WHITAKER, M. B. MANIFOLD and GRAMOPHONE CO., LTD. Controlling intensity of a beam of light in accordance with electrical oscillations, for use, for example, in recording sound. (10/12/27.)
295 351 SOC. DES ETAB. INDUSTRIELS DE E. C. ET DE A. GRAMMONT. Ionic valve with two anodes and two grids. (10/8/27.)
282 632 ARCTURUS RADIO CO. Power-operated vacuum tube construction, and circuit therefor. (24/12/26.)
307 955 BRITISH THOMSON-HOUSTON CO., LTD., L. M. T. BELL, and F. E. SMITH. High-tension ignition devices. (18/11/27.)
307 982 S. G. S. DICKER (N. V. Philips' Gloeilampenfabrieken). Electric discharge tubes. (21/11/27.)
307 718 J. STONE AND CO., LTD., and A. H. DARKER. Thermostatic controls for dynamo-electric machines. (6/12/27.)
307 957 H. G. BELL, T. W. ROSS, and ASSOCIATED ELECTRICAL INDUSTRIES, LTD. Protective gear for alternating-current systems. (7/12/27.)
307 767 P. WILSON. Mounting of vibrating reeds, more particularly for use in connection with electromagnetic gramophone pick-ups, loud-speakers, and the like. (9/12/27.)
282 739 SIEMENS-SCHUCKERTWERKE AKT.-GES. Mechanical relay for transmitting moving impulses. (24/12/26.)
307 726 J. STONE AND CO., LTD., C. J. LYTH, and F. J. PIKE. Methods of and apparatus for electrolytically depositing metal on tubes. (12/12/27.)
307 959 STANDARD TELEPHONES AND CABLES, LTD., and J. R. GOULD. Automatic or semi-automatic telephone systems and apparatus. (13/12/27.)
307 812 BRITISH THOMSON-HOUSTON CO., LTD., and L. J. DAVIES. Thermionic valves. (13/12/27.)
307 960 F. WARBURTON. Telegraph printers. (13/12/27.)
307 774 N. EVILL. Electric lamp standards and fitments therefor for use on arm-chairs and other articles of furniture. (13/12/27.)
307 855 MUIRHEAD AND CO., LTD., E. S. HEURTLEY, and J. V. FOLL. Electrically-driven tuning forks or reeds. (13/12/27.)
307 781 AUTOMATIC TELEPHONE MANUFACTURING CO., LTD., and C. R. WOODLAND. Mounting arrangements for fuse panels and the like as used in telephone exchanges. (13/12/27.)
307 961 A. EIDINOW and HEWITTIC ELECTRIC CO., LTD. Apparatus for the production of ultra-violet light. (13/12/27.)
307 856 E. Y. ROBINSON and ASSOCIATED ELECTRICAL INDUSTRIES, LTD. Vacuum electric tube devices. (13/12/27.)
307 857 E. Y. ROBINSON and ASSOCIATED ELECTRICAL INDUSTRIES, LTD. Vacuum electric tube devices. (13/12/27.)
307 962 A. K. CROAD (Hanovia Chemical and Manufacturing Co.). Process for securing good electrical contact with crystalline cuprous oxide. (14/12/27.)
282 401 W. A. MAAS and P. F. GRINSTEAD. Electrically operated typewriting-machines. (14/12/26.)
283 201 ASSOCIATED TELEPHONE AND TELEGRAPH CO. Telephone systems. (7/1/27.)
307 964 A. V. TOMLINSON (Westinghouse Air Brake Co.). Electrically-controlled fluid-pressure apparatus, particularly applicable for operating brakes. (15/12/27.)
307 966 W. E. BEATTY (BELL TELEPHONE LABORATORIES, INC.). Insulating-materials and methods of production thereof. (15/12/27.)
307 967 A. GREEN. Impulse-transmitting devices for electric switches or make-and-break contacts. (16/12/27.)
307 973 W. S. SMITH, H. C. CHANNON, A. L. MEYERS, and N. G. R. PARTRIDGE. Loaded electrical conductors. (16/12/27.)
307 977 STANDARD TELEPHONES AND CABLES, LTD., and E. P. G. WRIGHT. Automatic or semi-automatic telephone systems and apparatus. (17/12/27.)

Applications for Patents.

February 20th.

5 641 MARCONI'S WIRELESS TELEGRAPH CO., LTD. Radio communication systems, etc. (20/2/28, U.S.)
5 593 G. METCALF. Electric switch.
5 604 J. A. MUNRO. Electric switches.
5 688 C. W. NADAL and E. A. V. SANFTLEBEN. Number dials for telephone systems, etc.
5 591 R. T. NORTON. Electric wires, etc.
5 661 S. L. PRICE. Electromagnetic sound-reproducing devices.
5 670 G. PRIECHENFRIED and WIRELESS PICTURES (1928), LTD. Electrical transmission of pictures, etc.
5 596 D. E. ROGERS and VERITYS, LTD. Electrical switches.
5 673 SIEMENS-ELEKTROWARME GES. Electric irons. (28/2/28. Germany.)
5 572 H. F. YELLAND. Electric switchgear.

February 21st.

5 747 J. H. BAKER. Telephone systems.
5 809 C. R. BATES. Electric fuses.
5 569 F. B. BENSON. Signal amplifiers for wireless apparatus.
5 768 BRITISH POWER RAILWAY SIGNAL CO., LTD., J. H. GRAHAM, — PARSONS, and RELAY AUTOMATIC TELEPHONE CO., LTD. Signalling apparatus, etc.
5 735 J. N. CHAVIARA and J. F. GILL. Apparatus for regulation, etc., of electric currents.
5 718 T. CLARKE, E. EYRE, and W. HARRISON. Casings for electric lampholders.
5 820 GARRARD ENGINEERING AND MANUFACTURING CO., LTD., and H. V. SLADE. Controllers for electric motors.
5 806 C. LORENZ AKT.-GES. Apparatus for picture telegraphy, etc. (21/2/28, Germany.)
5 785 N. W. MCLACHLAN. Thermionic amplifiers.
5 770 A. W. MALEY and E. M. TAUNTON. Braking electrically propelled rail vehicles.
5 757 G. MARR. Electric switches.
5 758 DR. P. MEYER AKT.-GES. Mercury switches. (23/2/28, Germany.)
5 711 L. A. RAMSDEN. Electric signs.
5 779 SIEMENS AND HALSKE A.G. Electric remote control installations. (29/2/28, Germany.)
5 801, 5 803 F. S. SMITH. Transformers.
5 802 F. S. SMITH. High voltage terminal.
5 746 STANDARD TELEPHONES AND CABLES, LTD. Carrier telegraph alarm system. (6/3/28, U.S.)
5 747 STANDARD TELEPHONES AND CABLES, LTD. Telephone systems.
5 759 STANDARD TELEPHONES AND CABLES, LTD. (WESTERN ELECTRIC CO.). Method of producing carbon granules.
5 813 STANDARD TELEPHONES AND CABLES, LTD. (WESTERN ELECTRIC CO.). Secret signalling methods. (21/2/28, U.S.)
5 703 B. H. STARK. Holders for electric trolley pulleys.

February 22nd.

5 940 A. E. ANGOLD and GENERAL ELECTRIC CO., LTD. Switches, etc.
5 941 A. E. ANGOLD and GENERAL ELECTRIC CO., LTD. Automatic control of electric power supply units.
5 861 E. ASCH. Thermionic amplifiers. (22/2/28, Germany.)
5 924 AUTOMATIC TELEPHONE MANUFACTURING CO., LTD., and T. B. BLASHILL. Circuit arrangements employing gas discharge tubes.
5 918 BRITISH THOMSON-HOUSTON CO., LTD., R. L. CHANTRILL, and F. J. LANE. Electric protective arrangements.
5 935 A. H. CURTIS and IGRANIC ELECTRIC CO., LTD. Electrical contacts.
5 917 ELEKTRIZITATS AKT.-GES. HYDRAWERK. Electric condensers. (22/2/28, Germany.)
5 840 W. FENTON. Electric cigarette lighters.
5 939 GENERAL ELECTRIC CO., LTD., M. S. H. HUNT, and C. W. STOPFORD. Thermostatic electric switches.
5 928 L. MELLERSH-JACKSON (SIEMENS AND HALSKE A. G.). Electromagnetic relays.
5 891 T. D. KELLY and G. E. LEAVEY. Electric furnaces.
5 837 S. LOEWE. Electron discharge devices. (22/2/28, Germany.)
5 930 E. H. NEWMAN. Means for supplying h.t. current to thermionic valves.
5 931 E. H. NEWMAN. Wireless receiving apparatus.
5 890 A. J. ROWE. Thermionic valve amplifying circuits.
5 927 SIEMENS-SCHUCKERTWERKE A.G. Transformers. (25/2/28, Germany.)
5 872 W. B. SMITS. Electrical resistances. (23/2/28, Czecho-Slovakia.)
5 820 SOC. ANON. CALOR, and L. TROUILHET. Electric irons.
5 894 J. B. TAUNTON. Electric lampholders.
5 874 H. WALTER. Cable telegraphic transmission, etc.

February 23rd.

6 048 BENJAMIN ELECTRIC, LTD. Securing glass covers to reflector shades, etc. (1/3/28, U.S.)
6 016 BRITISH THOMSON-HOUSTON CO., LTD., C. G. MAYO, and J. C. READ. Mercury arc rectifiers.
6 017 BRITISH THOMSON-HOUSTON CO., LTD., H. DE B. KNIGHT, and J. C. READ. Electrical measuring instruments.
6 043 FEDERAL TELEGRAPH CO. Piezo-electric crystal apparatus. (25/2/28, U.S.)
6 051 C. GILLINGS. Telephone systems.
5 969, 5 970 T. R. HOLLIS. Suspension chains for electroliers, etc.
6 047 H. L. JAMES and E. LEVEY. Luminous devices for electric switches.
6 015 J. KOHNSTAM. Electric switches.
6 001 E. H. NEWMAN. Wireless receiving apparatus.
5 973 S. SINCLAIR. Safety device for thermionic valves.
6 014 WESTERN ELECTRIC CO., LTD. (BELL TELEPHONE LABORATORIES, INC.). Insulating materials.

February 25th.

6 088 ARCTURUS RADIO TUBE CO. Filament for vacuum tubes. (25/2/28, U.S.)
6 115 G. BAMBURG. Primary battery.
6 196 R. BERTRAND. Electric wave apparatus for production of music. (25/2/28, France.)
6 086 F. J. BRISLEE and BRITISH INSULATED CABLES, LTD. Insulation of electric wires, etc.
6 159 BRITISH THOMSON-HOUSTON CO., LTD. Electron discharge devices. (10/4/28, U.S.)
6 218, 6 219 C. O. BROWNE GRAMOPHONE CO., LTD., and A. WHITAKER. Mercury vapour discharge devices.

COMING EVENTS.

Saturday, May 4th.

INSTITUTION OF ELECTRICAL ENGINEERS (LONDON STUDENTS' SECTION).—Visit to Mr. R. Borlase Matthews's "all-electric" farm, East Grinstead, Sussex.

Tuesday, May 7th.

ELECTRICAL CONTRACTORS' ASSOCIATION (DERBY BRANCH).—Ordinary meeting.
INSTITUTE OF METALS.—36, Victoria Street, Westminster. Lecture by Sir Oliver Lodge, F.R.S., on "Some Ideas about Metals."
INSTITUTION OF CIVIL ENGINEERS.—Great George Street, Westminster. 35th James Forrest Lecture on "Roads and Road Transport," by Sir Henry P. Maybury. 6 *p.m.*
TELEVISION SOCIETY.—Engineers' Club, Coventry Street, London. Paper by Capt. R. Wilson on "Some Practical Considerations in the Building of Television Apparatus." 8 *p.m.*

Wednesday, May 8th.

ELECTRICAL CONTRACTORS' ASSOCIATION (EASTBOURNE SUB-BRANCH).—South Street. Ordinary meeting.
ELECTRICAL CONTRACTORS' ASSOCIATION (SHEFFIELD BRANCH).—Ordinary meeting. 5.30 *p.m.*
OVERHEAD LINES ASSOCIATION.—Institution of Electrical Engineers, Savoy Place, Victoria Embankment, London. Paper by Col. W. A. Vignoles on "Getting Consumers in Rural Areas." 5.30 *p.m.*
POLYTECHNIC SCHOOL OF ENGINEERING.—307-311, Regent Street, London. Lecture I (Course of six lectures) by Mr. W. H. Date on "Thermionic Valves." 6.30 *p.m.*

Thursday, May 9th.

ELECTRICAL CONTRACTORS' ASSOCIATION (EAST YORKS BRANCH).—Metropole Hall, Hull. Ordinary meeting.
ELECTRICAL CONTRACTORS' ASSOCIATION (BIRMINGHAM BRANCH).—Ordinary meeting.
ELECTRICAL CONTRACTORS' ASSOCIATION (NOTTINGHAM BRANCH).—Ordinary meeting.
INSTITUTION OF ELECTRICAL ENGINEERS.—Savoy Place, Victoria Embankment, London. Annual general meeting. 6 *p.m.*

The meeting of the Meter and Instrument Section of the Institution of Electrical Engineers, which was to have taken place to-day (Friday) at 7 p.m., has been cancelled. See page 533.

Current Topics.

Raw Materials.

COMMENCING with the special Raw Materials and Manufacturers' Supplies issue published last November, we planned to publish a detailed survey of the raw materials and specialised manufacturing equipment available to electrical firms. In the second issue of each month we are dealing in turn with every class of material, and the whole series, which will occupy an extensive period, promises a wealth of useful, and mainly hitherto unpublished information. Already we have dealt with synthetic resin products, insulating varnishes, untreated fabrics for insulating purposes, metals for conductors, etc., and in the present issue special attention is devoted to pressboard, the development of which material for electrical purposes furnishes a remarkable instance of the rapid rise in the status of a third-rate insulator to a degree of suitability for some of the most important applications in the manufacture of high voltage apparatus, including the insulation of big transformers for the "grid." As the subject has received such little attention in the past, the information now given by Messrs. DUNTON AND MUIR should prove useful, as illustrating recent improvements in the characteristics of pressboard, and indicating the important position now occupied by this material for insulating purposes. It is of incidental interest that until the outbreak of the Great War our supplies of this material, both for its original use in the finishing and pressing of woven fabrics, and for the electrical employment for which it was adapted, were all received from foreign sources. It was the difficulty of war-time restrictions which led British electrical manufacturers to investigate the electrical possibilities of pressboards, and it is pleasing to note that those investigations paved the way for the home-production of supplies and their substitution for some of the costly materials used in the manufacture of transformers prior to 1914.

Education in Installation Work.

To those who have noted with apprehension the dearth of technically trained personnel in some sections of the industry, the foresight shown by the Electrical Contractors' Association in taking a practical part in the training of apprentices in the installation trade, has, for some years, been a source of gratification. By advocating the extension of indentured apprentices, by offering facilities for lads to receive adequate training, aud by the regular provision of gold, silver and bronze medals with money awards to apprentices of outstanding ability, the E.C.A. has already gone far towards ensuring that steady influx of competent employees which is so desirable in the interests of contractors and public alike. The Association's efforts in this direction have been carried a stage further by the formation, in co-operation with the City and Guilds of London Institute, of an Advisory Committee on Electrical Installation Work, including representatives both of the industry and a number of educational authorities. This committee has drafted a new scheme of syllabuses and of certificates in electrical installation work, and this has been adopted by the City and Guilds for the purpose of their examinations and by the E.C.A. in connection with its apprenticeship scheme. An important recommendation is made to education authorities that preparatory courses should be provided for boys aged from 14 to 16 years, and designed to cover the critical period of two years between the elementary and the technical school. It is hoped that by such courses the interest of boys may be turned from the usual "blind alley" occupations and in the direction of electrical matters, with a view to their subsequent entry into the electrical industry.

The Central Board's Report.

ELSEWHERE in this issue we give some of the salient features in the first annual report of the Central Electricity Board, which covers the period from the Board's appointment to December 31st last. For an official publication it is surprisingly well-produced, and the large and pleasant-looking type in which it has been set up is an invitation to detailed study of what is a thoroughly interesting and workmanlike production. The story it tells is one of steady, co-ordinated work in one well-defined direction, and, regarded as the first mile-post on the road to a national interconnected supply network, it can only be regarded as a remarkable piece of work. In the short period of its existence the Board has adopted schemes providing for 74·6% of the population of the country, but as this publication is concentrated in only 42·8% of the total area, it is inevitable that the part of the Board's work which is still before it, i.e., the adoption of schemes to cater for the remaining 25·4% of the people who are scattered over 57·2% of the area of the whole country, will present difficulties which have been absent from earlier schemes. So far as they have gone with their work—and this report gives some idea of the vast amount of detail involved—

Digitized by Google

the Board has interpreted in the happiest possible manner the spirit as well as the letter of the much abused Electricity (Supply) Act of 1926.

Newcastle's Great Show.

NEXT Tuesday the North-East Coast is, in its characteristically big way, opening an exhibition which for size and interest can be rated as second only to Wembley. The main purpose of the North-East Coast Exhibition is to restore the flagging fortunes of an area which has pioneered many important industrial developments and has recently suffered the economic changes which have rendered many of the local industries unprofitable. In the place of these vanished activities it is hoped to found new industries which will benefit by the wonderful facilities of convenient siting and "cheap and abundant" supplies of electricity which are ready to hand. This bold bid is one that we can all hope to see succeed. Electrically and generally, Tyneside industry has many interesting things to show, and we hope that all who can will make an early opportunity to pay a personal visit to Newcastle's great exhibition.

Window Displays.

THOSE electrical contractors and supply undertakings who have taken part in the E.D.A. Selling Campaign will be interested to learn of a Window Display Competition which has been organised by the London "Evening News" and the British Association of Display Men, details of which will be found elsewhere in this issue. Since the competition is to be held during the last few days in May, electrical entrants need have no fear that the May cooking display of the E.D.A. will be materially affected; neither will the June arrangements be interfered with. In fact, the enterprising contractor may arrange three different windows in as many weeks, each one telling a different story. The competition in question includes a section devoted to windows showing "things to use," including, of course, domestic and other electrical appliances, and in this class lies the contractor's opportunity to show his skill. The goods shown must be of British manufacture, and preliminary judging of their presentation will be carried out by a personal visit of the judges. With the experience gained from battery manufacturers' competitions, electric sweeper competitions, C.E.D.A.C., etc., the electrical retail trade should now be in a position to show a window strong in originality and compelling as a sales force; further, since electrical goods do not appeal to a specialised public, the subject of the display may range from the reception of wireless pictures to the heating of water by electricity.

Battersea Again.

LIKE many of our readers we dislike the sort of publicity that the electrical industry is securing in the daily Press, following the protests that have been so widely made against the erection of the new power station at Battersea and the extension of the Fulham station. Leading articles, correspondence columns, and even Royal Academy banquets, now seem incomplete unless some reference is made to the vexed question. The grounds of complaint are —quite without foundation—widening to include black smoke and grit, and the sources of complaint are being similarly expanded, first to Brimsdown, next to the Clarence Dock station at Liverpool. As we have urged before, no electricity supply undertaking should ever merit the description "soulless utility," which was so publicly applied by the Archbishop of Canterbury, and it cannot command public support when the public believes that the benefits it confers in one way are more than counterbalanced by the real or imaginary nuisance and damage it may cause in another way. This public criticism, we feel, is getting out of hand, and steps should be taken to cope with it without delay. Hardly anyone in the land can be in ignorance of the case against Battersea, and other projects of a similar nature, but the general public has yet to hear an authoritative, convincing statement of the other side of the question. If we can make out a good case for proceeding against public opinion as expressed to-day, let us boldly tackle the problem of converting the objectors. To ignore the protests, in the hope that the storm will blow over, only serves to stiffen the backs of the opposition. A suitably-phrased statement issued by the Electricity Commissioners would do much, at this juncture, to put the matter on a more satisfactory footing.

E.T.B.I. Progress.

AMPLE proof is afforded in the annual report of the Electrical Trades' Benevolent Institution, not only of the growing importance of its activities, but also of its improving finances. Each year sees an increase in the number of people assisted, and during the year under review over 400 grants were made, against 221 for the preceding year. Once again, however, the Council are able to report that every qualified applicant has received assistance. An extension of the Institution's beneficent work has been the initiation of a pensions scheme, and since April, 1928, seven pensions have been awarded. The results have been so gratifying that the scheme will probably be extended in the current year to enable more beneficiaries to enjoy the advantages of a fixed income. The Institution does not seem to be sufficiently well known among those classes of electrical men who are most likely to stand at some time in need of its assistance, and as participation on a contributory basis is now possible for all, at a cost of as little as five shillings a year, we hope that employers and others interested will make special personal efforts to secure an increase in the number of associates, who, for their contribution of little more than a penny a week, are entitled to the benefits of membership of the Institution.

The National Radio Exhibition.

THIS year's radio exhibition, which will be held at Olympia during September, will be the first to be held in London at which the public may listen to organised loud-speaker demonstrations on the stands of the exhibitors. In contrast to the "pig in a poke" methods of previous years the man-in-the-street visiting this year's show will, at least, hear working what he buys before he takes it home, and though demonstrations of actual broadcast reception will not be permitted to exhibitors, a common transmission will be supplied by the organisers of the show at certain times of the day. Whether this transmission will be in the nature of a relay of broadcast reception, gramophone records, or the exhibition band, we do not know, but whatever it is to be it will, we feel sure, afford considerable opportunities for increased trade, permitting, as it will, the separation of the "sheep from the goats" in the way of loud-speaker units. Though we still favour the German method of erecting broadcast reception cabinets for wireless exhibition purposes, the common transmission scheme of the Radio Manufacturers' Association is a good one, for wherever a loud-speaker is working its output will, in substance, if not in quality, be the same as its neighbours, thus avoiding the medley of sounds likely to result from other methods where special cabinets are not provided. The condition attached to these demonstrations—that no amplifiers be used—is also good, for the public is thus assured that all instruments will receive a common "signal strength" and may therefore be judged on their individual merits.

Illumination Design.

WE are glad to note that a further Illumination Design Course is being planned by the E.L.M.A. Lighting Service Bureau. The nineteenth of the series is to be held from June 10th to 14th, and the subjects to be dealt with include a number which have not received attention in previous courses. The value of these efforts is so widely recognised that it is unnecessary for us to emphasise the fact that attendance is amply repaid. It may be added, however, that the recent remodelling of the interior of the premises provides considerably improved facilities for realistic demonstrations to accompany the lectures.

ELECTRICAL PRESSBOARDS.

Developments which have led to Important Applications in the Manufacture of High Voltage Apparatus—Improved Electrical Characteristics—Manufacturing Processes.

By A. R. DUNTON, A.M I.E.E., and A. W. MUIR, D S.O., M.C., B.Sc.

THE development of electrical pressboards constitutes a remarkable, if not unique, example of a material rising in a few years from the status of a third-rate insulator to that of one suitable for the most important applications in the manufacture of high voltage apparatus. In spite of this the subject has received little attention in articles and other publications dealing with insulating materials, and it is safe to say that the majority of engineers have not realised the improvements which have been effected in the characteristics of pressboard, and the important position now occupied by this material for insulating purposes.

Variously known as pressboard, presspahn or fullerboard, the material was originally manufactured for use in the finishing and pressing of woven fabrics, and it is from this use that its name is derived. Prior to 1914 the supplies of the material, both for its original purpose and for electrical applications for which it was adopted, were derived largely from Germany and America. It was the stoppage of one source, and restrictions upon supplies from the other, that led electrical manufacturers in this country to seek their requirements from British makers, and to co-operate with those makers for the production of a material of better electrical characteristics. One particular object of the investigations was to produce an inexpensive substitute for the costly materials then employed in transformer manufacture.

Important Results.

An account, probably the only one published, of some of this research work, which has led to very important results, is given in an article by A. P. M. Fleming and Allan Monkhouse in THE ELECTRICIAN of November 25th, 1921. In that article the authors describe an investigation carried out by Messrs. B. S. and W. Whiteley, Ltd., and the Metropolitan Vickers Research Department, and the development of an early form of one of the new varieties of pressboard in which

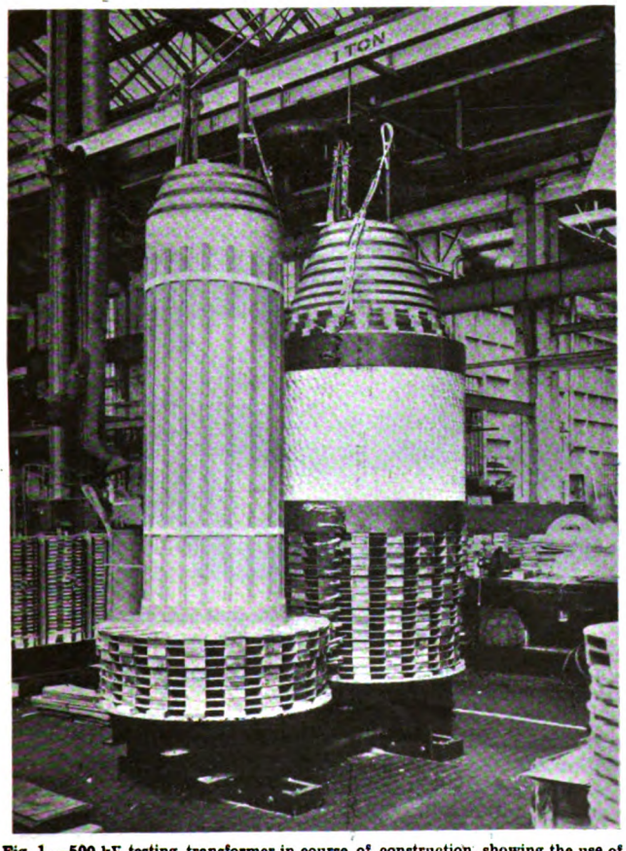

Fig. 1.—500 kV testing transformer in course of construction, showing the use of pressboard insulation.

greatly improved electrical characteristics have been obtained. In the investigation samples from a large number of British and foreign manufacturers were examined by X-rays, under the microscope, by chemical analysis and by electrical tests. The X-ray examination disclosed in some samples the presence of metallic particles, probably due to such things as buttons, pins, and other fastenings getting into the beaters with old

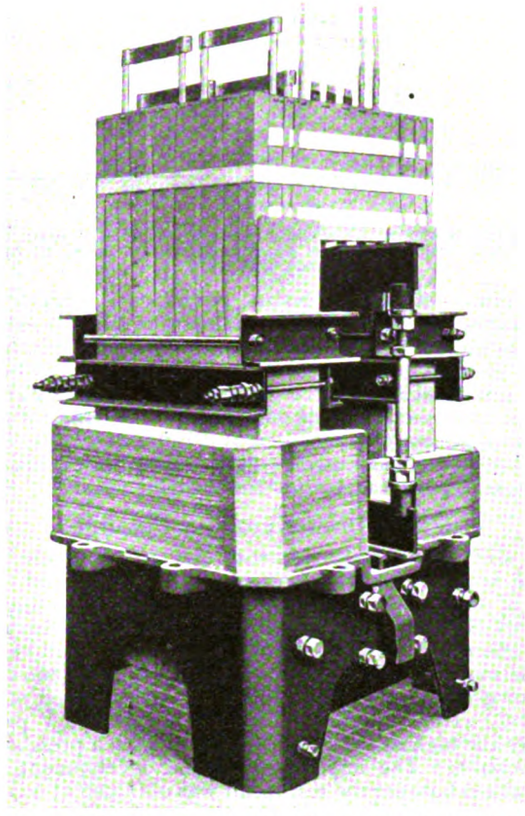

Fig. 2.—66 kV transformer under construction with pressboard insulation.

rags, ropes, packings, etc., used as the raw materials. Apart from this weakness, which was easily remedied, the investigation showed that the nature of the fibre employed was an important factor in determining the electrical strength. The conclusions reached in this respect were summarised as follows :—

(1) Wood-pulp boards are too stiff for most purposes and liable to age rapidly, although their electric strength is good.
(2) Cotton-pulp boards are soft, porous, yield a high electric strength, and are very pliable.
(3) Jute and hemp pulp boards show a high electric strength, but being made from highly lignified fibres they become very brittle after prolonged immersion in hot oil.
(4) Linen pulp boards are tough, pliable, and show a high electric strength.

Two further important conclusions reached were :—

(1) The electric strength of pressboard is directly proportioned to the density for any class of raw material.
(2) The porosity and ability to absorb liquids also bears a direct relationship to density but is modified by the nature of the finish imparted to the board and by the means used to produce the denser boards.

As a result of these conclusions development proceeded on the lines of mixing various proportions of jute and cotton fibres, in order to combine the strong interlaced structure of the cotton board with the close-knit character of the jute board. A mixture which gave a high electric strength together with mechanical strength and flexibility was adopted, and the resultant pressboards, given the trade name of " Elephantide," were put on the market in various grades. In subsequent developments, it may be noted, the use of jute fibres has been greatly reduced, owing to the poor ageing qualities of these fibres in hot oil.

The co-operation between pressboard makers and electrical

Digitized by Google

users has been steadily continued, and the progressive improvement in the material has fully justified the research work involved. Whereas the use of pressboard in its original form was confined to small parts in low voltage insulation, the improved material is now extensively used for general insulation purposes even in large units and, in selected grades, in transformers and other apparatus for the highest voltages of

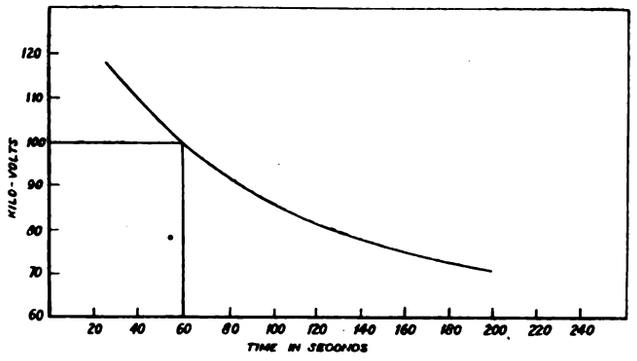

Fig. 3.—Curve showing results of electric strength tests in oil at 90 deg. C. on a special "Elephantide" pressboard ¼-in. thick, dried 48 hours, oil-saturated 48 hours, at 90 deg. C.

transmission systems and testing equipment. Figs. 1 and 2 show striking examples. Fig. 1 illustrates the extensive use of pressboard insulation in a 500 000 V testing transformer, one of two units built by the Metropolitan-Vickers Electrical Co. for use together to give 1 000 000 V. Fig. 2 shows, in course of construction, a 66 000 V shell-type transformer, in which also the use of pressboard is clearly seen. High grade pressboard is also being used to a great extent in the insulation of 132 000 V transformers for the British "grid."

Further Improvements Possible.

That still further improvements may yet be made, as, for instance, by the blending of other fibres, is indicated by the results of tests upon a special board recently produced by Messrs. B. S. and W. Whiteley, Ltd. The actual test results on this board are shown in Fig. 3, from which it will be noted that the material, though only ⅛ in. thick, gave one-minute breakdown voltage values of 100 000 V when tested in oil at 90 deg. C. This value represents a stress of 770 V per mil, probably the highest figure ever obtained with a pressboard of this thickness. The importance of the development is the more marked because the test result was obtained at 90 deg. C. The value should not be confused with results which are often given for tests at 20 deg. C., since there are many materials which appear good when tested at normal temperature, but virtually become conductors at 90 deg. C.

It is gratifying to record that this remarkable material is a British product, and interesting to add that it is produced by hydro-electric plant under almost ideal conditions in the open country of Yorkshire, far from the contamination of smoke or chemical fumes.

As a result of a survey of the materials produced by various manufacturers, a specification (No. 231) has been issued by the B.E.S.A. This specification recognises four grades of pressboard, described as follows:—

GRADE I.—Hard, non-porous, untreated pressboard having a density not less than 1·15 grammes per cu. cm. and not exceeding 1·30 grammes per cu. cm. after 18 hours' drying at 80 deg. C., and characterised by a relatively high electric strength.

GRADE II$_a$—Soft, untreated pressboard having a density less than 1·15 grammes per cu. cm., but not lower than 0·90 grammes per cu. cm. after 18 hours' drying at 80 deg. C., and consequently having a relatively lower electric strength combined with greater absorption than Grade I pressboard.

GRADE IV.—Extra dense, untreated pressboard having a density exceeding 1·3 grammes per cu. cm. after 18 hours' drying at 80 deg. C. and characterised by a higher electric strength than Grade I.

GRADE V.—Thin, untreated pressboard having a density not less than 1·15 grammes per cu. cm. and relatively great flexibility and high tensile strength after 18 hours' drying at 80 deg. C. (This class of pressboard is specially adapted for slot lining and similar purposes.)

NOTE.—In addition to the above, a further grade of pressboard is recognised for electrical purposes, as follows:—
GRADE III.—Pressboard impregnated during manufacture with varnish oil, wax, and the like to improve its electrical properties. This grade is not included in this specification, but a separate specification for impregnated pressboard is under consideration.

The specification gives curves showing the minimum permissible one-minute breakdown voltages for the various grades when tested in air at 90 deg. C. A general impression of the standards set may be given by the following readings taken from the curves:—

1 MIN. BDV—VOLTS-PER-MIL IN AIR AT 90 DEG. C.

	Specimen 1/32 in. thick	⅛ in. thick
Grade I	260	218
,, II	240	204
,, IV	300	255
,, V	270	—

The value for Grade V, which is used in thin sheets, is not given beyond a thickness of 0·04 in., at which it is 260 V per mil.

The best electrical boards conforming with the requirements of the B.E.S.A. Specification are produced from specially selected and blended fibres. The raw material is treated by boiling, beating and straining processes similar to those of paper making, so as to form a highly hydrated cellulose pulp. The "beating" process consists of disintegrating the fibres by the action of blunt knives in a power-driven machine. Many modifications and improvements have been made in this process in order to produce fibres as long as possible, and so obtain maximum flexibility in the finished board.

The prepared pulp is allowed to flow on to running endless belts which pass over vacuum drainage chambers in which as much as possible of the water is drained away. The drained pulp is then carried forward on the belts to the large rotating mandrels of a board machine, such as is illustrated in Fig. 4. Here the fibrous material is built up in a series of layers until a cylinder of the required thickness is produced. The completed cylinder is slit longitudinally to remove it from the mandrel, and then handled as a sheet through the pressing and drying processes.

In the pressing process the sheets are interleaved with several layers of open woven cloth which serve to drain away the water which is pressed out. The impression of the cloth can be seen on the finished pressboard unless it has been highly calendered or planished.

After pressing, the material still has a content of about 30% of free water, and this is finally removed by slow drying in through-type ovens. Fig. 5 shows a press and drying oven in the Pool Mills of Messrs. B. S. and W. Whiteley, Ltd. A stack of unpressed material is seen in the foreground, while

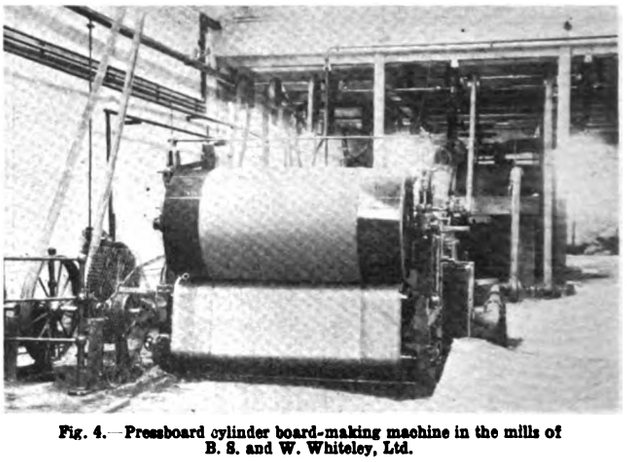

Fig. 4.—Pressboard cylinder board-making machine in the mills of B. S. and W. Whiteley, Ltd.

beyond the press is a quantity of pressed board ready for loading into the conveyor oven.

In the paper mills of Messrs. Mannings, one of the largest American pressboard manufacturers, the boards are made by a similar method, but the drying time has been reduced by subjecting the boards to a tunnel drying process in which the boards pass between rollers which press out the moisture. The development is being watched with interest, as the process is still in the experimental stage and the high quality and reliability of the product has yet to be demonstrated in service.

German manufactured pressboards, still generally known as presspahn, are in most cases characterised by a highly planished surface. This finish, which is also given by British

Digitized by Google

makers when called for, gives an attractive appearance which may be desirable in cases where the material is used, chiefly for its mechanical properties in air. It has also the characteristic, desirable in such cases, of taking a better varnish coating, thus decreasing the tendency of the board to absorb moisture. For oil-immersed insulation, however, a planished

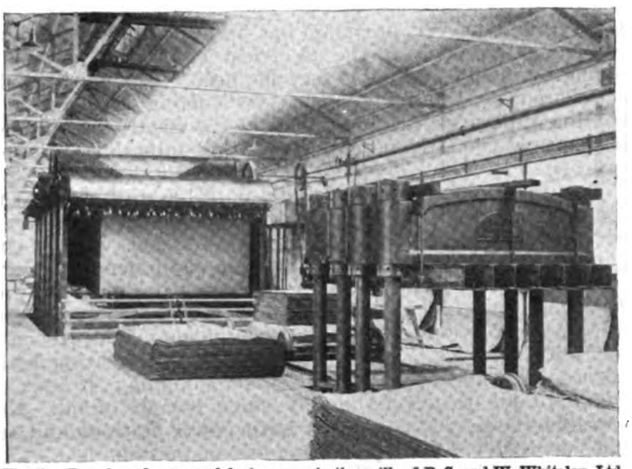

Fig. 5.—Pressboard press and drying oven in the mills of B. S. and W. Whiteley, Ltd.

finish is unnecessary, and is, in fact, undesirable as its lightly reduces the oil-absorptive capacity of the board, and raises the value of its specific inductive capacity. In oil-immersed insulation this causes a departure from the constant voltage gradient which is so important in high voltage design.

(*To be continued.*)

BOOK REVIEWS.

Technical Drawing. By G. E. Draycott. (London Humphrey Milford.) Pp. viii + 232. 6s. net.

The ability to prepare a clean "working drawing" is of vital importance to the student, and therefore he must not only possess a thorough knowledge of the principles of drawing, but also know how to apply them correctly. The object of this book is to set before him, in as simple a manner as possible, these basic principles. A brief description of drawing instruments and the methods of using them is given, following which is a section devoted to plane geometry. Orthographic and isometric projection have been systematically dealt with, and the same remark applies also to both intersection an development of surfaces. Hand sketching, not the least important part of engineering drawing, forms the subject of chapter xi.

The principle feature of this book is its simplicity, and for this reason it should prove useful to both the students of the junior day school and also those of the elementary evening classes.

W. S.

The Case of Benn v. Maxton (being a correspondence on Capitalism and Socialism, to which is appended the report of a Broadcast Debate). (London: Ernest Benn.) Pp. 215. 5s. net.

To those who believe Socialism to be the hope of the world, as well as to those who dread it like a pestilence, not to mention those who, without any strong feeling either way, love to hear two accomplished exponents of opposite systems brilliantly score off each other, this book can be recommended. The duel between these debaters does not end in a verdict or a decisive division; it just comes to a natural end without telling the reader dogmatically which is right. But before it ends it has put the reader through a most stimulating educational course.

The book came into being in this way. Sir Ernest Benn, the Individualist, and Mr. James Maxton, the Chairman of the Independent Labour Party, first debated in public at the London School of Economics. A second contest of the same kind was arranged by the Labour Party, and these discussions were so popular that the B.B.C. secured these two opponents for an hour's debate. The occasion of this debate, simultaneously broadcast from all B.B.C. stations, was the first time effect was given to the removal of the ban on controversial broadcast. Mr. Maxton and Sir Ernest Benn both felt, however, that a viva-voce discussion, limited in time and scope, could be improved upon in correspondence. They therefore exchanged a number of letters in which they debate at greater length the opposing views of Capitalism and Socialism. This vivacious correspondence, in which both men combine the hardest of hitting with the best of good humour, is not designed to convert anybody, but is to be welcomed as the first occasion upon which two opposing and equally authoritative points of view have been brought side by side within the compass of a single volume.

H. C. L.

Der Einfluss des cos ϕ auf die Tarifgestaltung der Elektrizitätswerke. By Hans Nissel, Dr.-Ing. (Berlin: Julius Springer). Pp. 52. Price, 4·5 marks.

Although the study of the effect of power-factor on the economics of electric supply is almost as old as alternating-current distribution, its importance is as great as ever it was. There is still ample room for serious discussion of this question, and much remains to be done in many areas to place electricity charges on an equitable basis. The present study has particular reference to conditions in large towns.

In the first part, the relations between cos ϕ and the capital cost and losses of a supply system are developed. The theoretical tariff based on such results is shown to be impracticable. The second part is devoted to the discussion of some of the tariffs in force. These include (i) the apparent power tariff, in which the charge is based on kVA, (ii) the two-part tariff consisting of a charge for the power or kW component, and a reduction or an increase depending on the amount by which the power factor is above or below a given value—e.g., 0·8; (iii) the mixed cos ϕ—tariff in which the charge is based on kVA plus an extra for reactive power.

These three tariff forms are critically compared respecting relation to generating costs, economical inducement to power-factor improvement by the consumer, measurement and computation, and intelligibility to the consumer. The author shows that with respect to these four considerations the first mode, namely, tariff based on the apparent power or kVA consumption is superior to the other modes of charging. The little book will well repay a careful study.

S. Parker Smith.

Sir Joseph Wilson Swan: A Memoir. By M.E.S. and K.R.S. (London: Ernest Benn.) Pp. 183. 7s. 6d. net.

This delightful memoir, written by a son and a daughter of the late Sir Joseph Swan, comes very opportunely just after the I.E.E. celebration of the jubilee of his invention of the incandescent carbon filament electric lamp, and just before the threatened celebration, by the National Electric Light Association of America, of the self-same invention by Mr. T. A. Edison. Readers of this journal are, of course, aware of the true facts, but the complete story, here set out clearly and concisely, is one that is well worth the reading. Although practical success did not come to Swan's work on incandescent lamps till 1878, he had worked at the problem many years earlier. By 1855, if not before, he was successful in making strong carbon spirals, and five years later he had produced an elementary form of lamp which was rendered ineffective for practical purposes by the inability to get a sufficiently good vacuum in the bulb. With Sprengel's invention of the mercury vacuum pump in 1865 further development was possible, and a workable lamp produced, but the fundamental discovery of a further evacuation of air during incandescence, made in 1878, was the real key to the solution of a problem which had occupied so many years of intermittent experiment.

Swan's claim to remembrance does not by any means rest upon the incandescent lamp alone, but as this was his chief electrical invention, and as such far-reaching developments have arisen from it, electrical men naturally give it pride of place.

Of equal importance in other spheres were some other products of his inventive genius. The bulk of the collodion used for photographic purposes in this country to-day is made according to the formula discovered by Swan over seventy years ago, and he played an outstanding part in the development of the carbon process and bromide printing paper. The half-tone processes for making typographic blocks are largely the outcome of his inventions. The squirted cellulose filaments which he later developed for the incandescent lamp led to an elementary form of artificial silk, and his miners' electric lamp and his development of the Planté storage battery, which gave practicality to the employment of secondary batteries on a large scale, are but a few of his other memorable works.

Of his personal story, of his happy family life, and of his manifold interests and enthusiasms it is impossible to speak here, but we would especially commend these portions of the memoir for the light they shed on the remarkable yet unassuming personality of a great British inventor and scientist.

HANDLING AND TREATMENT OF INSULATING OILS.

Report Based on Information Supplied by 57 Supply Undertakings—Tanks and Pipes—Oil Heating Facilities—Use of Filter Presses and Centrifuges.

A REPORT has just been issued by the Electrical Apparatus Committee of the National Electric Light Association of America showing the trend in practice for the storage and treatment of insulating oils, based on information supplied by 57 representative operating companies.

In the section devoted to the design of handling and treating equipment it is stated that permanent facilities for the storage and treatment of insulating oils for electrical equipment are provided by more companies at power stations than at central reconditioning plants, and by considerably less than either at local sub-station reconditioning plants.

Oil Storage Equipment.

The majority of companies provide separate tanks for clean and dirty oil storage at power stations rather than at central reconditioning plants or at sub-stations.

Separate tanks, for transformer and circuit breaker oil respectively, are provided at central reconditioning plants and at local reconditioning plants, by the majority of companies. Companies each having an installed capacity of 100 000 kVA or more, provide separate tanks for transformer and circuit breaker oil, respectively, at all reconditioning plants.

Permanent tanks are installed for clean oil storage, in most cases, at power stations and at central reconditioning plants, but only in a limited number of cases at sub-stations.

Where permanent tanks are not installed for clean oil storage, the majority of companies use drums in preference to portable tanks or tank trucks.

Whereas permanent tanks for dirty oil storage are installed at power stations by slightly more companies than those which use drums, only a few companies report such tanks at central reconditioning plants and at sub-stations.

The majority of permanent clean oil storage tanks are located above ground; and except at sub-stations, where they are usually outdoors, opinion seems to be about equally divided as to whether they should be located outdoors or indoors. The Public Service Co. of Colorado reports that, due to condensation and water leakage during storage, the use of storage tanks placed outdoors and below ground has resulted in a decrease of the dielectric strength.

Permanent clean oil storage tanks are not thermally insulated against atmospheric changes by any reporting company. A few companies report sealing the tanks and using moisture-extracting breathers on clean oil storage tanks at central reconditioning plants. Whenever moisture-extracting breathers are employed, the material used is calcium chloride.

When provided at central reconditioning plants, separate dirty oil storage tanks are usually located above ground and either outdoors or indoors. The Turner Falls Power and Electric Co. has found it advisable to mount its later installations above ground in order to reduce condensation. At power stations the locations for their separate dirty oil storage tanks seem equally divided as to whether they are placed above ground or below ground, and outdoors or indoors. At sub-stations, however, these tanks appear more often to be located outdoors and above ground.

Where separate dirty oil storage tanks are used, it seems that very little effort is made to seal them thoroughly or thermally to insulate them against atmospheric changes.

Most of the companies reporting provide both clean and dirty oil tanks of sufficient capacity to hold the oil from the largest unit.

Independent oil lines are provided for clean and dirty oil respectively in all three types of reconditioning plants, and the same decision appears to hold true in the operation of oil lines for transformer and circuit breaker oil respectively.

In the majority of cases reports indicate that permanent oil piping is located above ground except at sub-stations, where it is buried unprotected in the ground.

Regarding the material used for piping, it is found that wrought iron has been used by the majority of companies for all three locations. At power stations some companies use uncoated steel. Wrought iron and galvanised steel are specified equally for sub-station use.

The great majority of companies report that their piping is permanently connected to the electrical equipment. At the same time, however, provision has been made by most of the companies to connect the electrical equipment to the oil piping by means of flexible metallic hose. Further flexibility is secured by providing means for cutting in portable oil heating apparatus, in the oil lines of the electrical equipment if, upon occasion, the permanent heating units should develop trouble.

The use of different types of non-portable equipment at the central reconditioning plants appears to be equally divided between centrifugal and filter press equipment. A few companies are using both types of treating equipment in order to secure complete reconditioning when treating very dirty oil. The Duquesne Light Co. is the only company reporting the installation of chemical treating equipment. The Rochester Gas and Electric Corporation uses lye when treating badly-burned oil, showing discoloration or sludging; it uses one pound of lye to approximately three barrels of oil. Non-portable equipment is used at both power stations and sub-stations, with the filter press type predominating.

The prevailing rated capacity of non-portable centrifugal apparatus for use in central and local plants is 600 gallons per hour at a temperature of 50 deg. C., the prevailing rated capacity of filter press equipment for use in central and local plants, 1 000 gallons per hour at a temperature of 50 deg. C.

Facilities for heating oils during treating processes include electric heaters in the majority of cases. Very few companies use steam or other facilities for heating. The Detroit Edison Co. has installed 5 kW 220 V heaters under its circuit breaker tanks, for use during severe weather. The Dayton Power and Light Co. employs two immersion heaters rated at 2 kW each. The Duquesne Light Co. reports the installation of steam heating units in their reconditioning plant in order to prevent oxidation of aerated oil produced by the use of electrical heating units which have no adequate temperature control.

For portable equipment at central and local reconditioning plants, the greatest usage seems to lie in filter press apparatus. Two companies use a combination unit consisting of a centrifuge and a filter press mounted on one machine.

For portable apparatus at power stations the rated capacity of centrifugal equipment varies from 100 to 800 gallons per hour at a temperature average of 50 deg. C., and filter press equipment ranges in capacity from 200 to 1 800 gallons per hour at a temperature average of 50 deg. C. The rated capacity of the centrifugal equipment most frequently used is 400 gallons per hour; for the filter press equipment most frequently used the rated capacity is 800 gallons per hour.

Maintenance of Plant.

With regard to the operation and maintenance of handling and treating equipment, only a comparatively few of the fifty-seven reporting companies have found it necessary to apply paint or varnish in order to prevent rusting on interior surfaces of transformers or oil storage tanks and containers. The materials used by these companies include shellac, red metal paint, lacquer, varnish and bakelite varnish. One company uses bakelite varnish and a cork lining on covers, as as well as an external coating of paint and ground cork, in order to prevent internal condensation. Another company applies to the transformer covers, after a thorough cleansing, three coats of shellac.

Many companies have facilities for maintaining during storage an adequate dielectric strength for more than six months, on an average, at their central reconditioning plants and for more than twelve months, on an average, at their power stations. The methods of accomplishing this result are varied. One company keeps the clean oil storage tanks entirely filled up in order to avoid entrapped air spaces and, when necessary, the oil is centrifuged. Another stores the drums with the bungholes pointed down, thereby preventing the collection of water in empty drums. A third company keeps the temperature of the room containing oil tanks at 15 deg. F. above the outside air temperature. The majority of the others maintain the dielectric strength by reconditioning the oil more frequently than condensation can occur in any appreciable quantity; others use small tanks and frequently change their oil. Since the average practice is to filter into and out of

Digitized by Google

storage, no appreciable trouble is encountered in maintaining an adequate dielectric strength.

No apparent trouble in maintaining the cleanness of permanent oil storage tanks has been found, due to the methods employed in keeping this equipment clean. Almost all the companies report a periodic cleaning, ranging in time from four to six months, by flushing with clean oil and wiping when empty. The prevailing practice in the cleaning of portable tanks and drums is also to wash with clean oil.

Reports indicate that inspection for rust or sediment in fixed containers is regularly conducted by the majority of companies, the method of inspection usually depending upon visual examination of tank interiors.

Maintenance of Oil Piping.

Considerable trouble in the maintenance of oil piping is due to joint leakage, valve seat leakage and valve packing leakage, the greatest difficulty being experienced with the former. The remedy for joint leakage which has proved most valuable to the Public Service Company of Northern Illinois and the Texas Power and Light Company in the maintenance of oil pipe lines at reconditioning plants is first to cover the threads with white lead and oil, and then to cover them with bakelite varnish and a General Electric compound known as No. 880.

No difficulty has been experienced by any company due to the congealing of oil in buried lines; satisfactory preventive measures having been obtained by burying the pipe to a depth of from two to three feet, by preheating the oil and by running steam lines in the same trench with the oil lines. Thermal insulation is not employed by any reporting company to prevent the congealing of oils.

Corrosion of pipe lines buried in the soil is experienced more at sub-stations than at either central reconditioning plants or local power station reconditioning plants, but the number of replies indicating that any corrosion at all has taken place is relatively few.

At their central reconditioning plants, as well as at their power stations and at their sub-stations, the majority of companies do not permit clean oil to remain in pipe lines not in actual use.

When dehydrating transformer oil at central and local reconditioning plants, more companies use the filter press method than any other, although several companies use a combination centrifuge and filter press at all reconditioning plants. The only additional method employed in dehydrating transformer oil is the use of a filter of Fuller's earth, reported by the Shawinigan Water Power Co.

More circuit breaker oil is successfully dehydrated by filter press than by centrifuge or by a combination of centrifuge and filter press.

Carbon Removal.

The filter press is also accepted as the favourite apparatus for the removal of sediment and sludge from transformer and breaker oil, although the centrifuge and the combination of the two are also used, and even the filter of Fuller's earth has some advocates. The San Diego Consolidated Gas and Electric Co. reports the use of the following unusual formula for the removal of carbon: add one pound of gold dust dissolved in two gallons of water to fifty gallons of oil, heat to 200 deg. F. for half an hour, then agitate with steam jet and run through centrifuge with water seal. The Rochester Gas and Electric Corporation reports that transformer and breaker oils are treated with lye when the presence of acid is noted; for burned oil showing discolouration, one pound of lye is used to three barrels of oil. The Cleveland Electric Illuminating Co. reports that it is unable to remove all traces of carbon from heavily carbonised breaker oil, but that the dielectric test, after one run through the centrifuge at 200 gallons per hour, is better than 25 kV.

Some interesting figures have been obtained in regard to the total volume of transformer oil reconditioned each year by various operating companies. The New York Edison Co. heads the list of companies reporting, with 400 000 gallons per year at its central reconditioning plant. The Alabama Power Co. reports the greatest quantity handled by local reconditioning plants at power stations and at sub-stations, the figures being 306 000 and 432 000 gallons per year respectively.

Figures on the total volume of circuit breaker oil reconditioned per year are also significant. The Philadelphia Electric Co. handled the largest quantity of any central reconditioning plant, viz., 80 892 gallons. The maximum quantity of oil reconditioned by any one company at power stations is 650 000 gallons, the figure submitted by the Duquesne Light Co. The largest quantity reported by any company under any method of reconditioning is the 1 100 000 gallons at the sub-station reconditioning plants of the Southern California Edison Co.

Comparison between the filter press and the centrifuge, in operating experience for one pass of oil, is given in a table. It should be noted that two passes through the oil treating equipment are usually necessary in order to secure the return of a high dielectric strength. The number of hours of continuous operation between changing of blotters or cleaning of equipment depends entirely upon the original condition of the oil. The variation in filter press costs per thousand gallons of oil is so wide that it is omitted from the report. This variation can best be understood by an examination of the methods employed in treating very dirty oil; the companies showing low blotter costs make a practice of running their oil first through the centrifugal apparatus and then through the filter press, and are therefore able to use their blotters over again when handling fairly clean oil.

Many difficulties have been encountered in the operation and maintenance of handling and treating equipment. With regard to design defects, it has been reported that the time required to start and to stop the centrifuge is too great, that a blotter press driven by a repulsion motor constitutes a fire hazard as the result of motor sparking, that oil accumulation on the commutator contributes to dust collection and the motor should therefore be entirely enclosed, that a safety switch should be provided at the motor, and that thermostatic control of blotter press heaters would make operation simpler and safer.

Mechanical Defects.

With regard to mechanical defects, it has been reported that a by-pass relief valve should be placed on the centrifuge, that difficulty is experienced in cleaning centrifuges or certain types, that blotter press bearings require too frequent renewal, that difficulties have been experienced in renovating oil with the filter press in cold weather, although the application of heat to the oil will probably overcome them, and that blotters should be shipped from the factory in sealed packages in order to eliminate the absorption of moisture which would otherwise take place during transportation.

With regard to electrical defects, it has been reported that certain electrical heaters are too small and not sufficiently rugged, that trouble has arisen from the burning out of heating units, that it has been necessary to replace centrifuge switches having insufficient capacity, that centrifuge heaters do not have sufficient capacity, that the electrical connection of heaters under blotters often become damaged because of insufficient flexibility and that heaters for portable presses should be weatherproof.

Numerous companies are experiencing difficulties in the consideration of ratings, it being stated that the rating of equipment depends entirely on the dirtiness of the oil, and that no comparison should be made between the actual rating and the rating given by the manufacturer; centrifugal equipment particularly is reported to be considerably overrated. It is quite obvious that the quality of oil obtained from centrifuge or filter press depends entirely on the dirtiness of the oil; it has been reported that it is sometimes necessary to pass oil once through a press after two or three passes through a centrifuge in order to dehydrate it and that, in a few cases, sludge could not be removed by means of a centrifuge.

In discussing the question of portability, the operating companies seem to feel that portable presses and heaters should be lighter and should be weather-proof, should be arranged for shipment without crating and should be provided with larger wheels, designed for running on cinders and loose dirt, and that containers for storing dry blotters should be added. The general opinion seems to be that the centrifuge requires a more skilled operator than the filter press, particularly on centrifuges necessitating the changing of dams to accomplish dehydrating economically, in which case operators find it difficult to select the proper size of dam. Operators also report difficulty in consistently maintaining the required oil temperature to the centrifuge, and in passing the hot oil to the cold breaker tanks without the occurrence of condensation and the consequent decrease of dielectric strength.

CENTRAL ELECTRICITY BOARD.

Features of First Annual Report—Details of Accepted Schemes—Tentative Plan of Complete "Grid"—Design of Transforming Stations and Transformers—Work in Progress.

THE Central Electricity Board has just issued its first annual report* covering its operation during the period from the setting up of the Board on March 1st, 1927, to December 31st, 1928.

In the introduction the circumstances which led up to the passing of the Electricity (Supply) Act, 1926, and the objects for which the Board was constituted, are briefly summarised, and it is pointed out that " shortly, the function of the Board is to co-operate with the supply industry in reducing the cost of production to a minimum and concurrently in increasing the availability of supply, thus leading to an acceleration of the growth of output and consumption which of itself is the surest means of bringing about the desired benefits to consumers "

The procedure laid down by the Act for the preparation of schemes and the methods adopted by the Board in considering and adopting schemes are outlined.

Up to December 31st, 1928, the Board had considered five schemes, and adopted four. The salient facts relating to these schemes are as follows :—

Scheme.	Area Square miles.	Population (1921 Census).	Sales of Electricity 1925/26. Millions of Units.
Central Scotland ..	4 980	3 761 200	528
South-East England ..	8 828	11 392 561	1 283
Central England	7 311	5 218 146	715
North-West England and North Wales	9 082	6 980 925	1 214
Total adopted ..	30 201	27 352 832	3 794
† Mid-East England ..	7 455	4 529 880	703
Total	37 656	31 882 712	4 497
Great Britain	88 141	42 769 196	5 606

The details of the Schemes are set out, and maps are given showing the area covered by each, the selected stations, the sub-stations and (diagrammatically) the route of the " grid " lines. There is also a map (p. 13) giving tentatively the complete grid for the whole country.

Grid System.

Pages 13 to 24 give a technical description of the grid, with diagrams of the towers and layout of the sub-stations, as well as five photographs showing towers actually erected, a tower undergoing a test, and a grid circuit breaker.

The grid will consist of some 3 000 miles of overhead lines operating at the standard frequency of 50 cycles per sec. and a pressure of 132 000 V. This system differs from the systems of the Continent and the U.S.A., which have mainly been developed to *transmit* large blocks of power over long distances from localised water power or brown coal areas. " In Great Britain, however, the availability of suitable coal over wide areas and without wide variation of price, coupled with the fact that the country has no large water power resources, calls rather for a system of *interconnection*."

With regard to choice of voltage for primary transmission, the report points out that great diversity exists with regard to the voltage adopted for e.h.t. transmission systems.

The grid voltage had to be determined in the light of the use to which the lines would be put, and the conditions are somewhat special. The generating stations selected for the schemes are either at or near the principal load centres, consequently most of the power, especially during the winter months when the load is heaviest, will be sent out direct from the station busbars for local transmission and distribution without passing over the grid system. Consideration of the loads likely to be met with in these circumstances, and with due regard to emergency requirements, showed that the necessary line capacity should be of the order of 50 000 kW. It follows from the interconnected nature of the system that individual transmission distances are comparatively short; consequently the only remaining factors which had a bearing on the choice of voltage were the degree of security obtainable and the cost. In the preparation of the district schemes, the Electricity Commissioners decided in favour of 132 000 V, being influenced to a certain extent by the possibility that some time in the future short lengths of underground cable might be found to give reliable service at this working pressure where circumstances might warrant the heavy additional capital expenditure involved.

Shortly after the Electricity Commissioners transmitted the first scheme to the Board, the International Electro-Technical Commission, in fixing standards for e.h.t. transmission lines, abandoned 132 000 V as a standard, and now has no intermediate steps between 110 000 and 165 000 V. Investigation of the cost of the various kinds of plant required showed that if the voltage was raised from 132,000 to 165 000 V the capital expenditure on the grid would increase by 12% without making it possible profitably to utilise the increased carrying capacity which would thereby be obtained. On the other hand if the voltage were reduced to 110 000 V the capital cost of the system would be increased by approximately 5% as in many instances lines would have to be duplicated in order to provide the necessary capacity.

After careful consideration of the various arguments for different types of conductor, the Board decided to adopt steel-cored aluminium conductors, so as to secure the largest reasonable spans from tower to tower.

The towers for the primary lines have been designed in consultation with Sir Reginald Blomfield, R.A. The average height will be from 70 to 80 ft., and 16 standard types have been settled. The towers will, as a rule, be galvanised, and there will be roughly six towers per mile.

In certain cases, e.g., where the lines will cross navigable rivers, special towers will be necessary. For the crossing of the Clyde, the Forth and the Cart, towers have been designed varying between 200 and 338 ft. in height.

Switching Arrangements.

Transforming stations giving duplicate supplies will be provided at each grid point. At the most important stations the switching arrangements will be of the conventional type, one circuit breaker being provided for each transmission line and one for each transformer. The busbar sections will be in duplicate, and there will be a circuit breaker for coupling the sections. At less important grid points a specially simple type of sub-station has been devised. In this type of station there will be only three 132 000 V circuit breakers, one between line sections and one on each of the two transformers. This arrangement will reduce to a minimum the capital cost, ground area, and number of vulnerable points. In certain cases special switching arrangements are required, in others the restricted space available makes it necessary to introduce constructional features of particular kinds, and in order to meet such conditions a range of designs has been prepared.

The complete list of sub-station types is as follows :—

Designation.	Description.	Application.
L.N.E. ..	Low Non-Extensible ..	Grid supplies where no extension other than increase of transformer capacity is contemplated.
H.N.E. ..	High Non-Extensible ..	
LE. ..	Low-Extensible	Grid supplies where extensions beyond the capacity of the single 3 switch arrangement will be necessary in the future.
H.E. ..	High-Extensible	
L.D.B. ..	Low Double Busbar ..	Grid supplies at the most important stations.
H.D.B. ..	High Double Busbar ..	
C. ..	Connections only between lines and transformers ..	Used where transformer feeders are applicable or necessary.

Illustrations of typical lay-outs are given in the report.

The " low " type of sub-station is used wherever sufficient ground area is available. In the " low " type stations the amount of structural steel is reduced to a minimum, and the

* Copies are obtainable from the publishers, Whitehead, Morris, Ltd., or through any bookseller at 2s. 6d. (3s. post free.)

† Adopted on March 19th, 1929.

Digitized by Google

apparatus is placed as near ground level as safety considerations permit. The arrangement reduces maintenance costs and facilitates inspection and operation. The " high " type sub-stations are more in accordance with existing American and Continental practice. Owing to the disadvantages associated with their maintenance and inspection, they will be used only in cases where ground area is insufficient for " low " type stations.

In all types of sub-stations the arrangements will be such as to allow for overhaul or inspection of any circuit breaker with the rest of the station in service.

All 132 000 V stations will be of the outdoor type. The decision to use outdoor apparatus was reached only after very careful investigation. Very substantial economic advantage is obtained by eliminating buildings; danger from explosion and fire is almost entirely removed and inspection is simplified.

The 66 000 V stations which will be erected in the London area will be of the indoor type.

A uniform standard of rupturing capacity of 1·5 million kW has been adopted for all 66 000 and 132 000 V circuit breakers. Circuit breakers, both of the explosion pot and multibreak type, are being used.

The standard capacities of transformers to cover all grid requirements are 7 500, 10 000, 15 000, 20 000, 30 000, 45 000, 60 000, and 75 000 kVA. The transformer specifications have been drawn up in such a way as to get transformers with minimum light load losses and magnetising currents compatible with reasonable first cost. The preliminary tests which have been carried out indicate that the manufacturers are meeting their guarantees as to losses and efficiency in a very satisfactory way.

All transformers are designed for operating with the neutral points of the 132 000 V windings connected directly to earth. This feature of the design results in greatly reduced first cost as compared with that of transformers designed for operation with insulated neutral points. It also simplifies the design of the apparatus which is required for maintaining constant voltage on the busbars of the undertakers.

Voltage Regulation.

The method of voltage regulation which has been adopted on all transformers, except the least important, is that which employs taps on the higher voltage windings. The transformation ratio can be changed while the transformers are on load. The range of voltage variation which has been provided is ± 10 %.

The voltage regulating methods employed by the different manufacturers differ in detail, some favouring the use of auto-transformer or impedance systems, others resistances, and one uses divided windings, but it has not been deemed expedient to restrict development by standardising any particular design at this stage.

Air cooling is to be used on all transformers. Experience in other countries indicates that the most vulnerable parts of high voltage transformers are the terminal insulators. Two types, oil filled and condenser, are being used, but care has been taken to ensure that the insulators of all types are mechanically interchangeable, The condenser type of bushing has hitherto been largely a foreign product, but British firms are now producing satisfactory insulators of this type.

The decision that lightning arresters will not be used makes it especially important to ensure that the winding insulation will be of the highest grade, and all grid transformers have their windings heavily reinforced at both outgoing and neutral point ends.

Overload and leakage protective devices are to be installed on both higher and lower voltage windings, and, in addition, provision has been made for the installation of Buchholz relays if experience shows that more sensitive protection is required.

Space is available at each sub-station for erecting reconditioning and repair sheds, but it has been decided not to proceed with the erection of these sheds unless experience shows them to be necessary. This decision is contrary to current practice in other countries, but it was arrived at only after consultation with the principal transformer manufacturers.

Dealing with works in progress, the report states that the Board were able to invite tenders for the main transmission lines in Central Scotland (the first scheme) in September, 1927; for the transformers in November, 1927, and for the switchgear in January, 1928. In the second and subsequent schemes they were able to proceed more quickly. By the end of last December contracts had been placed as follows:—

	Central Scotland.	South-East England.	Central England.	North-West England.	Total.
	£	£	£	£	£
Primary transmission lines	439 239	980 084	30 743	—	1 450 066
Secondary transmission lines	—	14 235	—	37 139	51 374
Primary transforming stations	649 685	633 038	—	—	1 282 720
Secondary transforming stations	64 182	32 922	—	13 723	110 827
Totals	1 153 106	1 660 276	30 743	50 862	2 894 987

In Scotland the actual erection of towers is in progress on the routes Greenock–Yoker, Port Dundas–Dalmarnock, and Clyde's Mill–Bonnybridge, which are nearing completion. In South-East England work is in progress on the line from Bedford to Little Barford, 46 towers out of approximately 73 having been completed. In North-West England towers are being erected on the secondary line from Stockport to Macclesfield.

The Wayleave Position.

In regard to wayleaves, the routes of the lines are largely determined by the configuration of the land, and deviations can only be made within small limits, and, generally speaking, at considerable cost. " These factors have added considerably to the difficulty of the Board, whose settled policy it is to reduce to a minimum any action which may spoil the amenities of the countryside, and at the same time to meet as far as possible the reasonable wishes of individual owners as to the exact position of the towers."

The Board have welcomed representations and co-operation from the societies and local authorities concerned in the preservation of amenities, and " acknowledge the helpful and public spirit in which the majority of landowners have recognised the need of facilitating the Board's work, even where it has not been possible to make those minor alterations which the owners desire."

Up to December 31st last the position was as follows:—

	Mileage Surveyed.	No. of towers to be erected.	No. of Wayleaves obtained.
Primary Lines:			
Central Scotland ..	245	1 442	1 158
S.E. England	120¾	730	416
Central England ..	9½	61	12
Secondary Lines:			
N.W. England ..	12	100	100
S.E. England ..	6¾	86	23

The Board recognise that individual undertakers may require additional supplies before the grid would reach them in the normal course. To meet such cases the Board exercise, wherever possible, their powers to make temporary arrangements, and where necessary, construct portions of the grid in advance of programme. " By this means they have already shown the utility of the grid in saving authorised undertakers uneconomical expenditure on the extension of small generating stations, and in making supplies available in new areas."

Arrangements, including the construction of lines, have been made to give supplies: (*a*) At Little Barford for the development of new area in Bedfordshire, Cambridgeshire, and Huntingdon; (*b*) at Worthing, to supplement existing supplies; (*c*) at Aylesbury, to supplement existing supplies and open up rural areas; (*d*) at Macclesfield, Buxton, and the surrounding district. Other arrangements of a similar nature are in negotiation for supplies in and around London; at Kettering and in the Alderley Edge and Wilmslow district.

In order to provide for expenses during the initial period before the disbursements of the Board should become sufficient to justify raising a loan, the Board arranged with the Bank of England, who are the bankers to the Board, for temporary advances, and this arrangement still continues. The total amount of such advances up to December 31st last was £339 000.

There are 7 appendices to the report, the first of which sets out the advantages and economies to be derived from interconnection. The next four give technical details of the grid. Appendix 6 is a progress report, and the final appendix reproduces the Board's standard form of wayleave consent.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

"The Battersea Problem."

[To the Editor.]

Sir,—With regard to the letter in your issue of May 3rd from Messrs. Siemens Schuckert (Gt. Britain), Ltd., I am of course perfectly well aware that in a number of power stations throughout the world effective methods are being taken to eliminate dust, grit, and other finely divided solid matter from chimney gases, although incidentally even this is a somewhat neglected section of power station operation, especially in London, for example.

What I stated, however, was that no one in the world has yet attempted to tackle the question of the elimination of sulphur in the gases, that is to say sulphurous acid (SO_2) and sulphuric acid (SO_3 combined with water), due to the combustion of the sulphur in the coal, which of course is generally present both in the inorganic and the organic form. Obviously any method of filtration or electrostatic precipitation will not eliminate gas, and the only way to do this is by means of some process or processes involving chemical reaction, of which naturally the simplest, from the theoretical point of view, would be washing by means of dilute alkalis.—I am, etc.,

David Brownlie.

46, Grange Road,
Ealing, W.5.
May 4th.

[To the Editor.]

Sir,—The sulphur and grit problem is a very serious matter when it is considered that in burning a ton of coal there is from 50 to 80 lb. of concentrated sulphuric acid produced. The prevailing idea is that this terrible nuisance cannot be feasibly overcome, which is erroneous, simply because it has been tackled in the wrong way, i.e., after combustion, which is courting failure, instead of before. There are many factors nullifying success after combustion, the very large volume of hot flue gases, and the highly diluted state of the sulphurous oxide, which becomes sulphuric acid on mingling with damp atmosphere.

A striking instance of the damaging effects is to be plainly seen in the eating away of the top portion of the iron chimneys at the Barton generating station, where there are ragged portions from 4 in. to 7 in. completely eaten away. If it will eat through iron in this way, and in a short time, it requires no undue labour of the mind to gauge the pernicious corrosive effects on property, vegetation and lungs.

There is an improved process of fuel utilisation that will not only thoroughly eliminate the sulphur and grit nuisance, but will, at the same time, reduce the fuel costs of any generating station.—I am, etc.,

Chemical Engineer.

Eccles, May 4th.

The Incandescent Lamp Jubilee.

[To the Editor.]

Sir,—With reference to your editorial paragraph, under this heading, in your issue for May 3rd, may I suggest that, as I have shown in my article in the official "Journal of the Institution of Electrical Engineers" for April last, of the three inventors, St. George Lane Fox Pitt, Sir Joseph Swan, and Thomas Alva Edison, the one of the three who made the first and the most fundamental invention is Lane Fox Pitt.

I have just written for the Press a review of Sir Joseph Swan's recently published memoirs, in which I am sure no one will suggest that I have not done him justice as a great and original inventor; but the carbon filament lamps of all these three inventors are now entirely obsolete, while Lane Fox Pitt's fundamental patent for distribution at constant potential, with everything in parallel, not only anticipated both the other inventions, but was at its time an entirely new idea, and still holds the field.

Both Swan and Edison have other great inventions to their credit, and both must have gained considerable wealth; but the debt of science due to Lane Fox Pitt has never been acknowledged, while his inventions never earned him a single penny. He still lives, and all I suggest is that he should have the recognition that is in justice due to him.

By all means let the Institution of Electrical Engineers protest to the American National Electric Light Association that Swan's claims come before those of Edison, but let them at the same time point out that Lane Fox Pitt has clear fundamental patent priority over both of them, as everyone must admit.—I am, etc.,

A. A. Campbell Swinton.

The Athenæum,
Pall Mall, S.W.1.
May 6th, 1929.

[To the Editor.]

Sir,—While I would like to believe your very courteous suggestion about the American plan to celebrate Edison's invention of Swan's lamp, I can hardly imagine that this step has been taken in ignorance of the fact that the jubilee of Swan's great invention was officially celebrated by the Institution of Electrical Engineers last December.

Again, I seem to remember that one of the Smithsonian Institute's publications giving the history of the incandescent lamp gives credit, albeit perfunctorily, to the real inventor.

I agree that a protest should be made to the N.E.L.A., and trust that your efforts to uphold British prestige will not be made in vain.—I am, etc.,

G. H. L. Smethurst.

London, N.8.
April 27th.

North-East Coast Exhibition.

[To the Editor.]

Sir,—Some fears have been expressed that inadequate arrangements have been made for the accommodation of the many thousands of visitors to the great North-East Coast Exhibition at Newcastle-upon-Tyne, which is being formally opened by H.R.H. the Prince of Wales on Tuesday May 14th.

This is not so. Not only have very extensive arrangements been made in the city of Newcastle itself, but the exhibition is situated within extremely easy reach of a large number of the attractive seaside and inland resorts where excellent and extensive accommodation for an enormous number of visitors is available.

There is a well-organised Accommodation Bureau, whose address is 31, Westgate Road, Newcastle-upon-Tyne.—I am, etc.,

P. J. Brown,
Publicity Agent,
North-East Coast Exhibition.

Newcastle-upon-Tyne.
May 4th.

Some Fallacies of Load Factor.

[To the Editor.]

Sir,—I have read with interest the letters of Messrs. Martin, Blaikie, and Brettelle, in The Electrician of January 11th and 25th, and February 1st, commenting on my article in your issue of January 4th, and distance must be my excuse for not replying earlier.

I am sorry the article should be regarded as pouring opprobrium on either municipal or company engineers, or the undertakings they manage. Nothing of the kind was intended; nor was it desired to discuss their relative merits. That the financial aspect of any action is of serious import to a company surely will not be gainsaid, though one may agree fully that financial stability is best secured if one keeps the ideal of service well in the foreground, and that a penny-wise policy may often be pound-foolish. That the financial aspect of an action to a municipal undertaking is much less important also seems quite evident. These facts are, perhaps, seen more clearly in other fields of enterprise than electricity supply and afford one of the strongest reasons for making water supply a municipal affair. Put briefly, I should say that the guiding principle of a municipal undertaking should be service with due regard to the financial position; and of a company the financial position, with due regard to service.

As I have said previously (The Electrician, Vol. XCIX, p. 745), I consider that the published figures of electricity undertakings have had a tremendous influence in stimulating municipal undertakings towards success. But, as at cricket, averages are not the only consideration; and I fear that there are both municipal committees and municipal engineers who would look askance at developments such as those carried out by the Chester Corporation ("J.I.E.E.", December, 1928) on the ground that such must certainly be detrimental to the position on the statistical tables. Granted that there have been many difficulties placed in the way of expansion of area of municipal,

Digitized by Google

as of company, supplies in Great Britain, there are, nevertheless some municipalities which have shown that such expansion is not impossible ; and the skill displayed by so many municipal engineers in the intensive development of their restricted areas suggests that vast extensive development might also have taken place with financial justification, had service, in its wider sense, been kept more in the foreground. To this extent, I am ready to criticise municipal engineers and undertakings alike ; but I cannot agree that to criticise is necessarily to pour opprobrium.

Mr. Martin, I think, has failed to read my article carefully. There is no contradiction between the statement that " better load-factors will permit of lower *average* costs of electricity," and my subsequent argument ; but apparently the importance of the word " average," now italicised, has been overlooked. Nor, had he followed my argument, would he have suggested that the sale of a large number of extra units at a negligible margin over their extra cost would enable other units to be sold at a lower figure than before. This seems to be a very common fallacy ; but as soon as the proposition is put into figures, however rough, its absurdity is seen. There is no question of the selection of figures to give the result aimed at, as appears to be suggested. Any other figures with the same premiss will give the same result.

Mr. Martin, with Mr. Brettelle's support, questions my contention that diversity factor is insufficiently regarded, and load factor too much, on the ground that they are too closely interwoven to be easily considered apart. I agree that diversity factor cannot be considered without load factor ; but the converse is certainly not the case ; and I think that a study of tariffs in force in Great Britain and elsewhere would speedily show that there are many undertakings, both company and municipal, which do not realise that, owing to diversity factor, water heaters with a 30% load factor, operated by time switches or the equivalent, deserve in most cases a lower tariff than those permanently in circuit, or operated by means of a load levelling switch.

Australian Practice.

Mr. Blaikie will find from the article above quoted that I am well acquainted with the rateable value tariff. In Australia the most favoured tariff of this nature bases the annual charge on floor space. The extended areas of supply and large gardens surrounding many quite small houses probably account for this. A tariff of this kind is an empirical one, which aims at giving due weight to load factor, diversity factor, and density of load, for normal domestic supplies ; but the fact that it is purely empirical prevents it from being suitable for universal application, as most undertakings recognise.

For example, Dr. S. Parker Smith (" An All Electric House," " J.I.E.E.," No. 351), though taking the bulk of his energy on a tariff with a running charge of ½d. per unit, nevertheless is given by Glasgow Corporation the benefit of a flat rate of ⅜d. for energy for night water heating. Again, Sydney (N.S.W.) with a tariff based on floor space, prohibits the use of large geysers, and requires current for the lighting of private tennis courts to be metered separately. Tariffs of this kind aim at encouraging consumers to take increased supplies of electricity at reduced rates, and I should expect them to have more influence on the statistical figures than on the financial position of the undertakings adopting them. This may or may not afford an explanation of the fact stated by Mr. Blaikie, and suggested in my article above referred to, that they are much more popular with municipal than with company engineers.

I do not follow Mr. Blaikie's suggestion of the proper tariff for bulk supplies from the " grid." I should say that those distributing authorities who take all their supplies from the grid will probably have quite a low diversity factor, of the order of 1·25 to 1·5 ; and that, consequently, for these a tariff of a Hopkinson type will be quite appropriate. On the other hand, if sundry of the larger distributors are encouraged to retain unselected stations of moderate efficiency to assist in carrying their peak loads, these particular authorities will contribute largely to the diversity factor, and therefore to the load factor of the grid ; and will be entitled to correspondingly better terms, irrespective both of the magnitude and of the load factor of their own demands from the grid.

I readily agree with Mr. Brettelle's contention that a company must be prepared to take risks ; but subject to the qualification that the reasonable expectation of profit must be commensurate with the risks incurred. However, his statement that 0·115d. is the approximate extra cost of additional units in a modern station with coal at 12s. 6d. per ton seems to indicate that his views and mine are not so far apart as at first sight would appear. On this basis, the " relatively small " municipal undertaking in London which he cites as selling current for night water heating at 0·33d. would incur an extra cost of about 0·23d. per unit, thus showing some 40% margin between selling price and cost ; and this is quite in accordance with the opinion I expressed that where extra cost is 0·35d. a selling price of 0·5d. is much more rational than 0·375d.

Mr. Martin questions my economics ; and on that point I think we must agree to differ. In my opinion, lavish expenditure during the post-war years, by governments and individuals alike, is the prime cause of the financial stringency and dearth of employment in both England and Australia to-day. And this being so, I cannot subscribe to the doctrine that a reduction in price which causes a marked increase of expenditure on a luxury is bound to be permanently beneficial to the community.—I am, etc.,

EDWARD V. CLARK.

Adelaide.
April 4th.

Two-Part Tariffs.

[TO THE EDITOR.]

SIR,—In a leaderette in your current issue you refer very kindly to an article which appeared under my name in a previous issue in which mention was made of a three-part tariff. As you remarked that it may well be that the best approach to the nearly ideal method of charging may eventually be evolved along these lines, may I point out that in the course of that article I actually did mention a finding which holds out some promise of being useful.

Statistics obtained from the working of the three-factor tariff show that a curve given by a sliding-percentage of rateable value, varying, say, from 18½% on rateable values of £15, down to 12½% on rateable values of £75 and over, conforms very closely to the curve resulting from the fixed charges based on the three-factor tariff.

May I here say that I did not, and do not, advocate a three-factor tariff if there is something simpler to hand combined with reasonable equity.

As regards a sliding-percentage of rateable value, or, if you will, a sliding rateable value tariff, such as indicated, naturally the anomalies inherent in a single-basis tariff would still exist, but the broad conformity referred to is much in its favour, for the reason that the results obtained from a three-factor basis must be about the fairest it is possible to produce, owing to the smoothing-out of the anomalies of the separate factors.

A hope was expressed that the new rating reassessments under the Rating and Valuation Act, 1925, would be on more equitable lines than formerly, thus providing a reasonably practicable basis on the above lines for a two-part tariff. These new assessments are now available, and the effect of applying them is at the moment being investigated.—I am, etc.,

C. F. MOUNSDON.

Sevenoaks.
May 6th.

MINING TYPE TRANSFORMERS.

First of a New Series of Specifications.

THE British Engineering Standards Association has issued a British Standard Specification for mining type transformers, this being the first of a series of specifications that are in the course of preparation for mining electrical apparatus by the Colliery Section. The specification applies to oil-immersed naturally cooled transformers primarily for use underground in collieries, and, whilst no stipulation is made on flameproofness as an essential requirement, it includes the necessary constructional provisions to satisfy the requirements of the Coal Mines Acts underground in collieries. The Colliery Electrical Section has also in the course of preparation specifications for mining type motors and generators, flameproof switches and circuit breakers, miners' hand lamp bulbs, underground lighting fittings and cable glands and sealing boxes.

Copies of the new Specification (No. 355–1929) can be obtained from the British Engineering Standards Association, Publications Department, 28, Victoria Street, London, S.W.1. price 2s. 2d. post free.

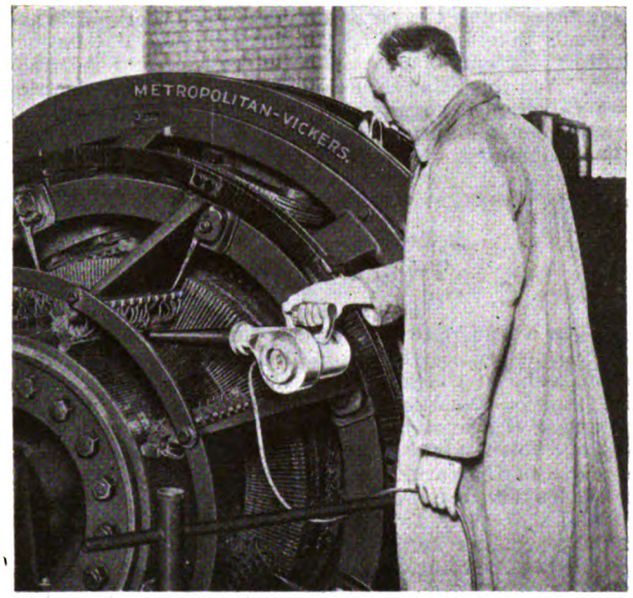
MANUFACTURERS' EQUIPMENT.

A Blower for Motor Windings—New Range of Squirrel Cage Motors—Electric Lamps for Face Working in Fiery Mines—Cable-Braiding Machines.

ONE of the most important functions of the "Cadillac" portable blower, supplied by METRO-VICK SUPPLIES, of 155, Charing Cross Road, London, W.C.2, is the cleaning of electric motor windings and housings. It is claimed that for this purpose the blower is better than compressed air on account of



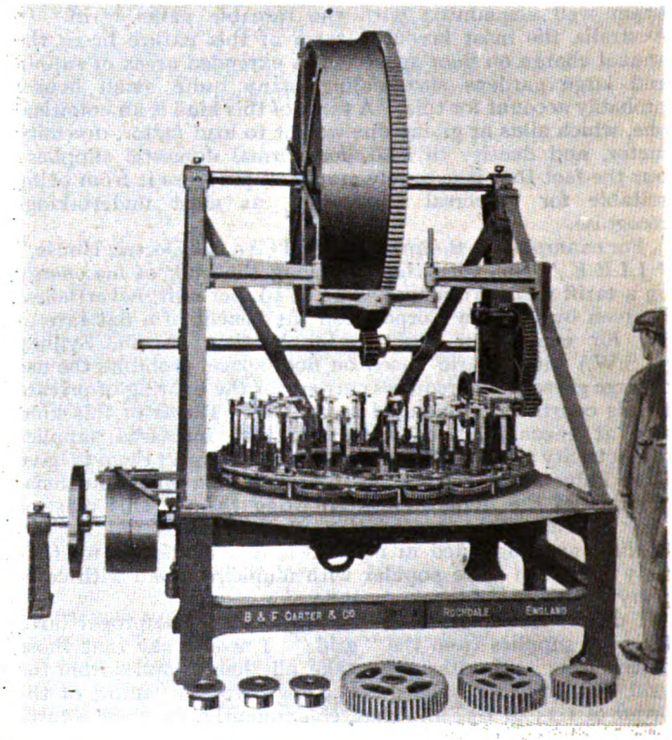
Illustrating the "Cadillac" blower of Metro-Vick Supplies.

convenience in moving, absence of the moisture due to condensation in compressor tanks, freedom from the danger of injuring windings with excessive pressure, the superiority of a continuous high-velocity blast of air at relatively low pressure to the quickly-expended force of a compressor, and low cost. Special attachments enable the blower to be used in various circumstances such as are to be met in textile and flour mills, printing works, theatres and hotels, telephone and telegraph works, cable companies, tobacco manufacturers, engineering firms and power stations.

We have received from JOHN DAVIS AND SON (DERBY), LTD., of All Saints' Works, Derby, particulars of the type K 60 M-L pneumatic electric lamp for use at the working face of a fiery mine. The lamp is a self-contained unit which can be coupled up to any compressed air main. It consists of a metal casing containing a generator driven by a compressed air turbine. The interior of the lamp, both generator and protecting glass, is in communication with the exhaust side of the turbine and a pressure of about 2 lb. per square inch is maintained in the interior by means of a spring loaded exhaust valve. As an additional precaution a safety device is incorporated which cuts off the current in the event either of the air supply failing, or the lamp glass being damaged or removed. This device consists of a spring loaded diaphragm, one side of which is in connection with the outside air, the other side exposed to the excess pressure in the interior of the lamp. The diaphragm carries a contact, which normally engages with a fixed contact and short circuits the generator. When the lamp is working, the excess pressure in the interior holds the contacts apart and permits the lamp to light. Failure of this pressure from any cause permits the contacts to close and makes the whole system dead. A system of small holes is provided in the lamp, so that a scavenging stream of air flows through it during working. Consequently, any gas which may have penetrated in during the time the lamp has been standing out of use, is driven out before the lamp lights up. The turbine and generator rotors are carried on a short steel spindle. An extension of the shaft carries a centrifugal governor to prevent racing. The turbine is of the radial two-stage type, air passing in through a tangential nozzle, traversing the vanes first in an inwards direction, then through a transfer port, and secondly in an outwards direction. In order to make the lamp independent of the air pressure, and to permit its being used on air supply systems in which wide variations of pressures occur, a reducing valve is incorporated in the lamp, which reduces the pressure to 40 lb. per square inch at the nozzle, so that the lamp can run at any pressure desired above this figure. In special cases, where the pressure in service falls lower than 40 lb. per square inch, a special setting can be given to cover any reasonable requirements of pressure variation. The generator has an output of 60 W at 25 V. A standard 25 V 60 W bulb is used in a special resilient mounting. The bulb is protected by a stout glass dome secured in place by a gunmetal locking ring fitted with a magnetic lock, and a steel guard is provided to prevent the dome being accidentally damaged or broken.

B. and F. CARTER AND CO., of Lark Works, Hare Street, Rochdale, have sent us details of their 36-spindle cable-braiding machine for covering electric cable up to diameters of 3 inches. The machine is arranged with a haul-off capstan of 5 ft. diameter which is sufficiently wide to take three turns of the largest size cable that is to be braided. The machine is fitted with what are known as "Speedway" carriers, which, it is claimed, give an increased speed of between 20% and 100% greater than the ordinary "weight-and-dropper" type of carrier, and being built up practically of steel throughout are free from breakages. This machine is fitted with machine-cut gearing. The same firm advise us that they have just completed a similar machine, but arranged for dealing with lead covered cable up to 5 in. diameter. The haul-off capstan of this machine is 8 ft. in diameter, which is the smallest diameter that this size of cable will give to. This machine is also fitted with "Speedway" carriers. We understand that it is the largest braiding machine made in this country for this class of work.

A new range of protected squirrel cage induction motors (known as type K) in sizes from 1 to 25 H.P., 400/440 V, three-phase, 50 cycles, is manufactured by the BRITISH THOMSON-



A 36-spindle cable-braiding machine for diameters up to 3 in., by B. and F. Carter and Co.

HOUSTON CO., LTD., Rugby. Their type K motors comply with B.S.S. 168, have high power factor, give maximum starting and overload torque, and take low starting current. Ball and roller bearings are fitted. The rotor has aluminium bars and end rings cast in one piece by a special process and is claimed to be practically indestructible under service conditions. The core is ground on the periphery to ensure true running. The stator windings are specially dried and impregnated under vacuum.

ADVERTISING ABUSES.

Methods of Blackmailing the British Electrical Manufacturer.

FOLLOWING our recent reference to the exposure of practices which can only be described as blackmail in advertising, made by Mr. C. Pinkham in a recent lecture to the Glasgow Publicity Club, we have received numerous requests for details of the abuses referred to. As it is apparent that Mr. Pinkham's experiences in this field are not merely isolated examples we print below some extracts from his paper in the hope that this publicity will lead other victims to ventilate the abuses to which they have been subjected, and to a general stiffening of resistance to proposals which are regrettably prevalent in the electrical industry to-day :—

During the last few years I have been impressed by the rapid growth of the number of advertising propositions, which do not, and cannot, stand on their own feet, i.e, on their merits as advertising schemes. There are many forms of this phenomenon, but they all come down in some degree to a species of blackmail, or highway robbery—if you don't pay up and take space your firm will be looked on with severe disfavour, will lose an order, or will even be struck off the list of suppliers to the firm for whom the proposition is being promoted.

Let me take you through one or two forms of it. A favourite one, of which I have had dozens, in the last two years, takes this form. A firm of publicity agents goes to a municipal authority or a large firm and says in effect—you would like a brochure describing your municipality or your firm, as the case may be—all right, we will produce it for you and it won't cost you anything—(or perhaps a slight charge may be made). Just give us a list of your suppliers, *they will be only too pleased* to take advertising space. In some cases the agents even get a supply of letter-headings from their clients and write in the client's name.

Let me quote a paragraph from a letter I received in reply to a refusal to go into such a production :

" It will interest you to hear that a number of the chief nationa advertisers are supporting this booklet, not because they will probably secure much benefit from the advertisement from the general point of view, but in consideration of the amount of business which will ultimately accrue from the———Co."

After I had replied in suitable terms to their letter, they wrote an explanatory note in which they said :

" Of course it would be impossible for us to approach anv firm for a book of this kind unless a certain amount of business was done with the company."

There you have the whole matter in a nutshell.

Then there is the house organ bearing many pages of ads. ; in most cases inserted by suppliers who, whether the advertising value be great or be nil, feel that they have not the chance of weighing these considerations against the price charged, but that they *must* go in in order to preserve their business relations with the firm producing it.

Then there is the person who openly demands that you should take space you do not want, because he has bought your products, or has an order to place, or because it is a necessary qualification if you wish to get on his list for inquiries. The medium in question may be a time-table or programme, a poster site, or what not, but my point is, it is not a proposition which stands or falls by its advertising value, but is something approaching, as I said, blackmail. I have even had a man walk into my office with an order in his hand, and offer it to me if I purchased it with advertising space.

Then there are the editorial pages devoted to some big firm in, I regret to say, some national papers, which other firms who supply the said firm with material are expected to pay for, often at fancy rates. Here, again, use is sometimes made of the firm's letter-heading when writing to suppliers. There is, of course, a certain amount of advertising value here, but the rates are usually high, the money could be used to better advantage, and the underlying principle is coercion.

Now let us see what it all means. It means, of course, intense irritation to the victim. It also means, of course, the expenditure of a considerable sum of money in a year which we grudge, which we feel is wasted ; for none of us is able to withstand all these attacks.

Important as these aspects are to the individuals concerned, I feel there are other aspects which are really far more important. In the first place, every pound we spend on propositions of this type reduces the amount of our appropriation which is available for ordinary publicity expenditure at commercial rates. This, of course, not only reduces the income of those principals and agents who have *sound* publicity to sell, but, in wasting part of our allocation, it makes the average return per pound spent over our whole appropriation less, and therefore tends to give *our* principals, who have spent the money, a poorer impression of the efficiency of advertising.

I am not suggesting that there can be no such thing as some legitimate reciprocal trading in this matter. For instance, if I decide to go in for railway advertising, as long as I get value for money, I am naturally going to show preference for taking space with those railways who are good friends to my firm on the other side of the business ; that is only right and fair. Similiarly, if my firm is approaching another who is in the market for motors, I can see no reason why we should not ask for special consideration, price and quality being equal, on the ground that we buy some product extensively from this firm.

On the other hand, we should not be justified in going to such a firm who are using steam drive, and saying to them, in effect, however much you may be convinced that steam drive is the best for your job, you have got to put in some of our electric motors or lose all our business. There *can* be legitimate reciprocity, but what I inveigh against are attempts to force advertisers to spend money on types of publicity they do not favour, to force advertisers to take space of some value at uncommercial rates, or more often than not, to take space of no advertising value at all, by means of threats more or less veiled, sometimes baldly stated, sometimes implied.

I.E.E. GOLF.

Details of the North-Western and Mersey and North Wales Centres Competition.

THE golf competition of the North-Western and Mersey and North Wales (Liverpool) centres of the Institution of Electrical Engineers, in aid of the Institution Benevolent Fund, will be held on May 29th, on the links of the Hesketh Golf Club, Cambridge Road, Southport.

The tournament will be a bogey competition under handicap, and will be open to members and their friends. The player, being a member of the I.E.E., returning the best net score against bogey, will receive the G.P. Dennis trophy and replica, the trophy to be held by the winner for one year. If the best net score is returned by a non-member of the Institution, he will be awarded one of four prizes under medal play rules. There will be an optional sweepstake of 2s. 6d., divided so that three-sixths will be awarded to the competitor who returns the best card, two-sixths to the second best card, and one-sixth to the third best card. A two-ball foursome competition which will be open to ladies will be played for four prizes under medal play rules. Members of the home club will be penalised two strokes off their full handicap for local knowledge. A putting competition will be arranged, and a fee of one shilling will be charged on each card taken out. The prize will be awarded for the best score returned on the first card, and the sweepstake will be awarded, proportioned as above, to the best score on any card. Competitors may arrange their own partners and may start from 10 a.m. onwards, all cards to be returned by 5.30 p.m. The net proceeds will be handed over to the I.E.E. Benevolent Fund. The prizes have been presented by British Insulated Cables, Ltd., the British Thomson-Houston Co., Ltd., Callender's Cable and Construction Co., Ltd., the English Electric Co., Ltd., the General Electric Co., Ltd., Metropolitan-Vickers Electrical Co., Ltd., and other friends.

THE ROYAL INSTITUTION.

The annual meeting of the Royal Institution was held on May 1st, Sir Arthur Keith in the chair. Sixty new members were elected in 1928, and 64 lectures and 19 evening discourses were delivered. Officers for the ensuing year are :—PRESIDENT, The Duke of Northumberland ; TREASURER, Sir R. Robertson ; SECRETARY, Major C. E. S. Phillips ; MANAGERS, Lord Blanesburgh, Sir James Crichton-Browne, Sir Arthur Keith, Sir Richard Paget, Messrs. E. Clarke, F. G. Donnan, W. H. Eccles, W. Vaux Graham, J. S. Highfield, V. Warren Low, C. H. Merz, R. Mond, C. C. Paterson, G. C. Simpson, and W. J. Tennant. VISITORS, Messrs. M. A. Adam, E. N. da C. Andrade, J. H. Batty, F. H. Berryman, M. Ellis, K. R. Hay, D. Heron, G. W. C. Kaye, W. Macnab, E. S. Mond, H. M. Ross, W. S. Rowntree, S. Skinner, H. R. D. Spitta, and A. E. Western.

NEWS IN BRIEF.

New Telephones for the Post Office—Bombay and Electric Water-Heaters—Fares to the N.E. Coast Exhibition—The E.T.U. and Unemployment.

RIPON Electricity Committee is considering plans for electricity showrooms.

It has been decided to light the Parish Church of Albury (Surrey) electrically.

The Henley-on-Thames Charity Trustees propose to light the almshouses electrically.

Birmingham Salvage Committee is to erect and equip an electric vehicle garage at the Lifford depot, at a cost of £6 430.

Bangor (co. Down) Corporation requires an electrical engineer and manager.

Barnstaple Lighting Committee is preparing a scheme for an electrical showroom.

Ballot papers for committee vacancies, session 1929–30, of the Western Centre, I.E.E., should be returned to-day (Friday).

At a meeting of the Overhead Lines Association on May 15th, Lt.-Col. W. A. Vignoles will give an address entitled "Getting Consumers in Rural Areas."

Members of the Association of Mining Electrical Engineers (South Wales Branch) visited the works of the Electrical Construction Co., Wolverhampton, on Thursday.

The annual dinner of the Bradford Engineering Society was held at the Great Northern Victoria Hotel, on May 3rd. Those present included Mr. H. Unwin, president; the Lord Mayor of Bradford, Prof. F. C. Lea, guest of honour; Messrs. R. A. S. Thwaites, Thos. Roles, and W. Kirby.

Mr. J. Rowan, general secretary of the Electrical Trades Union states, in his monthly report, that so far as the E.T.U. is concerned, there is no complaint, except in one or two isolated areas, of any scarcity of employment. In most areas there is an acute demand for the Union's members.

Bombay Corporation has amended the water by-laws so as to admit of electric water heaters being connected to the direct water supply pipe.

The Women's section of the Eastbourne local Labour Party has suggested the provision of electrically fitted public washhouses at the Victoria Drive and Martello housing sites.

The 1928 edition of the annual volume of "Regulations and Orders relating to Mines under the Coal Mines Act, 1911," has been published by H.M. Stationery Office (price 1s.; post free 1s. 4d.)

Torquay Electricity Committee has decided to continue negotiations with the contractors in the town with regard to the sale of fittings and apparatus, before coming to any decision regarding the purchase of new premises for electricity showrooms.

At the Wednesday's meeting at the annual conference for the National Association of Goldsmiths, at Weston-super-Mare, Mr. F. Hope-Jones delivered an address entitled "Britain's Supremacy in Time-Keeping." Mr. R. P. Howgrave-Graham also spoke at the same meeting.

On May 2nd members of Preston Corporation visited the Crown Street electricity works, Messrs. Hawkins' Green Bank Mill, where a modern electrical plant is installed, and the joint sub-station of the English Electric Co.'s works, Strand Road; they also inspected the new Preston-Blackpool transmission line.

Hett P.C. is to borrow £200 for electric street lighting.

Manchester Education Committee has decided to adopt electric lighting at Mobberley open-air school.

Birkenhead Electricity Committee is to consider a scheme for providing wiring installations through automatic meters.

Eastbourne Corporation has informed the Ministry of Health that, if required, an undertaking will be given that no one shall have an electric light ray bath, when these are provided at the Devonshire Baths, without medical sanction.

The Walsall telephone service was changed over to the automatic system on May 4th.

The Postmaster-General has ordered 60 000 telephone transmitters and receivers of British manufacture. (See page 569.)

A sum of £1 000 is to be expended by the Aberdeen Tramways Committee for providing music at the Sea Beach and Hazlehead from July 15th to August 3rd.

The annual meeting of the contributors to the Benevolent Fund of the I.E.E. was held yesterday, when a statement of accounts and balance sheet to December 31st last was presented.

The question of the pay of blind ex-Service men employed as telephonists in Government Departments has been considered by a committee of the National Whitley Council for the Civil Service. An advance of 3s. a week basic has been offered and has been accepted by the staff side.

The London and North Eastern Railway Co. announces that during the North East Coast Exhibition, day excursion tickets, available by the 1.10 a.m. train from King's Cross, London, and for return by 11.13 p.m. train from Newcastle, will be issued on the opening day (May 14th) and every Saturday from May 25th onwards.

A scheme of improved lighting for the sea front at Tower Gardens is being made by Herne Bay U.D.C., at an estimated cost of £225.

Plans of the Beauharnois Light, Heat and Power Co. for power development in the St. Lawrence, have been approved by the Canadian Government.

Work is being commenced on a new training school at Lambeth North (London) station for the drivers, guards, signalmen and other grades concerned in the operation of the Underground Railways.

The Hull Medical Officer of Health describes in his annual report an experiment carried out in connection with the artificial lighting of schools. Several firms installed electric lighting in different rooms and the efficiency of the installations was measured in candle power at various points.

The Post Office announces a list of places in the Home Counties which will in future be served by the London Toll Exchange instead of the Trunk Exchange. These include towns as far distant as Clacton-on-Sea, Eastbourne, Littlehampton, Bletchley, etc.

Watt-hour meters recently approved by the Electricity Commissioners include the "Ferranti" type F.C.C. single phase, rated sizes 10, 12½, 20, 25, 40 and 50A, 200 to 250 V, at 50 cycles, and "Korting and Mathiesen" type WZ.5° single phase, rated sizes 1·5, 3, 5, 10, 15, 20 and 30A, 100, 110, 200, 210, 220, 230, 240, and 250 V, at 50 cycles.

LOOKING BACKWARD.

FIFTY years ago THE ELECTRICIAN *of May 10th, 1879, recorded that :—*

The s.s. "Seine" was able to sail to complete the submarine cable between Mozambique and Natal.

A correspondent expressed the view that "as the telephone becomes better known . . . it will largely supersede the telegraph for many purposes."

Mr. W. H. Preece, in an inaugural lecture at the opening of the Albert Hall Exhibition of Electric Light Apparatus, said that "the electric lamp of the future remains to be invented," and that ideas as to its distribution were "as futile as those regarding the philosopher's stone and perpetual motion."

* * *

TWENTY-FIVE years ago, according to THE ELECTRICIAN *dated May 13th, 1904 :—*

Recommendations on the construction of underground sub-stations were issued by the Home Office.

The Institution of Electrical Engineers was holding a meeting to alter its Articles of Association so as to permit the creation of the new office of "President Elect." The National Electrical Manufacturers' Association had a membership of 64.

An L.C.C. return showed that 15 local authorities and 14 companies possessed statutory supply powers within the County of London. Average load factors were 16·05 for local authorities and 13·75 for companies.

* * *

TEN years ago, as reported in THE ELECTRICIAN *of May 9th, 1919 :—*

A reduction of the Excess Profits Duty to 40 per cent. was a "welcome" Budget provision.

All restrictions on lighting were to be suspended for four days to permit of the illumination of buildings during the peace celebrations.

Mr. William Noble was appointed engineer-in-chief of the G.P.O. in succession to Mr. William Slingo.

PERSONAL.

IT is reported that Mr. H. Sewell, late of the Macintosh Cable Co., will be general manager of Derby Cables, Ltd. See page 573.

Mr. D. Williams, of the Leicester Corporation Electricity Department, has been appointed consumers' engineer at the Rugby electricity works.

Amongst the presentations at the Levee at St. James's Palace, on Tuesday, was that of Mr. E. G. Benn, who was presented by his father, Sir Ernest Benn.

A portrait of Sir Hugo Hirst, painted by Mr. Richard Jack, R.A., is included in the Royal Academy Summer Exhibition, which opened on Monday.

Sir J. A. Ewing, F.R.S., has been appointed a member of the Advisory Council to the Committee of the Privy Council for Scientific and Industrial Research in place of the late Mr. R. W. Reid.

Personal estate in Great Britain to the value of £71 657 was left by the late Dr. C. Scheibner du Riche Preller, who was for many years engaged on electric railway undertakings in Central Europe and was formerly chairman of the Dimmat Valley Electric Railway Co.

Torquay Electricity Committee has recommended the payment to Mr. H. F. G. Woods of 500 guineas for the special services he has rendered as consulting engineer in connection with the extension of the generating station at Newton Abbot and the installation of additional plant.

Mr. A. C. Morgan, secretary to the technical management at the Belvedere works of Callender's Cable and Construction Co., Ltd., who is taking up a position in London, has been presented by his colleagues with an inscribed gold watch. Mr. Morgan has been on the staff for 22 years.

Contributions to the National Radium Fund, which has been established as part of the Thank-offering for the King's convalescence, include :—Lord Weir, £250 ; Western Union Telegraph Co., £10 10s. ; General Electric Co., Ltd., £500 ; Mr. Sydney Evershed, £52 10s. ; Underground Electric Railways Co. of London, Ltd., £500 ; and Mr. F. A. B. Lord, £5 5s.

Mr. Arthur E. Apps was presented on Tuesday with a silver cigarette box by the staff and employees of the London and South of England branch of Simplex Conduits, Ltd., on his retiring from the post of sales representative after 18 years. Mr. Apps is a Batti-Wallah of long standing, and is taking up an engagement with the Millars Machinery Co., Ltd.

Obituary.

SIR PERCY KENDALL STOTHERT, on Monday, aged 65 years. He was chairman of Stothert and Pitt, crane makers, of Bath.

OVERHEAD LINES ASSOCIATION.

Preliminary Details of the Summer Meeting to be held in July.

THE summer meeting of the Overhead Lines Association will be held in Cheshire very early in July by invitation of the directors of the Mid-Cheshire Electricity Supply Co., Ltd., and of the President of the Association. The local arrangements will be made by the President as time and circumstances may permit, and will be notified to members later. They will include inspection of the new designs of sub-stations for bulk supply for small towns, suburbs and villages, from the 33 kV main system ; also representative country lines, including some on native timber treated on the Cobra process, single phase, 3 300 V, with special guarding and compound lines 3 300 V and 220 V, on the same poles. The route will include many of the beauty spots of mid-Cheshire and, by way of contrast, the salt district near Brunner Mond's Works ; also an inspection of subsiduary areas. The special type of lifting building will be inspected. It is hoped to assemble at Crewe at about midday, and to end at 6 p.m. at the same centre.

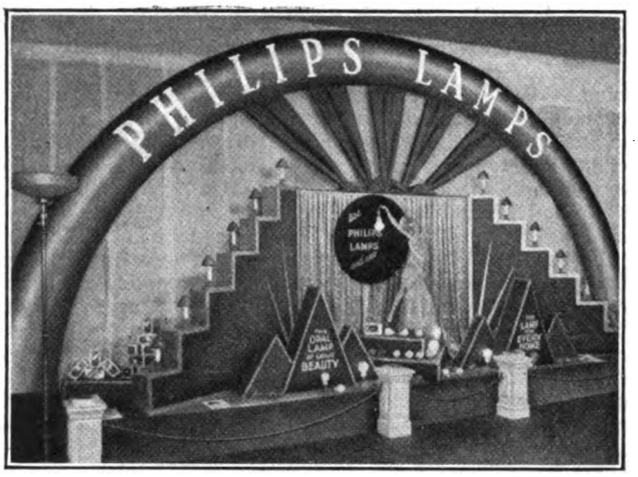
It is hoped that this visit, being held in the North Midlands, within easy reach of North Wales, Lancashire, Yorkshire and the South Midlands, will be attended by members from all parts. In the case of London members, a train, with restaurant car, will leave Euston at 8.30 a.m., stopping at Rugby and arriving Crewe at 11.36. Returning at 6.14 p.m., reaching London at 9.5.

In order to complete arrangements and to fix a date, members are asked to notify the Honorary Secretary before June 1st, giving him a list of the dates they have free during the first ten days of July.

BUSINESS ITEMS.

Messrs. SHIRLEY, electrical and wireless dealers, have opened a new showroom at 130, Cowley Road, Oxford.

T. BEADLE AND CO., LTD., of 3, 4, and 5, Castle Street, Hull, in addition to branches at Grimsby, Leicester and Liverpool, have opened a trade branch at 96, Hamilton Street, Birkenhead.



A special display of Philips lamps at the premises of Messrs. Lewis's of Liverpool.

The Ipswich branch of the GENERAL ELECTRIC CO., LTD., is moving, as from Monday, May 13th, from Commercial Union Buildings, Princes Street, to premises in Westgate Chambers, 40B, Westgate Street.

SIEMENS ELECTRIC LAMPS AND SUPPLIES, LTD., 38–39, Upper Thames Street, London, E.C.4, point out that each of the 11 new cars of the Swansea and Mumbles Railway has been equipped with "" Silvalux " gasfilled opal traction lamps.

The ELECTRIC FURNACE CO., LTD., 17, Victoria Street, London, S.W.1, has recently received a number of orders for furnaces in foreign countries, in some cases in spite of heavy import duties. These include two Héroult furnaces for India and Brazil, four Ajax-Wyatt furnaces, each of 600 lb. capacity, and four Ajax-Northrup high frequency furnaces varying from 15 cwt. to 2 cwt. capacity for France. A one ton Ajax-Northrup furnace will shortly be put into operation in France. This furnace, of which the output is equivalent to a four-ton arc furnace or an eight ton open hearth furnace, is claimed to be the largest high-frequency furnace yet constructed, and has been designed and built in Great Britain. Three 5-cwt. Ajax-Northrup furnaces will shortly be started in France, the order having been received last year.

BIRMINGHAM ELECTRIC FURNACES, LTD., 55, George Street, Birmingham, inform us that they have received an order from Moss Gears Co., Ltd., Tyburn, Birmingham, for an electric re-heating furnace. This firm has already three furnaces of the same make in operation. These comprise a large box type furnace for carburising ; a continuous rotating annular hearth furnace ; and a small box type furnace for re-heating purposes. Included among other recent contracts are a box type electric furnace for carburising, for the Alvis Car and Engineering Co., Ltd., Coventry ; an electric re-heating furnace for the same firm ; and three electric re-heating furnaces for David Brown and Sons, Ltd., Park Works, Lockwood, Huddersfield.

PROPOSED DOMESTIC APPLIANCES EXHIBITION.

A conference to discuss the possibilities of a periodical exhibition for household appliances was held recently under the auspices of the Household Appliances Section of the London Chamber of Commerce, among those present being Mr. T. G. Leith, of the G.E.C., and Mr. V. W. Dale, of the E.D.A. Mr. L. J. Hydle, chairman, said that he felt that the ironmongery and allied trades were now of sufficient importance to warrant their organising an exhibition of their own. Mr. L. Leith said that his company was of the opinion that more co-ordination could exist between manufacturers and ironmongers' in the sale and display of electrical appliances. It was decided that the Ironmongers Federated Association should be asked to approve the suggestion and to encourage manufacturers to support such an exhibition.

LEGAL INTELLIGENCE.

Hearing of Evidence in Respect of Extension of B.T.-H. Lamp Patent.

IN the Chancery Division, on Monday, Mr. Justice Luxmoore had before him an application of the British Thomson-Houston Co., Ltd., for an extension of their patent No. 10 918, dated May 8th, 1913, relating to gasfilled incandescent electric lamps. Applicants asked for an extension for five years, on the ground that they had suffered loss or damage owing to the war.

Sir A. Colefax, K.C., for the applicants, said the application was made under sub-section 6 of section 18 of the relevant Act. The patent had been the subject of litigation in this country, and its validity had been upheld by the House of Lords. The invention was made in the United States by a gentleman in the employ of the General Electric Co. of America. When war broke out considerable work had been done in this country by the British Thomson-Houston Co., who were the grantees and registered owners of the patent in the application of the invention to large-sized lamps, suitable for voltages generally obtaining here, and progress had been made in their manufacture. Since tungsten was not made in this country, filaments were made here from imported tungsten. When war broke out the applicants had to make suitable tungsten. Further, the gas essential for our voltages was argon for the smaller lamps, mixed with another gas in the larger sizes.

Lamp Sales.

His case was that in respect of the large lamps their manufacture was seriously interfered with, while application of the invention to smaller sized lamps would find the greatest use. In fact, it constituted to-day 70% of the actual sales in this country of lamps made in accordance with the invention. So far as the British Thomson-Houston Co. and their licensees were concerned, the company became a controlled establishment in 1915 and remained so till the middle of 1919. The lamp department was largely occupied in making wireless valves and special lamps required for military purposes. Their licensees were also controlled establishments.

His case was that the applicants had lost for four years the life of a valuable patent. The few lamps made in this country during the war were supplied to the Government, and in 1918 there was an importation of these lamps for Government purposes from Holland.

Notice of objection to the extension had been given by Mr. Claude H. Morrell and by Mr. A. H. Gower. An objection by Lissen, Ltd., was, he understood, withdrawn. There were objections by a union of French lamp manufacturers. The Nox Electric Lamp Co., who were represented by Sir Duncan Kerly, wanted a licence, which applicants were not indisposed to grant on certain terms and subject to royalties. Applicants had not refused a licence, except in one case for good reasons. The other objectors were Tungstalite, Ltd., the Nye Electric Co., Ltd., and the Nelson Electric Co., Ltd. They said that if applicants had suffered loss by reason of the war, they had more than recouped their losses since. They also said that prices were too high, but as last year 17 million of these lamps were sold in this country it did not look as if this were the case or as if the public were suffering. Another objection was that large dealers had been given the option that if they would take other lamps of the applicants they would receive a bigger discount on the patented lamps. The patent was in force, and had been extended in the principal European countries, with the exception of France, where it had been held invalid on the ground of alleged prior publication. The decision was to be the subject of appeal.

Affidavit evidence having been read, Sir Duncan Kerly said he was not there to oppose on behalf of the Nox Co., but his contention was that he had a concluded agreement for the grant of a licence, and he would ask his Lordship not to grant an extension unless he had a licence according to the agreement.

The hearing was continued on Wednesday and further adjourned.

Marconi Royalties.

The appeal by Marconi's Wireless Telegraph Co., Ltd., from a decision of Mr. W. S. Jarratt, Comptroller-General of the Patent Office, and Mr. H. C. Haycroft, his assistant, was again before Mr. Justice Luxmoore, in the Chancery Division, last week.

Sir Duncan Kerly, resuming his speech for the appellant, said the Marconi Co. had granted 2 200 licences and had never yet refused a licence to what might be described as a solid applicant. The Comptroller's decision was that the 12s. 6d. royalty was too high and that there was reason to believe it might exclude a body of possible buyers. There was no evidence to support that view.

Mr. Trevor Watson also addressed his Lordship in support of the appeal.

Mr. Moritz, for respondents, said this case affected a large body of traders and a trade of national importance, but there were no novel principles involved. Compulsory licences had been part of the law of this country for nearly fifty years and scores had been granted. The Marconi Co. never had manufactured broadcast receiving apparatus, but had a subsidiary company, the Marconiphone Co., to which it granted a licence to make apparatus. Dealing with his submission that there had been a refusal to grant a licence to the Brownie Co. on reasonable grounds, Mr. Moritz said there was a concealment of the fact that all licensees were not treated alike. Certain firms who could manufacture by mass production were granted special licence terms, while at the same time the other licensees were told that everybody was being granted licences on the same terms. It had come to the information of the respondents that the British Thomson-Houston Co. had never paid the scale of royalties suggested in the evidence, and that they had paid at the rate of 2s. 6d. per valve holder.

Sir Duncan Kerly said the British Thomson-Houston paid a 10s. royalty, and they continued to pay 10s. royalty down to just before the hearing of the case before the Comptroller. On the eve of the hearing they did not make their payment, and, in fact, they had made no payment since in this matter. They had not been pressed to make it, nor had any agreement been made. The matter was merely standing over, and no doubt it would be affected by the result of these proceedings. As regards the other licensees, until the Brownie application was made they continued to pay, but some of them, on that application being made, were allowed to let the matter stand over.

Mr. Moritz said he could not accept the evidence. Within the last twenty-four hours they had discovered that 10s. was not the rate at which the B.T.-H. Co. paid.

Mr. Shelley, for the Brownie Co., argued that any manufacturer must get a licence from the Marconi Co. or go out of business, but it did not follow that the licence was a reasonable one.

At the resumed hearing on Wednesday, the Attorney-General, Sir T. Inskip, gave the case for the Crown, after which Mr. Justice Luxmoore reserved judgment.

Marconi v. Langham Radio.

In the Official Referees Court of the High Courts on Monday, Sir Francis Newbolt, K.C., had before him an action brought by Marconi's Wireless Telegraph Co., Ltd., against Langham Radio, of 96, Regent Street, W., in which plaintiffs claimed a declaration that they were entitled to inspect the defendants books and accounts relative to certain licenses granted by the plaintiffs to defendants under a contract of May 6th, 1926, to ascertain the amount due and payment of the same. The matter came before Mr. Justice McCardie on January 23rd last, who sent it to the Referee, as the defendants submitted to judgment.

Mr. Samuels, for the plaintiffs, said the auditors found that there was due to the plaintiffs £11 066.

Mr. Gardiner, for the defendants, did not contest this, and the Official Referee entered judgment for plaintiffs for the amount stated, with costs.

FIBRE CONDUIT.

We have received from H. D. DOUGLAS AND CO., LTD., of 7, Victoria Street, London, S.W.1, particulars of "Bermico" multiple conduit, for the laying of underground cables. This conduit is made of fibre with sleeve joints, and, it is claimed, is immune from the action of those acids and alkalis commonly found in soil. The makers state that the dielectric strength when the conduit is dry is approximately 50 000 V, and is at present in use with cables carrying voltages of from 2 300 to 132 000. Several ducts of this material may be bound with iron bands, and in order to overcome the possibility of setting up an induced current in the bands when used for high tension work, they are fitted with fibre insulators.

IN PARLIAMENT.

London Passenger Traffic Bills Passed by House of Commons Committee.

THE L.C.C. (Co-ordination of Passenger Traffic) Bill, as amended by the Select Committee was discussed in the House of Commons last week.

Mr. G. M. Gillett moved to amend clause 2 so as to provide that a " reasonable return " on capital should not exceed 5% per annum or 1% in excess of the average Bank rate during the preceding year, whichever was the lower.

Sir H. Jackson opposed the amendment. The Committee had decided that the return must be such as would enable additional capital to be raised at above par. The amendment was rejected.

An amendment to leave out certain provisions in clause 3 relating to payments into a common fund was also defeated, as was an amendment proposed by Mr. E. Thurtle to limit the capital admissible as ranking capital. The Bill was passed for third reading.

In the discussion on the London Electric Railways Bill, Sir Henry Jackson said immediately after the passage of the Bill work would be begun on the extension of the Piccadilly tube from Finsbury Park (to Southgate). The third reading of this Bill was also agreed to.

Grampian Electricity Bill.

In consequence of the death of Viscount Younger, chairman of the House of Lords Committee which has been considering the Grampian Electricity Supply Co.'s Bill, and of the failure of the parties concerned to agree to the appointment of a new chairman, the Committee has been discharged, and if the measure is to be proceeded with, it will be necessary for it to be re-introduced and re-committed.

Mansfield Co.'s Trolley Vehicles Bill.

The Bill promoted by the Mansfield and District Light Railway Co. seeking powers to convert the existing tramway system to a trolley vehicle system, etc., came before the Local Legislation Committee of the House of Commons recently.

Mr. F. Wrottesley, K.C., for the promoters, said Mansfield Corporation had carried on a policy of incredible and reckless granting of licences for omnibuses. Unless protection was given to the statutory undertaking there must be an end of the system. The directors had decided that the tramways should go, as the streets of Mansfield were very narrow. The alternative was the trolley vehicle system. The promoters also sought power to construct as trolley vehicle routes, two authorised but as yet unconstructed tramway routes.

Sir Joseph Nall, chairman of the company, gave evidence in support of the Bill. He maintained that on established routes the trolley vehicle had every advantage over the petrol bus. He described the bus conditions in Mansfield as chaotic.

Mr. W. G. Marks, manager of Nottingham Corporation tramways, gave evidence as to the suitability of the trolley vehicle system for the proposed routes.

Mr. Arthur Collins, financial expert, said the gross cost of the proposed conversion would be £49 015, including £13 333 for the renewal of the tramway tracks.

Mr. Craig Henderson, for the Trent Motor Traction Co., Ltd., said it would be unjust to grant the monopoly.

Mr. James Haller, county surveyor for Nottinghamshire, said the proposed trolley vehicle route from Mansfield to Blidworth was unsuitable.

Alderman Beck, Mayor of Mansfield, said a conference of local authorities had decided that it would be to the general interest of the inhabitants to oppose the proposals.

The Committee approved the Bill, and decided to include the monopoly powers, and to introduce a clause protecting the interests of existing holders of omnibus licences on the specified routes. All new licences to ply for hire on the specified routes would be issued only to the promoters. The slight extension to the specified routes would be allowed, but the proposed trolley vehicle routes to Clipstone and Blidworth would not be sanctioned.

Derbyshire and Nottinghamshire Power Bill.

On April 25th the Unopposed Bills Committee of the House of Commons passed for third reading the Bill promoted by the Derbyshire and Nottinghamshire Electric Power Co. for new capital powers. The principal object of the Bill is to seek authority to raise further capital to the extent of £500 000 and to increase the borrowing powers by half that amount.

"JUBILEE OF LIGHT."

American Claims for Invention of the Incandescent Lamp.

FOR the information of readers who have not seen the full details of the American plans to honour Mr. Edison for the discovery of the electric incandescent lamp (actually invented by the late Sir Joseph Swan), we reprint below extracts from the N.E.L.A. " Bulletin " for April, which give some idea of the scale on which the celebrations are being organised :—

" The international celebration of the Golden Jubilee of Light—marking the fiftieth anniversary of the invention of the incandescent light bulb by Thomas Edison—will be inaugurated in Atlantic City, beginning on the evening of Friday, May 31, the inauguration festivities to continue throughout the fifty-second convention and exhibition of the N.E.L.A.

" In addition to opening the world-wide festival of light, the event will initiate a brilliant light display throughout the entire resort and approaching highways, to last until October 21st, the anniversary date.

"Fifty Golden Years."

" This year marks the fiftieth of fifty golden years of lighting and electrical progress. And October 21st, 1929, will mark the fiftieth anniversary of Thomas A. Edison's invention of the first practical incandescent lamp, the very corner-stone over which the electrical industry has raised itself.

" This golden year, then, and that golden day offer not only the vast lighting industry, but the entire civilised world, that long-waited-for opportunity to pay a fitting personal tribute to the master inventor for the greatest of all his gifts to mankind, and that opportunity to celebrate fittingly the fiftieth birthday of the incandescent lamp, both with Light's Golden Jubilee.

" According to extensive plans already taking shape, Light's Golden Jubilee will be just as much an occasion for serious retrospect, profound appreciation and genuine inspiration as it will be a celebration, gala, festive and jubilant. It will be a celebration exclusive to no one company, to no one industry, nor will it be limited to any single nation. It is upon the people of the world, upon a grateful people, that the blessings of Edison have been showered. Light's Golden Jubilee offers the electrical trade a golden opportunity to join hands with the world at large in standing beside the man who gave the world light without flame, the man whose life is an inspiration to all, the man who stands for all that is American and good. Individually and collectively the men of the electrical industry owe it to themselves to make Light's Golden Jubilee the greatest tribute ever paid a living man.

" Light's Golden Jubilee sponsoring committee, which is now being formed, will have at its disposal an adequate organisation to plan, to direct, and to co-ordinate the many events and activities of the jubilee. It is expected that the time between now and the National Electric Light Association convention at Atlantic City in June will be devoted to crystallising and perfecting plans and organisations, and preparing essential literature. It is the general plan to start the first of a great series of events relatively early, with the thought of leading up to a tremendous climax on October 21st —the fiftieth birthday of the incandescent lamp; October 21st will be ' The Night of Light,' and will be the occasion of a celebration and tribute to Thomas Edison which will encircle the globe and echo through the years that follow.

" Light's Golden Jubilee should be the occasion for jubilee lighting festivals all over the nation. It will call upon all branches of the industry to promote the movement nationally and locally. Every retailer, wholesaler, central station and manufacturer will have a twofold opportunity—first, of active direct participation, and, second, of encouraging others to participate.

" The jubilee will be magnificently supported by Henry Ford, Edison Pioneers, and close personal friends of Thomas Edison. All of Edison's original laboratories and machines are being moved to Dearborn, Mich., where Menlo Park will live again and through the years as part of the great Ford Museum of American Industry.

Following publication of the American proposals, we have received numerous protests from British electrical engineers against the action of the N.E.L.A., and there is increasingly strong support for the suggestion, made in our columns last week, that a formal letter of protest should be sent by the Institution of Electrical Engineers to the American organisations concerned.

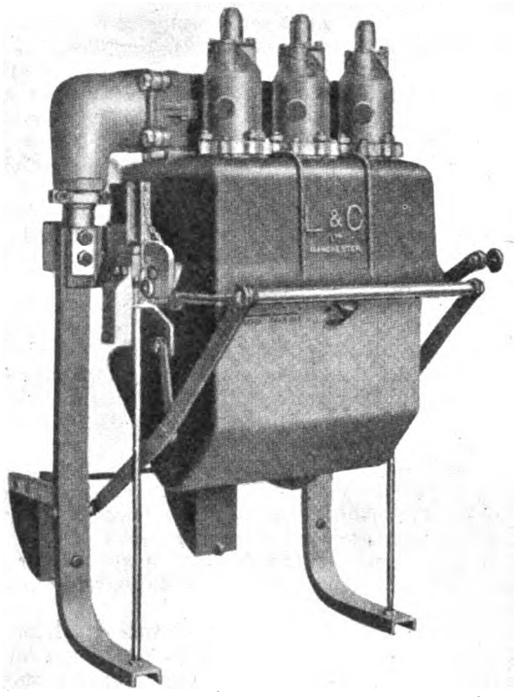
ISOLATING SWITCH FUSES.

WE have received from LONG AND CRAWFORD, LTD., 2, Gorton Road, Manchester, S.E., particulars of a self-isolating oil-immersed switch-fuse arranged for various types of line and cable terminal connections and designed for use on 3 300, 6 600, 12 500 and 33 000 V single and three-phase systems. The gear is equally suitable for mounting on overhead line pole cross arms, on a frame structure, or for kiosk and cubicle fitment.



One of the service type self-isolating oil immersed switch-fuses by Long and Crawford, Ltd.

The oil switch fuse unit is constructed in two main parts. The top or fixed portion carrying the through insulators and terminals for connections to the line and transformer on branch circuit, and the lower part containing the switch with its operating gear, replaceable fuses, and oil tank. The electrical connection between the two parts is made through concentric plugs and sockets forming the isolating feature of the gear, the latter being operated by the movement of a lever, which lowers the oil tank for fuse replacement by an extension of the same movement. Both plugs and sockets are completely shrouded and encased within the unit, and when opened are separated by a wide gap. No extraneous isolators are required. The switch, which functions under an adequate head of oil, has an independent operating handle so interlocked with the isolating gear that a mistake in the sequence of operations cannot occur. The fuses are of a replaceable type engaged in suitable carriers and forming the switch arm. They are always immersed in and freely open to the oil in the switch tank, and rupture the circuit under a good head. Access to the fuses can only be obtained when the switch has been opened, the isolators separated and the oil tank lowered.

INDUSTRIAL COUNCIL FOR WEST MIDLANDS.

The annual meeting of the District Industrial Council for the Electricity Supply Industry, in the West Midlands area, which deals with wages and conditions of service in the counties of Warwickshire, Staffordshire, Worcestershire and Shropshire, was held at the Chamber of Commerce, Birmingham, on April 22nd. The Council consists of an equal number of employer and trade union representatives. Coun. R. F. Dempster presided. During the year the West Midlands Joint Electricity Authority and Cannock U.D.C. Electricity Department became affiliated to the Council. It was reported that the number of men employed by undertakings affiliated to the Council totalled 3 400, while the weekly wages bill amounted to approximately £11 000. Special investigations with regard to various classes of labour have been carried out with every hope of settlements satisfactory to both sides. General wages rates as stabilised by the agreement made in December, 1927, have been continued and renewed to December 31st, 1929.

The Council expressed thanks to the chairman, Coun. R. F. Dempster (Amalgamated Engineering Union), to Mr. G. R. J. Parkinson (Midland Electric Corporation), vice-chairman, and to Mr. C. Heathcock, hon. secretary and treasurer.

WINDOW DISPLAY.

Interesting Competition Open to London Electrical Showrooms.

THE annual competition for challenge cups organised by the London "Evening News" and the British Association of Display Men, with gold, silver and bronze medals presented by the British Empire Union, and diplomas by the British Association of Display Men, will be held in the London Postal Area, during the period May 23rd to 30th, inclusive, concurrently with the Empire Marketing Board competitions.

That section of the competition which is of most interest to the electrical trade falls under Class 3, which is confined to displays of "Things to Use," which includes domestic electrical appliances. This class offers gold, silver and bronze medals, as well as diplomas.

The competitions are open to all retail shops and stores in the London Postal Area. Windows must be entirely dressed with merchandise produced in the United Kingdom (Great Britain, Northern Ireland and any other part of the Empire). The inclusion of goods produced in foreign countries, even though packed in Great Britain or Northern Ireland, will disqualify an entry.

Entry forms may be obtained from the Secretary, the British Association of Display Men, 11, Berkeley Street, London, W.1, and must reach that address not later than May 13th. On receipt of entry form, each competitor will have posted to him a special window strip and card, and no display will be eligible for the competition which fails to show the card in a prominent position. Windows must be dressed for the period May 23rd to 30th, inclusive. The preliminary judging will be carried out by a personal visit of judges appointed by the British Association of Display Men, and a card will be handed to the competitor when his displays have been judged. The judges, during the preliminary test, will select in each district the two best competitors in each class for consideration by the central committee of judges for the challenge cups. Each competitor successful in this preliminary test will be asked to have a photograph of his window, as dressed for the judging, sent to the Secretary of the British Association of Display Men. Such photographs to reach him by June 5th, with the class and grade written on the back of the photograph with name and address. Any competitor failing to submit a photograph by that date will be disqualified. The arrangement of grades is:—Grade "A"—shops and showrooms employing 11 or more assistants; Grade "B"—6 to 10 shop assistants; Grade "C"—5 or less assistants. Points will be allotted by the judges on the following basis:—capacity of the display to sell merchandise, 20 points; originality of design or arrangement, 20 points; general attractiveness and neatness, 20 points; simplicity, 10 points; workmanship, 10 points; inexpensiveness of display and use of least accessories, apart from goods, 10 points; neatness in displaying price tickets and advertising matter, 10 points.

ELECTRICAL WOMEN.

Details of the Summer Outing—The Annual Conference—The Birmingham Branch.

THE summer outing of the Electrical Association for Women will be held on June 12th, when a visit to Ashford will be made by the invitation of the Ashford District Branch. The party will travel by motor coach via Maidstone and members will be received at Ashford by the chairman of the Urban District Council, to be followed by a visit to the electricity works. Tea will be served and a garden party held at "Gleniffer Brae," the home of Mr. and Mrs. H. Wilson, members returning to London at 10 p.m. Those intending to be present should notify the Director by June 3rd.

The conference and annual general meeting will be held at Newcastle-on-Tyne, on July 10th, 11th and 12th, by the invitation of the N.E. Coast Branch.

Members of the Birmingham and Midlands Branch paid a visit on April 25th to the needle factory of Henry Milward and Sons, Redditch, about 70 forming the party. The factory is entirely electrically equipped. At the conclusion of the visit, every member was presented with a souvenir of the visit in the form of a needle case. Mrs. H. K. Beale, president, delivered a vote of thanks to the firm and staff for all they had done.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, when available.

AYR DISTRICT COMMITTEE.—Electric light wiring in District Fever Hospital, Old Cumnock. Specification from Mr. J. E. MacEwan, 62, Robertson Street, Glasgow, C.2.

CARDIFF CORPORATION.—Electric lighting of High School, Girls' Extension, The Parade, Cardiff. Specifications from the City Electrical Engineer.

MELTON MOWBRAY URBAN DISTRICT COUNCIL.—Electric light wiring of Egerton Lodge, Melton Mowbray. Forms of tender from the surveyor, Mr. W. H. Jarvis, Corn Exchange, Melton Mowbray.

ST. PANCRAS (LONDON) BOROUGH COUNCIL.—Electric motor driven pump. Specification, etc., from Electricity Department, 57, Pratt Street, Camden Town, N.W.; deposit £1.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, May 10th.—(a) Main 33 000 V switchgear, each circuit breaker having rupturing capacity of not less than 1 500 000 kVA; (b) auxiliary 33 000 V switchgear, each circuit breaker having rupturing capacity of not less than 500 000 kVA, with group feeder reactors, for Ironbridge power station. Specification (No. 4) and form of tender from Mr. E. F. Hetherington, chief engineer and manager, Phœnix Buildings, Dudley Road, Wolverhampton; deposit £2 2s.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, May 10th.—(1) One 50 000 kW turbo-alternator, with step-up transformers, etc.; (2) condensing plant, boiler-feed pumps, evaporators, etc.; (3) circulating water pumps, etc., for Ironbridge power station. Specification (No. 2) and form of tender from Mr. E. F. Hetherington, chief engineer and manager, Phœnix Buildings, Dudley Road, Wolverhampton; deposit £2 2s.

BLACKBURN CORPORATION, May 11th.—Supply of 10 drums of l.t. cable. Further particulars from the Electrical Engineer, Town Hall, Blackburn.

SOWERBY EDUCATION DEPT., May 11th.—Electric light installation in Heptonstall Council School and head teacher's house. Specifications from Mr. A. Beilby. Education Offices Sowerby Bridge.

STOCKPORT CORPORATION, May 11th.—Supply of two wireless sets for elementary schools. Specification can be seen at the Education Offices, Town Hall, Stockport.

WEST RIDING EDUCATION COMMITTEE, May 11th.—Electric light installation in South Crosland Netherton Council School Specifications from Mr. W. Heeley, 4, Macaulay Street, Huddersfield.

LONG ASHTON RURAL DISTRICT COUNCIL, May 13th.—Electric light installation in Council houses at Fenswood, Long Ashton. Particulars from Mr. A. E. Hicks, clerk, Flax Bourton, Bristol.

GLASGOW CORPORATION, May 14th.—Electric lighting installation at Haghill No. 2 housing scheme (tenement section), intermediate type. Specifications, etc., from the General Manager, Electricity Department, 75, Waterloo Street, Glasgow.

Electric Trolley Wire.

MANCHESTER CORPORATION, May 14th.—Cadmium copper trolley wire, and copper bands for tramway rails. Specifications, etc., from the General Manager, Corporation Tramways, 55, Piccadilly, Manchester.

WEST RIDING EDUCATION COMMITTEE, May 14th.—Electric light installation in mixed and infants' departments of Robin Hood School, Rothwell. Specification, etc., from Mr. Percy Beaumont, Education Offices, 8, St. John's North, Wakefield.

WOOLWICH GUARDIANS, May 15th.—Supply of electrical refrigerator, for use at the Institution, Plumstead High Street, London, S.E.18. Specification from the Clerk, Union Offices, 99, Rectory Place, Woolwich, S.E.18.

GLASGOW CORPORATION, May 16th.—Supply of (2) l.t., paper insulated, one, two, three and four core and e.h.t. cables; (3) small i.r. insulated cables and flexibles; (4) electric cookers; (5) meters; (6) arc lamp carbons; (12) electric kettles, for 12 months. Specifications from the General Manager, Electricity Department, 75, Waterloo Street, Glasgow, C.2. State whether cable schedule (2) or (3) is required.

HULL CORPORATION, May 16th.—Supply and laying of underground cables. Specifications, etc., from Mr. J. N. Waite, city electrical engineer and manager, Electricity Works, Sculcoates Lane, Hull; deposit £2 2s.

CHERTSEY GUARDIANS, May 18th.—Electric lighting installation at the Institution, Ottershaw, near Chertsey. Specifications from Mr. F. J. Wareham, clerk, Council Offices, West Byfleet, Surrey.

PANNAL (YORKS) PARISH COUNCIL, May 20th.—Electric or gas lighting, from October 1st to March 31st, for three years. Further particulars from Mr. J. H. Brooksbank, clerk, Lund House Green, Harrogate.

BELFAST CORPORATION, May 21st.—Manufacture, supply and erection of (*a*) h.t. armour-clad switchgear (specification No. W. 80), and (*b*) air preheaters for boilers (No. W.81); also for manufacture and supply of (*c*) 22 000 V, three phase transformers (No. W.82), and (*d*) cable drum trailer and tractor (No. W.83). Specification, etc., from Mr. F. H. Whysall, city electrical engineer, East Bridge Street, Belfast; deposit £2 2s. each for items (*a*), (*b*) and (*c*).

Overhead Lines.

BELFAST CORPORATION, May 21st.—Manufacture, supply and erection of 22 000 V, 3-phase overhead transmission line. Specification (No. W.84), etc., from Mr. F. H. Whysall, city electrical engineer and general manager, East Bridge Street, Belfast; deposit £2 2s.

BETHNAL GREEN (LONDON) BOROUGH COUNCIL, May 22nd.—Electric lighting installations in two blocks of tenement buildings. Specification, etc., from Mr. H. W. Couzens, 9, Old Queen Street, London, S.W.1; deposit £2 2s.

LARNE GUARDIANS, May 22nd.—Electric light installation in connection with conversion of workhouse buildings into a district hospital. Specifications can be seen and forms of tender obtained at the office of Mr. W. Pleasance, 44, Wellington Place, Belfast, or at the Union Offices, Larne.

RICHMOND (SURREY) GUARDIANS, May 22nd.—Re-wiring for electric lighting of certain buildings at Grove Road Institution, Richmond. Particulars from Mr. C. L. Fenn, Guardians Offices, Parkshot, Richmond, Surrey; deposit £1.

WEST LANCASHIRE RURAL DISTRICT COUNCIL, May 23rd.—Electric lighting scheme for parish of Aughton. Specifications, etc., from Mr. James Scott, 358, Royal Liver Building, Liverpool; deposit £2 2s.

BOOTLE CORPORATION, May 24th.—Electrician's work in connection with erection of 122 houses, under the Northfield Road housing scheme. Specifications from the Borough Engineer, Town Hall, Bootle; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, May 25th.—Supply and erection of 33 000 V metal clad switchgear, in connection with South-East England Electricity Scheme. Specification (No. S.E.E.—G.S.1) from Mr. Richard H. Fox, secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

EPSOM URBAN DISTRICT COUNCIL, May 25th.—Supply and erection of l.t., d.c. switchboard, with the changing over of connections, with certain instruments and gear from the existing switchboard. Specification, etc., from the Resident Electrical Engineer, Electricity Works, Depot Road, Epsom; deposit £3 3s.

GEORGE HERIOT'S SCHOOL, EDINBURGH, May 30th.—Electrical installation. Specification, etc., from Mr. John Anderson, superintendent of works, 20, York Place, Edinburgh.

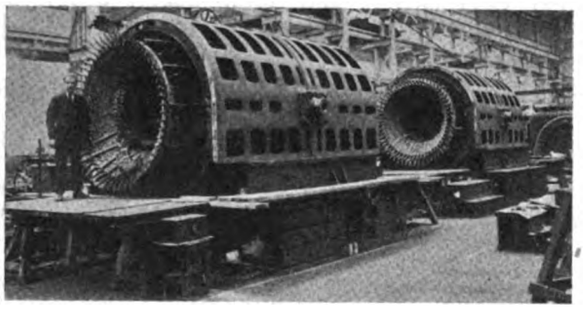
SUTTON AND CHEAM URBAN DISTRICT COUNCIL, June 7th.—Installation of fire alarm system, connected with the fire station. Plans showing positions of fire alarm boxes, etc., from the Engineer and Surveyor.

CROYDON CORPORATION, June 3rd.—Supply and erection of (*a*) one 20/25 000 kW turbo-alternator, with condensing plant, pumps, etc.; (*b*) boiler house extensions, with two 100 000 lb. per hour boilers, stand-by coal conveyor from siding, coal-handling plant at siding, steam piping and receiver, etc.; (*c*) engine room extension, switch house, bridges, and pump house; (*d*) 6 600 V switchgear, transformers, etc. Specifications, etc., from the Engineer and Manager, "Electric

Digitized by Google

House," 38, High Street, Croydon; deposit £1 1s. for each section.

EAST HAM EDUCATION COMMITTEE, June 12th.—Electric lighting installation at the Salisbury School. Specification, etc., from the Secretary, Education Office, Town Hall, East Ham, London, E.6; deposit 10s. 6d.



ALTERNATOR stators for 3 000 r.p.m. steam turbine and alternator sets in course of manufacture at the works of the English Electric Co., Ltd. The stator in the foreground is for a 37 500 kVA set being constructed for West Ham. The turbine will have a h.p. cylinder and two l.p. cylinders exhausting into a single-body condenser, which will be the largest of its type so far produced at Rugby, with a weight of some 100 tons. The second stator is for the 31 250 kVA turbo set under construction by the same company for Leicester Corporation. Readers may recall that a set practically identical with the latter was recently ordered by Sheffield Corporation.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

NEW SOUTH WALES PUBLIC WORKS DEPARTMENT, May 13th.—Supply and erection of synchronous condenser (contract 257, 28). (Reference B.X. 5 205.)

POSTMASTER GENERAL'S DEPARTMENT, MELBOURNE, May 14th.—Loading coil pots (schedule C. 433). (Reference B.X. 5 284).

EGYPTIAN MINISTRY OF PUBLIC WORKS, May 15th.—Supply and erection at Government Printing Office, Cairo, of 120 kW d.c. Diesel electric generating set, with foundations, artesian well, electrically-driven water cooling pump, etc. Forms of tender, etc. (10s. 6d.) from Chief Inspecting Engineer, 41, Tothill Street, London, S.W.1.

MELBOURNE AND METROPOLITAN TRAMWAYS BOARD, May 15th.—Supply of 500 kW sub-station rectifier unit, arranged for automatic control, with necessary switchgear (contract 677). (Reference B.X. 5 206.)

MELBOURNE AND METROPOLITAN TRAMWAYS BOARD, May 15th.—Supply of sub-station units for automatic control, comprising two rotary converters of 1 000 kW and one of 500 kW (contract No. 678). (Reference B.X. 5 210.)

PRETORIA MUNICIPALITY, May 20th (extended from May 6th).—Supply of cables, switchgear and transformers. (Reference B.X. 5 245.)

SOUTH AFRICAN POSTS AND TELEGRAPHS, May 23rd.—Supply of rubber covered wire and telephone cable (contract No. 153). (Reference B.X. 5 229.)

INDIAN STORES DEPARTMENT, May 27th.—Supply of 500 kW, 6-phase rotary convertor, starting panel, etc. (order No. N./9 736). (Reference B.X. 5 279.)

VALPARAISO PORT ADMINISTRATION, June 1st.—Four electric travelling cranes of portal type (capacity 3 metric tons each). (Reference A.X. 7 892.)

AUCKLAND ELECTRIC POWER BOARD, June 3rd.—Supply of cables and accessories. (Reference B.X. 5 248.)

NEW SOUTH WALES PUBLIC WORKS DEPARTMENT, June 4th.—Supply of 18 electrically operated water level indicators (contract No. 61/1928–29 W.S. and S.). (Reference B.X. 5 233).

VICTORIAN ELECTRICITY COMMISSION, June 4th.—Supply of 22 000 V transformers and spares (specification No. 29/36). (Reference B.X. 5 216.)

NEW ZEALAND POSTS AND TELEGRAPHS, June 18th.—Supply of telephone cords (No. P. and T. 151/1425). (Reference B.X. 5 251.)

VICTORIAN RAILWAY COMMISSION, June 26th (extended from May 15th).—Supply of geared, three-phase, electric winding engine. (Reference A. 7 630.)

SOUTH AFRICAN POSTS AND TELEGRAPHS, June 27th.—Automatic wall and table pattern telephones (tender No. 158). (Reference B.X. 5 273.)

STATE ELECTRICITY WORKS, MONTEVIDEO, July 8th.—Construction and equipment of 50 000 kW power station.

POSTMASTER GENERAL'S DEPARTMENT, MELBOURNE, July 9th.—Resistances and reactances (schedule C. 426). (Reference B.X. 5 281.)

NEW SOUTH WALES GOVERNMENT RAILWAYS, July 10th.—One 750 kW turbo-alternator; 2 200 V ironclad switchgear; two switch operating batteries; and two motor generator sets. Specifications from the Chief Electrical Engineer, 61, Hunter Street, Sydney.

NEW ZEALAND POSTS AND TELEGRAPHS, July 16th.—Telephone bells (P. and T. No. 151/1 444). (Reference B.X. 5 272.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, August 6th.—Supply of 120-ton, four-motor, overhead travelling crane and runway (specification No. S.M. 358). (Reference A.X. 7 810.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, August 13th.—Water turbine driven generating sets and switchgear, for Waitaki power development (section 2). (Reference B.X. 5 278.)

Tenders Accepted.

GENERAL POST OFFICE.—Edison Swan Electric Co., Ltd., charging tablets.

MERSEY DOCKS AND HARBOUR BOARD.—Callender's Cable and Construction Co., Ltd., electric cables.

HULL CORPORATION.—Siemens-Schuckert, supply of cables to telephones department, £279 9s. 3d. (Recommended.)

SHEFFIELD CORPORATION.—Rees Roturbo Manufacturing Co., Ltd., motors and pumps for Rivelin water pumping station, £1 055 15s.

MALVERN URBAN DISTRICT COUNCIL.—Pirelli-General Cable Works, Ltd., about 1 000 yards of h.t. concentric cable, class 3, £550 per 1 000 yards.

SOUTHEND CORPORATION.—General Electric Co., Ltd., h.t. switchgear and transformers, £5 220 2s. 10d.; Union Cable Co., Ltd., l.t., a.c. cable, £9 501 7s.

LEICESTER CORPORATION.—Hayward-Tyler and Co., Ltd., supply of three electrically-driven pumps for Belgrave pumping station, £4 097. (Recommended.)

LIVERPOOL CORPORATION.—Mather and Platt, supply, erection and maintenance of electrically operated pumping machinery at Aubrey St. Station, £2 840.

METROPOLITAN ASYLUMS BOARD.—Alpha Mfg. and Electrical Co., Ltd., installation of automatic telephone system at North Western Hospital. (Recommended.)

BRISTOL DOCKS COMMITTEE.—English Electric Co., Ltd., eight spare electric motors, for use in connection with grain elevators at Royal Edward Dock extension.

FULHAM (LONDON) BOROUGH COUNCIL.—S. Smith and Son, £20, five "Wootton" electric safety lamps, with charging apparatus, for use in sewers, £20. (Recommended.)

GLASGOW CORPORATION.—W. F. Dennis and Co. (for Felten and Guilleaume), copper trolley wire (German manufacture), £1 260. (Recommended.) Lowest British offer for same quality, £1 372.

GLOUCESTER CORPORATION.—General Electric Co., Ltd., supply and erection at the electricity works of two 1 000 kW motor generators for conversion of 11 000 V, 50-cycle, a.c. to 460/500 V d.c.

LIVERPOOL CORPORATION.—Annual supplies: Alternating current motors and starting gear, Crompton Parkinson, Ltd., English Electric Co., Ltd., British Thomson-Houston Co., Ltd., and Airedale Electrical and Manufacturing Co., Ltd.; insulated cables, Mersey Cable Works, Ltd., Geipel and Co., Ltd., and Edison Swan Electric Co., Ltd.; electricity meters, Ferranti, Ltd.; incandescent lamps, Tungstalite, Ltd.

ST. PANCRAS (LONDON) BOROUGH COUNCIL.—Electric Construction Co., Ltd., supply and erection of kiosk type sub-station and switchgear, £388. (Recommended.) Other tenderers: Johnson and Phillips, Ltd., £436 and £491; General Electric Co., Ltd., £513; Ferguson, Pailin, Ltd., £513 19s.; British Thomson-Houston Co., Ltd., £541; Park Royal Engineering Co., Ltd., £565; Crompton, Parkinson, Ltd., £574 (plus rough labour); New Switchgear Construction Co., Ltd., £669; Switchgear and Cowans, Ltd., £675; Whipp and Bourne, Ltd., £887 10s.; J. G. Statter and Co., £895.

WIRELESS NOTES.

Advance Particulars Concerning the National Radio Exhibition of 1929.

THIS year's National Radio Exhibition will be held at the New Hall, Olympia, London, from September 23rd to October 3rd, the promoters being the Radio Manufacturers' Association. The positions of applicants for space will, as in former years, be made by ballots, one being for members of the R.M.A., and another for non-member applicants, so long as application is made by May 31st. After that date applications will be dealt with in order of date and space allotted accordingly, if available. All exhibits must be of British manufacture.

The conditions of the exhibition are the same as in previous years, except that this year special arrangements have been made whereby loud speakers, whether independent units or incorporated in receivers, may be demonstrated at certain times of each day of the show. The input for these demonstrations will be common and will be supplied by the organisers, local amplification or demonstrations of reception are, however, prohibited. The use of accumulators or batteries for lighting and power will not be allowed and the organisers have arranged to carry out all wiring requirements of exhibitors both as regards loud speaker demonstrations and stand lighting.

The layout of the ground floor of the exhibition is the same as last year with the exception that a double staircase will be provided for admittance to the gallery. The latter will this year be devoted to exhibitors' stands to the exclusion of the dance floor and the large space occupied in previous years by the B.B.C. Some of the additional space thus gained will accommodate twenty-five specially constructed cabinets or rooms, wherein loud speaker demonstrations may be conducted from the common input or from gramophone records.

Radio Wholesalers' Federation.

At a meeting of the new Council of the Radio Wholesalers' Federation, held on May 1st, Messrs. C. H. G. Hobday, of Hobday Brothers, Ltd., and W. A. Hunt, of the London Electric Stores, Ltd. were co-opted members. The officers for the year were elected as follows:—CHAIRMAN, Mr. E. W. Houghton, Houghton-Butcher (G. B.), Ltd.; VICE-CHAIRMAN, Mr. B. R. Banks, Brown Brothers, Ltd.; HON. TREASURER, Mr. A. G. Beaver, the Sun Electrical Co., Ltd. The above gentlemen, with Mr. T. Beadle, T. Beadle and Co., Ltd., again constitute the Federation's Liaison Committee.

A "Fultograph" photo-electric transmitter has been installed at Hilversum, and experimental broadcasts of still pictures will commence this month. The present stations offering "Fultograph" service are 5XX, 5GB, 2LO, and Vienna. Radio-Paris will shortly be added to the list.

Mr. W. H. J. Ryder, of North Shields, has presented the Tynemouth Jubilee Infirmary with a "Met-Vick" all-electric 5-valve wireless set. The apparatus is fitted with volume controls where required, and operates off a 240 V 40 cycle supply, for 70 headphones and six loud speakers.

THE NATIONAL REGISTER.

Executive Committee Approves Seventeen Applications from Contractors.

AT the May meeting of the Executive Committee of the National Register of Electrical Installation Contractors, held at the Institution of Electrical Engineers on May 3rd, twenty-eight applications from electrical contractors for admission to the National Register came up for consideration. Of these ten were declined and one was withdrawn.

The names and addresses of the seventeen successful applicants are given below:—

Belshaw and Co., Ltd., 68, Victoria Street, Westminster, London, S.W.1.

Burrell, R. C., 1, Back James Street, Harrogate.

Bush, E., and Co., 26, Sunbridge Road, Bradford.

Collins, C., 32, Denbigh Place, London, S.W.1.

Forrest and Webb, 12, Elmhurst Road, Handsworth, Birmingham.

Girdler, Edward, 131B, Streatham Road, Mitcham, London, S.W.16.

Holt, Allan, Electrical and Sanitary Engineering Co., 2, College Square East, Belfast.

Law and Carruthers, 1A, Cross Street, Bury, Lancs.

McMaster, Malcolm, Kerrsland Drive, Upper Newtownards Road, Belfast.

Maddocks, E. S., 6B, Flixton Road, Urmston, near Manchester.

Nicholson and Ade, 31-35, South Street, Eastbourne.

Podmore, Colin, J., 41, High Street, Longton, Stoke-on-Trent.

Shrosbery, Bakewell and Co., Ltd., 69, Crouch Street, Colchester.

Sothers, C. A., Ltd., 156, Hockley Hill, Birmingham.

Taylor, Percy, 98, Station Road, Taunton.

Troy, F., and Co., Ltd., 194-6, Finchley Road, Hampstead, London, N.W.3.

York, William, H., 11, Alcester Road, South, King's Heath, Birmingham.

ELECTRIC TRACTION.

Scottish Tramway Orders Inquiry—Applications for Restriction of Competition.

A COMMISSION, presided over by Lord Lamington, held an inquiry last week into applications by owners of tramway undertakings for Provisional Orders.

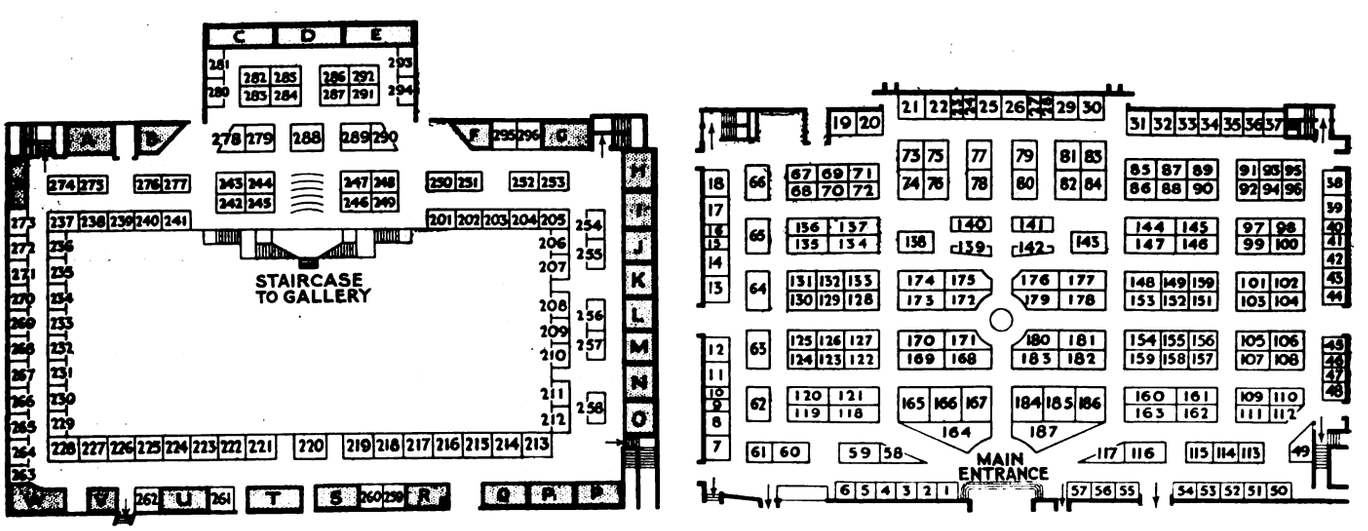
Ayr T.C. asked for power to run omnibuses in the burgh and five miles from the burgh boundary, and for protection from competition along the existing tramway route.

Mr. T. A. Gentles, K.C., for the Corporation, said the loss on the tramway undertaking last year was £1 849.

Mr. Wm. Grant, manager of the undertaking, said if the powers asked for were not granted he saw no hope of being able to run the tramways without a loss.

The Commission found the preamble of the Order not proved.

[Details of the other applications are unavoidably held over.]



A plan of the gallery on the left, with the ground floor on the right, showing the stand arrangements for the National Radio Exhibition, to be held in the New Hall, Olympia, London, in September. The shaded portions indicate the special loud speaker demonstration cabinets, all of which have already been allotted to R.M.A. members.

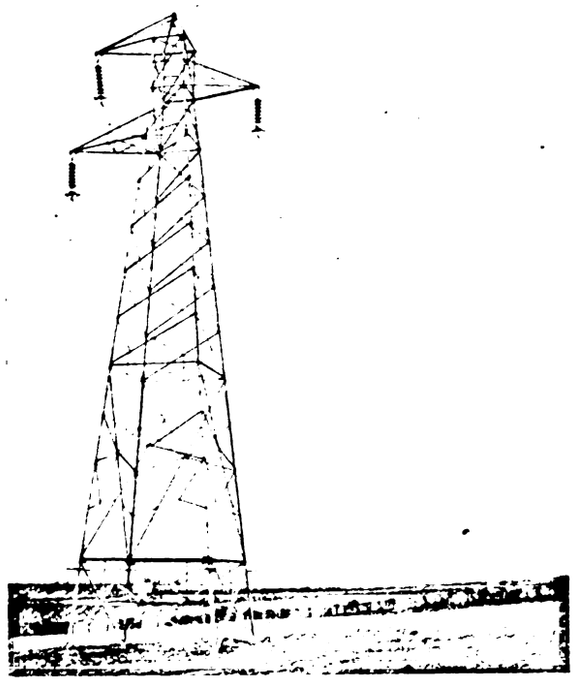
ELECTRICITY SUPPLY.

Additional Plant for Aldershot—Chester Extensions—Assisted Wiring at Bolton—Porthcawl Loan Refused—Loans for Cables, etc., at Marylebone.

WALSALL Electricity Committee is to extend mains at a cost of £7 000.

Aldershot T.C. has applied for a loan of £4 560 for an additional 1 000 kW set.



THE switching in, at full pressure, this week of the first 20 miles of overhead lines in connection with the Central Scotland Electricity Scheme, marks another milestone on the path of electrical progress. It is worth recording that this is the first transmission at 132 000 V in Great Britain. The section referred to will supply power from Dalmarnock sub-station, Glasgow, to Bonnybridge. A short section of line erected by the same contractors, British Insulated Cables Ltd., of Prescot, but situated in England, between Bedford and Little Barford, was made alive last week and is in commission at 33 kV. The latter voltage will be raised to 132 kV as soon as the rest of this scheme is completed.

Hornsey electricity department is to supply St. Luke's Hospital, Muswell Hill.

All lamps in the main roads of Conway have been converted from gas to electric lighting.

Coventry Electricity Committee seeks sanction to borrow £7 621 for extensions of mains.

Croydon Electricity Committee has accepted tenders for the erection of four sub-stations.

Heston and Isleworth Electricity Committee is to carry out mains extensions to cost £13 566 10s.

Formby U.D.C. has applied for a loan of £6 500 for electricity purposes for the next three years.

Nottingham Corporation has applied for a loan of £150 000 for extensions of mains and transformers.

Stoke Newington (London) B.C. has obtained sanction for a loan of £3 000 for free wiring installations.

Forres T.C. has concluded an agreement with the Grampian Electric Supply Co. for lighting in the town.

Wimbledon Finance Committee has received sanction to borrow £3 428 for a sub-station site and buildings.

Chailey R.D.C. has decided not to object to the construction of an overhead 11 000 V line between Haywards Heath and Uckfield.

Torquay Corporation has obtained an Order to supply the premises of the Co-operative Wholesale Society in Buckfastleigh U.D.C.

Barnstaple Lighting Committee is to apply to the Commissioners for sanction to a loan of £6 750 for a 300 kW Diesel generating set.

Plans for the erection of two sub-stations at Butterhill Triangle and Beacon Hill have been approved by Torquay Electricity Committee.

Tilbury U.D.C. has applied for loans of £5 000 for mains and services, £750 for plant, £4 200 for domestic apparatus, and £2 350 for wiring installations.

The Commissioners have sanctioned loans of £6 260 for the construction of stores for Burnley electricity department and £35 000 for mains extensions during the next three years.

The Whitehall Securities Corporation, which holds the whole of the shares in the Wellington District Electricity Co., proposes to take electricity in bulk to Wellington (Somerset) from Exeter.

Chester City Council has received sanction to a loan of £18 000 for overhead mains and £2 000 for outdoor sub-stations and equipment in connection with the supply to Kelsall, in the area of Northwich R.D.C.

Bolton Electricity Committee has adopted a scheme of assisted wiring. The Water Committee has made tentative arrangements with the Lancashire Electric Power Co. for a supply in connection with the Bromiley Well.

By the reductions in the charges approved of by Liverpool City Council last week, the drop in the revenue from Liverpool and Bootle will amount to about £21 000. The reduction in the other areas will bring the total decrease to £34 499.

Porthcawl U.D.C., having failed to obtain from the Electricity Commissioners sanction to a loan of £23 000 for electricity supply purposes, has decided to open negotiations with companies, individuals, and other authorities with regard to a supply.

Marylebone B.C. electricity department is to lay cable and put in electric lighting equipment at the chapel at East Finchley cemetery.—The Electricity Committee has received sanction to borrow £115 652 for electricity cables, switchgear, and transformers.

The Exe Power Experiment Association has been informed that the Board of Trade will grant permission to moor two pontoons in the Exe estuary, for the purpose of ascertaining what power can be obtained from the tidal waters, in connection with the scheme for harnessing the Exe for electrical purposes.

In submitting the 1929-30 estimates to Edinburgh T.C. last week, Treasurer Harvey said for electricity the estimate was nearly £400 000. The reason for that figure was the desire to complete as rapidly as possible Portobello station, which was becoming a generating station for Scottish national purposes.

The Irish Free State Electricity Supply Board has notified the Mayor of Limerick that the Board has placed the contract, for the distribution system for the city, valued at about £32 000. The work will commence in about a month's time, and is due for completion by mid-September. The network, when completed, will be fed from the temporary station at Ardnacrusha, pending Shannon supply. When Shannon supply is available in Limerick, the existing station will be shut down and dismantled.

Lancaster T.C. has applied for a Special Order to increase its area of supply so as to include (inter alia) the township of Heaton-with-Oxcliffe. Morecambe T.C. has notified Lancaster Council of a desire to take over the White Lund factory and the immediately adjoining area as part of its supply district, and that no objection will be raised to Lancaster Council's application, subject to this area being transferred to the Morecambe undertaking.—Lancaster Electricity Committee proposes to borrow £27 000 for two new boilers for the Caton Road station.

Mr. F. Gordon Tucker, on May 1st, held an inquiry into the application of the Maidstone T. C. to take an overhead 6 000 V cable to Aylesford, Ditton, and East Malling. Mr. E. E. Hoadley said the Corporation wanted to supply the Empire Marketing Board fruit preservation station, and the East Malling research station, and continue to West Malling, where the Corporation had already contracted for street lighting. There were objections on the grounds of alleged disfigurement of the countryside by the poles and inadequacy of the offer of 2s. per pole. The inspector said if electricity was to go into rural areas it had, in the main, to go overhead at the cheapest possible rate.

ELECTRICAL NEWS OF THE WEEK IN PICTURES.

A new electrically-operated flashing sign which has been installed on the London-Southend road.

A group taken during the recent Salesmen's Conference of the Chloride Electrical Storage Co., Ltd., at Clifton Junction. Many, if not all, of the faces will be familiar to the trade, in spite of our reduction of the photograph for reproducing purposes.

Visitors and officials, taken outside the new Colchester automatic telephone exchange, on the occasion of the recent inspection by the Mayor, Coun. John Russell, and members of the Council.

The "Relay" private automatic branch telephone exchange of Cardiff Corporation was opened on Wednesday, by the Lord Mayor, Ald. W. R. Williams. The system includes four switchboards, connecting the City Hall, the Law Courts, and the Electricity Departments at the Hayes and Ninian Park Road. The police charge room is shown above.

A substantial order has been placed by the Post Office with a London manufacturer for a new type of telephone receiver, an illustration of which is given above. The instrument is intended as an alternative to the type at present in use, and, designed by the Post Office Engineering Department, may be adapted for automatic or manual exchanges.

COMPANY NEWS.

Quiet Market for Electrical Shares—Anchor Cable Co.'s Increased Dividend—Shanghai Electric Construction's Improved Position—Expansion of Richmond Co.'s Undertaking—Associated Electrical Industries' Meeting.

THE market for the shares of electrical undertakings—supply, transportation, equipment and telegraph—has been quiet during the past week, and changes in our list of price quotations are few and far between. Two outstanding features call for notice. Shropshire, Worcestershire and Staffordshire Power "B" shares have risen a further 3s. 9d. above £2; and British Insulated Cables ordinary shares, which for a long while past have been creeping up, have been marked down 25s. after deduction of the share bonus. For the first time for a long while, the telegraph section, including Eastern and Marconi issues, is without change.

These payments, with £52 500 income tax, absorbed £262 500, being the rent paid by the Western Union Telegraph Co. for the year, equal to 3½% on ord., 6% on pfd. and 1½% on dfd.

Digitized by Google

stk. Blce. at credit of rev. acct., £65 625, is available for paymt. of divs. for qrtr. to March, 1929.

BRUSH ELECTRICAL ENGINEERING CO., LTD.—Accts. for 1928 show that, after provg. for gen. charges, maintenance of plant and bldgs., int. on deb. stks., income tax, and £16 681 for depreciatn. of bldgs .and plant, net pft. is £67 406. To gen. res., £6 010; div. (10%), £47 640; further 4% int. on prior lien participatg. 2nd deb. stk, £2 044; to surplus acct. for apportionmt. btwn. shhldrs and co-partners, £11 711. This surplus is allocated as to £1 873 to shhldrs. and £9 839 to co-partners. The shhldrs' proportion has been added to undivided pfts. acct., which now stands at £82 817, from which it is proposed to distribute 1% on the shs, tax free, in cash or shs. as shhldrs. may desire.

OFFICIAL QUOTATIONS.—The following securities have been granted quotations in the official list: 1 225 000 £1, fully paid, ord. shs. of Associated Electrical Industries, Ltd.; 210 £1, fully paid, ord. shs. of the Brompton and Kensington Electric Supply Co., Ltd.; 925 000 £1, fully paid, ord. shs. and 1 400 £1 fully paid, 5% pref. (non-cum. and participatg.) shs. of the Newcastle-upon-Tyne Electric Supply Co., Ltd.; $2 004 200 cap. stk. of the American Telephone and Telegraph Co.; 2 069 934 10s., fully paid, ord. shs. of Pinchin, Johnson and Co., Ltd.; 600 000 £1, fully paid, ord. shs. of the Scottish Power Co., and 12 393 £1 fully paid, ord. shs. of the Underground Electric Railways Co. of London, Ltd.

MARCONI'S WIRELESS TELEGRAPH CO., LTD., in an announcemt. to the shhldrs., the directors state that they anticipate that on or about May 18th, the shhldrs. will receive from the Bank of England, which is actg. on behalf of Cables and Wireless Ltd., the necy. documts. settg. out in detail the terms and conditns. of the offer made to the shhldrs. of the Cable and Wireless Cos. to exchange their stk. and shs. in those cos. for shs. in Cables and Wireless, Ltd. and fully explaing. the steps to be taken by those who decide to accept the offer. After careful consideratn. and consultatn. with the directors of Cables and Wireless, Ltd., the directors have decided to pay an intm. div. of 20%(actual), less tax, on the ord. shs., and an additnl. 10% (actual), less tax, on the 7% cum. participatg. pref. shs., out of pfts. available for distributn. in respect of the year 1928. This div. will be payable on May 18. The available profits will not permit of any further distributn. in respect of 1928. The Cable Cos. have already paid their usual divs. for 1928. Mtgs. of shhldrs. of the Cable Cos. and of Marconi's Wireless Telegraph Co., Ltd., will be held on May 29 to consider and approve certain alteratns. in the articles of associatn. of the several Cos., to come into force when the merger proposals become operative. At the meeting of Marconi's Wireless Telegraph Co., Ltd., the shhldrs. will also be asked to approve the accts. for 1927.

Company Meetings.

SHANGHAI ELECTRIC CONSTRUCTION CO., LTD.—At the meeting on May 1st, Mr. J. S. Haskell, chairman, said the balance sheet showed a remarkable recovery from the difficult and uncertain conditions which characterised the period of civil war and general disturbance in China. Their traffic receipts, at £370 274, showed an increase of 30·9%. Operating profit was £167 232. By transferring £25 000 to general reserve they had raised that account to £135 000. The report and accounts were adopted, and resolutions were passed authorising the creation of 200 000 new £1 shares and the issue, by way of capitalisation of profits, of 100 000 new shares in the ratio of one for every five held.

ANGLO-PORTUGUESE TELEPHONE CO., LTD.—Sir Alexander Roger, presiding at the meeting last week, said they had increased the reserve for renewals by £14 580, and this now stood at £68 722. In addition, they had created a general reserve of £25 000. Net profit was £42 886, compared with £31 412 for 1927. The number of telephone stations at the end of December showed an increase of 1889, or approximately 9%. The new rates came into force on September 1st, 1928. It was their intention to replace the manual equipment with automatic equipment as and when it became economical to do so, and they had several small automatic stations in course of erection. The telephone business in Portugal undoubtedly had a prosperous future. That country was now in telephone communication with most of the European countries. The report and the dividends proposed therein were approved.

WEST LONDON AND PROVINCIAL ELECTRIC AND GENERAL TRUST, LTD.—Mr. Harry Kahn, presiding at the recent meeting, said the net profit, £25 206, was £9 870 higher than for the previous twelve months. They had disposed of a further part of their holding in the Chiswick Electricity Supply Corporation. Investments, at £383 856, were £126 080 higher than last year. The net profit of the Chiswick Corporation for 1928 was £7 254 higher than for 1927. It paid the same dividend as in the preceding year, namely 16%, on a larger capital, and the amount allocated to depreciation was £2 000 greater. The position of the Trust was a very sound one. They had a capital reserve of £35 000 and a general reserve of £12 500, besides the large surplus over book values which the valuation of the investments showed. The report and accounts were adopted.

RICHMOND (SURREY) ELECTRIC LIGHT AND POWER CO., LTD.—At the meeting on May 3rd Sir Thomas Bethell read the speech prepared by Sir Harry Renwick (who was unavoidably absent), in which it was stated that the total receipts for the past year were £75 065, an increase of £5 767. Profit on working was £46 486, increase £6 564. After provision for sinking fund, depreciation, reserves, etc., the balance available for distribution was £26 281. The directors proposed to pay a final dividend of 7% on the ordinary shares, making 11% for the year, leaving £4 281 to carry forward. They were changing over from direct to alternating current. Since the close of the year, 591 kW of new business had been obtained, and output had increased by 20% over the corresponding period of last year. The report and accounts were adopted.

BOURNEMOUTH AND POOLE ELECTRICITY SUPPLY CO., LTD.—Lord Erskine, presiding at the meeting on May 3rd, in the unavoidable absence of Sir Harry Renwick, read the speech in which the latter dealt with the figures in the report (abstracted in our issue of May 3rd) and added: We propose to declare a dividend final of 9% on the 720 000 £1 ordinary shares, making 15% for the year. This will leave £6 268 to be carried forward. We will now pass on to matters of general interest affecting your company. Regarding the negotiations with the local authorities for extension of tenure of the company's undertaking, a number of meetings have taken place, but settlement has not yet been arrived at. I am hopeful that at no very distant date a settlement will take place, and I believe, when reached, it will not be unsatisfactory to you as shareholders. The company has acquired controlling interests in other supply undertakings, and has two Orders pending for Wimborne and district. The company purchased some time ago a site at Hamworthy, in the Poole area, and application is being made to the Electricity Commissioners for sanction to erect a new capital generating station on that site. For the first three months of this year there is an increase of 637 kW in the supplies applied for, compared with the corresponding period last year, there is an increase of over 18% in the electricity sold, and unless any unforeseen circumstances arise I think you may look forward to another successful year. The report and accounts were unanimously adopted.

ASSOCIATED ELECTRICAL INDUSTRIES, LTD.—Mr. H. C. Levis, presiding at the meeting on Tuesday, said reference was made at the last ordinary general meeting to negotiations with the British Thomson-Houston Co., Ltd., the Edison Swan Electric Co., Ltd., and Ferguson, Pailin, Ltd., with regard to co-operation with a view to eliminating unnecessary duplication of effort and expenditure and effecting economies in various directions. The plans had been brought to a successful conclusion. The plan finally adopted involved the use of that company as a holding company. To preserve the goodwill connected with the name of Metropolitan-Vickers Electrical Co., Ltd., it was intended to change the name of an existing subsidiary company to Metro-Vick Electrical Products, Ltd., but later it was decided to change the name of this subsidiary to the old name of that company—namely, Metropolitan-Vickers Electrical Co., Ltd., and that was its name to-day. The chairman next gave particulars of the operations involved in the transfers of the shares and the changes of and additions to the boards of directors. The whole group of companies, he said, employed nearly 30 000 people in England, and they possessed manufacturing facilities in Australia. The report, which covered the work of the Metropolitan-Vickers Co., showed that during the year the intake of business increased about 16 per cent. in money value, representing in volume of material a greater increase, while the output constituted a record. As regarded the group as a whole, for the first four months of this year the volume of business had increased. There had been a substantial increase in the number and volume of orders for the smaller class of apparatus, rather than an increase in contracts of considerable magnitude. The report and accounts were adopted and the dividends of 8 per cent. on the preference and 6 per cent. on the ordinary shares for the year 1928 were approved.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

LYONS, Herbert, trading as J. LYONS, electrical and wireless engineer, 300, Willesden Lane, London, N.W.2. In response to a circular letter issued by Messrs. Phillip L. Causley and Co., accountants, of 70, Hatchard Road, London, N., a meeting of the creditors of the above was held on May 6th, at Winchester House, Old Broad Street, E.C. The statement of affairs as at April 30th last showed liabilities of £577, made up as follows: Trade creditors, £208; preferential claims, £64; cash creditors, £170; bank overdraft, £60; law costs, £25; and capital accounts, £50. The assets consisted of stock, £124; book debts, £33; fixtures and fittings, £30; debit balances, £5; J. Lyons, Ltd., £28; and work in hand, £25; making a total of £246, or a deficiency of £331. It was stated that the debtor was previously in a partnership and then started trading on his own account. There were various contracts and other work which it was thought would be profitable, and the business, it was believed, could be carried on successfully in the future. On May 2nd last a company called J. Lyons, Ltd., was formed to take over the assets as a going concern. Certain of the cash creditors were taking shares in the company, which was willing to make arrangements to pay the other creditors in full.

Mr. D. Weller, of the Palatine Trade Protection Office, said he understood that the assets had been transferred to the company, and he enquired where the money for the assets had gone. The debtor's accountant replied that no money had passed, but the debtor was being allotted fully paid shares in the company. The latter was willing to offer deferred notes to the creditors which would be redeemable over 12 months, with a reasonable rate of interest.

A resolution was passed in favour of the matter being dealt with n bankruptcy.

London Gazette, etc.

Company Winding-up Voluntarily.

SUPER ELECTRIC HEATERS, LTD. By reason of its liabilities, April 25th. F. E. Bendall, Midland Chambers, Warwick Passage, Birmingham, accountant, appointed as liquidator. Meeting of creditors at the offices of Poppleton and Appleby, Midland Chambers, Warwick Passage, Birmingham, on May 13th, at 12 noon.

Order Made on Application for Discharge.

GREGORY, Albert Butterworth, 29, St. Alban's Road, Seven Kings, Essex. Wireless expert. Discharge suspended for six months, until September 18th.

Partnerships Dissolved.

CROFTS AND SMITH (John Frederick CROFTS and Edward William SMITH) Queen Street, Deal, Kent, electrical, mechanical and radio engineers, by mutual consent, April 24th, 1929. The business will be carried on by E. W. Smith.

MACKAY AND ORR (John Holmes ORR and William A., SMALL). electrical engineers and agents, 7, Ann Street, Glasgow, as at December 31st, 1928, by mutual consent. The business will be carried on by J. H. Orr on his own account, under the old name.

W. G. PYE AND CO. (William George PYE, Thomas Allen White ROBINSON and Harold John PYE), manufacturers and sellers of (*a*) wireless transmitting and receiving sets and apparatus used in connection therewith, and (*b*) scientific instruments and apparatus, physical and electrical apparatus and instruments of precision of all kinds, Granta Works, Cambridge, by mutual consent, March 26th, 1929. Debts received and paid by W. G. Pye and H. J. Pye, who will continue the businesses specified in paragraph (*b*) above, under the old style.

W. S. WATSON (Walter Samuel Watson and John Stuart DENHOLM), electrical engineer and contractor, 267, Langside Road, Glasgow, as at March 31st, 1929, by mutual consent. The business will be carried on by W. S. Watson on his own account, under the same firm name.

Bankruptcy Proceedings.

BALL, Walter Reginald (trading in partnership with another, and described in the receiving order as R. Ball and Co.), electrical engineer, 287, Upper Street, Islington, London, N. The affairs of this firm came before Mr. Registrar Warmington in the London Bankruptcy Court last week, on the hearing of an application for discharge by the debtor Ball. The Official Receiver said that the adjudication in bankruptcy took place in May, 1925, the ranking liabilities being £2 230 as far as the joint estate was concerned. Proofs of debt had been lodged for sums amounting to £1 029. The assets were £20. According to the separate estate of the applicant he owed £160 and no assets were disclosed. In January, 1922, with a capital of £100, the applicant began business as an electrical and mechanical engineer in Upper Street, N., and in

Digitized by Google

March of the following year he was joined in partnership by the debtor Leech. They traded under the above style. In September, 1924 they entered into a contract to supply The X.L.O. Co. with 15 000 pairs of wireless headphones at the rate of 500 a week between September, 1924 and April, 1925. At the time the date of the delivery of the first consignment was not specified, but they afterwards agreed to urge delivery for October 17th, 1924. Owing, however, to late delivery by the manufacturers of certain of the materials required for the contract, delivery was not made by that date and in consequence the contract was cancelled on the following day. In February, 1925, the firm was sued for breach of contract and judgment was given against it for £369, of which £70 was paid. The debtors continued their business until March, 1925, when their stock, machinery, and effects were sold under an execution levied by another creditor. The applicant was without regular occupation and dependent from March, 1925, for six months on relatives, but he was afterwards employed as a traveller on a commission basis. The debtors had attributed their insolvency to the loss of business owing to the failure of the manufacturers to supply goods on order, to their liability under the judgment obtained against them in February, 1925, and to loss sustained on the sale of their stock-in-trade by the sheriff. They had explained that the goods supplied by their sub-contractors for the contract entered into with the X.L.O. Co. were marked with the latter's trade mark and consequently were worthless for realisation purposes after the contract was cancelled. No trading or profit and loss accounts or balance sheets were ever prepared and the debtors added that they first realised insolvency in October, 1924, up to which date they had had a surplus of £800. The Official Receiver opposed the application on the grounds that the applicant's assets were not of a value equal to 10s. in the £ and that he had omitted to keep proper books of account, and his Honour suspended the discharge for 3 months.

HELIKON WIRELESS CO., LTD., 6, Park Royal, North Acton, Middlesex. The winding-up order herein was made in December last. According to the statement of affairs there are liabilities amounting to £1 188, against assets of £51, less preferential claims of £27, a deficiency of £1 164. The issued capital of the company was £197. It was registered in November, 1925, and was formed for the purpose of carrying on business as merchants and dealers in wireless accessories. The company commenced business at an office and warehouse in Camomile Street, London, E.C. In May, 1928, a factory was acquired and the company began to manufacture electric lamps. Balance sheets and trading and profit and loss accounts were made out for the year ending November 30th, 1926, and these show a trading loss of £392, and for the year ending November 30th, 1928, a further loss of £392.

Boric Acid (Crystals),, £30 0 0 *Sodium Bichromate* per lb. 3 1/2d.
Rubber—Para fine, 11d.; plantation, 1st latex, 10d.

∴ The metal prices are supplied by British Insulated Cables Ltd., and the rubber prices by W. T. Henley's Telegraph Works Co., Ltd.

THE LEAD MARKET.

A firmer tone was apparent in the lead market last week, and according to James Forster and Co., prices opened steady on Monday and slightly advanced until Friday, when there was a small setback. The American market is steady with the price unchanged at 7 cents.

Closing prices on May 3rd were £24 8s. 9d. for May, £24 6s. 3d. for June, £24 3s. 9d. for July, and £24 1s. 3d. for August, or about 5s. per ton higher on the week.

NEW COMPANIES.

ASSOCIATED ENGINEERING AND METAL SUPPLY CO., LTD.—Cap., £500. Manufacturers of and dealers in steel and other metals, electrical and other machinery, etc. Reg. Office: 16, Deansgate, Manchester.

WIRELESS-ELECTRIC (WHOLESALE), LTD.—Cap., £1 650. To acquire business of wireless factor and electrical supplier now carried on by C. E. Coulson, at 23, North Street, (City), Bristol, as "Wireless Electric Wholesale."

ROBINSON, NELSON AND CO., LTD.—Cap., £4 000. Manufacturers of and dealers in physical, electrical and scientific instruments and apparatus, laboratory equipment, etc. Solicitors: Forsyth, Bettinson and Co., 36, Cannon Street, Birmingham.

SPHINX ELECTRIC, LTD.—Cap., £300. To acquire registered trade mark "Sphinx" from Auto-Bulbs, Ltd., and to carry on business of manufacturers of and dealers in electric lamps, fuses and signs, etc. Reg. Office: Sphinx House, Hatton Garden, London, E.C.1.

VENRECO, LTD.—Cap., £8 000. To adopt an agreement with Reandco, Ltd., and W. S. Veness, and to carry on business of manufacturers of and dealers in electrical fittings, appliances and component parts. Reg. Office: 55, Neal Street, Long Acre, London, W.C.

ZIRKO, LTD.—Cap., £1 500. Experimenters with, workers in, manufacturers of and agents for vulcanite, ebonite, rubber, rubber substitutes, compositions and insulating materials of all kinds, etc. A permanent director: A. W. Wright, Melverne, Gorden Lane, Moor Park, Fazackerley.

BROADCASTING LAMPSHADES, LTD.—Cap., £200. Manufacturers of and dealers in lamp shades, lamps, lighting apparatus, loud speakers, wireless receivers and components, electrical instruments and apparatus, etc. A director: J. Phillips, 146, Broadhurst Gardens, West Hampstead, London, N.W.

TRUPHONIC RADIO, LTD.—Cap., £75 000. To acquire undertaking of Truphonic, Ltd., and to carry on the business of manufacturers of and dealers in radio, television, electrical apparatus, manufacturers, importers and exporters, electrical engineers, etc. Solicitors: Ashurst Morris Crisp and Co., 17, Throgmorton Avenue, London, E.C.2. (Public Co.)

DERBY CABLES, LTD.—Cap., £100 000. To carry on the business of electrical engineers and contractors, manufacturers of and dealers in cables, insulating materials, lifting appliances, etc. Directors: C. A. Newton (chairman), J. H. Lord, H. Newton, H. B. Potter, and F. Newton (managing director). Secretary: E. A. Swindall, Solicitors: Flint, Marsden and Bishop, Derby.

ELECTRICAL TRADE MARKS.

This list has been specially compiled for us from official sources by GEE AND CO. *Patent and Trade Marks Agents, 51 and 54, Chancery Lane, London, W.C.2, from whom further information may be obtained.*

ALLSCOTT.—495 953. Class 8. Wireless telephonic apparatus and parts therof James Scott, trading as James Scott and Co., 56, Inglis Street, Dunfermline, Scotland engineer. October 15th, 1928. User claimed from December 5th, 1924.

UNIVISAPHON.—496 376. Class 8. Philosophical and scientific instruments and apparatus. John Good, 173-174, Finsbury Pavement House, Moorgate, London, E.C.2; manufacturer. October 26th, 1928.

THERMAG.—499 090. Class 8. Automatic electrical overload switches. Allen West and Co., Ltd., Engineering Works, Lewes Road, Brighton, Sussex; electrical engineers and manufacturers. January 16th, 1929.

FARADEX.—499 506. Class 8. Philosophical and scientific instruments and apparatus. Rooke Brothers, Ltd., 55, Cardington Street, London, N.W.1; radio manufacturers. January 29th, 1929.

ADZCOPE.—498 684. Class 8. Electrically illuminated advertising and display signs. Messrs. George Alfred Woodman, Richard Tudor Rees, Trevor George Edwards, and Emil Rudolph Alexander, trading in co-partnership, 120, Westbourne Road, Penarth, Glamorganshire; manufacturers. January 4th, 1929.

CONVOLUXE.—499 817. Class 8. Gramophones, wireless telephonic instruments, and gramophone records. Celebritone, Ltd., Commerce House, 72, Oxford Street, London, W.1; manufacturers. February 7th, 1929.

EQUIFLEXIAL.—499 824. Class 8. Sound-reproducing instruments. Celestion, Ltd. London Works, London Road, Kingston-on-Thames, Surrey; manufacturers. February 7th, 1929.

H.U. (sign).—498 480. Class 8. Electrical batteries (not for medical purposes) and electrical transformers. Charles Reginald Francis Hanson, trading as Hanson and Co., Building 191, Trading Estate, Slough, Buckinghamshire; electrical engineer. December 27th, 1928.

MICROFICIENT.—500 220. Class 8. Philosophical, scientific instruments and apparatus. Graham Farish, Ltd., 17, Masons Hill, Bromley, Kent; instrument makers. February 20th, 1929.

Opposition to the registration of the following trade marks can be lodged up to May 17th.

491 639. Class 8. Wireless telegraphic and telephonic instruments and apparatus, and sound producing, reproducing, transmitting and recording instruments and apparatus, and parts, all being goods included in Class 8. The Ormond Engineering Co., Ltd., 199, 201, 203 and 205, Pentonville Road, London, N.1; manufacturers. August 31st, 1928.

AEONIC.—496 367. Class 8. Wireless telephone apparatus. J. L. Gotlieb and Co., Ltd., 15, Cromer Street, London, W.C.1; manufacturers. October 26th, 1928. (By consent.)

VIVA-TONIC.—500 527. Class 8. Philosophical and scientific instruments. The Columbia Graphophone Co., Ltd., 102 to 108, Clerkenwell Road, London, E.C.1; manufacturers. February 28th, 1929. To be associated with No. 471 115 (2 52 5).

Opposition to the registration of the following trade marks can be lodged up to May 24th.

GLOVERS CABLES.—497 090. Class 8. Electric cables. W. T. Glover and Co., Ltd. Trafford Park, Manchester; manufacturers of electric cables. November 15t , 1928. To be associated with No. 387 907 (2 139) and another. Advertised before acceptance, the applicants alleging distinctiveness.

GINNIPORTO.—497 737. Class 8. Philosophical and scientific instruments. David Lannon and Phillip Lannon, trading in co-partnership, 18, Savile Row, London, W.1; merchants. December 4th, 1928.

AUDIOGRAPHOPHONE.—499 582. Class 8. Philosophical and scientific instruments. The Columbia Graphophone Co., Ltd., 102 to 108, Clerkenwell Road, London, E.C.1; manufacturers. January 31st, 1929. To be associated with No. 219 222 (1 102) and others.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

307 989 A. E. Watkins. Radio telegraph, telephone, and like signalling circuit and apparatus. (21/12/27.)
307 994 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Sealing or joining of glass and quartz. (22/12/27.)
307 995 Johnson and Phillips, Ltd., and D. M. Broughton. Electrical relays. (23/12/27.)
308 002 R. Brooks and Metropolitan-Vickers Electrical Co., Ltd. Electric vehicles. (5/1/28.)
308 009 Birmingham Electric Furnaces, Ltd., and A. G. Lobley. Electric resistance furnaces. (11/1/28.)
308 021 H. Heath and R. W. Bill. Boxes or cases for electrical apparatus. (26/1/28.)
308 037 F. O. Seyd. Electric gas-lighters. (7/2/28.)
308 041 J. C. Macfarlane and W. A. Macfarlane. Electric rotary convertors. (9/2/28.)
308 052 General Electric Co., Ltd., and A. Wardle. Terminal arrangements for electrical devices. (18/2/28.)
308 056 General Electric Co., Ltd., and E. H. Croft. Electric motor control systems. (22/2/28.)
287 048 Siemens and Halske Akt.-Ges. Duplex signalling systems. (12/3/27.)
286 737 G. Mombur. Electric speed-indicators. (10/3/27.)
308 085 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Thermionic generators and the like. (19/3/28.)
292 903 Siemens and Halske Akt.-Ges. Telephone sets. (25/6/27.)
291 032 I.G. Farbenindustrie Akt.-Ges. Process for preparing lead electrode for electric storage batteries. (24/5/27.)
308 118 J. Downs and Watts, Fincham, and Co., Ltd. Portable electric lamps. (25/5/28.)
292 474 Westinghouse Electric and Manufacturing Co. Apparatus for sorting or classifying articles by means of light. (16/6/27.)
293 796 E. Pohl. Supporting-frames for Rontgen-ray photographic apparatus. (12/7/27.)
308 131 W. Petri. Process and mould for casting accumulator grids. (6/7/28.)
294 618 Associated Telephone and Telegraph Co. Telephone systems. (7/1/27.)
308 144 J. C. Macfarlane and W A. Macfarlane. Electric rotary convertors. (9/2/28.)
297 825 Ateliers J. Carpentier. Telegraphic printing systems. (30/9/27.)
297 117 J. Seegmuller. Electric meat and like roaster. (16/9/27.)
308 156 L. Thurm. Electromechanical amplifier. (4/10/28.)
307 730 K. Kaisser. Starting-device for electromoters equipped with a clutch. (12/10/27.)
304 702 Associated Telephone and Telegraph Co. Telephone systems. (7/1/27.)
308 283 D. P. Battery Co., Ltd., and J. Waddell. Negative secondary battery plates. (21/9/27.)
308 183 C. A. Turner. Rotary electric switches. (15/11/27.)
308 286 A. Muriel [legal representative of G. Fornaca, (deceased)]. Means for regulating the supply of current from dynamos having a third brush for use in power-driven vehicles. (8/12/27.)
308 288 S. G. S. Dicker (Naamlooze Vennootschaap Philips' Gloeilampenfabrieken). Circuit arrangements embodying discharge tubes. (16/12/27.)
308 184 P. McDermid and P. S. McDermid. Means for controlling electric hoists and elevators. (19/12/27.)
308 185 Walsall Hardware Manufacturing Co., Ltd., and A. E. Read. Junction boxes for metal-sheathed electric cables. (19/12/27.)
308 186 A. Reyrolle and Co., Ltd., and J. Mirrey. Electric switchgear. (19/12/27.)
308 188 L. H. Peter and Westinghouse Brake and Saxby Signal Co., Ltd. Apparatus for rectifying alternating electric currents. (19/12/27.)
308 189 L. H. Peter and Westinghouse Brake and Saxby Signal Co., Ltd. Apparatus for rectifying alternating electric currents. (19/12/27.)
308 190 L. H. Peter and Westinghouse Brake and Saxby Signal Co., Ltd. Apparatus for rectifying alternating electric currents. (19/12/27.)
282 676 International General Electric Co., Inc. Regulating devices. (24/12/26.)
308 192 K. Younghusband, J. Summers and Sons, Ltd., and English Electric Co., Ltd. Heating of the rolls of metal-rolling mills. (19/12/27.)
308 239 Creed and Co., Ltd., F. G. Creed and A. Orling. Electric contact making and breaking devices and associated controlling and controlled means. (20/12/27.)
308 335 English Electric Co., Ltd., and R. D. Ball. Alternating current electric machines. (22/12/27.)
308 336 W. S. Smith and N. W. McLachlan. Two-way telephone and the like systems. (22/12/27.)
308 337 W. S. Smith and N. W. McLachlan. Thermionic and the like amplifiers. (22/12/27.)
308 334 A. Reyrolle and Co., Ltd., and B. H. Leeson. Electric protective arrangements. (28/12/27.)
308 378 A. Reyrolle and Co., Ltd., B. H. Leeson, and E. W. M. Scott. Electric protective arrangements. (28/12/27.)
308 380 Harland Engineering Co., Ltd., and F. G. Warburton. Driving mechanism of electrically driven paper machines and the like. (28/12/27.)
308 381 T. Yamanouchi. Electric cable joint. (29/12/27.)
308 382 F. Von Brunner. Means for generating electricity by evaporating liquids. (29/12/27.)
282 831 Akt.-Ges. Brown, Boverie, et Cie. Electric time relays. (30/12/26.)
308 384 Sachsenwerk Licht-und Kraft Akt.-Ges., and T. Schmitz. Alternating current dynamo-electric machines. (31/12/27.)

Applications for Patents.

February 25th.

6 141 Callenders' Cable and Construction Co., Ltd., and P. V. Hunter. Electric cables.
6 074 C. Cremer. Electric cables. (20/9/28, Germany.)
6 216 F. G. G. Davey and Wireless Music, Ltd. Sound producing devices.
6 217 F. G. G. Davey and Wireless Music, Ltd. Electromagnetic vibratory devices.
6 133 W. H. Dearden, G. Lawton and Standard Telephones and Cables, Ltd. Continuous loading for signalling conductors.
6 082 W. Donegani. Electric signs.
6 136 Dubilier Condenser Co. (1925), Ltd. Radio receiver, etc. (24/2/28, Germany.)
6 129 Grierson, Ltd. and R. Grierson. Electric heating of buildings, etc.
6 072 E. H. Hill. Turntable for portable wireless sets, etc.
6 087 A. Lederer. Electric discharge tubes. (24/2/28, Austria.)
6 213 Lichtenberg and Jones, Ltd., and J. A. Szabadi. Protective arrangements for thermionic valve circuits.
6 076 J. McCallum. Connections for cables, etc.
6 077 B. L. Myer and Power Electric Co., Ltd. Electric radiators.
6 185, 6 186 N. Petersen and J. Sinclair Ross. Electric motors.
6 124 E. W. C. Russell (B. Kjellgren). Production of crystals for piezo-electric devices.
6 148, 6 149 B. Schwarz. Alternating current induction motors. (29/11/26, Austria.)
6 146 Siemens and Halske A.G. Telegraphic installations. (6/7/28, Germany.)
6 158 J. A. Smale. Telegraph instruments.
6 192 C. G. Smith. Secondary batteries.
6 170 C. Stille. Transmission of wireless telegraphy, etc.
6 171 C. Stille. Electromagnetic talking machine.
6 172 C. Stille. Recording sound by electromagnetic means.
6 145 B. H. Stone. Electric stoves.
6 132 West Manufacturing Co. Test sets for locating faults in transmission lines. (5/7/27, U.S.)
6 185, 6 186 J. Zetsche. Electric motors.

February 26th.

6 353 C. R. Altenheim (K. Spieckermann). Electric conductor rail.
6 236 J. H. Asdell and G. W. Ingram. Automatic controlling means for electric currents.
6 296 British Electric Transformer Co., Ltd. Measurement of thermal conditions in electrical apparatus.
6 300 British Thomson-Houston Co., Ltd., and F. H. Harris. Systems of electric control.
6 301 British Thomson-Houston Co., Ltd., and C. J. Morton. Rotary switches.
6 302 British Thomson-Houston Co., Ltd., and C. J. Morton. Ignition equipment for motor cycles.
6 256 W. H. Bulpitt and Bulpitt and Sons, Ltd. Safety appliance for electrically heated apparatus.
6 262 L. A. Catlin and Electro-Mechanical Brake Co., Ltd. Tramway brakes, etc.
6 329 G. Eaton. Electric toaster.
6 326 Ferranti, Ltd., and S. Z. de Ferranti. Electric fires.
6 331 A. E. Honey and J. Stone and Co., Ltd. Electric lighting installations for railway vehicles, etc.
6 254 Lane and Girvan, Ltd., and A. R. Wood. Electric fires.
6 241 C. Miles. Aerial systems for wireless telegraphy, etc.
6 325 N. V. Philips' Gloeilampenfabrieken. Photoelectric cells. (25/9/28, Holland.)
6 316 H. A. Whitehorn (Bell Telephone Laboratories, Inc.). Electric conductors.

February 27th.

6 389 H. Antranikian and U. A. Thuau. Distant transmission, etc., of images. (29/2/28, U.S.)
6 416 Automatic Coil Winder and Electrical Equipment Co., Ltd. Coil winding machines, etc.
6 357 H. G. Baggs and R. A. Smith. Electric fuses, etc.
6 359 C. Coppock. Means for regulating electric current.
6 455, 6 456 J. Cruwys, J. P. Keith, Power Equipment Co., Ltd., and G. Richardson. Electric circuits.
6 457 L. J. Francis. Telephone instruments.
6 439 H. J. Garnett, J. A. Holden and W. S. Smith. Manufacture of loaded signalling conductors.
6 408 General Electric Co., Ltd., and R. Orsettich. Dynamo-electric machines.
6 381 R. E. Hopkins. Dynamo-electric machinery.
6 437 Lignes Telegraphiques et Telephoniques. Coupling transformer arrangements. (9/3/28, France.)
6 366 B. Loewe. Manufacture of high emission cathodes. (28/2/28, Germany.)

COMING EVENTS.

Friday, May 10th.

Institution of Mechanical Engineers.—Storey's Gate, St. James's Park, London. Special general meeting. 6 *p.m.*

Monday, May 13th.

Electrical Contractors' Association (Liverpool Branch).—Ordinary meeting. 3 *p.m.*

Tuesday, May 14th.

Electrical Contractors' Association (Leicester Branch).—Corridor Chambers Ordinary meeting.
Electrical Contractors' Association (Swansea Branch).—Ordinary meeting.
Institution of Civil Engineers.—Great George Street, Westminster. Annual general meeting. 6 *p.m.*
Illuminating Engineering Society.—Home Office Industrial Museum, Horseferry Road, Westminster. Paper reviewing the proceedings at the meetings of the International Commission on Illumination, and on the International Congress held in the United States in 1928, by Mr. G. H. Wilson, followed by a discussion. 6.45 *p.m.*
Electrical Contractors' Association (Bournemouth Branch).—Ordinary meeting. 7.30 *p.m.*

Wednesday, May 15th.

Electrical Contractors' Association (Sussex Branch).—Midland Bank Chambers, Brighton. Ordinary meeting.
Overhead Lines Association.—Institution of Electrical Engineers, Savoy Place, Victoria Embankment, London. Paper by Col. W. A. Vignoles, on "Getting Consumers in Rural Areas." 5.30 *p.m.*
Polytechnic Engineering Department.—307–311, Regent Street, London. Lecture II (Course of six lectures) by Mr. W. H. Date on "Thermionic Valves." 6.30 *p.m.*
Royal Society of Arts.—John Street, Adelphi, London. Paper by Mr. R. Burrell on "The Reform of the British Patent System." 8 *p.m.*

Wednesday, May 15th–Thursday, May 23rd.

World Power Conference.—Barcelona, Spain. Sectional meeting on "Complete Utilisation of Water Power Resources."

Thursday, May 16th.

Institution of Electrical Engineers (Irish Centre).—Physical Laboratory, Trinity College, Dublin. Annual general meeting. 7.45 *p.m.*

Saturday, May 18th.

Association of Mining Electrical Engineers (South Wales Branch).—South Wales Institute, Cardiff. Annual meeting. 6 *p.m.*

LONDON ELECTRICAL ENGINEERS.

26th A.A. Battalion, R.E. (T.A.) (*Commanding Officer:* Lt.-Col. C. H. S. Evans, O.B.E. Headquarters: Duke of York's Headquarters, Chelsea).—According to the current Battalion Orders, 303 Company held a week-end camp on May 4th-5th. A similar camp for 302 Company is fixed for June 8th–9th. Musketry programme provides for firing by 301 and 303 Companies on May 26th and 302 Company on June 30th, all at Rainham Ranges. There is also a prize shoot open to all trained men of companies, at Rainham, on June 23rd.—A lantern lecture on the possibilities of aviation was given by Sir Alan Cobham on April 24th.

27th A.A. Battalion R.E. (T.A.) (*Commanding Officer:* Lt.-Col. M. G. Bland, O.B.E., T.D. Headquarters: Rochester Row, S.W.1). In Battalion Orders for May, it is announced that approval is given for Hon. Col. R. E. B. Crompton to continue the appointment for a further period of one year to take effect from Dec. 19th, 1928. The number of recruits needed is now about 37. As recruits cannot be accepted after the first week in July (for this year's camp) early application is desirable.—The annual musketry course will be fired as follows:—305 and 306 Companies, June 9th; 304 Company and recruits, June 23rd; Lewis guns and inter-company teams, July 7th.—Easter camp was held at Biggin Hill; 10 officers and 52 other ranks attended.—A cinema lecture on the "Manufacture of Batteries and Electric Bulbs" was given by Siemens Bros. on May 4th.

Our Overseas Trade.

THOUGH at first glance the Board of Trade Returns for April are not over encouraging, closer inspection shows that though there have been fluctuations in imports and exports since the corresponding month of 1928, the figures for the month under review indicate a general improvement, in that several of our basic industries have increased their export shipments. Particularly satisfactory is the return of the coal export trade, shipments during April amounting to 4 756 122 tons, valued at £3 865 895, representing an increase of 1 034 099 tons when compared with the figures for the corresponding month of last year. Similarly, the export of vehicles—under which heading are included ships, locomotives, and aircraft—improved during April to £5 897 553, an advance of £1 662 779 on the corresponding figure for April, 1928. Included in this total is £2 772 960 on account of shipbuilding, which during the four months of this year shows an improvement of £3 054 178 when compared with the same period of 1928, and nearly £6 000 000 when contrasted with the corresponding months of 1927. Since these two industries, coal and shipbuilding, have at last shown some indication of moving out of the mire in which they appeared to be lodged, the returns make interesting reading for this reason alone. There are, however, other industries which show improvement in the April returns, not the least of which is the electrical industry. Detailed figures of the electrical returns will be found elsewhere in this issue, where it is shown that exports of electrical machinery and apparatus improved last month by £301 543 when compared with the March figures; and by £244 743 when compared with April, 1928. These increases were chiefly brought about by larger shipments of various motors and generators, rubber covered and non-rubber covered wires, wires other than submarine, and telegraph instruments, which between them accounted for an increase in trade of £209 787. Though the exports of telegraph and telephone instruments alone improved by £28 500, imports of the same class of goods increased by £45 666, indicating, therefore, that there is still plenty of potential custom in these goods in the home market, competed for by the foreigner. Other large imports were rubber covered wires, with an increase of £15 424, electric lamps, £7 902, and various electrical goods, £30 277. On the whole, however, the April figures, with a favourable balance of exports over imports of £1 130 997, may be regarded as satisfactory, and, with total exports for the four months of this year exceeding total imports by nearly £4 000 000, we may be said to be holding our own. Though this total excess may not be as high as many would like to see it, it is well to remember that the severe weather experienced during February hindered to a large extent trade which would have normally been conducted during this period.

The Incandescent Lamp Jubilee.

WE are glad to learn that, as a result of the attention drawn in these columns to the proposed American celebration of "Light's Golden Jubilee," the matter received some discussion at the annual meeting of the Institution of Electrical Engineers, and that the suggestion, made by a reader of THE ELECTRICIAN, that the Institution should send a protest to the National Electric Light Association of America against a proposal to give credit for the invention of the electric incandescent lamp to Mr. EDISON instead of to the late Sir JOSEPH SWAN is likely to be acted on by the I.E.E. Council. In announcing that the Council proposed to take some action, COL. EDGCUMBE expressed doubt as to whether the publicity of the Institution would reach the level of the American publicity. We do not think this is very material, for so long as Mr. EDISON is not proclaimed to the world as the inventor of the *first* incandescent electric lamp, and mention is made of the name of the first inventor, we see no reason for attempting to outvie the Americans in the publicity field. Already, in our own quiet way, we have celebrated the jubilee of the first lamp, and the Americans are certainly entitled to celebrate the jubilee of the second lamp in the field—if they feel so disposed. Our sole concern in this question has been to vindicate the rights of a great British inventor, and when we learn that the N.E.L.A. arrangements have been suitably modified we will gladly let the matter drop.

Battersea: A Reply.

IN the various references we have made to the agitation against the erection by the London Power Co. of its proposed new power station at Battersea, we have endeavoured to regard the matter chiefly from the customer-relationship point of view, believing that a public utility undertaking which causes avoidable annoyance to its customers and prospective customers is more correctly described as a public nuisance. We have also expressed uneasiness at the apparent indifference of the Power Company to the widespread newspaper agitation which its proposals have aroused, and many of our readers must have shared our surprise that no reply was forthcoming in answer to

Digitized by Google

the criticisms which have been appearing in the public Press during the past two months. We are glad, in common fairness, to state that information which we have received this week clearly shows that the company is fully alive to the importance of making a considered reply to its critics. As evidence of this desire we have been supplied by the London Power Co. with a copy of a letter, embodying a complete statement of the company's position, and an answer to the criticisms. This letter was sent nearly a fortnight ago to a daily newspaper, which did not publish it until Wednesday of this week. For the information of our own readers we reproduce on another page the substance of the London Power Co.'s defence. Beyond pointing out that the statement reveals confidence in the early solution of the difficult problem of dealing with sulphurous emissions, and puts forward a strong reasoned argument against the removal of the station to a down-river site, we propose for the time being, at any rate, to reserve comment on the technical points at issue.

An Example to Follow.

SINCE Mr. F. W. PURSE found a way of making the I.E.E. Wiring Regulations compulsory in the borough of which he is chief electrical engineer, i.e., by incorporating the I.E.E. Regulations with the Borough Council's by-laws, there has unfortunately not been a rush on the part of other municipalities to follow West Ham's courageous lead. We were, therefore, gratified to hear Mr. J. CHRISTIE'S announcement at the Sussex Branch dinner of the E.C.A., that similar action is proposed at Brighton, and that when the regulations are actually embodied in the Corporation's by-laws the Electricity Department will take care to see that they are rigidly enforced. Many other municipal engineers could take similar action. Thus they would not only secure the obvious advantages derivable from reliable installations in their consumers' premises, but would also help materially to raise the standard of electrical installation work.

The B.B.C. Report.

THE governors of the British Broadcasting Corporation have published their second annual report and according to its reading, the year under review "witnessed a steady endeavour to improve the quality and increase the variety of programme material transmitted, and developed the plans for better distribution combined with a series of alternative programmes, referred to in the last report as the regional scheme." The governors record as an "important event" the formation of the National chorus of 250 amateur singers, while "symphonic work of the first order by 'simultaneous broadcast'" is promised in the early future. The report reads as though there were never any disagreement with the material broadcast, and though the revue and variety section of the programmes is dismissed in eight lines, symphony music, chamber music, opera and oratorio, special programmes (i.e., Schubert's Centenary), appreciation of music, dramatic productions, debates and discussions, running commentaries, etc., occupy over two pages, while education and religious service material occupy another page. The children's hour is dismissed in seven lines. From the point of view of a report this unequal allocation of space may be in order, but it indicates that the governors of the B.B.C. are still very devoted to that side of broadcasting which is popularly known as "highbrow." Apart from programme material the report contains much of interest and shows, among other things, the success of the S.O.S. messages broadcast during the year, in that of the 751 transmitted, over 40% were successful. The Sunday evening "Good Cause" feature was also a successful one, for during the year no less a sum than £60 000 was contributed by listeners. Dealing with the finances of the Corporation, the governors state that the income from licences was £871 763 and from publications £120 635, the total with interest and sundry receipts being £1 002 505. Expenditure was £879 324, of which £538 990 was devoted to programmes, and, considering the number of stations to be maintained, this certainly appears to be a satisfactory proportion.

An Engineering Achievement.

PARTICULARS given in the report concerning the engineering side of the Corporation show that during 68 000 hours of working the percentage breakdown was as low as 0·035%, or 0·005% more than in 1927, due to damage done to transmitting aerials by the gales of November last. In connection with the latter erections, some interesting experiments were carried out by means of kites on Salisbury Plain, and though the first kite aerial was probably that used by SENATORE MARCONI in his first transatlantic experiments at Newfoundland, the purpose of these two flights was strangely different. Whereas in their early use it was thought that height would result in the desired signals being received, in the case of the B.B.C. experiments their use was adopted for reasons of economy in an investigation of the problem of working several transmitters on one frequency in order to make the most of the available wavelength channels. Considerable experiment was made during the year under review with transmissions on short waves, and though the report makes no mention of any revolutionary discovery, it nevertheless records "good progress." The engineering department of the B.B.C. has also developed a new electrical control apparatus for use in the Manchester station, and though, as with many other organisations, the engineering side of the business receives the least publicity, there is evidence in the report that our belief and confidence in the B.B.C. from the technical viewpoint are not misplaced—in spite of the attractions which the "talkies" appear to have for wireless engineers in general, and B.B.C. engineers in particular.

Contractors' Overhead Charges.

ALTHOUGH primarily of interest to electrical installation contractors, the detailed examination and analysis of trade charges in the electrical installation industry which is given elsewhere in this issue also merits some attention from supply engineers, consulting engineers, architects, quantity surveyors, and even of consumers. For some time past the view has been expressed from within the industry as well as from without, that the cost of installations is too high, and that this is exerting a braking effect upon the development of electricity consumption. Unfortunately, many of the contractors have been quite unable to contest such allegations because their cost-accounting systems have been so rudimentary in character that there has been difficulty, not in deciding whether the profit made was too high, or even adequate, but in discovering whether there was any actual profit on their transactions. The complexity of the business and the relatively high proportion of overhead charges to the cost of materials used makes certain knowledge of costs absolutely essential in the conduct of a successful business. Such investigations as have already been made show that, far from charging too much, many contractors do not charge enough, though a minority admittedly secure a profit of sorts through charging the public for its inefficiency. We understand that much useful work has been done recently by the Electrical Contractors' Association on the problem of overhead charges, but many installation contractors still find difficulty in deciding exactly which items of expense should be allocated to establishment charges and the relative percentage of these items to the total. Our article this week, which is contributed by an installation engineer who has devoted much time to study of the question, provides an answer to most of these questions. We fully expect that some of the allocations in this analysis will arouse critical discussion and the usual facilities will be provided in our correspondence columns.

THE BATTERSEA POWER STATION.*

A Reply to Recent Criticisms—Hopes for New Methods of Flue Gas Treatment—Economic Reasons for Choice of Site.

By W. F. FLADGATE (Chairman, London Power Co., Ltd.).

THE London Power Co. has not hitherto intervened in the controversy regarding the erection by the company of a power station at Battersea. But the time has now, I think, arrived when I should state for the information of the public the material facts of the case, and explain the views and intentions of the Power Company.

The question of erecting a station on the Battersea site had come before the directors of the London Power Co. in the later part of 1926, and they were advised that, from the engineering and economic point of view, the site was the very best that could possibly be obtained. They made no secret of the fact that they were acquiring that site, and brought their project prominently before the Committees of both Houses when the " Chiswick Station " Bill was under consideration, not by way of opposing the proposal of the Joint Electricity Authority, but as a complementary proposition.

Consideration of Site.

Before definitely deciding on the Battersea site, the London Power Co. gave very careful consideration to the question of an alternative site down the river. In view of the heavy transmission costs they were quite unable to make out an economic case for such a site, and a more recent survey and consideration of this possibility, with estimates based on the use of still higher voltages, has confirmed the correctness of their earlier opinion.

One of the first steps taken by the Central Electricity Board was to consider the scheme for the South-East of England. This scheme scheduled several stations of the London Power Co. as being " selected " stations, and the station which was proposed by the Joint Electricity Authority at Chiswick was put forward in that category. The Central Electricity Board gave the most careful consideration to the scheme, and in the result discarded the station at Chiswick and selected for adoption the station at Battersea. The whole of the approved plans for dealing with South-East England and the transmission system in connection therewith are based upon the erection of a station at Battersea.

The Power Company, who had acquired the site at a very large price, accordingly proceeded with the completion of their plans for the Battersea station, which had been submitted to and approved by the Electricity Commissioners and which have also been approved by the Central Electricity Board. Considerable progress has now been made in the construction of the works and plant.

So far as the commercial side of the undertaking is concerned, it is right to point out that the London Power Co. is in no sense a commercial undertaking. By its constitution it is precluded from making any profit. It can only pay a fixed interest on its securities. The whole of the saving which the company may be able to make is to be applied in reducing the charges for current to their constituent companies, thus enabling those companies to supply the public of London at a cheaper price.

When the Electricity Commissioners issued their statutory consent to the erection of the Battersea station, they attached to their consent the condition :—

> The Company shall in the construction and use of the said generating station, take the best known precautions for the due consumption of smoke and for preventing as far as reasonably practicable the evolution of oxides of sulphur and generally for preventing any nuisance arising from the generating station or from any operations thereat.

The London Power Co. has always fully recognised the importance of the obligations thus imposed upon it, and from the outset has given careful consideration to the steps to be taken to secure its performance. In particular, as regards the treatment of the flue gases from the boilers, which is the topic to which criticism has recently been chiefly directed, the company has specially invoked the assistance of their own, and independent, expert chemists in connection with the design and equipment of the station.

It is no doubt true that the problem of dealing with sulphur fumes is a comparatively new one in its application to power stations, but it is manifestly unfair to the London Power Co. to pronounce it in advance to be incapable of solution, and to do so casts an unmerited slur on the present state of advancement of the arts of engineering and chemical science.

The advice which the company has received from its advisers, to whom it has given the freest possible hand, fortunately belies the pessimistic anticipations which have been so widely circulated, and affords reliable ground for believing that by the proper selection and pre-treatment of the coal before burning, and by the adoption of suitable plant, it is practically possible to render innocuous the fumes which arise in the process of generation. I can assure the public that the company will not be deterred by any considerations of cost from adopting every possible precaution which can be devised. It is in their own interest to do so. Problems of no less difficulty have been surmounted in the past history of the electrical industry.

Lest the omission of any reference to smoke and dust should be construed as evidence of the company's inability to cope with these, I may say at once that not the slightest apprehension is felt by the advisers of the company on this score. There is an abundance of experience to work upon in this connection.

I turn now to another and different aspect of the matter. I refer to the criticism that the erection of a power station at Battersea would be ' an economic mistake."

Let us examine this question, which, after all, is only a variation of the oft-debated problem as to whether it is more economical to site a station (*a*) as near as possible to the centre of gravity of its load, or, (*b*) at some distant site which may have the advantage of remoteness, but which has the concomitant disadvantage of necessitating long overhead or cable trunk lines traversing—in great part—congested areas by several divergent routes.

Careful estimates have been prepared of the transmission capital costs and annual losses which would be involved in dealing with the whole of the energy from a station of the size of Battersea located some 15–17 miles down river, as compared with a station on the Battersea site. These estimates are necessarily only approximate in the absence of a detailed survey of the possible routes. They do, however, cover transmission partly by overhead lines—where feasible—and partly by cables, and at the alternative voltages of 66 000 and 132 000.

Question of Costs.

Shortly, it may be said, that in the case of a station at the suggested distance, the extra capital costs on transmission would range from £3 000 000 to £1 850 000, according to the system and voltage adopted. After due consideration, and making allowance for all contingent factors incidental to the use of a transmission voltage of 132 000—on the most favourable basis it would not appear safe to reckon on a lower figure than £2 100 000.

Against the incidence of the capital charges on this latter figure, together with the line maintenance costs, the line losses and the rating, may be set the saving of sixpence per ton on sea-borne coal direct to both sites, by steamer, amounting in the aggregate, and on the ultimate output of the station, to some £15 000 per annum. Most careful inquiries have been made before accepting the above figure of sixpence per ton, and the company is assured that although this figure may fluctuate slightly from time to time, it is an outside figure and should be accepted by " anyone who knows the trade."

The advisers of the London Power Co. have come to the definite conclusion that—apart from the difference in value of the respective sites, which, after all, has no very appreciable bearing on this question—there would have to be a difference in the cost of coal at least 6s. per ton in favour of the down-river site to justify its selection, and to counteract the additional transmission and transformation costs.

It will, I think, be generally admitted amongst engineers that cables operating at 132 000 V and upwards are at the present time more or less " on trial." They can hardly be

* Being extracts from a letter embodying a complete statement of the London Power Co.'s position, and in answer to newspaper criticisms.

Digitized by Google

said as yet to have emerged from the experimental stage, and experience is very limited.

Whatever the future may hold in store in this direction—and it is probably hopeful—a note of caution is surely necessary before London is committed to such a system for the transmission of the entire energy output of a station of the magnitude of Battersea situated on the lower reaches of the river.

It is understood that the Central Electricity Board has placed an order for a limited amount of this class of cable. This work is, however, regarded by that body as being of a trial or experimental character, and the order has been placed at the entire financial risk of the contractor, with stringent guarantees of replacement by cables operating at lower voltages.

Cable-laying in Congested Streets.

It may be convenient to refer at this point to an observation made by Sir John Snell, when considering the Chiswick Bill, before the Parliamentary Committees, which has a distinct bearing on the present case—namely, that owing to the high cost of laying cables through the congested streets of London, and the high cost of reinstatement of the paving, etc., it is not commercially practicable to transmit the large quantities of energy which are and will be (particularly *will* be) required in the West End of London, wholly from the eastern end.

In this view the London Power Co. most fully concur, fortified, as they are, by their experience of the present condition of the streets in the area over which they have the right to lay cables—namely, the whole of the County of London. In these circumstances, if the energy generated at stations on the lower reaches of the river Thames has to be transmitted to the West, it could only be done by devious routes north or south of the Metropolis, thus adding very greatly to the transmission costs, and which has not been fully taken into consideration in compiling the foregoing estimates.

The London Power Co. do not subscribe to the principle that a generating station should be located near to a particular colliery or to a particular group of collieries, which is not in their ownership or under their control. They believe that the best interests are served by selecting a site available, if need be, to all the coal fields of the country. If the Kent coal be all that is claimed by its sponsors there is nothing to prevent its use at the Battersea site.

Reference has been made to the practice in other countries with the suggestion that their example should be copied in the case of London. What are the facts? Take Berlin for an illustration. At the present time the bulk of the electrical requirements are supplied from four power stations within the city limits, and a fifth station, also within the city, is under construction.

By the year 1932, it is estimated that out of a total demand of 720 000 kW, only some 60 000 kW will be sent into the city from stations situated on the brown coal fields—in the form of bulk supply. There is little here, therefore, to support the argument advanced against Battersea in favour of long distance transmission from remotely situated stations. The position in Paris is similar.

The case of Melbourne and the Morwell brown coal fields has no relevance to the present controversy, as will be admitted by those who have any knowledge of the situation, political and economic, in Victoria, Australia.

Again, take the large American cities—viz., New York, Brooklyn, Chicago, Baltimore, Philadelphia, Milwaukee, etc., and we find that their stations are either entirely or mostly within city limits and as close up to the load as possible. This is particularly the case in New York, where huge stations—greatly in excess of Battersea—are located in some of the densest parts of the city, one such new station now in commission being designed for an ultimate capacity of 1 000 000kW.

And be it remembered that American coals, especially those of the Middle West are much higher in their sulphur content than are British coals, and yet the sulphur problem does not appear to have impressed itself on our American friends.

It has been stated that a proposal brought forward in 1906 by the London County Council for the erection of a station at Battersea was rejected by Parliament. Agreed; the ground of the refusal was not the unsuitability of the site, but the desirability of bringing forward a more comprehensive scheme for London and the surrounding district.

The whole object of the building of these new modern stations is to bring about two things—first, the gradual elimination of a number of other stations which are less efficient, which burn more coal per unit generated, which are liable to cause nuisance, and which are not in a position to adopt the up-to-date improvements that large new stations can afford to include; and second, the reduction by the increase in the use of electricity of the quantity of coal burnt both industrially and domestically. On balance there can be no doubt that a less quantity of deleterious fumes will find their way into the atmosphere under the modern system than under the existing regime.

The South-East England Electricity Scheme forms part of a comprehensive scheme for the British Isles which has been formulated for the express purpose of providing electric light and power in greater quantities and at less cost than hitherto. Any hindrance of this scheme can only be regarded as retrograde, and would delay the closing down of less suitable stations.

I conclude by summarising the position as it appears to the London Power Co.:—

(*a*) The principle of establishing a power station on the river within the Metropolitan area was before both Houses of Parliament so recently as 1927, and was approved by them after very exhaustive investigation and on evidence for and against, which dealt particularly with the question of the alleged nuisance caused by chimney fumes.

(*b*) The London Power Co. obtained a statutory sanction towards the end of 1927 for the establishment of a power station at Battersea by the body expressly set up by Parliament in 1919 to decide all such matters.

(*c*) The Battersea station was approved and selected by the Central Electricity Board, in 1928, as an integral feature of their adopted scheme for South-East England after hearing objections thereto—principally on the ground of nuisance.

(*d*) On the strength of their statutory position the London Power Co. has raised three millions of money for the express purpose of building a station on the site sanctioned.

(*e*) The London Power Co. have entered into contractual obligations for civil engineering works and plant—including the purchase of the site—amounting to £2 000 000—in every case with British firms employing British labour.

(*f*) It has not been proved, nor indeed even seriously suggested until quite recently, that it would have been economically sounder to have built the station on the lower reaches of the river.

(*g*) Neither has it been demonstrated that the disastrous effects upon the atmosphere, which have been so freely foretold in communications founded in many instances on an entire misconception of the position, are in the least likely to materialise in actual practice. In this connection—as an example—one has only to refer to a statement made to the effect that with the station completely erected and working at full capacity, then using 10 000 to 12 000 tons of coal per week, one-third of the total plant will use 2 000 tons per day. Our critics might at least be arithmetically accurate.

I.M.E.A. CONVENTION.

Brief Details of the Papers to be Read at Torquay—The Social Events.

WE understand that the following papers will be read and discussed at the annual convention of the Incorporated Municipal Electrical Association, to be held at Torquay from June 3rd to 8th:—"Whitleyism in the Electric Supply Industry," by Ald. W. Walker (June 4th); "Some Notes on Recent High Court Cases and Current Legal Problems in Connection with the Generation and Supply of Electricity," by Mr. J. H. Rothwell; and "The Heavy Oil Engine and Its Application in Electricity Supply Undertakings," by Mr. G. Porter (June 5th); and "Standardisation of Methods of Charge," by Mr. E. J. Jennings (June 6th).

The social events will include a reception by the President on June 3rd, a reception by the Mayor and Mayoress of Torquay on June 4th, a garden party at the invitation of the Torquay Electricity Committee, and a dance at the invitation of the Mayor and Mayoress of Torquay on June 5th, and the annual dinner, followed by a dance, on June 6th. The special Women's Day programme includes a lecturette by Miss M. Partridge on "Women's Work in Connection with Rural Electrification in Devonshire."

Mr. P. A. Spalding has submitted a report to Omagh U.D.C. on the proposals to supply electricity in the town. He states that the initial cost of a complete scheme for the entire urban area should not exceed £10 000. A charge of 9d. per kWh for lighting would be fully competitive with gas at 5s. 5d. per 1 000 cubic feet. The Council has decided to adopt the scheme and to engage Mr. Spalding to prepare plans and act as the Council's engineer.

TRADE CHARGES IN THE ELECTRICAL INSTALLATION INDUSTRY.

Detailed Analysis of Items Comprising Overhead Expenses—What is a Reasonable Profit?—Low Earnings of Installation Engineers—Standardising Cost Accounting.

(SPECIALLY CONTRIBUTED).

ELECTRICAL installation engineers (contractors) and many other people inside and outside the industry, including supply authorities, consulting engineers, architects, quantity surveyors and consumers, are exhibiting considerable interest at the present time regarding the amount to be allowed for overhead charges, on-costs, establishment charges or trade charges (as this item is variously termed) and also the profit accruing to electrical installation engineers as a recompense for their labours.

Many people, with little or no knowledge of the trade, feel that trade charges in the installation section must be and are exorbitant, and that the contractors seriously assist in maintaining an unreasonably high price for good quality residence, factory and similar wiring.

Architects have repeatedly taken exception to the writer's charge of 20% for trade charges, excluding profit, and have stated, in explanation of their criticism, that builders take on work at 10%, 7½% and even 5% on cost. The reply is, of course, obvious. We deal in comparatively inexpensive things which are troublesome and require a lot of detail work, whereas builders deal in relatively costly articles which are, on the whole, simple and are ordered in large quantities.

To take the extreme case, a bronze ceiling plate and lampholder, special shade and "flame" lamp are required, wired with old gold flexible, as an extra to contract. Visualise the staff work required to get this material on to the job, and the value of the material when it is on the job.

Unfortunately, no figures are yet available for publication from British firms, but quite recently a conference was held in the U.S.A. between representatives of the National Electric Light Association, the National Electric Manufacturers' Association, the Electrical Supply Jobbers' Association, and the Association of Electragists International, for the purpose of finding out what, if anything, is retarding the growth of electrical service, more particularly in the residence or domestic field.

The Electragists stated their views in an admirably prepared and reasoned pamphlet, entitled "The Economic Factors Affecting Wiring Development," and a considerable amount of space was devoted in this booklet to the subject of Overhead and Profit.

A copy of this booklet has fallen into the hands of the present writer, and as the analysis he made for his own use may be of interest to many readers of THE ELECTRICIAN, it was considered desirable to publish it.

Before going into the figures, a few of the more important introductory remarks will be quoted, as they apply with equal force in this country.

Cost of Ignorance.

"Ignorance of the cost of business operations stands in the way of progress of men in every industry more than any other one thing.

"While it is important that we secure adequate profits from the operation of our business, these profits should be secured from efficient business operations rather than from charging the public for our inefficiency.

"It is foolhardy for a man to sell his business service blindly at the prices he thinks other men are asking, without knowing the relations of his own costs to those prices, for the percentage of successes among those 'other men' who are setting his prices is pitifully small.

"The final item of cost on every job is 'overhead.' In the electrical installation business the overhead is exceptionally low. It is lower than that of the retailer, the manufacturer or the central station.

"The actual figures are for 1925 and were obtained from 18 firms, small and large, situated in different parts of the country." (Note, six only are quoted as being representative.)

"Nine concerns that made a profit had an overhead of 30·6% to 41·9% of the prime cost.

"The successful ones paid very low salaries to the head of the business. The fellow who did £2 200 worth of business paid himself less than £5 3s. per week, and, besides working with the tools, he did all his own book-keeping. *He couldn't get a man to work for him for that amount.*

"It makes no difference what kind or what priced materials are used in wiring; these overhead costs must be paid. If the jobs are decreased in cost, then the ratio of overhead goes up. It is not possible to decrease these costs by decreasing the cost of wiring materials.

"The average overhead of the successful electrical installation engineer is around 35% of the materials and labour cost. For the unsuccessful ones it was over 40%.

"It is generally admitted that in a competitive business, a 10% profit on capital invested in a business is not unfair or excessive. The utilities, in a non-competitive market, are permitted to earn up to 8%.

"What do the electrical installation engineers get? Nine successful ones earned 0·5 of 1%, 0·8 of 1%, 2%, 3·5%, 4%, 4·6%, 4·7%, 6·5%, and 7% on operations.

"If the central stations enforce such a policy (e.g., hammering down the price of installation work), sooner or later the industry will pay the price. The low priced men cannot give service and do a workable job at these prices unless somebody drops a lot of money, paying their cost of doing business. Public dissatisfaction is bound to arise, and that will be expensive to the supply people."

Establishment Charges.

Many electrical installation engineers and accountants seem to find considerable difficulty in deciding exactly which items of expense should be allocated to establishment charges, but reference to the large table accompanying this article (page 582) should go a long way to settle this difficulty and should prove a useful guide. If British electrical installation engineers have their accounts prepared on this basis in future they will be in a position to compare their costs with the costs of other British firms which may be published from time to time with benefit to all concerned.

If there were sufficient general demand from members, the Council of the Electrical Contractors' Association would undoubtedly arrange for a standard set of books and forms to be printed and sold to members at advantageous prices.

All amounts shown in the tables have been converted from dollars to pounds sterling, and comparative figures are given as a percentage of the Total Prime Cost of Sales (line 34). No adjustment has been made for the higher cost of living and scale of wages and salaries prevailing in America.

MANAGEMENT SALARIES.—Under this head there is included remuneration paid to all officers and managers. Owners of the business engaged in active management should pay themselves a salary equal to that which it would require to secure someone else to fill their positions. Commissions allowed to agents for securing orders are not treated as salaries, but are shown separately under "Commissions Allowed."

Turnover.	Management Salaries.	% of total P.C. (Line 34).
£	£	
2,195	255	16·9
5 550	428	10·9
12 750	1 030	11·0
27 270	2 680	14·0
53 500	3 460	8·8
87 500	5 130	7·8

Taken as a whole, the figures are irregular, but from and including the fourth line, they show the decreasing ratio expected. The amounts falling under this section probably appear high to us, but in this connection it should be noted that wiremen are paid from 75 cents to one dollar per hour in California and $1.50 in New York, say, approximately 6s. 3d. per hour.

As a suggestion for British partners or owners of businesses who desire in future to charge their services, the scale of 5% up to £10 000 sales invoiced and 2½% beyond may be considered —e.g., for a £30 000 turnover :—

	£10 000 at 5% =	£500
	20 000 at 2½% =	500
Total sales	£30 000	£1 000 salary, plus profits.

Digitized by Google

If desired this can be adjusted as follows :—

First £10 000 at 5%.
Next £20 000 at 3½%.
After 2½%.

The thing is to get a basis and to see that your customer pays reasonably for the service you render him. Profit on capital invested in your business is an entirely different thing from payment for service rendered, and not to charge the business with the services of a working director is unduly to deflate the establishment charges and to deceive anyone who is using the figures as a basis of calculation.

Payments to Employees.

OTHER SALARIES.—All other employees on the pay roll of the firm other than journeymen and helpers, are included in this section.

As shown, the item appears to be small in relation to the management salaries :—

Turnover.	Other Salaries.	% of total P.C. (Line 34).
£	£	
2 195	—	—
5 550	322	8·25
12 750	715	7·68
27 270	1 390	7·27
53 500	2 540	6·47
87 500	7 000	10·65

The results are regular with the exception of the last, which shows an unaccountable rise.

TOTAL SALARIES.—Probably the more natural way would be to lump the salaries, and this is done in the table following, with the addition that a column is added showing the ratio of total salaries to wages paid to operatives.

Unfortunately the latter figure will vary considerably, depending on the ratio of showroom sales to contract work.

Turnover.	Total Salaries.	% of Total P.C. (Line 34).	Labour (Line 31).	% Salaries of Wages.
£	£	%	£	
2 195	255	16·9	256	10·0
5 550	750	19·25	1 335	56·2
12 750	1 745	18·68	2 740	63·8
27 270	4 070	21·26	6 000	68·2
53 500	6 000	15·27	9 420	63·8
87 500	12 130	18·45	23 700	51·3

English practice would be nearer 25% to 33⅓% as the upper limit for ratio of salaries to wages paid in a normal installation business.

As we have already noted that management salaries are excessive, possibly the explanation will be more obvious if other salaries are examined in relation to wages.

Turnover.	Other Salaries.	Labour.	% Other Salaries to Wages.
£	£	£	
2 195	—	256	—
5 550	322	1 335	24·2
12 750	715	2 740	26·1
27 270	1 390	6 000	23·1
53 500	2 540	9 420	27·0
87 500	7 000	23 700	29·5

These are closer to good British practice, but they show an upward rather than a downward tendency for the larger businesses.

NON-PRODUCTIVE LABOUR.—An account is provided for wage payments to electricians and auxiliary workmen, that cannot be allocated to specific jobs. There is only one item of £130 and it does not call for further comment.

RENT.—In this account, all payments made as rental of all offices and warehouse space, also taxes and insurance on leased property are included.

In the event of the firm holding the freehold, a sum equivalent to the letting value should be included. Similarly, if it is a freehold property and a mortgage has been obtained, interest payable on the mortgage should be included here. Possibly a better name for this item would be premises account.

Examination of the figures gives the following results :—

Turnover.	Rent.	% of Total P.C. (Line 34).
£	£	
2 195	25	1·66
5 550	275	7·05
12 750	168	1·80
27 270	372	1·94
53 500	1 470	3·75
87 500	1 480	2·25

A London firm would consider the first four figures very low, as space fetches anything from 5s. to 25s. per sq. ft.

Provincial firms would probably be able to produce figures comparing favourably with the first four in the above table.

LIGHT, HEAT AND POWER.—These figures scarcely call for comment, as they are relatively insignificant. Payments made for light, heat and power, both for shops, offices, and warehouses should be included.

STATIONERY AND OFFICE SUPPLIES.—This item includes cost of stationery, books, forms and miscellaneous office supplies, together with postage, coinage, etc., thereon. Typewriter repairs, ribbons, waste paper baskets and items having a short life, which it is not desired to charge to capital account would be included here.

TRAVELLING AND ENTERTAINING.—Wherever possible hotel, rail and other expenses incurred by members of the staff in connection with contracts would be charged to "direct job expense" of the contract concerned. The balance of items not otherwise allocatable would be charged to this account.

The large table shows low figures under this section, due apparently to the fairly extensive use of motor cars.

Turnover.	Travelling and Entertaining.	% of total P.C. (Line 34).
£	£	
2 195	—	—
5 550	68	1·74
12 750	46	0·49
27 270	47	0·24
53 500	540	1·38
87 500	—	—

The last firm possibly include expenditure under this section under "miscellaneous."

TELEGRAPH AND TELEPHONE.—

Turnover.	Telegraph and Telephone.	% of Total P.C. (Line 34).
£	£	
2 195	14	0·93
5 550	18	0·46
12 750	46	0·49
27 270	103	0·54
53 500	123	0·31
87 500	300	0·46

These figures appear to be closely comparable with firms of similar size operating in this country.

POSTAGES.—This section includes cost of postage stamps, and registered letters.

Turnover.	Postage.	% of Total P.C. (Line 34).
£	£	
2 195	7	0·46
5 550	8	0·20
12 750	30	0·32
27 270	35	0·18
53 500	87	0·22
87 500	—	—

The last firm probably include this item under "telegraphs and telephones," or, alternatively, under "miscellaneous."

Low Advertising Allowance.

ADVERTISING.—All expenses for advertising, of whatever nature, e.g., printing, addressing, posting, artists' work, photographs, etc., are included in this item.

As British firms are frequently accused of slackness in this matter the data is printed below for careful consideration.

Turnover.	Advertising.	% of Total P.C. (Line 34).
£	£	
2 195	4	0·26
5 550	31	0·79
12 750	196	2·10
22 270	95	0·48
53 500	405	1·03
87 500	308	0·56

TAXES.—Income and property tax are included in this section. The desirability of including these in overheads appears to be open to question. Property tax chargeable against freehold property may appear more appropriately under rent, while income tax is a charge against profits, e.g., no profits, no income tax, but the "overheads" remain.

Turnover.	Taxes.	% of Total P.C. (Line 34).
£	£	
2 195	7	0·46
5 550	10	0·25
12 750	76	0·81
27 270	5	0·03
53 500	244	0·62
87 500	1 400	2·13

Digitized by Google

INSURANCE.—Payments on account of all insurance premiums paid are included with the following exceptions—

a. Motor car—chargeable to same.

b. Workmen's compensation, national health, etc.—included under wages.

c. Fire, loss of profits, etc., due to same cause to be charged "rent" or "premises" account.

Items to be considered in connection with insurance include loss of wages or cash in transit between bank and office and office and job, damage to property and persons on contracts, rent of office during reconstruction of premises after fire, building and contents against fire and possibly burglary, loss of material on contracts, accidents to members of the staff on contracts, etc., in addition to the workmen's compensation, etc.

Turnover. £	Insurance. £	% of Total P.C. (Line 34).
2 195	7	0·46
5 550	21	0·53
12 750	71	0·76
27 270	335	1·75
53 500	367	0·93
87 500	470	0·72

The reason for the high figure paid by the fourth firm is not clear. The average is about 0·75 of 1%.

ASSOCIATION EXPENSES.—With one exception these only average 0·1 of 1%, and do not call for comment.

CARRIAGE.—This item varies considerably between the different firms, probably due to different methods of accountancy. For example, the carriage on goods purchased is part of the cost of the goods and may be charged to the job direct. Carriage on goods sold will probably be charged on the invoice to the customer, or if delivered by motor van the cost will appear in that section. In the later returns, this item is deleted altogether.

Examined in detail, the figures are as follows :—

Turnover. £	Carriage. £	% of Total P.C. (Line 34).
2 195	35	2·33
5 550	46	1·18
12 750	—	—
27 270	54	0·28
53 500	600	1·53
87 500	183	0·28

A Debatable Point.

INTEREST.—In the present writer's view, it is a debatable point whether interest should be included in "overheads." Viewed from one angle, it is part of the cost of running the business and is therefore chargeable. From another angle, it indicates shortage of capital. If the capital is available, money will not be borrowed and the profits should be larger.

In the accounts under examination all charges for interest are included, whether for notes payable, trade acceptances payable or open account.

The item only affects three of the firms and is of relatively small importance.

CARS AND LORRIES.—Items included in this account include cost of maintenance and operating the vehicles, such as rent of garage, repair and renewals of equipment, petrol and lubricating oil and tyres, together with fire, theft and liability insurance.

The detailed examination follows :—

Turnover. £	Cars and Lorries. £	% of Total P.C. (Line 34).
2 195	95	6·30
5 550	88	2·26
12 750	105	1·12
27 270	527	2·76
53 500	625	1·59
87 500	770	1·17

MAINTENANCE AND REPAIR.—Repairs to furniture and fixtures, painting and repair of premises and minor alterations, are charged to this account.

Analysis provides the following result :—

Turnover. £	Maintenance and Repairs. £	% of Total P.C. (Line 34).
2 195	—	—
5 550	—	—
12 750	13	0·14
27 270	—	—
53 500	—	—
87 500	890	1·35

Painting and repairs to premises would be preferably charged to premises account.

MISCELLANEOUS EXPENSES.—All miscellaneous and incidental disbursements, not otherwise detailed, are included in this account, e.g., donations and subscriptions to charity, 'bus, tube and tram fares, advertisements for employees. Careful check should be kept on this account, and if any item constantly reappears and assumes substantial proportions, consideration should be given to the desirability of opening a separate account for it.

Analysed, the following results are obtained :—

Turnover. £	Miscellaneous. £	% of Total P.C. (Line 34).
2 195	8	0·53
5 500	40	1·02
12 750	93	1·00
27 270	170	0·89
53 500	113	0·29
87 500	289	0·44

An Interesting Item.

BAD DEBTS.—Always an interesting item, if and when it appears. Some regard it as a direct reflection on the counting house in failing to collect money quickly, while others regard it as a necessary and justifiable business risk, e.g., nothing venture, nothing have.

Turnover. £	Bad Debts. £	% of Total P.C. (Line 34).
2 195	10	0·66
5 550	10	0·25
12 750	46	0·48
27 270	400	2·09
53 500	190	0·48
87 500	115	0·17

Some meticulous people may argue that this is not a true "overhead," but a charge against profits. Others will reply that it is part of the recognised cost of carrying on business, and therefore chargeable. In any case, it is desirable to fix a reasonable limit to the amount and to investigate details closely if and when it exceeds that figure.

DEPRECIATION.—Many installation engineers entirely overlook the necessity of dealing adequately with these items. Several methods are employed for ascertaining reasonable allowances, as for instance :—

Tools.—Allow the first year's purchases to show on the balance sheet at cost, and charge all subsequent purchases to renewals. Alternately, charge all tools having a reasonable life to capital account and write off 33⅓% of the *original* or first cost each year.

Lorries and Cars.—At least 33⅓% should be written off the *first* cost annually.

Furniture, Fixtures and Fittings.—A reasonable sum is 10% of the first cost, except when buildings are leased. In this case, sufficient must be written off fixtures and fittings attached to the building to reduce the book value to nil at the expiration of the lease.

Stock.—Each installation engineer must decrease this item on his own experience, but 12½% is suggested as a reasonable figure.

Analysed, the total results are as follows :—

Turnover. £	Reserves for Depreciation. £	% of Total P.C. (Line 34).
2 195	34	2·26
5 550	33	0·84
12 750	78	0·82
27 270	371	2·94
53 500	862	2·17
87 500	679	1·01

In the event of premises being held under a repairing lease, a further allocation to a special reserve fund will be necessary, calculated in a manner such that "*x*" annual payments, accumulated at compound interest over the period of the tenancy, will provide, at the expiration of the tenancy, a sufficient sum of money to execute all repairs, repainting, etc., to the satisfaction of the landlord under the terms of the tenancy agreement.

TOTAL OVERHEAD EXPENSES (EXCLUDING PROFIT).—As has been previously stated, the total results are undoubtedly high compared with good British practice, due principally to the high ratio of managerial expenses.

Digitized by Google

Analysed in detail the following result is obtained :—

Turnover.	Total Overheads.	% of Total P.C. (Line 34).
£	£	
2 195	531	35·11
5 550	1 444	36·99
12 750	2 880	30·70
27 270	6 887	35·00
53 500	12 325	31·33
87 500	20 113	30·58

Figures for businesses of similar size in this country would probably vary between 25% and 17½%. The general average being 20 or 22½% for a turnover between £25 000 and £50 000.

Revised Grouping.—Information to hand indicates that the revised grouping of accounts adopted by the Association of Electragists International is as follows :—

Salaries (Managerial and Other Salaries); Non-Productive Labour; Rent or Premises Account; Light, Heat and Power; Stationery and Office Supplies; Travelling and Entertaining; Telegraph and Telephone; Postage; Advertising; Taxes; Insurance; Association Expense; Warehouse Upkeep; Maintenance and Repairs; Interest; Cars and Lorries; Miscellaneous; Reserve Appropriations; Allow-for loss on Notes and Accounts Recoverable; Allowance for Depreciation on Furniture and Fixtures; Allowance for Depreciation on Cars and Lorries; Allowance for Depreciation on Tools; Allowance for Depreciation on Stock. No provision appears to have been made for legal charges and audit fees, both of which are essentially "Overheads."

Allocation of Overhead Costs.—After the overhead costs have been ascertained for several years, the question arises, how the estimated costs for the current year are to be fairly allocated over the work to be done during the current year.

Clearly the overhead costs represent the average cost of either repairing a faulty flexible to a vacuum cleaner or of carrying out a £5 000 contract. Again, one £5 000 contract can be carried out at less cost for supervision and clerical work than one hundred jobs each of the value of £50.

Some firms decide that the ascertained establishment charge is the average cost, and every job they tender for, whether it be large or small, is priced on the same basis, e.g., if material and labour cost £5 they add 20% and 10%. Similarly, if the materials and labour cost £1 000 they add 20% and 10%. This method is very sound in practice, and if the principle is adhered to and the estimated costs are accuiate forecasts of the actual cost of the job there is little risk of the results of the year's trading showing an unsatisfactory result.

Other firms add 33⅓% and 10% to labour and 10% and 10% to material because, as is well known, the risk of loss, and also the supervision required, is much greater on labour than on material. In fact, drawing office and estimating costs are allocatable to labour overheads, because if material only is sold, these departments would disappear.

"Pious Hope."

Again, it is argued that the cost of a purchased article is an ascertainable fact, whereas the estimated cost of labour for a contract is an expression of pious hope at the best, and it is an accepted business principle that the greater the risk, the greater the margin of profit.

Other firms frankly recognise that large contracts can be carried out at less cost than small ones and calculate a sliding scale. Thus, for example, consider a business having a total

(Conversions from dollars to pounds sterling by slide rule.)

Digitized by Google

turnover of £40 000 and an overhead cost of 21%. Calculated on material and labour, the Association of Electragists consider a reasonable scale to be as follows :—

Prime Cost of Job ..	£5	£10	£20	£50	£100	£250	£500	£1 000	£2 500
Overhead % of Prime Cost	45%	38%	30%	25%	24%	22%	19%	16%	14%

If this scale is adopted, variations to contract cannot be taken at contract rate because a £2 500 contract would be taken at 14% on the prime cost to cover overheads and the appropriate addition for a £5 extra would be 45% or £2 5s. and not 14% or 14s.

The various methods applied to a contract of which the net cost of material and labour are respectively £55 and £45 give the following results.

(1) FLAT RATE OF 20% AND 10%.

Materials	£55	
Labour	£45	
E.C. Add 20%	£100	
Net Cost of Job.. ..	20	
	£120	
Add 10% Profit ..	12	
Selling Price		£132

(2) VARIABLE ON MATERIAL AND LABOUR.

Material.. ..	£55 0 0		
E.C. 10% ..	5 10 0		
Total Cost ..	£60 10 0		
Profit 10% ..	6 1 0		
		£66 11 0	
Labour	£45 0 0		
E.C. 33⅓% ..	£15 0 0		
Total Cost ..	£60 0 0		
Profit 10% ..	6 0 0		
		£66 0 0	
Selling Price			£132 11 0

(3) SLIDING SCALE.

Material ..	£55 0 0		
Labour	£45 0 0		
	£100 0 0		
E.C. for £100 @ 24%	£24 0 0		
Total Cost ..	£124 0 0		
Profit 10% ..	£12 8 0		
Selling Price			£136 8 0

In practice, in mixed contracting work, the second method appears to give the best result, because if the contract value is inflated by fittings, batteries, engines, switchgear or other costly plant which does not involve much staff work, the total price works out to a reasonable figure.

An expression of opinion in the correspondence columns by readers who are interested in the subject will undoubtedly prove of very considerable interest to all concerned, and particularly to the writer of this article.

SUSSEX CONTRACTORS.

Speeches at Annual Branch Dinner of Electrical Contractors' Association.

MOST of the members of the Sussex Branch of the Electrical Contractors' Association, and guests representative of supply and manufacturing interests, were present at the annual dinner of the Branch, held on May 8th, at the Old Ship Hotel, Brighton. Mr. H. L. Holford, the chairman, presided. For the first time in its history the Branch invited ladies to the dinner.

The toast of "The Corporations of Brighton and Hove" was proposed by Mr. HOLFORD, who outlined the great possibilities for electrical expansion in these south coast towns. Ald. H. J. GALLIERS (the Mayor of Brighton) in reply, gave details of the progress of Brighton's electricity undertaking, and mentioned that expansion was so rapid that further large capital expenditure would probably be called for within the next year or so. He pointed out that under the national electricity scheme they could not hope to make a profit on the generating side; this would come from distribution. He thought it was only right that a municipal undertaking should make some profit, though he did not countenance the making of big profits and their allocation to rate relief purposes. The MAYOR OF HOVE, who also replied, testified to the progress of the Hove undertaking, as an instance of which he mentioned that the number of electricity consumers had increased by 25 per cent. during the past year.

Co-operation at Eastbourne.

Proposing "The Electrical Contractors' Association and Allied Associations," Councillor R. S. CHATFIELD made appreciative reference to the co-operation existing between the Eastbourne electricity undertaking and the local contractors. The Corporation had built new electricity showrooms in keeping with the importance of the town, and had a special arrangement with E.C.A. contractors, at whose request a small sub-committee of the Electricity Committee was about to be formed to discuss certain outstanding matters with regard to the supply of goods.

Mr. W. H. WALTON (the President), who replied, commented on the amicable relations existing between all the Sussex branches and the municipal electrical engineers, and went on to speak of the work of the Association along two special lines—improving the quality of installation work and apprentice training—which would not only benefit the contractors themselves, but also the electrical industry as a whole. The Association had in preparation a booklet making a direct appeal to every architect in the land to use better workmanship and materials for electrical installations. This publication would tell the truth about good wiring and emphasise the dangers of shoddy wiring. It would raise the status of reputable contractors throughout the country, and would attract wide attention. The Association was making marked progress too in other directions, notably in the arrangement of special syllabuses for the education of apprentices. The Association was represented on the new committee appointed by the Electricity Commissioners to deal with assisted and hire-purchase wiring, and a further very formidable piece of work was involved in the preparation of a register which would eventually contain the names of all the recognised wholesalers, retailers and large users. The provision of the national grid meant that loads must be built up, and this in turn meant more installation work for many years to come.

"The Sussex Electricity Supply Engineers" was proposed by Mr. L. C. PENWILL, who drew attention to the fact that no fewer than eight supply engineers—Messrs, J. Christie, C. B. Smith, R. N. Torpy, G. Porter, J. K. Brydges, C. A. Frost, M. Whittle, and Major Grace—were present at the dinner.

Value of Registration.

Mr. J. CHRISTIE, who replied, said it should be obvious that supply engineers and contractors had a common interest. The success of a supply authority depended on the number of installations connected to its mains. If the Sussex contractors' prices were right, they should be very prosperous, for in Brighton alone nearly 3 000 new consumers were connected up annually. Every industrial establishment of any account in Brighton already used electric power. In the future they must look more and more to domestic heating and cooking for development. Consumption in Brighton was increasing rapidly, and if the present rate of progress were maintained, the undertaking would double its output every four or five years. Only about 25 per cent. of the energy generated at Brighton was sold for lighting, and the average price obtained for all purposes was less than 1¾d. per kWh. Arrangements were being made to hold a large exhibition at the Corn Exchange early in October, and if electrical people supported it properly, it would prove to be one of the best exhibitions ever held in the provinces. As a station engineer, he would like to see far more contractors enrolled on the National Register, as this would help supply authorities in declining to connect installations done by incompetent men. The time had come when a determined effort should be made to rope in all the competent contractors outside the Register, and all, be they "big" or "little" men, should have a chance. It was well known that the I.E.E. Wiring Regulations were not compulsory rules, but only recommendations. In Brighton, however, steps were being taken to provide, in a Bill that was being promoted, for embodying the I.E.E. Regulations in the Corporation's bye-laws. When this measure was passed, he would see that it was rigidly enforced.

The toast of "The Ladies and Visitors" was the subject of an amusing piece of oratory by Mr. A. C. WATTS, and a brief reply was made by ALD. BARNETT MARKS. In the absence of Mr. Walter Riggs, "Our Chairman" was wittily proposed by Mr. R. WILSON SMITH, and briefly acknowledged by Mr. H. L. HOLFORD.

THE I.E.E. ANNUAL MEETING.

Premium Awards—The Council and "Light's Golden Jubilee"—New Bye-Laws and Re-admission of Ex-enemy Members.

THE annual general meeting of the Institution of Electrical Engineers was held on April 9th, Lieut.-Col. K. Edgcumbe (president) in the chair. The award of premiums was an nounced as follows :—

The Institution Premium to Messrs. Johnstone Wright and C. W. Marshall ; Ayrton Premium to Mr. L. G. H. Sarsfield ; Fahie Premium to Messrs. A. E. Foster, P. G. I.edger and A. Rosen ; John Hopkinson Premium to Sir C. A. Parsons, F.R.S., and Mr. J. Rosen ; Kelvin Premium to Messrs. E. B. Wedmore, W. B. Whitney and C. E. R. Bruce ; Paris Premium to Mr. J. L. Carr ; Extra Premiums to Capt. J. G. Hines, Mr. B. L. Goodlet, Mr. L. H. L. Badham and Mr. W. Phoenix ; Wireless Premiums to Mr. T. L. Eckersley, Capt. P. P. Eckersley and Mr. A. B. Howe, Messrs. R. M. Wilmotte and J. S. McPetrie.

The PRESIDENT presented the Council's Report, and commented on one or two features. He expressed satisfaction at the increase of membership by 518, and drew attention to the committee which was to consider how the Institution can be of greater value to overseas members.

The adoption of the Report was seconded by Mr. P. ROSLING.

The Summer Meeting Date.

Mr. L. W. PHILLIPS discussed a number of matters in the Report, and first congratulated the Council upon furnishing technical libraries for the local sections. With reference to the appointment of a lecturer to give special students' lectures during the year, he suggested that a feature of such lectures should be the lives of pioneers of the electrical industry. He also suggested that the Summer Meeting might be held at some other period of the year than June, as this was not always a convenient time for many members to attend.

Speaking of the Jubilee of the incandescent lamp, he suggested that insufficient publicity had been given to this by the Council, and that the occasion warranted something more than a half-hour lecture, as was the case this session.

With regard to the Electrical Appointments Bureau, he drew attention to the fact that there were only 36 names on the list of applicants on March 29th, as against 65 last year, and inquired whether this was due to the better state of the industry or to the fact that the Appointments Bureau was not very productive in finding jobs. Referring to the disappointment expressed in the Report that only 900 members were sufficiently interested in "Science Abstracts" to purchase copies, he pointed out that members of other societies were supplied with "Science Abstracts" at lower rates than those charged to members of the Institution, and suggested that this might be the reason for the small number of copies purchased.

The PRESIDENT, referring to the matter of the Appointments Bureau, said that more appointments had been found last year than in previous years, and that accounted for the smaller number of names on the books. The other points would be considered by the Council, but as regards publicity, the Institution was not an organisation for such work, and left that matter to the E.D.A. and similar bodies.

Major THEODORE RICH, speaking with regard to the Jubilee of the incandescent lamp, said that in a few months' time, in America, they were going to have a big celebration in connection with this, but in the announcements with regard to it the name of Swan was not mentioned. He suggested that the Institution should gently hint that Swan had something to do with the invention of the incandescent electric lamp, because it was quite evident that the celebration in America would give all the credit to Edison.

The PRESIDENT replied that the Council had been considering this point only that afternoon. The Americans were proposing to hold what they called "Light's Golden Jubilee," which in America would be largely connected with the name of Edison, and the Council was proposing to take some action. In any case, he doubted whether the publicity of the Institution would reach the level of the American publicity.

The Annual Report was then adopted.

Lieut.-Col. CORTEZ LEIGH (hon. treasurer) presented the accounts, which showed a credit balance of £6 040. In doing so he mentioned the fact that this would be his last year as hon. treasurer, and expressed satisfaction that during his three years of office the assets of the Institution had increased by £22 431. The Council, he added, was considering a proposal to establish a scholarship available at universities, and also other means for making satisfactory use of the funds available. Finally, Lieut.-Col. Cortez Leigh paid a tribute to the great assistance which he has been given by the staff.

Mr. W. C. P. TAPPER congratulated the Council on having at last got rid of the Tothill Street property. He noticed that a profit of £5 000 had been made, but it would be interesting to know the percentage return on the investment since the property was first acquired. Finally, Mr. Tapper made the suggestion that instead of accumulating assets, it would be wise to spend the money in some useful manner.

The HON. TREASURER stated that during the first few years of the investment on the Tothill Street property the return was 3%, but in more recent years it had been 4½%.

Mr. LL. B. ATKINSON reminded the meeting that this did not include the £5 000 profit.

The PRESIDENT, referring to Mr. Tapper's last point, said the difficulty in recent years had been to make both ends meet, and therefore, perhaps, the Council had been a little ultra conservative. Now that the position had improved, steps were being taken to make the best use of the money available, and one matter had already been mentioned, namely, a scholarship. It might be said by some that the best thing to do would be to reduce the subscriptions, but a little arithmetic would soon show that this could only be a very small reduction, and would not justify the loss in funds involved. He felt that the money could be more usefully employed in other directions, and that was being carefully considered.

The accounts were then adopted. Votes of thanks were unanimously accorded to the hon. local secretaries and hon. secretaries abroad, and also to the retiring hon. treasurer.

The PRESIDENT added to the hon. treasurer's remarks on the excellent manner in which the staff carried out its work under Mr. Rowell, and the meeting concluded.

A Special General Meeting was then held to consider modifications of the Bye-Laws.

The "Companion" Class.

The PRESIDENT, in explaining the scheme, which was given in detail in a circular which had been issued to the members, said the matter had been very thoroughly considered by a committee of the Council, which had consulted with the Local Sections. He drew attention to the formation of a new class known as "Companions," and outlined the other alterations to be made as regards Graduates and Students in order to remove the difficulties that had been recognised for some time. As regards the formation of the class of "Companions," he said there had been more discussion over that word than over any other matter, but even those who objected to it had eventually to acknowledge that they could not provide a better one. There was a precedent for it, because the Institution of Mechanical Engineers had a Companion class, and the intention was that in that class should come men who were not necessarily electrical engineers, but who were eminent in some other branch of engineering, and in this way the Institution would keep in touch with those other branches. The President also drew attention to the fact that, under the Bye-Laws as proposed to be modified, ex-enemy members would no longer be under the disability that they could not re-join until a special meeting had been called by the Council.

The proposed alterations were put to the meeting, and were seconded and discussed.

Mr. PHILLIPS drew attention to the alteration of Bye-Law 23 relating to enemy members and, as he had done on the occasion of several previous annual general meetings of the Institution, expressed dissatisfaction at the manner in which the Council had dealt with this matter. He reminded the meeting that it was eleven years since the war ended, and yet no action had been taken by the Council to deal with the position of ex-enemy members. The history of electrical science, and indeed other sciences, clearly indicated their international character, and therefore they should not perpetuate hostile feelings among nations. Notwithstanding the alteration in the Bye-Laws now proposed, he felt that it left the position in a very unsatisfactory state and he moved the deletion of the final words in the proposed Bye-Law, namely, "and for such further period thereafter as the Council may determine."

Digitized by Google

In other words, he wished that ex-enemy members should automatically become members again at the close of hostilities.

Sir THOMAS PURVES as Chairman of the Committee which has dealt with this matter, whilst expressing sympathy with Mr. Phillips's views, said he did not think the amendment would be of any value because a member who had ceased to be a member through a state of war would have to apply for readmission in any case.

Mr. PHILLIPS said what he desired was that such a member should be able to apply for membership immediately on cessation of hostilities and that the Council should not have the power to prevent him doing so.

Mr. F. GILL suggested that such a member would be in a better position under the new Bye-Law, because if he were to apply immediately after cessation of hostilities, there might be such feeling still existing that he would be rejected, whereas if it were left to the discretion of the Council, they, feeling the pulse of the Institution, would be able to judge the best time for inviting ex-enemy members to rejoin.

Mr. Phillips's amendment was then put to the meeting, and lost by a large majority, only three voting for it.

Service Candidates.

Mr. A. C. SPARKS referred to the difficulty of officers in the Army, Navy and Air Force obtaining admission to the Institution through not being able to obtain the necessary support from people who must, under the Bye-Laws, personally know their qualifications. The difficulty he said arose through so many of these officers being stationed abroad, and therefore being unable to obtain the necessary signatures. Mr. Sparks also referred to the period of office of members of Council, and suggested that it should not be possible for a member to serve for so long as eight years out of ten and it would be more to the advantage of the Institution to reduce the period in order to spread service on the Council over a wider field. A maximum of five years, he suggested, was ample.

Sir THOMAS PURVES speaking with regard to the difficulties of service members getting the necessary signatures, said that that condition had been modified in such cases, and he hoped publicity would be given to the fact that qualified people placed in such difficulty could obtain membership on the recommendation of persons who had interviewed them and formed a judgment.

The PRESIDENT referring to Mr. Sparks's comments as to length of membership of Council, suggested that there were certain difficulties in the way of making an alteration which would reduce the period to five years. He indicated, on the advice of the solicitor, that it was not a matter which could be gone into in detail at this meeting but he promised that the Council would carefully consider what Mr. Sparks had said.

Mr. E. H. O'SHAUGHNESSY suggested that the difficulty could be handled by the members themselves, because when they saw a man was nominated for a second term of office, they could make other nominations.

The resolutions regarding the alterations in the Bye-Laws were then unanimously adopted.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

[TO THE EDITOR.]

The Incandescent Lamp Jubilee.

SIR,—I am obliged for the space which you gave me in your columns for May 10th, on this subject, but I find since I wrote you, through the courtesy of Mr. Lane Fox Pitt himself, who has lent me a copy of his patent No. 3988 of October 9th, 1878, that he was not only the first patentee of electric distribution at constant potential, with everything in parallel, but that he was also, in the same specification, the first to patent what is now known as the gasfilled metal-filament lamp, his patent being prior to any lamp patent of Swan, and before even Edison's British patent for a platinum-wire lamp, which is dated the 23rd of the same month and year.

No doubt modern lamps of this character use filaments of tungsten, and are filled with Argon gas, while Lane Fox Pitt used a platinum-iridium alloy for his filament, and nitrogen for his gas. In his time, however, neither tungsten in the form of wire, nor Argon in any form, were known, and in his patent specification Mr. Lane Fox Pitt was careful to say specifically: "In order to prevent the deterioration of the material when incandescent, I sometimes surround it with an atmosphere of nitrogen gas," just as in modern lamps Argon is introduced to prevent the deterioration (probably evaporation) of the tungsten.

No doubt tungsten is a better substance than platinum-iridium to use as a filament, as being able to stand higher temperatures, while no doubt Argon, as a more suitable gas, is better than nitrogen; but in both cases the principle involved is exactly the same, namely, to use a filament with the highest possible melting point, and to prevent evaporation of this hot filament by counter bombardment by a neutral gas.—I am, etc.,

A. A. CAMPBELL SWINTON.

40, Chester Square,
London, S.W.1.
May 13th.

[TO THE EDITOR.]

SIR,—The suggestion that Edison was the inventor of the first incandescent electric lamp is definitely refuted in the "General Electric Review" for May, by Mr. C. L. Clarke, who was intimately connected with Edison's work in the early days. This writer, in an article on "Edison's First Commercial Lamp," says:—

"Edison knew on October 21, 1879, after months of intensive effort, that in all its fundamentally essential details he had at last invented an electric lamp to take the place of the ordinary gas lighting burner. . . ."

". . . Edison's horseshoe lamp, with its carbonised bristol-board filament, was the original sprout from the seed sown by his discovery and invention of October 21, 1879, which demonstrated that the seed had commercial life, and started its growth and spread throughout the world."

This insistence on a date in 1879 is of particular interest in view of the facts recorded in the memoir, "Sir Joseph Wilson Swan, F.R.S.," reviewed in your columns last week. Here it is recorded that:—

"At a meeting of the Newcastle-upon-Tyne Chemical Society held on December 18th, 1878, Swan was able to show an incandescent carbon lamp, which consisted wholly of a glass bulb, pierced with two platinum wires supporting between them a straight thin carbon conductor $\frac{1}{15}$th inch in diameter. . . . On January 17th, 1879, the lecture was repeated and a similar lamp exhibited at Sunderland."

"The news that Swan had solved the problem of incandescent electric lighting by means of a vacuum lamp quickly spread through Newcastle, and he was invited to give a public lecture describing his invention. Accordingly, on February 3rd, 1879, he delivered a lecture on electric lighting to an audience of over 700 people. . . . At the lecture he exhibited in operation a lamp similar to that shown in December, 1878. The same lamp was exhibited again in operation at a lecture which he gave at the Town Hall in Gateshead on March 12th, 1879, before an audience of about 500."

Comparison of the two sets of quotations clearly shows that Swan's lamp was publicly exhibited ten months before the date put forward by the Americans as the birthday of the incandescent lamp. It is thus a ludicrous essay in relativity for the N.E.L.A. to organise a "Golden Jubilee of Light." They have obviously chosen the wrong year and the wrong inventor.—I am, etc.,

"QUID PLURA."

Liverpool.
May 13th.

[TO THE EDITOR.]

SIR,—The quotations you give from the N.E.L.A. "Bulletin" of the preparations that are being made in America for the celebration of the "Golden Jubilee of Light" stand as an interesting object lesson, not only of the power of auto-suggestion, but also of the very thorough way in which the Americans celebrate an occasion which they consider worth while. A nation-wide programme covering nearly five months(!), with an international broadcast to wind up, is arranged by the Americans. Over here a short lecture in the privacy and subdued illumination of the lecture theatre of the Institution of Electrical Engineers was the sole outward mark of British remembrance of the work of a great British inventor. One can hardly wonder that the news of our blatant publicity has not yet reached the eyes and ears of the N.E.L.A.—I am, etc.,

L. C. SMITHERS.

Lincoln.
May 11th.

[TO THE EDITOR.]

SIR,—My dictionary supplies a possible reason for the proposed American celebration of the "Jubilee of Light." In the sense used in Jewish history the word "jubilee" signifies "every fiftieth year . . . at which time all the slaves of Hebrew blood were liberated, and all lands which had been alienated during the period reverted to their former owners."

Digitized by Google

Perhaps the alienated credit for the invention of the incandescent lamp may revert in a similar way to its former owner.

Some Fallacies of Load Factor.

[To the Editor.]

Sir,—So far as Mr. Edward V. Clark is interested in the motives and practice of municipalities and companies, I should like to point out that very small profits and very large sales have made Mr. Henry Ford the richest man in the world; also that Mr. Ford's aim has always been service. Nevertheless, I agree with Mr. Clark that the 100% L.F. ideal is not the best way to set about the business. My reason for saying this is that the load factor system of analysis is not sound.

I disagree with Mr. Clark when he brushes aside the rateable value tariff as unsuitable for universal use, but I presume he does not realise it is a quantity tariff with the rateable value expedient applied in the case of small consumers.

The following sketch of the two forms of analysis may make the matter clear:—

Load Factor.	Quantity.
Fixed Charge. — Management, Rates, Distribution, some Wages and Repairs, some Coal, and all Capital charges, divided by kW demanded equals a charge per kW demanded.	Management, Distribution divided by number of consumers equals charge per consumer. Add capital charges on Mains for any selected size group, with capital proportion of rates divided by number of consumers in the group equals total charge per consumer.
Running Charge. — Remainder of Coal, Wages, and repairs, divided by number of units sold, equals charge per unit.	Coal, Wages and Repairs divided by units sold equals charge per unit. Add Capital charges for Generating Plant with proportion of Rates for the same sized group, with fixed average load factor for the group, expressed as a charge per unit, equals total charge per unit.
Comparative Charges for Small Consumer.—Say £4, plus 0·5d. per unit.	Say £3 10s., plus 1·125d. per unit.

A load factor system would probably be divided up into two or three sections according to size, or for purposes such as power, and a quantity system into any number or sized sections, possibly six. Each section in size has an increasing charge per consumer, and a decreasing charge per unit, so the tariff is continuous. There is a point between each section where the resultant charge is the same on either scale.

From this sketch the possible application to the national system will be apparent, though the actual figures might prove to be impracticable.

It will be admitted that the main cost of the "grid," such as poles, insulators, switchgear and housing, also administrative expenses and maintenance, are not in any way related to the demand. On the other hand, generating plant should be cheaper, partly on account of large scale, and partly on account of less spare plant. Also the Board's consumers will not vary so much in load factor, probably between 20 and 35%.

When all adjustments have been made in the sale of energy to selected stations, which may be about 74%, the balance might be divided up in proportion to size, for fixed charges, plus a uniform rate for unit charge. Or, failing this, a distribution on the rateable value basis might be more acceptable than a load factor system. A good deal might depend on the growth of this system amongst authorised distributors.

In such a case Mr. Clark would be consistent in his plea that load should be left to look after itself, a recommendation with which I cordially agree.—I am, etc.,

J. Rutherford Blaikie.

Bedford,
May 12th.

The Wireman's View-point.

[To the Editor.]

Sir,—As a wireman who tries to take an intelligent interest in the machine of which he forms but a cog, may I offer some views on the electrical contracting trade from this point of view.

From the public point of view it is reasonable to assume that little skill is required in the electrical contracting industry, in that every plumber, hot water fitter, jobbing builder and decorator, claims to be an "electrical engineer," while on the other hand what genuine electrical contractor is there who claims to be plumber, fitter, decorator, or builder? With such conditions prevailing, the public give their contracts to the lowest tender, believing the work of such tenderer to be up to standard. While there are such people as plumber, gasfitter, builder, decorator, etc., competing in the contracting industry, there will always be shoddy wiring, in the same way that there will always be good electrical wiremen unemployed, and wishing they were plumbers or gasfitters.

Some people in the industry claim that compulsory registration would alter the position, but here again, with competition as it is, as much as they dislike it, contractors are compelled to accept work at cut prices in order to keep their businesses going, with the result that unless a wireman works "fast and furious," taking little heed of shoddy wiring, but keeping his eye on the clock, so that as little time as possible need be spent on the job, his employer will lose money, while he (the wireman) will lose not money, but his job, for being too slow. There are exceptions, of course, but such is the general position as the writer has found it.

Another thorn in the electrical contracting industry is the employment of boy labour, that is, one man in charge of a number of boys attempting to do an experienced man's work. As regards indentured apprentices, it ought in many cases to be made a criminal offence to delude a lad into thinking that he will one day be able to obtain satisfactory employment, as the tuition given is sometimes of the scantiest. At most his only guarantee is regular employment during the period of his apprenticeship.

The writer is in no way a Jeremiah, but the conditions as met with by a workman in the industry are often of better barometric value with a view to prophesying the future storms, than many of the round-the-table conferences of partners and directors. Until the "kerbstone" contractor is eliminated, and prices for installation work are sufficient to pay for good materials and men, the industry as a whole will be in disrepute, and shoddy wiring will prevail.—I am, etc.,

"Wireman."

London.
May 3rd.

Advertising Abuses.

[To the Editor.]

Sir,—May I, as an advertising man in the electrical industry, add to the congratulations which Mr. Charles Pinkham has doubtless already received for his courage in exposing a scandal which constitutes a growing strain on the resources of electrical manufacturing firms. The extremely careful and tactful way in which most of these propositions are put forward makes it impossible for any one advertising manager to take up a firm stand with any likelihood of success. There are always so many who will privately admit the existence and baneful effects of the abuse, but do not feel justified in coming forward publicly in a matter which may involve their firm in loss of business.

It seems to me that while Mr. Pinkham and others connected with the big firms may boldly resist the advances of the advertising blackmailer, the smaller firms cannot afford to take the big risk. In the circumstances, could not a body like the Incorporated Society of British Advertisers take some collective action to put an end to this invidious form of coercion?—I am, etc.,

"Advertising Manager."

ELECTRIC FANS FOR 1929.

Details of Some of the New and Improved Designs for A.C. and D.C. Supply—Special Selling Facilities Offered by Manufacturers.

THE gradually improving weather suggests that electrical contractors will soon be receiving inquiries for electric fans, and in order to assist in the stocking of different types, we give this week a number of suggestions received from manufacturers. With such a machine as a fan the development of new models each year is unnecessary, though as will be appreciated from the following descriptions many improvements have been introduced since last year.

Some of this year's models are new, however, and among these may be mentioned the type No. S.14 026 of SIEMENS ELECTRIC LAMPS AND SUPPLIES, LTD., of 38–39, Upper Thames Street, London, E.C.4. The oscillating device incorporated is a departure from the earlier pattern and the mechanism has been reduced to a few simple parts enclosed in a grease-tight gear box. There is only one range of oscillation, the makers having found in practice that it is seldom one requires to vary the arc of oscillation. Improvements have been made in the design of the fan motors, while the base is of wide diameter to prevent overturning the fan accidentally. In d.c. models, the commutators have what the makers claim to be an unusually large number of segments and the new type of brush-holders with metallic caps will be appreciated. The speed regulator is made of non-combustible and non-hygroscopic materials. Lower current consumption has also been considered without sacrifice in breeze volume.

The "Cosmos" fans offered by METRO-VICK SUPPLIES, Trafford Park, Manchester, for the 1929 season include several 12 in. and 16 in. oscillating desk and bracket fans designed to give an oscillating movement of 90 deg., while the mechanism consists of a few simple parts enclosed in an aluminium casing. The power absorbed is low, and the fans pass through the angle of oscillation approximately twelve times per minute. The "Cosmos" 54 in. ceiling type fan for d.c. supply is fitted with a motor of the two-pole series-wound enclosed ventilated type. The a.c. fan is of single-phase, enclosed ventilation, induction type, and the makers claim that the careful design and conservative rating ensure coolness in operation. The fan consists of three blades, and has a current consumption at 220 V of 0·455 A. Type O.1 fan regulators for d.c. ceiling fans and type F.1 for a.c. ceiling fans are also new "Cosmos" developments. Designed for wall mounting, eight stops are provided to give, full on, six speed reduction stops and off. The standard finish of these regulators is white enamel with bronze lines to match the fans. The type F.1 regulator can be supplied with a static condenser fastened to the casing, and permanently connected in circuit, so as to render unnecessary the connecting up of any extra apparatus when this type of regulator is used. The condenser is automatically discharged when the switch is brought to the "off" position. The makers state that the combination results in an improved power factor and decreased power charges per fan motor, as compared with fans installed without the condenser type of regulators. Figures furnished by

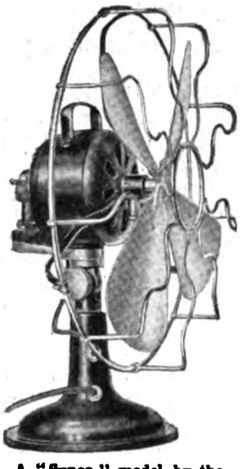
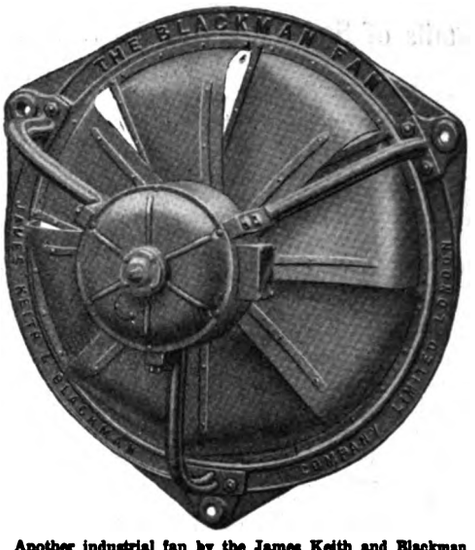
An a.c. single-phase "Streamline" fan, by the James Keith and Blackman Co., Ltd.



A "Sunco" model, by the Sun Electrical Co., Ltd.



Another industrial fan by the James Keith and Blackman Co., Ltd.

Metro-Vick Supplies show that with an 8μF condenser the power factors of 200/230 V and 220/250 V fans are improved up to 0·95 and unity respectively.

The General Electric Co., Ltd., of Magnet House, Kingsway, London, W.C., is again conducting a special fan campaign in the form of proportioned advertising in commercial, industrial and technical journals and in high-class magazines. To supplement these advertisements sales-helps have been devised for trade use of dealers, while showcards and cut-outs are available for window displays and counter demonstrations. The company has introduced a new range of induction type fans for desk and bracket mounting, fitted with a motor having cast shells, the stator being built up of stampings punched from selected steel sheets, and carefully insulated to reduce losses. The motor is of the shaded pole squirrel cage type with a speed regulator in the form of a choker, situated in the base of the fan. Both "non-oscillating" and "oscillating" types are offered. The former pattern is adapted for desk or bracket use by means of a trunnion attachment, and in either position a wide range of adjustment is available. In the "oscillating" pattern a continuous movement over a wide area is provided by means of special mechanism. Attention has also been given to the design and manufacture of ceiling fans for both a.c. and d.c. supply. In this respect the G.E.C. has modified its existing range of fans of this type by splitting each type into two patterns known as the "Distribution" and the "Velocity" types. The "Distribution" type is fitted with blades on which the contour is so designed to give a distributed breeze over a wide area, while the blades of the "Velocity" type are arranged to give a concentrated breeze over a relatively restricted area.

L. G. Hawkins and Co., Ltd., 30–35, Drury Lane, London, W.C., are specialising this year on the "Supreme" 8 in. model for a.c. or d.c. supply, finished in nickel plate. The makers advise us that they have had one of these fans running for twelve hours a day for three weeks, and the rise in temperature has been practically nil.

Particulars have been received from the Electro Manufacturing Co. of America, 32nd and Arch Streets, Philadelphia, of a "Circulair" fan which is so constructed that the blades revolve in an horizontal plane, thus avoiding to a large extent the possibilities of direct draught. The unit is made in two sizes, namely, 9 in. and 6 in., in mahogany, walnut, ivory, or black, with the choice of the top fitment or cone. The latter may be in the form of an ash tray, flower holder or humidifier. The motor is designed for either a.c. or d.c. at 110 or 220 V. The illustration of the fan which accompanies this article shows the desk model.

Another departure from the usual design in fans is made by the Revo Electric Co., Ltd., of Britannia Works, Tividale, Tipton, in the "Elite" model. This fan, made for both a.c. and d.c. in voltage ranges from 100–250, has 10 in. blades, and is made in three types for both forms of supply. The motor is of the enclosed type, fitted with supporting legs of the adjustable type to allow of variation of the angle of the blades. The latter are enclosed in a brass wire guard. Other fans by the same firm include desk fans of the oscillating and non-oscillating types, cabin and ceiling fans, port hole and exhaust fans.

The latest additions to the range offered by Marelli and Co., Ltd., of 19–20, Garlick Hill, London, E.C.4, include an oscillating type of fan, having 12 in. or 16 in. blades. The base is hinged, thus permitting the model to be used as a wall fitting or desk type. This machine is available in both sizes for a.c. or d.c., the speeds being for the a.c. 12 in., 1 360 r.p.m. and for the 16 in., 1 370 r.p.m. The d.c. machines have speeds of 1 500 r.p.m. for the 12 in., and 1 420 r.p.m. for the 16 in. The normal range of oscillation is about 85 deg., the fan moving through a horizontal plane approximately 16 times per minute. The oscillating mechanism consists of a worm on the motor shaft meshing a worm wheel on which axis is fitted a pinion, which in turn drives a gear wheel acting as a crank wheel, all being enclosed in a gear case at the back of the motor. The crank wheel is connected by a link to the stationary base of the fan, causing the motor body and blades to oscillate with each revolution of the crank wheel. The worm wheel drives the pinion through a ball clutch placed on the vertical pinion shaft, so constructed that it will slip automatically should the fan meet any obstruction while oscillating, without interfering with the motor. This in conjunction with another simple device enables the fan to immediately reverse and automatically resume its oscillatory motion through another angle. The oscillatory motion may be stopped or resumed by the turning of a lever which engages or disengages the pinion.

The Bergmann Electric Co., Ltd., 82, Victoria Street, London, S.W.1, informs us that the range of fans offered last year will be available again this season. The range includes industrial and domestic types, the latest model being an induction type oscillating model.

Berkeley and Young, Ltd., Hays Mills, Birmingham, are again featuring their "Bandy" range of fans. These are fitted with universal movement, and by means of a thumb screw the fan may be set to run in any desired position either on desk, table, wall, or bracket. Each model is of single speed and is fitted with "on and off" switch conveniently placed on the pedestal. Blades are of stout lacquered brass with rigid guard, and the finish in black enamel and gold lines. There are two sizes, namely, 10 in. and 12 in., supplied, if required, with three speed regulators. Models are stocked for voltages from 100–250 V, and, in the alternating current type, the motors are of the commutator variety suitable for 25 to 50 cycles.

S. G. Leach and Co., Ltd., of 26/30, Artillery Lane, London, E.C., are again featuring the "Universal" desk fan which, fitted with 12 in. diameter blades, is provided with a quick break switch, having three speed positions. The fan is made in both the oscillating and non-oscillating types, and can be obtained for any voltage from 100/250, d.c. or a.c., a universal motor being used.

Digitized by Google

THE A.E.G. ELECTRIC CO., LTD., 131, Victoria Street, London, S.W.1, are again offering the attractive table lamp and fan combination, called the "Ventilux." The company also supplies desk, trunnion, oscillating, ventilating, and ceiling fans, the DVO2 of the latter class being an oscillating model. The diameter of the blades is 12 in., approximately, while the total length is about 33 in. The machine is fitted with a special wind guide blade which gives a regulation of the rotary speed. A special feature of the machine is the method of lubrication.

THE GLOBE ENGINEERING CO., LTD., of Brighouse, advise us that they are now manufacturing alternating current fan motors, particularly 12, 15, 18 and 24 inch single-phase and three-phase fan motors of the totally enclosed self-starting type; larger sizes to specification are also manufactured. The same firm are also makers of a.c. and d.c. motors for direct coupling to blowers, and also supply complete plants for organ blowing, including motors of specially silent type when required.

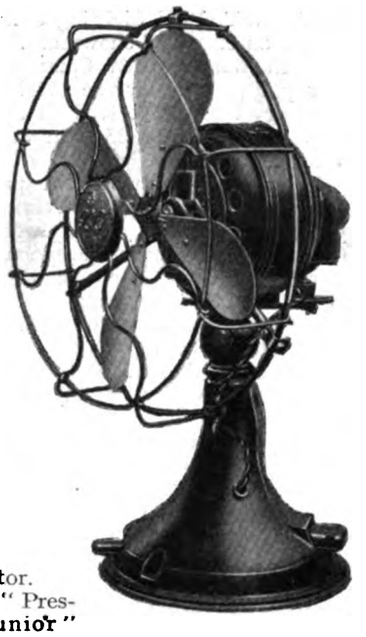
THE STANDARD ELECTRICAL CO., Myrtle Engineering Works, Cross Roads, Keighley, who have been specialising, for nearly 30 years, in the manufacture of box blade propellers, also paddle and multivane steel plate fans, for medium and high pressures, offer their services, in the application of fans for any duty. They are also suppliers to the trade of d.c. and a.c. fan motors.

"Sunco" fans, by the SUN ELECTRICAL CO., LTD., of 118/120, Charing Cross Road, London, W.C.2, cover both domestic and industrial requirements. Their latest domestic type is a swivel and trunnion, desk and bracket oscillating model, fitted with 10 in. diameter blades, with a consumption of 26 W in the case of d.c. and 30 W in the case of a.c. supply. The fan oscillates in a horizontal plane through an angle of 110 deg., the motion being stopped if desired by the setting of a lever. A safety clutch is provided, which operates automatically, and, in the case of obstruction, allows the fan to reverse and resume its oscillatory motion in another direction. Other fans in the "Sunco" range include revolving ceiling types which, made with four blades of either 12 in. or 16 in. sweep, are suitable for a.c. or d.c. supply of 100 to 250 V. The 12 in. d.c. model is fitted with a motor giving 1 350 revs. per min., and has a consumption of 42 W, while the 16 in. d.c. fan revolves at 1 420 revs. per min., and has a consumption of 72 W. An a.c. series-commutator machine fitted with 12 in. blades has a speed of 1 500 revs. per min., with a consumption of 58 W. The 12 in. a.c. induction type of ceiling fan has a consumption of 58 W and a speed of 1 400 revs. per min., whereas the 16 in. model, with a consumption of 115 W, has a speed of 1 375 revs. per min. A wide range of box-blade and three blade, light and heavy duty, propeller, ventilating and exhausting fans is made by the Sun Electrical Co., Ltd., in addition to a number of ventilating ring types. Automatic shutters for box-blade exhaust or ventilating ring type fans are also supplied, the purpose of these being to prevent back draught when the fan is not running.

A desk type "Circulair" fan by the Electro Manufacturing Co.

A special fan window fitting by the General Electric Co., Ltd.

Since the publication of our last fan number, the JAMES KEITH AND BLACKMAN CO., LTD., 27, Farringdon Avenue, London, E.C.4, has placed on the market a range of single-phase condenser type fans. These have been designed for standard supplies of 200 to 250 V at 50 cycles, and the motors have double windings with one circuit directly connected to the mains and the other to the main in series with a condenser which is embodied in the switch supplied with the fan. The motor is self-starting by means of a single-way switch so that should the supply be cut off and later restored, independently of the switch, the motor is not liable to damage. Owing to the leading current in the condenser circuit compensating for the lagging current in the main winding the motors have a high power factor. As both sets of windings are used, a larger output is obtainable from the motor.



A G.E.C. suggestion.

The "Prescot Junior" d.c. ceiling fan by BRITISH INSULATED CABLES, LTD., Prescot, is again expected to be of interest to the public, and though no improvements have been made since last year, it lacks nothing in appearance or efficiency. The motor is of the enclosed type and has a consumption of 80 W at 220 V. The blades are of aluminium, set at an angle of 12 deg., and have a diameter of 48 in. The makers state that the motor is designed to develop at the fan blades a mechanical power equal to about 40% of the electrical power consumed. Its normal speed is 300 r.p.m.

THE BRITISH THOMSON-HOUSTON CO., LTD., Rugby, is again specialising in 12 in. and 16 in. oscillating and non-oscillating fans, including a number of bracket types. All models are suitable for a.c. or d.c. at pressures from 100 to 120 V and 200 to 240 V. A wide range of ceiling and exhaust fans is offered, exclusive of the ship and train models. Box blade fans are made in sizes ranging from 12 in. to 36 in., and have consumptions from 60 to 240 W, according to type. Propellor fans are offered in sizes from 12 in. to 36 in., with air deliveries up to 14 000 c. ft. Automatic shutters and regulators both for a.c. and d.c. are also offered.

We are given to understand by WM. E. CULKIN AND CO., of School Close Mills, Neville Street, Leeds, that they are in a position to repair and rewind for the trade all types of small electric motors such as are used in fans, electric cleaners, washers, etc.; the conversion of motors from d.c to a.c. supply is also part of the service offered.

Electric motors and fans are also manufactured by VERITYS, LTD., of 31, King Street, London, W.C. These are made for both a.c. and d.c., and have a wide oscillating range. The consumption of the 12 in. model is 30 W, and a special slipping clutch is included, which, the maker's claim, protects the fan from damage due to obstruction, etc.

The series of fans made by the EDISON SWAN ELECTRIC CO., LTD., 123/5, Queen Victoria Street, London, E.C., includes models for desk and wall use, both oscillating and non-oscillating types, for d.c. and a.c. supplies. The diameters range from 12 in. to 16 in. The d.c. 12 in. model has a running speed of 1 200/1 300 r.p.m., while the 16 in. type has a speed of 1 000/1 100 r.p.m. The a.c. 12 in. and 16 in. fans have speeds of 1 400 and 1 350 r.p.m., respectively. Ceiling fans of various types are also made by the Edison Swan Co., the fixed, rotating and oscillating models being designed for both a.c. and d.c. supply, according to requirements.

NEWS IN BRIEF.

A British Trade Fair in Buenos Aires—Madagascar and Electrical Appliances—The Batti Wallahs' Society—Electrical Imports and the Irish Free State.

BARNSTAPLE Lighting Committee is to prepare a scheme for an electrical showroom.

Rotherham Health Committee is to invite tenders for X-ray apparatus for the Oakwood Hall Sanatorium.

Newry U.D.C. received 51 applications for three electrical engineer apprenticeships in connection with the electricity station.

Telephone subscribers in part of Stockport and Hazel Grove have sent to the Postmaster-General a protest with 500 signatures against the proposal to transfer them from the main Stockport automatic exchange to a new manual exchange at the south end of the borough. It is alleged that the change will result in increased cost of calls.

An electric pump is to be installed at North Berwick swimming pool for supplying sea water.

Funds are being raised for the provision of a new electrically-blown organ at St. Dunstan's Church, Canterbury.

The G.W.R. has decided that the lighting of the passenger and goods stations at Hayes are to be converted from gas to electricity.

Amongst the craft taking part in the Upper Thames Club handicap at Bourne End last week-end, was the "Cyra" owned by Mr. J. S. Highfield.

Members of the North Wales Branch of the Electrical Association for Women made a tour of inspection on May 9th of the Cunard Liner "Samaria" lying in Huskisson Dock, Liverpool.

The annual general meeting of the South Wales Branch of the Association of Mining Electrical Engineers, will be held to-morrow (Saturday), at the Esplanade Hotel, Porthcawl.

A proposal, put forward by the British Chamber of Commerce in the Argentine, for a British Trade Fair to be held in Buenos Aires during November, 1930, and February, 1931, has been endorsed by the Department of Overseas Trade, the Association of British Chambers of Commerce and the Federation of British Industries.

The report of the Reading telephone district for 1928 states that the growth noted in the previous year was maintained, 2 445 exchange lines and 3 986 telephone stations being added. Local and junction calls were 17 511 200 in 1927 and 19 329 523 in 1928, while trunk calls rose from 3 844 888 in 1927 to 4 143 177 in 1928.

The Postmaster-General announces the opening of a public telephone service between this country and Finland. At the outset the communication will be available from any part of this country but only to the south-western portion of Finland. Day charges per 3 minutes range from 21s. to 24s. 9d. and night charges from 12s. 9d. to 14s. 9d.

The Administrative Council of Madagascar has passed a resolution exempting from customs duty on importation into Madagascar of material destined for radio-telegraphic stations imported for the account of the State or the colony; and labour saving machinery and articles for the development of the colony. If within three months of the receipt of the resolution the French Government does not issue a Decree rejecting the proposal contained in the resolution, the latter will be promulgated in the colony and enter into effect.

Coventry Watch Committee is extending the police telephone box system. Boxes are now to be provided throughout the Foleshill division at a cost of £433.

The Federation of British Industries has signed a contract for the erection of a new building on a site in Tothill Street, London, S.W.1. Firms engaged in the work will all be members.

At the luncheon of the Batti Wallahs' Society, to be held at the Hotel Cecil on May 30th, Mr. Henry S. Horne will deliver an address entitled, "A Layman's View of the Electrical Industry."

LOOKING BACKWARD.

FIFTY years ago, according to THE ELECTRICIAN *of May 17th, 1879:—*

Some enterprising publicans were illuminating the exterior of their premises with electric light.

There were in England 320 duplex telegraph circuits at work, covering a total mileage of 40 000.

The noise made by the regulators of electric lamps shown at the Albert Hall Exhibition was at times sufficient to interfere with certain of the musical effects produced at concerts.

Edison secured a British patent for "Improvements in Lighting by Electricity." This was nothing like Swan's carbon filament lamp but "a candle or light-giving body . . . in which particles of metal or metallic oxide are moulded into a mass, adapted to the passage of the electric current, and rendered luminous by the same."

* * *

TWENTY-FIVE years ago THE ELECTRICIAN, *dated May 20th, 1904, reported that:—*

The I.E.E. Summer Meeting was to be held in America.

Mr. G. C. Lloyd became secretary of the Institution of Electrical Engineers.

Woolwich was the only Metropolitan council empowered to supply and let on hire electric wiring installations, fittings, and appliances.

* * *

TEN years ago it was stated in THE ELECTRICIAN *of May 16th, 1919, that:—*

Among metal stocks held by the Ministry of Munitions were 51 130 tons of copper.

The Electricity Supply Bill which provided for the establishment of the Electricity Commission was before the House of Commons.

Sir William Slingo estimated it would cost £5 000 000 and take ten years to instal automatic equipment in London's telephone exchanges.

Douglas (Isle of Man) Corporation is considering an electrical installation at the new pavilion on Douglas Head.

The new 12 kW Marconi transmitter at Bratislava is now broadcasting on 277·8 metres, and may be heard in this country.

The summer meeting of the Western Centre of the I.E.E. will be held on May 24th to 27th, when a visit will be made to Cheltenham.

Imports of electrical goods and apparatus into the Irish Free State during March were valued at £78 963 as against £37 885 for the same month last year.

A joint meeting of the Physical Society and Society of Glass Technology was held on Tuesday, at the Research Laboratories of the General Electric Co., at Wembley.

Burnley Electricity Department reports 428 prepayment meters fixed and 390 consumers on rateable value system. Appliances fixed on hire or hire purchase 73, and new consumers connected 71.

The summer meeting of the South Midland Centre of the I.E.E. will be held on July 2nd, when a visit will be made to Avonmouth docks. Inspection will be made of the e.h.t. and l.t. electrical equipment at the Royal Edward Dock; the motor-driven grain machinery; cold storage equipment; the new intake machinery, and the large squirrel cage motors with direct switching.

A report on the market for electrically driven water pumps in Brazil has been prepared by the Department of Overseas Trade from information forwarded by the Commercial Secretary at Rio de Janeiro. Copies can be obtained from the Department. (Reference A.X. 7 886.)

In a statement made to the Railway Committee of the Canadian House of Commons regarding a proposed increase of the capital of the Bell Telephone Co. of Canada to $150 000 000, Mr. C. F. Wise said it was proposed to spend $126 239 000 during the next five years upon extensions of the company's systems. Extensions in 1929 alone would cost $27 165 000.

It is announced that $82 000 000 (about £16 500 000) will be spent by the American Telephone and Telegraph Co. during the present year on new long distance telephone facilities in the United States. The programme includes the supply of a million loading coils, and about 24 000 telephone repeaters, as well as the stringing of 74 000 miles of new aerial wire, and the construction of three additional short wave transoceanic telephone systems supplementary to the present telephone facilities to Europe.

OVERSEAS TRADE.

Exports of Electrical Goods for Four Months Exceed Imports by £3 901 419.

EXPORTS of electrical machinery, apparatus and material, shipped from the United Kingdom during April, 1929, amounted to £1 674 234, against £1 429 491 during the same month last year, the increase being £244 743. Imports for the month under review amounted to £543 237, as compared with £454 012 for the same month of 1928, an increase of £89 225. For the four months of the year the total exports of electrical goods amounted to £6 123 591 or £79 717 less than for the corresponding month of last year. Imports for the same period amounted to £2 222 172, an increase of £199 385.

A comparison of exports for April with imports for the same month gives a favourable balance of £1 130 997, and for the four months the balance is £3 901 419.

The improvement in electrical exports for the month was made in shipments of such items as motors, other than for railways and tramways, and generators, the increase being £57 315. Other items which contributed to the increased business were rubber insulated wires and cables, other than telephone and telegraph, increase £11 721; similar wires, other than rubber covered, £43 475.

On the import side, though electrical machinery declined by £2 348, rubber covered wires increased by £15 424, and telegraph and telephone instruments by £45 666.

The following are detailed figures :—

	Month of April		Four Months.	
	1928.	1929.	1928.	1929.
IMPORTS.	£	£	£	£
Electrical Machinery	148 325	145 977	594 569	573 214
Electrical Wires and Cables, Insulated—				
Rubber insulated (not being Telegraph or Telephone Wires or Cables)	11 725	27 149	55 584	74 237
Insulation other than rubber (not being Telegraph or Telephone Wires or Cables)	39 139	38 665	174 171	183 956

Total of Electrical Goods and Apparatus	1 429 491	1 674 234	6 203 308	6 123 591

THE GENERAL ELECTION.

Candidates Include Representatives of Electrical Finance and Industry.

Amongst the Parliamentary candidates nominated for the next election are a considerable number who are engaged in or associated with the electrical industry. These include the following :—

Mr. J. W. McKAY, secretary of the Electrical Wholesalers' Federation. Mr. McKay possesses valuable experience of Parliamentary work and a long acquaintance with the electrical industry. He was at one time the South Wales and West of England representative of the Brush Electrical Engineering Co. and the British Electric Traction Co. (Lib.), for Coventry.

Mr. R. S. CHATFIELD, chairman of the Electricity Committee of Eastbourne Corporation (Lab.), for Eastbourne Division of East Sussex.

Mr. R. R. FAIRBAIRN, formerly manager of the Worcester tramway undertaking (Lib.), for Worcester.

*Mr. W. PRESTON, head of the firm of William Sanders and Co., electrical engineers, Wednesbury (Lib.), for Worcester (Con.), for Walsall.

*Lieut.-Col. Sir FREDERICK HALL, a director of the County of London Electric Supply Co., and the South London Electric Supply Corporation (Con.), for Dulwich.

*Mr. R. G. ELLIS, a director of the Yorkshire Electric Power Co. (Con.), for Wakefield.

Mr. P. J. PYBUS, chairman of the Power and Traction Finance Co., and a director of Willans and Robinson, the English Electric, and other electrical companies (Lib.), for Harwich.

*Mr. GEORGE BALFOUR, chairman of Balfour, Beatty and Co., the Scottish Central Electric Power Co., and a director of numerous other electricity supply and traction companies (Con.), for Hampstead.

*Sir PHILIP DAWSON, consulting electrical engineer, a partner in the firm of Kincaid, Waller, Manville and Dawson, a director of Johnson and Phillips, the Reading Electric Supply Co., Wessex Power Producers, Ltd., and other companies. He was a member of the Railway Electrification Advisory Committee set up by the Ministry of Transport, and of the Water Power Resources Committee of the Board of Trade (Con.), for Lewisham West.

*Ald. J. P. BURMAN, a member and formerly chairman of Birmingham Corporation Electricity Committee (Con.), for Duddeston Division of Birmingham.

Mr. SIDNEY E. GARCKE, a director of the British Electric Traction Co., and chairman of Tilling and British Automobile Traction and associated companies (Con.), for Kingswinford Division of Staffordshire.

Mr. E. A. HAILWOOD, managing director of Hailwood and Ackroyd, Ltd., makers of electric and other safety lamps, glassware, etc. (Ind.), for Belfast East.

Mr. E. KILBURN SCOTT, consulting engineer, and author of books on electrical and other subjects. He was for some years dynamo designer to John Fowler and Co., Ltd., and the Brush Electrical Engineering Co. He was also for some time engaged with Mr. Wilson Hartnell on electric lighting plants, etc., and has also been in the service of W. T. Goolden and Co., and Johnson and Phillips, Ltd. He was formerly in charge of the electrical engineering department of Sydney University, and has been a lecturer at University College, London (Lib.), for Leeds South.

SCOTTISH CENTRE I.E.E.

Members of the Scottish Centre of the I.E.E. paid their annual visit to Dundee on April 26th and 27th. Members and friends, along with members of the Dundee Sub-Centre, had luncheon at the Queen's Hotel, and in the evening the seventh ordinary meeting of the session was held at the Technical College, Bell Street, at which Mr. D. S. Munro, chairman of the Scottish Centre presided. A short informal paper on "The Lothians Protective Gear for Distribution" was read by Mr. H. C. Babb, on which there was a brief discussion. Thereafter, Mr. W. Holmes presented his paper on "Load-Levelling Relays and their Application in Connection with Future Metering Problems." Mr. Holmes's paper elicited a keen discussion on the part of Messrs. D. H. Bishop, Edwin Seddon, H. C. Babb, and George Fowler, to which Mr. Holmes made suitable reply.

* Represented the same constituency in the Parliament recently dissolved.

LEGAL INTELLIGENCE.

Further Evidence in Respect of Extensions of B.T.-H. Lamp Patents.

THE hearing of the application of the British Thomson-Houston Co., Ltd., for an extension of the Patent No. 10 918, dated May 8th, 1913, was again before Mr. Justice Luxmoore in the Chancery Division, on May 8th, 9th, 13th and 14th (see THE ELECTRICIAN of May 10th).

Sir Duncan Kirby, K.C., representing the Nox Electric Company, said their case was that they had a definite agreement with the British Thomson-Houston Co. for a licence. The suggested terms of the licence now put forward entitling the Nox Co. to manufacture 100 000 gasfilled lamps annually were inadequate in that the total number of lamps manufactured last year was 17 millions, and it was doubling every five years.

Sir A. Colefax, K.C., said the total output of the Nox factory was, according to the evidence, 750 000 lamps a year. The offer of a licence to manufacture 100 000 gasfilled lamps, plus a 10% increase annually, was, in the circumstances, in order.

Mr. John Gray, of the B.T.-H. Co., who was put into the box by Sir A. Colefax, stated, in reply to questions of opposing counsel, that at an interview with the representative of the Nox Co. it was fair to infer the B.T.-H. Co. would grant the Nox Co. a licence to manufacture, but he assumed that there would be negotiations as to the terms of the licence.

Position in 1914.

Mr. Corselles, for Kye Electric, Ltd., and Tungstalite, Ltd., two of the objectors, suggested that in 1914 the production of gasfilled lamps was 28 000 and of drawn wire lamps 9½ millions, and in 1918 the figures were 1¾ millions of gasfilled lamps and 18½ millions of drawn wire lamps.

Mr. Gray replied that the B.T.-H. Co., the General Electric Co., and the Siemens Company accounted between them for 80% of the total number of gasfilled lamps. They did not pay royalties to each other, and he did not think the royalties received by the B.T.-H. Co. had totalled more than £150 000.

Mr. Shelley (for the Nelson Electric Co.) asked if it had not been the policy of the B.T.-H. Co. to emphasise the gasfilled lamps during the past six years and not so much to develop the vacuum lamps?

Mr. Gray agreed that the sale of gasfilled lamps had increased compared with vacuum lamps, but could not say it was the firm's policy to press the sale of internally frosted lamps to the exclusion of other types.

Replying to Sir Arthur Colefax, Mr. Gray said, at his interview with the representative of the Nox Co. the question of terms to be inserted in the licence to them was not discussed.

Mr. Victor Wilson, of the General Electric Co., Ltd., said his company made a substantial proportion of the English lamp output. As manufacturers they did not pay royalties to the B.T.-H. Co. He had no doubt that the war was the impediment to communal manufacture of the gasfilled lamp.

This concluded the evidence for the applicants, and evidence of opposition witnesses was called.

Dr. Elkan Wechsler, representing Tungstalite, Ltd., said their output of incandescent electric lamps was about 1 000 a day with a quarter of a million per annum. He was formerly with Pope's Electric Co., Ltd.

Sir A. Colefax suggested to witness that Pope's did not manufacture gasfilled lamps during the war.

Witness said his recollection was that they did. He was chemist there and made experimentally the first gasfilled lamp, he thought about the end of 1918, Pope's having become licensees of the B.T.-H. Co. in April, 1918.

Mr. B. Wechsler, also associated with Tungstalite, Ltd., said his experience was that 40 and 60 W gasfilled lamps were not superior in lighting qualities to vacuum lamps, but were often inferior.

Mr. B. R. Agazar, representing Kye Electric, Ltd., said he had been associated with a number of companies which dealt in imported lamps. Two of these companies had been proceeded against by the applicants for infrigement of patent, and the relief sought was granted. In the case of Kye, Ltd., one of the companies who were the defendants in an action for infringement by the applicants in 1928, the company was compulsorily wound up. Kye Electric, Ltd., was a fresh registration. It dealt entirely in lamps of its own manufacture, and its output was now 30 000 lamps a week.

Mr. Horace Woolridge, of the Nox Co., said his company manufactured not only lamps but glass for the lamps. Their output was 750 000 a year, which they expected to increase to a million next year.

Sir A. Colefax said he would not contend that the Nox Co. were not a proper company to receive a licence.

Mr. Norman E. Paine, of the Nelson Electric Co., Ltd., said their output of lamps varied from 3 000 to 11 000 a week.

This concluded the evidence.

Sir Duncan Kirby, for the Nox Co., said they were content to leave the matter of the limitation in the licence offered to them to further discussion, and he did not further oppose the extension of the patent.

Mr. Corsellis, on behalf of Tungstalite, Ltd., and the Kye Electric Co., Ltd., contended that the patentees, rather than having made a loss owing to the war, had made a gain.

Mr. Shelley, for the Nelson Electric Co., said the evidence showed that there had been a considerable diminution in the price of gasfilled lamps in the period since the war, and that during the war the price was high, and maintained at more or less the same level.

Mr. Stafford Crossman, for the Comptroller-General of the Patents Office, said that the view of the Comptroller was that, if his Lordship thought there ought to be an extension of the patent, in all the circumstances, having regard to some extent to the sale by applicants of imported lamps, any extension his Lordship granted should not exceed two years. Further, any extension granted should be subject to an undertaking by the applicants that they would use their best endeavours to register all the licensees mentioned in their affidavits. The majority of the licensees were not, at the moment, on the register.

Sir A. Colefax, replying on behalf of the B.T.-H. Company, contended that so far as the municipal contracts were concerned, those contracts were not with the applicants but with the Electric Lamp Manufacturers' Association. There was no restriction on the user of lamps, but the conditions of the contracts were merely to give special conditions as to discount if the municipality undertook to purchase lamps only from members of the Association. He submitted that the contracts did not come within the scope of the section of the Act at all. He had no objection to a condition being imposed as part of an order, for the prolongation of the patent, making provision for the use of a manufactory having been established in this country for the manufacture of gasfilled lamps during the interval between the expiry of the patent and the date of the grant of the extension. But he did object to the insertion of any condition which would have the effect of franking the import of foreign lamps during the interval.

The Judgment.

Mr. Justice Luxmoore, in giving judgment said, in considering the question of extension he was bound to take into consideration the fact that it must necessarily take some time to put the articles made under this patent on the market commercially, and that during the war period some work was done on the patent, mainly, it was true, in connection with large lamps; further, he might take into consideration the fact that the profit on those lamps was probably higher than it would have been on small lamps. Further, the company during the war were making large-sized lamps and were gaining experience which must have been valuable to them with regard to the future development of their patent. After very careful consideration, he had come to the conclusion that the proper period for extension was two years. In coming to that conclusion he had been assisted by the view expressed by Mr. Crossman on behalf of the Comptroller that two years was a proper period for extension. The patent would be extended for two years and applicants must use their best endeavours to obtain the registration of licensees forthwith. There would be no order as to costs.

We are asked to make it clear to readers that the ZENITH ELECTRIC CO., LTD., was not concerned in the legal action referred to in our issue of May 3rd, and that it has no direct or indirect connection with any other firm having a somewhat similar title.

POST OFFICE WORKING WEEK.

The Conference of the Union of Post Office Workers at Eastbourne on May 10th, passed a resolution calling upon the incoming Government to re-nationalise the beam and cable services. The executive was instructed to concentrate on an endeavour to secure a working week of five days. Belfast was elected as the conference town for 1930.

PERSONAL.

SHOEBURYNESS Urban Council has appointed Mr. R. H. Holmes, of Pembroke, as electrical engineer and manager.

Estate of the gross value of £4 259, with net personalty £4 185 was left by the late Dr. Lionel Sells, a pioneer in X-ray work.

Mr. A. W. Makovski, of Tamplin and Makovski, Ltd., has been re-elected president of the Reigate and Redhill Chamber of Commerce.

Mr. A. H. Darker, chief electrical engineer of J. Stone and Co., will return to London after a world tour on June 6th, by the s.s. "Orama."

The rumour that Sir John Snell contemplates relinguishing his position with the Electricity Commission during the next twelve months is not confirmed.

The marriage of Mr. E. C. Brunt, of the Potteries Electric Traction Co., and Miss G. M. Ford, was solemnised at St. Luke's Church, Endon, recently.

Bury Electricity Committee has recommended that the salary of Mr. J. G. Potts, borough electrical engineer be increased from £850 to £950 per annum.

Mr. H. Willoughby Ellis has been nominated as president of the E.C.A. Allied Associations for 1929–30. Mr. H. C. Hazel has been nominated vice-president.

Mr. Samuel Insull, president of the Commonwealth Edison Co. of Chicago, has presented £10 000 to Queen's University, Kingston, Toronto, to endow a chair of preventive medicine.

Mr. C. E. Satchell, superintendent of telegraphs at Reading Post Office, has, on his retirement, received a canteen of cutlery and a barometer from the staff, and a clock from the controlling officers. Mrs. Satchell received a handbag and a bouquet.

Mr. James L. Gunn, general manager of the Grenock and Port Glasgow Tramways Co., has been appointed to the managership of Aberdeen Corporation tramways in succession to Mr. W. Forbes, who has been appointed to a similar position at Cardiff.

Sheffield Electricity Committee has decided to invite the following applicants to interview a sub-committee with respect to the position of general manager and electrical engineer, recently vacated by Mr. G. E. Fedden: Mr. S. E. Britton, Mr. W. H. Duffett, Mr. H. G. Fraser, Mr. E. Morgan, Mr. F. N. Rendell-Baker, Mr. C. L. E. Stewart, Mr. J. R. Struthers, Mr. H. E. Yerbury.

It is understood that the recent resignation of Mr. R. Lomax from the position of borough electrical engineer of Stockport was the result of a suggestion that he agree to a reduction of his salary. A member of the Council has caused a statement to be made that remarks relative to Mr. Lomax, made at a Council meeting, were not intended to disparage him in any way.

At the opening of the new Mining Laboratory of the Armstrong College, at Newcastle-on-Tyne, by the Prince of Wales, on Tuesday, a souvenir miner's lamp was presented to the Prince. The student chosen to make the presentation and welcoming speech was E. Maurice Fisher, eldest son of Mr. H. J. Fisher, the chief electrical engineer of Lambton and Hetton Collieries, Ltd., and president of the Newcastle Section of the Association of Mining Electrical Engineers.

It is reported that Mr. T. Edison has offered a free college scholarship, consisting of all tuition fees for four years, to the high school or preparatory school student who gives the best answers to one of his questionnaires. The governor of each State and the Commissioners of the District of Columbia will be asked to designate one male student who evidences high ability in scientific subjects during the school year 1928–29. Each of the 49 winners will receive a trip, at Mr. Edison's expense, to the Edison Laboratories, where the examination will be conducted.

Obituary.

MR. A. TAYLOR, on May 5th. He was chief electrician at the Markham Main Colliery, Armthorpe.

MR. ROYDON R. DOUGLAS, on April 18th, aged 62 years. He founded the Douglas Electric Construction Co., of New Orleans, and directed its affairs until September, 1927. He was born in Manchester.

MR. HORACE LESLIE HOTCHKISS, on May 10th, aged 87 years. He was for over 60 years connected with various telegraph companies. He started with the Gold and Stock Telegraph Company in 1867, and four years later organised the American District Telegraph Company. In 1873 he took part in establishing the Exchange Telegraph Company in London, and was a director of the company.

B.B.C. ANNUAL REPORT.

Income from Licences Over £871 763—Expenditure on Programmes £538 990.

ACCORDING to the second annual report just issued by the British Broadcasting Corporation, the financial policy of previous years was continued. The income for the year was £1 002 505, of which £879 324 was absorbed by expenditure, leaving a balance of £123 181 to be carried to the revenue appropriation account. The development of the service, the report states, called for a proportionately greater revenue expenditure in relation to both total income and licence income than in the year previous. In 1927, against a licence income of £800 959, the total revenue expenditure was £773 289, which left a balance of £27 669; apart from other income, towards the cost of current and contemplated capital expenditure; in 1928 the licence income (£871 763) fell short of the revenue expenditure total by £7 560 9s. 5d. In depending upon the revenue from publications for necessary capital expenditure during the year, as well as for a prudent reserve for future capital expenditure, the corporation, in effect, ensured the normal development and expansion of programme services. It is proposed to transfer the balance of £34 167, including £18 228 brought down from 1927, to capital account to cover capital expenditure during the year (other than on regional stations), and to transfer £100 000 to capital expenditure to be incurred in the construction and equipment of regional stations. The balance carried forward will be £7 242.

The Balance Sheet.

The balance sheet shows that the capital account was increased to £419 213, with £250 068 representing permanent assets. The depreciation reserve was increased (because of additions to the assets to which it applies) to £57 500 by a further provision of £31 150. The book value of plant and furniture discarded during 1928, amounting to £1 592, has been written off against this reserve, leaving a balance to be carried forward of £55 907. Investments increased to £256 937 and represent approximately funds appropriated and carried forward in respect of capital account, depreciation and contingency reserves. There were no special departures in expenditure.

The proportions to total expenditure of programme and engineering expenses—constituting the direct cost of the broadcasting service—were 61% and 19% respectively.

The expenditure on programmes amounted to £538 990. Administration salaries and expenses were £56 211. Governors' fees amounted to £6 100.

Wireless licences at December last numbered 2 628 392, exclusive of free licences for the blind, representing an increase on 1927 of 233 218.

Efforts were made to improve the quality of reception of matter experimentally broadcast to and from overseas by the use of short waves, and good progress was made in co-operation with Marconi's Wireless Telegraph Company.

The percentage breakdown was 0·035 in 68 000 hours' transmission; the increase of 0·005% over the 1927 percentage being due to damage to aerials during the November gales. During the year constructional work on the first of the regional stations was begun at Brookman's Court, Herts., and this station, when completed, will serve London and an area enclosed by a circle roughly 60 miles round London. A mobile transmitter mounted on a lorry was in use to determine the most advantageous site for the other stations.

The new studios at Manchester were put in hand and a new design of electrical control has been developed. The complete studio equipment will probably be the most up-to-date of its kind in the world.

The temporary station at Keston became inadequate for the work of checking the frequencies used by various European stations in addition to those in this country, and it was necessary, therefore, to undertake the building of a permanent structure at Tatsfield. The experimental transmitter at Daventry 5GB, although erected to investigate problems connected with design, has acted as a service station for the east and west Midlands. Freedom from breakdown was remarkable, as the original experimental plant and equipment were still in operation.

During the year 751 S.O.S. messages were broadcast from all stations, of which 316 (42·1%) were successful, 400 (53·3%) were unsuccessful, and in 35 (4·6%) cases the result was unknown.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, when available.

CHERTSEY GUARDIANS, May 18th.—Electric lighting installation at the Institution, Ottershaw, near Chertsey. Specifications from Mr. F. J. Wareham, clerk, Council Offices, West Byfleet, Surrey.

PANNAL (YORKS) PARISH COUNCIL, May 20th.—Electric or gas lighting, from October 1st to March 31st, for three years. Further particulars from Mr. J. H. Brooksbank, clerk, Lund House Green, Harrogate.

BELFAST CORPORATION, May 21st.—Manufacture, supply and erection of (*a*) h.t. armour-clad switchgear (specification No. W. 80), and (*b*) air preheaters for boilers (No. W.81); also for manufacture and supply of (*c*) 22 000 V, three phase transformers (No. W.82), and (*d*) cable drum trailer and tractor (No. W.83). Specification, etc., from Mr. F. H. Whysall, city electrical engineer, East Bridge Street, Belfast; deposit £2 2s. each for items (*a*), (*b*) and (*c*).

BELFAST CORPORATION, May 21st.—Manufacture, supply and erection of 22 000 V 3-phase overhead transmission line. Specification (No. W.84), etc., from Mr. F. H. Whysall, city electrical engineer and general manager, East Bridge Street, Belfast; deposit £2 2s.

BETHNAL GREEN (LONDON) BOROUGH COUNCIL, May 22nd.—Electric lighting installations in two blocks of tenement buildings. Specification, etc., from Mr. H. W. Couzens, 9 Old Queen Street, London, S.W.1; deposit £2 2s.

LARNE GUARDIANS, May 22nd.—Electric light installation in connection with conversion of workhouse buildings into a district hospital. Specifications can be seen and forms of tender obtained at the office of Mr. W. Pleasance, 44, Wellington Place, Belfast, or at the Union Offices, Larne.

RICHMOND (SURREY) GUARDIANS, May 22nd.—Re-wiring for electric lighting of certain buildings at Grove Road Institution, Richmond. Particulars from Mr. C. L. Fenn, Guardians Offices, Parkshot, Richmond, Surrey; deposit £1.

WEST LANCASHIRE RURAL DISTRICT COUNCIL, May 23rd.—Electric lighting scheme for parish of Aughton. Specifications, etc., from Mr. James Scott, 358, Royal Liver Building, Liverpool; deposit £2 2s.

BOOTLE CORPORATION, May 24th.—Electrician's work in connection with erection of 122 houses, under the Northfield Road housing scheme. Specifications from the Borough Engineer, Town Hall, Bootle; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, May 25th.—Supply and erection of 33 000 V metal clad switchgear, in connection with South-East England Electricity Scheme. Specification (No. S.E.E.—G.S.1) from Mr. Richard H. Fox, secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

EPSOM URBAN DISTRICT COUNCIL, May 25th.—Supply and erection of l.t., d.c. switchboard, with the changing over of connections, with certain instruments and gear from the existing switchboard. Specification, etc., from the Resident Electrical Engineer, Electricity Works, Depot Road, Epsom; deposit £3 3s.

GEORGE HERIOT'S SCHOOL, EDINBURGH, May 30th.—Electrical installation. Specification, etc., from Mr. John Anderson, superintendent of works, 20, York Place, Edinburgh.

MASSEREENE HOSPITAL, ANTRIM, May 30th.—Electric power plant and lighting installation for laundry. Specification D from Mr. F. D. Brown, consultant, 93, Ann Street, Belfast.

Lighting of Schools.

WEST RIDING ELECTRICITY COMMITTEE, May 31st.—Electric lighting of Maltby Crags and Aston Schools. Forms of tender from Mr. A. Adcock, Craigmoor, Godstone Road, Rotherham.

CROYDON CORPORATION, June 3rd.—Supply and erection of (*a*) one 20/25 000 kW turbo-alternator, with condensing plant, pumps, etc.; (*b*) boiler house extensions, with two 100 000 lb. per hour boilers, stand-by coal conveyor from siding, coal-handling plant at siding, steam piping and receiver, etc.; (*c*) engine room extension, switch house, bridges, and pump house; (*d*) 6 600 V switchgear, transformers, etc. Specifications, etc., from the Engineer and Manager, "Electric House," 38, High Street, Croydon; deposit £1 1s. for each section.

SUTTON AND CHEAM URBAN DISTRICT COUNCIL, June 7th.—Installation of fire alarm system, connected with the fire station. Plans showing positions of fire alarm boxes, etc., from the Engineer and Surveyor.

EAST HAM EDUCATION COMMITTEE, June 12th.—Electric lighting installation at the Salisbury School. Specification, etc., from the Secretary, Education Office, Town Hall, East Ham, London, E.6; deposit 10s. 6d.

CENTRAL ELECTRICITY BOARD, June 17th.—Supply, delivery and erection of 33 kV and lower voltage switchgear. Specifications (N.W.E. S.S.3 for indoor metal clad switchgear and N.W.E. S.S.4 for outdoor type switchgear) before May 21st, from Mr. Richard H. Fox, secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

BLOEMFONTEIN MUNICIPALITY, May 18th.—Supply and erection of (*a*) turbine and generator, condensing plant and auxiliaries and switchgear and cables; (*b*) cooling spray pond equipment, or cooling tower (contract No. 1). (Reference B.X. 5 192.)

PLOVDIFF (BULGARIA) PROVINCIAL COUNCIL, May 20th.—Supply of two Francis turbines, two 5 000 kVA generators, two 5 000 kVA, two 1 000 kVA and two 150 kVA transformers, for Votscha-Kricim power station.

PRETORIA MUNICIPALITY, May 20th (extended from May 6th).—Supply of cables, switchgear and transformers. (Reference B.X. 5 245.)

INDIAN STORES DEPARTMENT, May 21st.—Supply of 400 kW 6-phase rotary converter and accessories for His Majesty's Mint at Calcutta (order No. N./9691). (Reference B.X. 5 255.)

MONTEVIDEO PORTS ADMINISTRATION, May 22nd.—Supply of four electric cranes, to lift 3 tons, mounted on trucks. (Reference A.X. 7 814.)

SOUTH AFRICAN POSTS AND TELEGRAPHS, May 23rd.—Supply of rubber covered wire and telephone cable (contract No. 153). (Reference B.X. 5 229.)

EGYPTIAN PRISONS ADMINISTRATIONS, May 25th.*—One year's supply of lamps and electrical articles (section 7). (Reference C. 3 022.)

INDIAN STORES DEPARTMENT, May 27th.—Supply of 500 kW, 6-phase rotary convertor, starting panel, etc. (order No. N./9 736). (Reference B.X. 5 279.)

PRETORIA MUNICIPALITY, May 27th.—Supply of transformers required in connection with extensions of e.h.t. system. (Reference B.X. 5 258.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, May 28th.—Supply of telephone jacks and number plates (schedule C.417). (Reference B.X. 5 202.)

CLUJ (ROUMANIA) MUNICIPALITY, May 30th.—Compressor for cooling plant of ammonia system, with air-cooling coils, and a.c. motor and condenser, at the Slaughter House. (Reference A.X. 7 838.)

SOUTH AFRICAN POSTS AND TELEGRAPHS, May 30th.—Supply of telegraph materials, tubular arms, crossheads, bases, stay plates, etc. (tender No. 152). (Reference A.X. 7 767.)

JOHANNESBURG MUNICIPALITY, June 1st.—Supply and delivery of oil switches. (Reference B.X. 5 283.)

JOHANNESBURG MUNICIPALITY, June 1st.—Supply and delivery truck type cubicles. (Reference B.X. 5 285.)

TANGANYIKA GOVERNMENT, June 1st.—Concession for utilisation of Pangani River Falls for the development of electric power. Copies of the draft concession may be obtained from the Crown Agents for the Colonies, 4, Millbank, London, S.W.1.

VALPARAISO PORT ADMINISTRATION, June 1st.—Four electric travelling cranes of portal type (capacity 3 metric tons each). (Reference A.X. 7 892.)

AUCKLAND ELECTRIC POWER BOARD, June 3rd.—Supply of cables and accessories. (Reference B.X. 5 248.)

Digitized by Google

NEW SOUTH WALES PUBLIC WORKS DEPARTMENT, June 4th.—Supply of 18 electrically operated water level indicators (contract No. 61/1928–29 W.S. and S.). Reference (B.X. 5 233).

VICTORIAN ELECTRICITY COMMISSION, June 4th.—Supply of 22 000 V transformers and spares (specification No. 29/36). (Reference B.X. 5 216.)

ANTWERP MUNICIPALITY, June 17th.—Supply of 32 electric travelling cranes for new dock. (Reference A.X. 7 924.)

POSTMASTER-GENERAL'S DEPARTMENT, Melbourne, June 18th.—Supply of switchboard cable (contract C. 427). (Reference B.X. 5 228.)

NEW ZEALAND POSTS AND TELEGRAPHS, June 18th.—Supply of telephone cords (No. P. and T. 151/1425). (Reference B.X. 5 251.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, June 20th.—Two 5-ton electrically driven hoist blocks, with overhead conductors, runway girders and switches (tender No. 1 446). (Reference T/A.X. 7 867.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, June 20th.—Supply of one 10-ton and three 4-ton electric level luffing cranes (tender No. 1 437). (Reference A.X. 7 828.)

NEW SOUTH WALES PUBLIC WORKS DEPARTMENT, June 22nd.—Supply and erection of transformers, with certain spares, for Burrinjuck hydro-electric development (contract No. 29/29). (Reference B.X. 5 230.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, June 25th.—Supply of protected type telephone cable terminal boxes (schedule C.430). (Reference B.X. 5 231.)

VICTORIAN RAILWAY COMMISSION, June 26th (extended from May 15th).—Supply of geared, three-phase, electric winding engine. (Reference A. 7 650.)

SOUTH AFRICAN POSTS AND TELEGRAPHS, June 27th.—Automatic wall and table pattern telephones (tender No. 158). (Reference B.X. 5 273.)

VICTORIA STATE ELECTRICITY COMMISSION, July 1st.—Supply and delivery of 44 000 V transformers. (Reference B.X. 5 293.)

Construction of Power Station.

STATE ELECTRICITY WORKS, MONTEVIDEO, July 8th.—Construction and equipment of 50 000 kW power station.

POSTMASTER GENERAL'S DEPARTMENT, MELBOURNE, July 9th.—Resistances and reactances (schedule C. 426). (Reference B.X. 5 281.)

NEW SOUTH WALES GOVERNMENT RAILWAYS, July 10th.—One 750 kW turbo-alternator; 2 200 V ironclad switchgear; two switch operating batteries; and two motor generator sets. Specifications from the Chief Electrical Engineer, 61, Hunter Street, Sydney.

NEW ZEALAND PUBLIC WORKS DEPARTMENT, July 16th.—Supply of 250 galvanised steel transmission line towers to carry copper conductors, or 190 towers to carry steel-core aluminium conductors. (Reference A.X. 7 735.)

NEW ZEALAND POSTS AND TELEGRAPHS, July 16th.—Telephone bells (P. and T. No. 151/1 444). (Reference B.X. 5 272.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, August 6th.—Supply of 120-ton, four-motor, overhead travelling crane and runway (specification No. S.M. 358). (Reference A.X. 7 810.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, August 13th.—Water turbine driven generating sets and switchgear, for Waitaki power development (section 2). (Reference B.X. 5 278.)

Tenders Accepted.

GLOUCESTER CORPORATION.—Marconiphone Co., Ltd., 50 h.t. units, 38s. 6d. each.

GRAVESEND EDUCATION COMMITTEE.—G. E. Wallis and Sons, Ltd., electric lighting.

STIRLING CORPORATION.—A. Brewster, electrical works in connection with Trip Road housing scheme.

WIMBLEDON CORPORATION.—J. P. Hall and Sons of Peterborough, supply of feed pump, £626 10s. (Recommended.)

COLCHESTER CORPORATION.—Brightside Foundry and Engineering Co., Ltd., pipe work for the electricity works, £2 950.

CHESTERFIELD CORPORATION BATHS COMMITTEE.—The Chesterfield Engineering Co., for installing electric ventilating fans.

GLASGOW CORPORATION.—A. A. M. Turnbull and Co. electrical work at new police station, Millerston, £274 10s. 8d (Recommended).

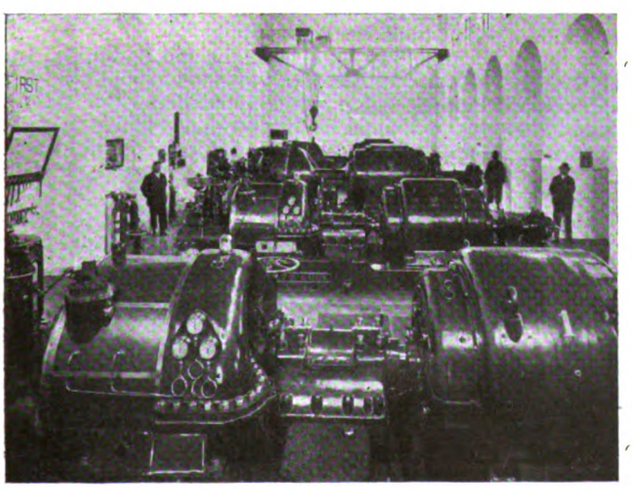
MANCHESTER EDUCATION COMMITTEE.—Electrical installations: John Adams, Ltd., School Lane school and Kingsway school; Sudlow and Co., Hough Road school.

HALIFAX CORPORATION.—Babcock and Wilcox, Ltd., two steel boilers with auxiliaries, £83 411; British Thomson-Houston Co., Ltd., switchgear for turbo-alternator, £720; Herbert Morris, Ltd., steel rails for crane gantry, £188.

LEEDS CORPORATION.—Squires and Sons, Ltd., electric light installation at Gateforth sanatorium, £102 14s.; Sun Electrical Co., Ltd., and George Casperson, supply of electric light fittings for 12 months; Measurement, Ltd., supply of meters for 12 months (about 2 500), schedule prices.

CENTRAL ELECTRICITY BOARD.—Watshams, Ltd., secondary transmission lines, for South-East England scheme; and secondary transmission lines for Central England scheme; Siemens Bros. and Co., Ltd., and John Collier and Co., Ltd., secondary transmission lines, and English Electric Co., Ltd., secondary transformers for North-West England and North Wales scheme. Approximate total £300 000.

MANCHESTER CORPORATION.—Metropolitan-Vickers Electrical Co., Ltd., 10 000 kVA transformer for Oldham Road sub-station; Forest City Electric Co., Ltd., automatic point-controllers; Herbert Morris, Ltd., 5-ton crane for Polygon depot; British Thomson-Houston Co., Ltd., 33 000 V switchgear for sub-stations and Barton power station; A. E. Sudlow and Co. (sub-contractors), switchgear, cables and lighting at Hyde Road car works extensions; Brush Electrical Engineering Co., Ltd., tramcar trucks; Nesta, Ltd. and G. D. Peters and Co., Ltd., upholstered seats for tramcars; Equipment and Engineering Co., Ltd., electric rail welding equipment.



A GENERAL view of the turbine room of the Electricity Department at Tientsin, with a street scene, on the right showing the effective lighting arrangements. Mr. R. A. Williams in his report for 1928 points out that 9 825 314 kWh were generated during the year with a coal consumption of 14 218 tons, the slight increase over last year's consumption being due to railway troubles during the summer. Sales of current during 1928 increased by 30% by comparison with 1927.

LONDON JOINT AUTHORITY.

Statistics Relating to Undertakings in the London and Home Counties.

THE second issue of the "Electricity Supply Return" for the London and Home Counties Electricity District has just been published by the Joint Authority. Earlier issues of the return, published by the London County Council, dealt with the period 1901–2 to 1924–25. The first four issues related to undertakings operating within the county of London; those for 1905–6 to 1917–18 related to an area somewhat larger than Greater London; those for 1918–19 and onwards related to the London and Home Counties Electricity District.

This issue follows generally the arrangements adopted in the earlier returns. Advantage has been taken of the facilities offered by the Electricity Commissioners to avoid disagreement between the figures published by the Commissioners and those appearing in this return. The area of the Electricity District is approximately 1 796 square miles and includes the whole of the counties of London and Middlesex and parts of the counties of Herts, Essex, Kent, Surrey, Bucks and Berks. It stretches from Hertford and St. Albans in the North to Dorking and Reigate in the South, and from Windsor in the West to Gravesend in the East. The population of the District, according to the 1921 Census, was 8 178 766, and the assessable value at April 6th, 1927, approximately £83 340 000. The figures given in the return relate to the whole area of the undertaking, although in some instances the area of supply of an undertaker extends beyond the boundary of the electricity district.

Total Capacity of Stations.

The total capacity of the generating stations at the end of 1927–28 was 1 254 507 kW as compared with 1 103 647 kW in 1926–27, and 1 061 642 kW in 1925–26. The total connections at the end of the year 1927–28 on the systems of all the undertakings comprised in the return represented a demand of 2 170 778 kW; for the two previous years the figures were 1926–27, 1 907 489 kW, and 1925–26, 1 754 707 kW. The total rated evaporative capacity from and at 212 deg. F. of the boiler plant installed in all the generating stations for the year 1927–28 was 14 779 210 lb. per hour, the figure for local authority stations being 7 057 910 lb. per hour (Metropolitan borough councils 4 444 070 lb. and extra-London local authorities 2 613 840 lb.), that for company stations 7 721 300 lb. per hour (London companies 6 648 300 lb.; extra-London companies 1 073 000 lb.).

The number of units generated in 1927–28 show an increase of 20·8% on the figures for 1926–27, and an increase of 34·9% on the figures for 1925–26. Of the total number of units generated and purchased by authorised undertakers in 1927–28, *i.e.*, 2 893 904 220 units; 124 273 134 units were used on works and 269 532 767 units were lost and unaccounted for, making a total of 393 805 901 units, which represents 13·6% of the total units generated and purchased by authorised undertakers. The total number of units sold (excluding bulk supplies) during 1927–28 was 1 493 880 881 compared with 1 234 462 574 for 1926–27, and 1 107 814 528 for 1925–26. The total sales (less bulk sales) for 1927–28 show an increase of 21·0% on the sales for 1926–27, and 34·9% on the sales for 1925–26.

The total expenditure charged to capital account by local authority and company undertakers amounted to a total at the end of 1927–28 of £70 592 497, as compared with £61 722 210 in 1926–27, and £57 775 603 in 1925–26. The total working costs of all undertakings (including cost of energy purchased in bulk, but excluding capital charges) amounted during the year 1927–28 to £8 556 020. The gross surplus on the working of all the undertakings comprised in the return amounted during 1927–28 to £7 601 421 made up as follows:—Metropolitan borough councils, £1 480 069; extra-London local authorities, £1 107 747; London companies, £4 009 015; extra-London companies, £1 004 590. The gross surpluses for the two preceding years were, 1926–27, £5 871 702; and 1925–26, £6 298 077.

The balances on net revenue account at end of year 1927–28 after appropriations for that year had been made were increased by the following amounts:—Metropolitan borough councils, £50 829; extra-London local authorities, £130 472; London companies, £595 197; extra-London companies, £46 298.

ELECTRICITY SUPPLY.

CREWE T.C. has applied for a loan of £15 000 for electricity extensions.

Halifax T.C. has applied for a loan of £30 000 for mains.

The Bolsover Colliery Company is to lay underground cables at Edwinstowe.

Residents of Berkswich are to approach Stafford Corporation, with a view to securing a supply for the parish.

Eastbourne Electricity Committee has decided to extend mains to Willingdon and Wannock at a cost of £5 832.

Burton-on-Trent Electricity Committee seeks sanction to borrow £10 000 in connection with assisted wiring.

West Lancashire R.D.C. has decided to include Banks, along with Hesketh, Tarleton, and Rufford, in a draft Order.

Ormskirk Electricity Committee has concluded negotiations with the Central Board for a bulk supply for the Ormskirk area.

Morecambe Electricity Committee has granted the request of the L.M. and S. Railway Co. for a supply of about 150 000 kWh per annum to its laundry.

Uttoxeter U.D.C. is to proceed with necessary work under the electricity scheme, and to arrange for wiring houses, at a charge additional to the tariff rate.

Bermondsey (London) Electricity Committee has prepared loan estimates of £20 000 for mains and services, £2 500 for meters, and £7 500 for installations.

Burnley T.C. has received sanction to loans of £35 000 for mains extensions during the next three years, and £6 260 for the construction of workshops and stores.

Walsall Gas Committee has decided that, for the purpose of reducing the maximum demand for electricity, a static condenser be purchased for the gas works for £270.

Leeds Electricity Committee has directed that assisted wiring charges through prepayment meters shall be 2d. per kW in excess of the flat-rate charge for lighting until 160 kW have been consumed for every £1 of cost of installation.

Bedford Electricity Committee proposes to erect an 11 000 V overhead line, at an estimated cost of £4 900, including transformers, switchgear, etc., between the Cryselco Works and the London Brick Co. and Forders, Ltd., and for supplying the intervening rural area.

Blackburn T.C. has received the consent of the Electricity Commissioners for a change over from d.c. to a.c. in certain districts of the Borough.—The Electricity Committee has authorised the overhaul of the turbo-generators at the Whitebirk generating station.

At a conference of local authorities of the Isle of Wight, it was decided to recommend support to an application by the Isle of Wight Electric Light and Power Co., Ltd., for a Special Order to cover that portion of the island not covered by the existing local Orders.

Ripon and Assisted Wiring.

The Ripon Electrical Co. has informed Ripon Electricity Committee that it has a complete scheme ready for operation if the Corporation does not intend to adopt assisted wiring. The company has been asked to submit details.—The Commissioners have approved the agreement between Harrogate and Ripon Corporations for bulk supply.

The South Metropolitan Electric Light and Power Co., Ltd., and the South London Electric Supply Corporation, Ltd., announce a domestic all-in tariff consisting of a standing charge based on the dimensions of premises, plus 1d. per kWh consumed, and an "all-in" tariff for business premises which includes a charge of 0s. 3d. per quarter per 100 W of installed lighting capacity and 1d. per kWh.

As there is no possibility at present of getting a market for power produced from the harnessed tide of the Exe estuary, the Exe Power Experiment Association has decided it must await developments. The local undertaking at Exmouth, which had apparently the only outside market for supplies, has been recently acquired from the Electricity Supply Corporation by Whitehall Services, Ltd.

The Borough Electrical Engineer of Eastbourne has been informed by the Electricity Commissioners that in future all capital expenditure which it is desired to meet out of revenue must be specifically sanctioned by the Commissioners, such sanction being subject to: (*a*) The reserve fund equalling 5% of the total capital outlay, and being invested in statutory securities; (*b*) from 1930 there must also be a working balance on revenue account equal to 5% of the total capital outlay; (*c*) capital expenditure charged to revenue is not to exceed 5% of the revenue of the undertaking for the year.

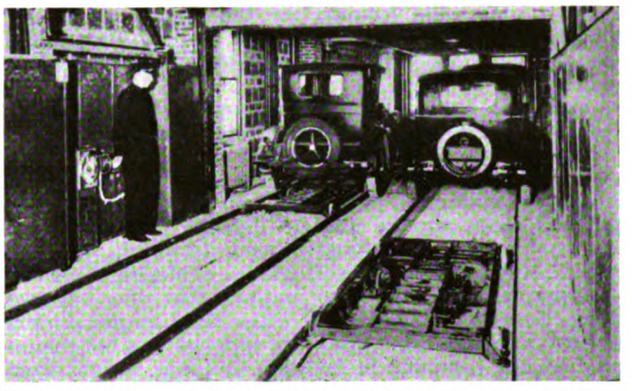
ELECTRICAL NEWS OF THE WEEK IN PICTURES.

One of the earliest pictures to reach us from the flooded area of Launceston, Tasmania, showing part of the damage done to the electricity works. At the time of going to press no technical details are available.

A general view of the Palace of Engineering at the North-East Coast Exhibition, Newcastle-on-Tyne, on Tuesday evening. During the day the exhibition was opened by the Prince of Wales, who inspected a number of the electrical exhibits. Nearly twenty firms engaged in the electrical industry have taken stands, and even at this early stage considerable interest and good attendances are reported. So far the exhibition has not been favoured with good weather, but record crowds are expected.

The outside sales staff of A. H. Hunt, Ltd., showing in the front row, reading left to right, Messrs. Allston (Eastern counties), Patrick (Midlands), Chamberlain (general manager), A. H. Hunt (managing director), C. H. Hunt (director), Baggaley (works manager), and Boon (special sales). Standing, left to right: Messrs. Compton (export), Stevenson (Scotland), Brand (South Western counties), Digby (Irish Free State), Ratcliffe (North Midlands), West (West London), Forbes (South-eastern counties), Richmond (East London), and Devereux (North-eastern counties).



The ground floor of the recently completed 24-storey building in New York devoted to the garaging of cars. It is the first New York example of the Kent Auto Hotel system, developed to eliminate traffic congestion. A car is run-in on the ground floor between rails. An electric trolley then conveys the car to one of three lifts and after a parking space has been booked the vehicle is carried to its berth at the rate of a floor a second. At the appropriate floor the lift doors open and the trolley runs the car to its place.

Three aspects of the stand of Metro-Vick Supplies at the "Brighter Homes" Exhibition, City Hall, Manchester, which has been attracting considerable attention. Features of the exhibit were the daily demonstrations of various domestic operations carried out electrically. In addition there was an attractive display of modern lighting fittings, including new Gilbert-Riley glassware, and examples of mains-operated wireless sets. From a business point of view the exhibition, which closed yesterday (Thursday), is voted to have been a considerable success.

MERCHANDISE MARKS ACT.

Further Evidence Regarding the Marking of Imported Glassware.

ON May 6th, 7th and 13th, the Committee appointed by the Board of Trade (under Section II of the Merchandise Marks Act), to consider the application of the glass manufacturers for an Order in Council to provide for the marking of imported glassware with an indication of its foreign origin, continued its inquiry from the adjournment on April 30th (see THE ELECTRICIAN of May 3rd).

Illuminating Glassware.

Mr. E. A. Hailwood (Hailwood and Ackroyd, Ltd.) gave evidence in support of the application. He said that his company made a quantity of illuminating glassware equivalent to 7% of the quantity imported. Between 75 and 80% of the consumption in this country was imported. The company's works were so laid out that they could increase their output up to a quantity equivalent to about 25% of the quantity imported. There was misapprehension as to the origin of illuminating glassware, due largely to the fact that many British firms producing complete lighting fittings did not make the glass but imported it, and it was assumed that the glass as well as the other parts of the fittings were British. There was no evidence in the catalogues of such firms that the glass was foreign. On the other hand, owing to the domination of the market by the foreign glass, there was sometimes difficulty in convincing buyers that the British glass was in fact British. His company made the lighting fittings as well as the glassware, but far more of the glassware was sold separately. Referring to a suggestion that three-ply glass could not be made in this country, he said that was not the fact.

Mr. N. L. Macaskie (counsel for the opponents), cross-examining, said that if the glassware of lighting fittings was stamped as being foreign it would be assumed that the whole of the fitting was foreign.

Mr. Hailwood replied that if the vendors of the fittings wanted to make it clear that the fittings were not foreign, they could indicate that they were British.

It was suggested by Mr. Macaskie that, inasmuch as labels were used for indicating prices, etc., on illuminating glassware, labels could also be used to indicate the origin, but witness replied that they would become detached.

Mr. F. L. Mayhew (a sales representative of Messrs. Hailwood and Ackroyd) also gave evidence, and said that when engaged in selling electrical fittings for one of the large manufacturers of electrical apparatus, the glassware supplied was not manufactured by the company in question, but was bought from America and Sweden. Many lighting units sold were considered by the purchasers to be entirely British, and the fittings in most cases bore a label indicating that they were British.

Mr. H. Upston (another sales representative of Messrs. Hailwood and Ackroyd) said that in selling electric lighting fittings many customers had concluded that the glass he was offering was foreign until he had pointed out to them that it was British.

Mr. N. L. Macaskie (counsel for the opposition) asked in how many instances his customers had thought that British glass was foreign during the 2½ years in which he had been with Messrs. Hailwood and Ackroyd.

Mr. Upson replied that there were about 50, or probably more.

Mr. B. Wiles (Hailwood and Ackroyd, Ltd.) corroborated Mr. Upson's evidence.

Accumulator Containers.

Mr. C. M. Mills (the Chloride Electrical Storage Co., Ltd.), opposing the application as regards glass containers for accumulators and batteries, said the company's output was approximately 90 000 cells per week or some 5 000 000 per annum. Of the total sales, 66% were made up in glass jars and of this quantity about 98% were in pressed glass, but since blown glass was used for the larger boxes this percentage represented only about 60% of the total value of glass. The cost of a glass container was approximately 10% of the total cost of a cell. With regard to marking imported accumulator glass containers, his firm knew their country of origin when they were imported. His company obtained its largest proportion of containers from British makers but also purchased abroad because of difficulty in getting necessary types in this country and because it desired to have a second source of supply. His company bought in this country to the extent of between 90 and 95% of their requirements. Continuing, Mr. Mills said that in 1919 it was impossible to obtain certain types of pressed glass containers in this country and it was necessary to buy from Germany and Czecho-Slovakia. Five years ago his company brought into this country samples of containers which the British makers had previously said they could not produce. Since then British makers had overcome the difficulties, and the bulk of the company's supplies were obtained in this country.

Answering questions as to being able to distinguish between British glass and foreign glass containers, witness said British glass was greener in appearance than foreign glass although he did not think the ordinary person would notice it. The trade, however, could tell without any mark. He admitted that British glass manufacturers had gone a very long way to meet the requirements of the battery makers in this country although there were still defects.

Mr. Wethered then cross-examined as to the risk of confusion whether the contents of a battery were foreign as well as the container if the latter were marked, and suggested there could be no such confusion if the container was marked "glass foreign."

Witness replied that it would be fairer to say on the container that the glass was foreign because there was difficulty in obtaining it from British manufacturers.

Mr. Hailwood put it to witness that Messrs. Hailwood and Ackroyd had on one occasion supplied some glass battery containers to the Chloride Electrical Storage Co. but they had been rejected, whereas the very same container had been accepted by the Post Office.

Witness replied that he was not aware of the instance. In answer to further questions by Mr. Hailwood on the point of encouraging the British glass maker, Mr. Mills emphasised the fact that his company bought over 90% of its glass containers in this country. He claimed, therefore, that the British battery makers were doing their best to encourage British glass makers though admitted that the latter had done much to meet the requirements of the British battery maker.

Mr. Hailwood suggested that there was a desire to "stimulate" British glass makers to produce under sweated conditions.

Witness denied that and replied that if the British glass makers did not wish to supply these containers and imported containers had to be marked, then probably the battery makers would have to use compound containers.

BUSINESS ITEMS.

NEW offices at St. Neots have been opened by the BEDS, CAMBS AND HUNTS ELECTRICITY CO.

The address of RADIO INTELLIGENCE, LTD. has been changed to Marconi House, Strand, London, W.C.

The Bucharest Radio Exhibition has been postponed, and will be held from August 15th to October 1st.

ALBERT E. SUDLOW AND CO. have vacated 25, Dickinson Street, Manchester, and have taken over new premises at 60, George Street.

T. BEADLE AND CO., LTD., wholesale electrical factors, of Liverpool, Hull, Grimsby, and Leicester, have opened a new branch business at 96, Hamilton Street, Birkenhead.

Mr. J. F. CROFTS has retired from Messrs. CROFTS AND SMITH, electrical and radio engineers, Queen Street, Deal, and the business will be continued by Mr. E. W. Smith, his partner.

The EDISON SWAN ELECTRIC CO., LTD., 123–5, Queen Victoria Street, London, E.C.4, announces price reductions of "Ediswan" vacuum type grid leaks and anode resistances.

Included in a Bristol Exhibition illustrating modern furnishing tendencies is a number of modern lighting fittings, including designs by Perzel lent by Messrs. TROUGHTON AND YOUNG of Knightsbridge.

For the signalling of the new terminal station at Auckland, N.Z., the Westinghouse electro-pneumatic system of power operation, together with a.c. track circuits and day colour light signals, has been selected, and the contract has been awarded to the WESTINGHOUSE BRAKE AND SAXBY SIGNAL CO., LTD., of 82, York Road, King's Cross, London, N.1. The plant (including the air compressors) will be supplied from England by the Westinghouse Brake and Saxby Signal Co., Ltd., with the exception of the interlocking frame of 128 levers, which will be built at Melbourne, Victoria, in the shops of their associated company, McKenzie and Holland (Australia), Pty., Ltd., Newport, Melbourne.

COMPANY NEWS.

Electricity Supply Holdings Improve, but Market Generally Inactive—Marconi Report—Cable and Wireless Descriptions Steady—Company News and Meetings—New Companies Registered.

INACTIVITY has characterised share markets during the past week, though one or two movements call for notice. Shropshire, Worcestershire and Staffordshire Power "B" ordinary shares have risen another five shillings and are near £2 10s., and Newcastle-upon-Tyne Supply ordinary shares at 26s. 3d. are 1s. 3d. up. In the manufacturing section British Insulated Cables are up again to 75s., and Henleys at 122s. 6d. are half-a-crown to the good. General Electric have had a further relapse, and the movement was continued below the price officially given in our table. British Electric Transformer shares are 1s. 3d. down at 13s. 9d.

AEONIC RADIO, LTD.—Directors propose immediate increase of cap. by issue of 1 250 000 shs., to be offered to the shhldrs at par.

RICHARD JOHNSON AND NEPHEW, LTD.—Div. at rate of 8% on ord. shs. recmded. Pref. div. for half-year will be payable June 1 and ord. June 4.

BRITISH ELECTRIC TRACTION CO., LTD.—Directors recmd. cash div. of 5%, less tax, def. ord. stk. and bonus of 10% fully-paid £1 def. ord. shs. for year ended March 31.

SHROPSHIRE, WORCESTERSHIRE AND STAFFORDSHIRE ELECTRIC POWER CO.—An offer to purchase whole of "A" and "B" ord. shs. at 50s. p. sh., ex. divs. payable May 15, has been received.

CALCUTTA ELECTRIC SUPPLY CORPORATION, LTD.—Pft. for 1928, £401 803, plus £47 683 brt. in. Deb. int., £27 500; pref. div., £48 889; div. on ord. shs. (5% actual) for half-year to June, 1928, £67 652; sinkg. fund on 2nd mtge. debs., £12 500; res. for taxes, £32 000; res. fund, £75 000; insurance, £3 000; retiring gratuity fund, £2 000; reserved for distributn. to domestic consumers, £22 551; div. on ord. shs. of 7% actual for second half-year, less tax, makg. 12% for year, plus 4d. p. sh. bonus, less tax. Fwd. £41 130.

PYE RADIO, LTD.—Statutory rpt. states that shs. allotted include 150 000 8% cum. participatg. pfd. ord. shs. of £1 ea. and 600 000 dfd. ord. shs. of 1s. ea. Cash recd. in respect of shs., £158 920. Payments: C.O. Stanley, cash purchase consideratn., includg. remuneratn. to W. G. Pye and Co. and int. to Feb. 12, 1929, £88 049; prelim. exes., £17 939; on acct. of new bldgs., £1 000; on acct. of new plant, £142; trading paymts., £58 941; blce. at bankers, £55 756.

EVER READY CO. (GREAT BRITAIN), LTD.—Pft. for year ended March 31, 1929, £210 167 (increase £22 204), plus £30 022 brt. in. To res. £41 130; donatns., £363; intm. div. on pref. shs. at rate of 10% p.a. for half-year ended Sept. 30, 1928, paid Nov. 30, 1928, £10 000; intm. div. at 10% on ord. shs. paid Nov. 30, 1928, £47 000; fin. div. of 5% on pref. shs., makg. 10% for year, £10 000; fin. div. of 25% on ord. shs., £92 500; div. of 25% on ord. shs. issued fully paid as bonus, £18 500; fwd. £30 696.

CHLORIDE ELECTRICAL STORAGE CO., LTD.—Report for year to March 31 shows pfit. of £216 936, agst. £185 097. Directors recmd. 5% div., with bonus of 3s. per sh., tax free on ord. shs., making 25%, providg. £11 500 for benefit employees, transfer of £50 000 to gen. res. (makg. £350 000), carryg. £69 833 fwd., agst. £59 822 bt. in. In Dec. last 65 925 "A" ord. and 14 000 "B" ord. were issued at £4 per £1 sh. These new shares rank for final div. in respect of year to March 31. Meeting, Manchester, May 17.

BIRMINGHAM DISTRICT POWER AND TRACTION CO., LTD.—Rev. for past year amntd. to £120 626, agst. £119 914 1927 and £119 740 for 1926. Deductg. charges for renewals, debenture int., taxes, etc., and addg. £44 995 bt. in, disposable total is £126 882. Allocation to reserve raised from £17 618 to £29 605, makg. £137 500, and the sum placed to deb. stk. sinkg. fund is £13 707, agst. £12 961. Div. of 7% on ord. is proposed, carryg. fwd. £45 855. The redemption of £19 598 of the first deb. stk. has reduced amnt. outstandg. to £244 131. Meeting, May 29.

BRITISH ELECTRIC TRANSFORMER CO., LTD.—In report for 1928 directors state that in order to provide workg. cap. to execute additional orders on hand negotiatns. are under way for the sale of some of co's properties. Pending realisation they have decided to postpone paymt. of half-year's pref. div., payable March 1. At later date consideration will be given to question of payg. div. Accounts for 1928 show that net pfts. dropped from £53 703 in 1927 to £14 740. With £10 855 bt. in total available is £25 595. It is proposed to place to deprctn. res. £4 000 (agst. £5 000). Pref. div. for half-year to June 30 last took £10 500, and it is proposed to carry fwd. £11 095. Meeting, May 21.

BRITISH POWER AND LIGHT CORPORATION (1929), LTD.—This co. invited this week subscriptions for 1 600 000 £1 fully paid shs. The Corporation has made arrangements for the purpose of acquiring a controlling int. in the North Wales Power Co., Ltd., Electricity Distribution of North Wales and District, Ltd., and the whole issued sh. cap. of the East

Digitized by Google

Suffolk Electricity Distribution Co., Ltd., the South Somerset and District Electricity Co., Ltd., the Trent Valley and High Peak Electricity Co., Ltd., the West Hampshire Electricity Co., Ltd., and the Ringwood Electric Supply Co., Ltd. The technical and commercial organisatns. of all these cos. will be centralised under the supervision of the corpn.

MARCONI'S WIRELESS TELEGRAPH CO., LTD.—Report for 1927 states that pfit. after pymnt. of deb. int. and pref. div., was £412 971, which, with the £25 196 bt. fwd. from 1926, left available £438 168. Two intm. divs. of 10% absorbed £414 390, leaving to be carried fwd. £23 777. Figures for 1928 are not finally made up or audited, but directors anticipated that profit available after pymnt. of deb. int. and of the pref. div. was approx. £408 500, which, with carry-forward from previous year, leaves total bal. available of £432 278. Directors decided to pay intm. div. out of pfits. for 1928 of 20%, less tax, on ord. shs. and an additnl. 10%, less tax, on 7% cum. partcptg. pref. shs. This will leave £3 252 to carry fwd. More detailed explanation of figures will be given at the general meetg on May 29. On or about May 18 shhldrs. will receive from the Bank of England an offer on behalf of Cables and Wireless to exchange shs. for shs. in that co. The report summarises the events leading up to the formation of Imperial and International Communications and Cables and Wireless. On the assumption that Cables and Wireless could pay int. on its pref. and "A" ord. shs., and that the Marconi Co. could pay 20% on its ord. shs., the div. position of hldrs. of 100 ord. shs. of £1 each, would be: Those who did not exchange would receive £20; those who did, £22 12s. 9d. The holders of 100 7% pref. shs. who did not exchange would receive £17; those who did £22 12s. 9d. Should Cables and Wireless be able to make a distribtn. not only on its pref. and "A" ord., but also on "B" ord. shs., those who did not exchange would be in a less favourable position. Directors recmd. all classes of shhldrs. to exchange their shs. for shs. in Cables and Wireless. At the meeting to be held on May 29, resolutions concerning certain new articles, and conditions for directors will be proposed, and, if passed, will be submitted for confirmation at an extraordinary meeting on June 26.

Company Meetings.

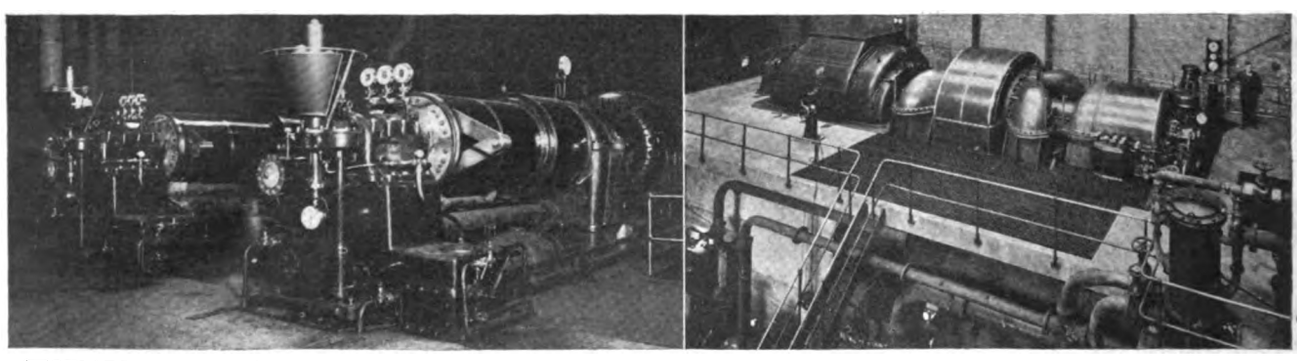
TRUPHONIC RADIO, LTD.—At the statutory meeting on May 10th, Lt.-Col. Sir Rhys Williams (chairman) said that the progress of the company could be described as phenomenal. With very little expenditure on advertising, orders amounting to three times the figure budgeted for had been received. Notwithstanding certain difficulties at the start, which had now been overcome, production had increased from 30 sets a week in February to 700 a week in April. As a result of attempting to fulfil the unexpectedly large orders their purchases of materials and labour costs were greater than was anticipated, and their working capital of approximately £27 000 was inadequate. It would therefore be necessary for shareholders to decide whether the company should limit its output, or whether they should continue to increase their present business, which would require further capital. The chairman having replied to questions, the proceedings terminated.

CABLE, TELEPHONE AND GENERAL TRUST, LTD.—Sir Alexander Roger, presiding at the meeting on May 8th, said they had paid the fixed dividends on the 6% cumulative preference shares and the "A" 7% non-cumulative preference shares, and were able to recommend the payment of a dividend on the ordinary shares of 4%, less tax, for the year, carrying forward £1 050, against £985 brought in. Specialisation in investment trusts, whose directors possessed an intimate knowledge of particular industries, was gradually spreading. In the case of their own company, which had been giving particular attention to the great telephone and cable industries and services connected with communications generally, they had sought to maintain a distribution of their interests over the various kinds of securities in the various countries throughout the world. The directors felt that a firm foundation had been laid on which their company could build, and they looked forward to the future with considerable confidence. The report and accounts were adopted.

NIGERIAN ELECTRICITY SUPPLY CORPORATION, LTD.—A statutory meeting of this company was held on May 10th, the Hon. Lionel Holland (chairman), presiding. This company was formed to acquire and complete the constructon and equipment of a hydro-electric installation at the Kurra Falls, on the Nigerian tin plateau. The company's programme provides for an initial installation of three units of 2 000 H.P. capacity each, so as to maintain 4 000 H.P. in permanent operation with a standby unit of 2 000 H.P., and subsequently for additional plant to bring the generating capacity up to 6 000 H.P., rising to 10 000 H.P. during the rainy season. The cost of the scheme is estimated to be £370 000. The plant is on order and constructional work well advanced. It is anticipated that the storage reservoir, with a capacity of nearly 3 000 million gallons, will be completed by the end of March, 1931, but that before then, by making use of the flow of the river for generation purposes, a considerable revenue will be earned from the supply of power.

INTERNATIONAL TELEPHONE AND TELEGRAPH CO.—At a special meeting of stockholders in Baltimore, on May 8th, the recommendations of the directors for an amendment to the charter of the corporation was approved, as follows: "To change the shares of capital stock of the corporation from shares each of a par value of $100 to shares without par value and to increase the authorised capital stock of the corporation from 2 500 000 shares of a par value of $100 each to 15 000 000 shares without par value and to change the number of issued shares of capital stock of the corporation to three times such number." It was announced that the amendment to the charter of the corporation would be filed with the State of Maryland on May 9th, making that date the effective date of the change. The directors, on May 9th, announced that they had authorised the issue of common stock without par value at an issue price of $50 per share and the offer of such stock to the stockholders for subscription in the ratio of one share for each 10 shares of no par value stock, or their equivalent, standing on the transfer books on May 24th.

BRITISH THOMSON-HOUSTON CO., LTD.—At the meeting on May 8th, Mr. H. C. Levis, chairman, said the profits for the past year, after deducting all expenses and charges other than interest on dividends and loans, were £422 729, to which was added the amount brought forward, £200 512. Interest on debentures and loans required £152 244, which was £27 500 less than the previous year, and the directors recommended



TOWARDS the end of last year the 10 000 kW two-cylinder turbo-alternator set, shown in the right-hand picture, was put into service at Ocker Hill, in the West Midlands Electricity District. The erection of the set and its condensing plant was completed by the English Electric Co., and we understand that in 3½ months' running on day load—8 a.m. to 5.30 p.m.—it has generated 6½ millions kWh without adjustments. In contrast to this modern plant are the two 1 500 kW reaction type turbo sets shown on the left, which were installed by the same company in 1906. After generating nearly 50 million kWh in the first six years these machines were still giving service during peak loads last winter, twenty-two years after their installation.

Digitized by Google

that there should be appropriated for depreciation £119 950. They then deducted the dividends paid on the preference shares during the year at the rate of 7% per annum, and recommended the payment of a dividend on the ordinary shares at the rate of 4% per annum, less tax, leaving £203 066 to carry forward. The amount of loans had been reduced from £1 310 000 to £335 000. They were enabled to make this reduction from the payments received for the Ediswan and Ferguson Pailin shares which the company owned. The holdings of the ordinary shares of that company by the International General Electric Co. of New York, together with the other ordinary shares of the company, had now all been acquired by Associated Electrical Industries, Ltd., but they could never speak too highly of the help and assistance which had been rendered to that company in the past, in both technical and financial directions, and which had been so instrumental in helping to build up that great business. The report and accounts were adopted and the dividends approved.

JOHNSON AND PHILLIPS, LTD.—Mr. John Macgregor presided at the meeting on May 9th. In consequence of the fact that he still felt some effect of the motor accident which happened to him last year, Mr. G. L. Wates read his speech, in which he said: The profits of the year, after making provision for bad debts and charging to revenue upwards of £15 000 for maintenance of buildings, plant, etc., mount to £106 417, to which is added £85 072 brought forward. Trading during 1928 was difficult and the expected revival in the demand for electrical apparatus did not mature during that year. The directors recommend the payment of a final dividend of 5%, less income tax, making a total of 10% for the year, leaving to be carried forward £80 903. The falling off in business which occurred towards the end of the year has passed, and there are now more orders going through the works than at this time last year. The demand for electrical plant has not yet caught up with the productive capacity of the industry. The low price of copper ruling during 1928 affected the value of the turnover and the ratio of profit. The exceptionally large contracts now being placed by the Central Electricity Board are bound to have a beneficial effect on our business in the future. The electrification of the rest of our railways in heavy traffic areas is a certainty of the near future. The results shown by those electrified already in operation have put this beyond doubt. The extension of our telephone system is a programme to which all political parties are committed; so is the development of our Crown Colonies, in connection with which we have already secured much valuable business. The expansion of our business in South Africa has resulted in our forming a subsidiary company in that Colony known as Johnson and Phillips (Pty.), Ltd., the whole of the share capital of which belongs to this company, and which South African company will be utilised for the purpose of our future business in the Colony. The report and accounts were adopted and the dividend was approved.

New Companies.

DUAL MOTORS, LTD.—Cap., £20 000. Manufacturers, importers, and exporters of and dealers in electrical and other motors for gramophones or otherwise, etc. Reg. office: 86, New Bond Street London, W.

SOUTHEND AND DISTRICT ELECTRIC SUPPLY CO., LTD.—Cap., £100. To acquire the business formerly carried on at 17, Commercial Street, London, E.1, as "H. Goldman," and to carry on business of dealers in and factors and suppliers of electrical and wireless appliances, etc. Solicitors: Appelbe and Morrison, 17, Commercial Street, London, E.1.

WESTERN ELECTRIC CO., LTD.—Cap., £20 000. Manufacturers and sellers of equipment and apparatus for reproduction, transmission, amplification or recording of sound by electrical or other means, independent of, or in connection or synchronism with or as incidental to the exhibition of motion pictures or for the transmission of pictures or images, etc. Solicitors: Johnson, Jecks and Colclough, 24, Austin Friars, London, E.C.

THE BRUSH ELECTRICAL ENGINEERING CO., LTD.

Problem of Excessive Competition—Electrical Industry on High Level of Activity—Volumes of Work, but Meagre Net Profits.

THE 40th general meeting of the Brush Electrical Engineering Co., Ltd., was held at the Holborn Restaurant, London, W.C., on Monday.

Mr. E. Garcke (chairman) said that he hoped that shareholders would agree that the present financial and industrial position of the company was satisfactory. It was right, however, that he should not attempt to gloss over the present situation, namely, that the prospects of maintaining the position was not altogether unclouded. The electrical industry as a whole had never in his experience been on a higher level of activity, or possessed a more favourable outlook of capacity to render service to the community than at present. However, the activity which characterised their industry was not shared by other important and kindred industries in this country. Those general clouds were now threatening to overshadow their own industry. To state it quite plainly, the industrial position of the country was not satisfactory. The problem with which they were confronted was the existence of excessive competition out of all proportion to the merits of emulation and efforts to improve the results of enterprise. It seemed ridiculous that the large capital now invested in the industry should be the means of producing huge volumes of work of a highly technical character with such meagre results in net profits. Where the bad general situation hit them in particular was that during the past year they had to sell about 25% more output in order to obtain the same profit. Such a situation could not continue for long.

The fact that the Brush Company had enjoyed a moderate measure of success since the War was due largely to special circumstances, for they had deliberately adopted the policy of concentrating their activities on three or four special lines, such as the Ljungstrom turbine, transformers and rolling stock for transport undertakings. Further, they had specialised in the relatively small sizes of the Ljungstrom turbine and had left the larger sizes of other turbines to be made by other firms.

Latterly, the Electricity Commissioners, in pursuance of the Electricity Act of 1926, had decided to discourage—he might say prevent—the extension of plant at many of the smaller electricity supply stations in the country, in order to concentrate the generating of electricity at relatively few "selected" super-stations. That was a development o which they must not complain, but they had had every reason to hope that the supersession of the smaller generating stations in favour of the concentration at the larger stations would be a more gradual process than appeared probable. The directors were confident that the Commissioners had every desire to promote the interests of the manufacturing industry consistently with those of the general community and hoped that the Commissioners would be able to carry out the change from small to large stations by evolutionary steps, with due regard to the dangers and detriment of undue haste in the nature of revolutionary measures.

With regard to the results of the year, the gross profit amounted to £153 857, being £6 800 more than in the preceding year. After allowing for various debits, placing £6 000 to reserve, and paying a 10% dividend, there was a net surplus of £11 700, or nearly £1 000 more than in 1927. Of that surplus £9 800 was payable to the co-partners and £1 900 to the shareholders in accordance with the co-partnership deed. With regard to that surplus, it had been the intention of the scheme that the proportion belonging to the shareholders should be distributed annually, but the amount had not been sufficiently large to justify a distribution. The aggregate now admitted of a distribution of 1% on the share capital, and the directors had decided to make that distribution this year as an addition to the standard dividend of 10%. The directors proposed that the shares of the company should be converted into stock, which would facilitate the distribution of amounts of small denomination. They were anxious to put the co-partnership scheme in a thoroughly satisfactory position of fairness all round, and as soon as the formalities had been completed in connection with the conversion into stock the stock holders would have the option of receiving that 1% either in cash or in fully paid stock at par. The co-partnership scheme had now been in operation for about three years. It was difficult to say how much of the increased profits earned was attributable to the operation of the scheme, but he was certain that all the men appreciated what had been done.

The report and accounts were unanimously adopted, and a resolution was passed converting the share capital of the company into stock.

MET-VICK FANS - FRESH AIR FRIENDS

Digitized by Google

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

308 385 C. A. SCHIERWATER. Dialling apparatus for automatic telephone instruments. (2/1/28.)
308 388 W. J. JOHN and H. WRIGHT JUN. Electric fuses. (6/1/28.)
308 401 SMITH METERS, LTD., E. W. SMITH, and H. E. AND A. W. ANGOLD. Coin freed prepayment mechanism for electricity meters. (19/1/28.)
308 393 J. E. POLLAK (HERMSDORF SCHOMBURG ISOLATOREN GES.). Electrical insulators. (10/1/28.)
308 398 SIEMENS BROS. AND CO., LTD., E. A. PETITHORY, and E. R. GARROD. Electric current interrupters. (18/1/28.)
308 400 BRIGHTON LIGHTING AND ELECTRICAL ENGINEERING CO., LTD., and E. HEAPS. Signalling devices for traffic controlling purposes. (19/1/28.)
308 406 BRITISH THOMSON-HOUSTON CO., LTD., and J. G. WELLINGS. Electric transformers. (27/1/28.)
284 630 BRITISH THOMSON-HOUSTON CO., LTD. Safety devices for electrical apparatus. (1/2/27.)
308 413 J. MCCULLUM. Lead sheathed electric cables. (3/2/28.)
308 416 BRITISH THOMSON-HOUSTON CO., LTD., A. A. POLLOCK, J. HUTT, and A. G. SALISBURY. Electric motors. (4/2/28.)
308 425 M. BING. Electrical plug and socket coupling with longitudinally divided sockets. (14/2/28.)
308 432 BRITISH THOMSON-HOUSTON CO., LTD., and L. GRIFFITHS. Magneto-electric machines. (21/2/28.)
308 440 GENERAL ELECTRIC CO., LTD., and N. C. SMART. Electrical signalling systems. (28/2/28.)
286 693 BRITISH THOMSON-HOUSTON CO., LTD. Systems of protection and control for electrical distribution systems. (9/3/27.)
308 448 MULLARD RADIO VALVE CO., LTD., and C. F. M. HAYES. Telephone instruments. (8/3/28.)
308 449 MULLARD RADIO VALVE CO., LTD., and C. F. M. HAYES. Telephone instruments. (8/3/28.)
287 484 MARCONI'S WIRELESS TELEGRAPH CO., LTD. Piezo-electric devices. (21/3/27.)
308 475 QUASI-ARC CO., LTD., and A. P. STROHMENGER. Electrodes for use in electric arc welding. (27/3/28.)
308 476 HARBEN'S (VISCOSE SILK MANUFACTURERS), LTD., and W. E. SHARPLES. Electric switches. (27/3/28.)
308 478 BROWN BROS. AND CO., LTD., and W. WALLACE. Ram and connecting rod fitted particularly for electro hydraulic steering gears. (29/3/28.)
288 302 J. CHATWIN (MERANO GES. OPTIK-FEINMECHANIK). Hand magnifying glass with electric illumination between the lenses. (4/4/28.)
308 493 P. E. MCIVER. Wireless telegraphy and/or telephony. (14/4/28.)
308 494 R. P. A. ANDERSON. Electric incandescent lamp fittings. (14/4/28.)
308 497 STERLING TELEPHONE AND ELECTRIC CO., LTD., and R. E. MILES. Cases for electric condensers and other electrical components. (18/4/28.)
292 461 SIEMENS AND HALSKE AKT.-GES. Circuit arrangements for intermediate amplifiers in two-wire lines. (18/6/27.)
308 505 I. LITVINCHEV. Device for directing or guiding tramway or other cars at rail junctions. (2/5/28.)
290 165 BRITISH THOMSON-HOUSTON CO., LTD. Methods of and apparatus for making electric incandescent lamps and similar articles. (7/5/27.)
291 436 C. DUPUIS. Electric call apparatus. (3/6/27.)
308 508 J. Y. JOHNSON (I.G. FARBENINDUSTRIE AKT.-GES). Insulation and securing of coil windings of lacquered wire. (9/5/28.)
308 521 W. T. HENLEY'S TELEGRAPH WORKS CO., LTD., and E. E. JUDGE. Lead covering of electric cables and the like by extrusion. (2/6/28.)
294 168 BRITISH THOMSON-HOUSTON CO., LTD. Thermionic apparatus. (19/7/27.)
294 145 C. BATY. Holders for electric lamps. (18/7/27.)
293 831 ATELIERS DE CONSTRUCTIONS ELECTRIQUES DE CHARLEROI. Testing arrangements for electric networks. (13/7/27.)
299 697 TELEPHON-APPARATIK-FABRIK E. ZWIETUSCH AND CO., GES. Impregnation material for use in electrical condensers. (29/10/27.)
298 131 N. KOOMANS. Directive aerials. (3/10/27.)
298 904 E. W. C. RUSSELL. Piezo-electric devices. (14/10/27.)
308 557 SMITH METERS, LTD., E. W. SMITH, H. E. ANGOLD, and A. W. ANGOLD. Coin-freed prepayments mechanism for electricity meters. (19/1/28.)
308 558 SMITH METERS, LTD., E. W. SMITH, H. E. ANGOLD, and A. W. ANGOLD. Coin-freed prepayment mechanism for electricity meters. (19/1/28.)
299 465 BRITISH THOMSON-HOUSTON CO., LTD. Voltage balancing for systems of electrical distribution. (27/10/27.)
301 326 TELEFUNKEN GES. FUR DRAHTLOSE TELEGRAPHIE. Radio transmitters. (24/11/27.)
303 150 TELEFUNKEN GES. FUR DRAHTLOSE TELEGRAPHIE. High frequency circuit arrangements, thermionic valve transmitters, and the like. (29/12/27.)
308 241 C. A. TURNER, Rotary electric switches. (15/11/27.)
308 625 A. F. BERRY. Apparatus for diffusion of light, heat and like radiant energy. (22/9/29.)
308 629 COMPAGNIE INDUSTRIELLE ET COMMERCIALE DU CYCLE ET DE L'AUTOMOBILE, and L. CHOLLET. Electrically-operated horns. (23/11/27.)
308 669 W. A. BURNS. Illumination and working of advertising-signs. (24/11/27.)
308 630 SIEMENS BROS. AND CO., LTD. and G. F. DUTTON. Microphones. (24/11/27.)
308 701 W. O. LITTLEBURY and IMPERIAL CHEMICAL INDUSTRIES, LTD. Electric blasting fuses and detonators. (24/11/27.)
308 638 A. J. ALDRIDGE, E. J. BARNES and E. FOULGER. Telephone transmitters. (23/12/27.)

Applications for Patents.

February 27th.

6 397 MACINTOSH CABLE CO., LTD., D. R. F. MILNER and J. G. ROBINSON. Fire proofing cable coverings, etc.
6 433 J. E. POLLAK (HERMSDORF-SCHOMBURG ISOLATOREN GES.). Arc guards for insulators or insulator chains.
6 393 POSTAL TELEGRAPH CABLE CO. Reproducing optical images at a distance. (29/2/28, U.S.)
6 454 TELEFONAKTIEBOLAGET L. M. ERICSSON. Selector contact bands. (28/2/28, Sweden.)
6 436 G. VIARD. Devices for maintenance of telegraph, etc., lines. (8/3/28, France.)
6 428 WESTINGHOUSE ELECTRIC AND MANUFACTURING CO. Electrode material for vacuum tube devices. (3/5/28, U.S.)

February 28th.

6 475 W. AITKEN. Automatic telephone systems.
6 567 ALLGEMEINE ELEKTRICITATS GES. Electricity meters. (29/2/28, Sweden.)
6 595 ASSOCIATED TELEPHONE AND TELEGRAPH CO. Remote control systems. (2/4/28, U.S.)
6 499 P. C. BARTON. Insulator mounting arms.
6 550 R. W. BLADES and BRITISH INSULATED CABLES, LTD. Arrangements for connecting electric cables.
6 549 L. G. BRAZIER and CALLENDER'S CABLE AND CONSTRUCTION CO., LTD. Apparatus for measurement of electrostatic capacity.
6 546 BRITISH THOMSON-HOUSTON CO., LTD. High frequency signalling systems (27/3/28, U.S.)
6 548 BRITISH THOMSON-HOUSTON CO., LTD., H. DE B. KNIGHT and G. S. C. LUCAS. Apparatus embodying light sensitive devices.
6 547 BRITISH THOMSON-HOUSTON CO., LTD. (Victor X-Ray Corporation). X-ray apparatus.
6 536 H. J. CAMP. Inductance coils.
6 599 H. C. CHANNON, J. H. DEAN and H. J. GARNETT. Insulating materials. (14/11/28.)
6 496 H. M. DUDGEON and T. C. E. ROWLAND. Current collectors for tramcars, etc.
6 539 A. EIDINOW and HEWITTIC ELECTRIC CO., LTD.—Radiant energy generating apparatus.
6 587 FABRIQUE D'APPAREILS ELECTRIQUES.—PAVARGER SOC. ANON. Apparatus for transmitting varying quotations of stocks, etc. (1/3/28, U.S.)
6 596 H. J. GARNETT and W. S. SMITH. Magnetic alloys. J. A. Holden.
6 497 W. E. GUY. Electric lamps and fuses.
6 545 INTERNATIONAL GENERAL ELECTRIC CO., INC. Centrifugal compressors with intermediate cooling. (1/3/28, Germany.)
6 611 B. KROL and MULLARD RADIO VALVE CO., LTD. Electron discharge tubes, etc.
6 531 V. J. D. LAWRENCE. Method of tracking needle of electrical pick-up.
6 607 T. G. MAIR and OLDHAM AND SONS, LTD. Galvanic batteries.
6 589 A. J. MARTIN and PLESSEY CO., LTD. Apparatus for reception of electrically transmitted pictures.
6 609 A. J. NEWMAN and F. H. STEPHENS. Electric switches.
6 524 A. H. RICE. Adjustable stand and electric heater for arc lamp.
6 525 A. H. RICE. Micrometer adjustment for arc lamp carbons.
6 616 G. VIARD. Devices for maintenance of telegraph lines, etc. (18/10/28, France.)
6 536 C. WATSON. Inductance coils.
6 604 R. N. WEBB. Electric condensers.

March 1st.

6 727 R. S. C. BALL and H. HEATHER. Slow speed electrical mechanism.
6 778 W. F. BEARDSHAW and S. H. KYNASTON. Picture telegraphy, etc.
6 683 D. M. B. BEAUMONT. Electric switches.
6 720 BRITISH THOMSON-HOUSTON CO., LTD. Electric furnaces. (1/3/28, U.S.)
6 722 BRITISH THOMSON-HOUSTON CO., LTD. Film controlled contact devices. (5/3/28, U.S.)
6 785 G. F. CLARK and GRAMOPHONE CO., LTD. Frames for electric motors of talking machines.
6 660 J. A. CRABTREE. Mounting electric switches.
6 787 R. T. DIXON and W. J. SILVESTER. Electric lamp holders for vehicles.
6 748 ELECTROACOUSTIC GES. Subaqueous sound transmitters. (10/3/28, Germany.)
6 784 GRAMOPHONE CO., LTD. and E. KNIGHT. Electric motors for talking machines.
6 781 J. HANSSON and N. KJELLSON. Burglar, etc., alarms.
6 659 T. R. HOLLIS and F. SHRIMPTON. Suspension chains for electroliers, etc.
6 755 A. E. HONEY and J. STONE AND CO., LTD. Electric regulators.
6 633 B. LOEWE. Arrangement for scattering auxiliary substance in vacuum valves. (1/3/28, Germany.)
6 712 G. C. AND P. A. LUNDBERG, A. P. LUNDBERG AND SONS, LTD. and G. PEGG. Electric switches.
6 711 G. MARR. Electric switches.
6 719 E. W. C. RUSSELL. Method of cutting piezo-electric crystals.
6 719 SCHUCKHARDT BERLINER FERNSPRECK UND TELEGRAPHENWERK A.G. Electromagnetic couplings. (28/12/28, Germany.)
6 761 A. E. WHITE (CENTRAL ELECTRIC TOOL CO.). Reciprocating motors. (13/4/28.)

March 2nd.

6 800 J. H. ASDELL. Illuminated signs.
6 870 ASSOCIATED ELECTRICAL INDUSTRIES, LTD. Photo-electric cells. (3/3/28, U.S.)
6 791 C. R. BAGGETT. Device for connecting dry cell batteries.
6 790 A. V. BOWATER. Locks, etc., for electric lampholders.
6 858 BRITISH THOMSON-HOUSTON CO., LTD. Resonant units. (2/3/28, U.S.)
6 832 O. E. BUCKLEY. Submarine cables.
6 863 J. N. CHAVIARA and J. F. GILL. Regulation, etc., of electric currents.
6 838 H. E. HUMPHRIES and SIEMENS BROS. AND CO., LTD. Electric selectors.
6 823 B. D. LEVY (R. A. BROWN). Portable electric light combination.
6 841 J. SALOMON. Electric motors (19/2/29, Germany.)
6 835 F. E. A. B. SEWELL. Wireless receiving circuits, etc.
6 878 SIEMENS AND HALSKE A.G. Incandescent lamps. (12/4/28, Germany.)

March 4th.

6 973 ACCUMULATOREN-FABRIK A.G. Sealing cover for cells of lead accumulators. (2/3/28, Germany.)
6 917 J. ANDERSON and G. ELLISON. Alternating current interrupters.
6 995 ASSOCIATED ELECTRICAL INDUSTRIES, LTD. Electric protective arrangements.
6 978 BRANDES, LTD. Contact terminals for electron tubes.
7 005 A. AND G. BRAY AND G. BRAY AND CO., LTD. Electrical connecting devices.
6 977 BRITISH THOMSON-HOUSTON CO., LTD. High frequency amplifier circuits. (2/3/28, U.S.)
6 968, 6 971 S. G. S. DICKER (N. V. PHILIPS' GLOELAMPENFABRIEKEN). Resistances.
6 969, 6 972 S. G. S. DICKER (N. V. PHILIPS' GLOELAMPENFABRIEKEN). Transmission of wireless signals.
6 979 S. DUNLOP (FU'LD AND CO. TELEPHON UND TELEGRAPHENWERKE A.G.) Telephone instruments.
7 032 ELECTRIC FURNACE CO., LTD. Annealing metal strips. (4/6/28, Germany.)
6 917 G. ELLISON. Alternating current interrupters.
7 040 GENERAL ELECTRIC CO., LTD., and W. WILSON. Electrical protective arrangements.
6 952 J. P. HAWORTH. Accumulators.
6 950 H. E. HUMPHRIES and SIEMENS BROS AND CO., LTD. Registering apparatus employing thermionic valves, etc.
6 961 G. C. AND P. A. LUNDBERG, A. P. LUNDBERG AND SONS, LTD., and G. PEGG. Electrical adaptors.
6 962 G. C. AND P. A. LUNDBERG, A. P. LUNDBERG AND SONS, LTD., and G. PEGG. Electric switches.
7 024 E. SCHARPENBERG. Sockets for electric cables.
6 933 F. SCHINDLER. Controlling apparatus for electricity supply systems.
6 974 SIEMENS AND HALSKE A.G. Electrical separation of rubber from latex. (12/3/28, Germany.)
6 981 SIEMENS AND HALSKE A.G. Electrical separation of rubber from latex. (18/4/28, Germany.)
6 983 SIEMENS AND HALSKE A.G. Electrical separation of rubber from latex. (10/11/28, Germany.)
6 991 SIEMENS AND HALSKE A.G. Electrical separation of rubber from latex. (17/3/29, Germany.)
6 890 W. A. STEVENS. Device for controlling regeneration in electrically propelled vehicles.

COMING EVENTS.

Friday, May 17th-Thursday, May 23rd.

WORLD POWER CONFERENCE.—Barcelona, Spain. Sectional meeting on "Complete Utilisation of Water Power Resources." Official visits follow from May 24th to June 4th.

Saturday, May 18th.

ASSOCIATION OF MINING ELECTRICAL ENGINEERS (SOUTH WALES BRANCH).—Esplanade Hotel, Porthcawl. Annual meeting. 5 *p.m.*

Friday, May 24th

INSTITUTION OF ELECTRICAL ENGINEERS (WESTERN CENTRE).—Queen's Hotel, Cheltenham. Summer meeting.

PHYSICAL SOCIETY.—Imperial College of Science, Imperial Institute Road, South Kensington. Paper by Dr. J. H. Vincent on "Experiments on Magneto-strictive Oscillations at Radio-Frequencies." 5 *p.m.*

Current Topics.

The Battersea Project.

IT could hardly have been expected that the publication last week of Mr. FLADGATE'S apologia for the London Power Co.'s Battersea project would effectively silence criticism, though it is of definite value in so far as it indicates that the promoters of the scheme do not propose to ride roughshod over the wishes of the public without first saying why they intend to adhere to their original plan. We wish we could share the Power Co.'s optimism at the prospect of the early discovery of means which will render it "practically possible to render innocuous the fumes which arise in the process of generation." While we say this in the hope that our pessimism may soon be shown to be unfounded, we cannot overlook the fact that one who is probably the country's greatest expert on similar problems in other industries has frankly expressed doubt that a workable commercial process can be evolved. If the London Power Co. considers such doubts as casting "an unmerited slur on the present state of advancement of the arts of engineering and chemical science" it should, according to its own statement, soon be in a position to make the one effective reply to that aspersion. Meanwhile we note that even the determination of the sulphur content of flue gases—let alone its elimination—involves difficulties of no mean order. The general practice of sampling the fuel bed refuse, determining its sulphur content, and then estimating that going to the stack by difference is easy but inexact, but the direct measurement of the sulphur in the flue gases is more difficult. In an investigation made by the U.S. Bureau of Mines, Pittsburgh coal was burned in the furnace of a small power boiler, and measurements were made for eight-hour periods of the total sulphur in the refuse, in the gases beyond the bridge wall, and in the flue gases, in the attempt to account for the total sulphur in the coal. With the greatest care, the total sulphur as measured invariably averaged less than that in the coal. The measurements as reported show that from 3·2 to 4% of the total sulphur was found in the refuse; from 82·2 to 93·3% in the gases at the bridge wall; and from 75·4 to 83·4% in the flue gases. At the bridge wall, therefore, the percentage of unaccounted sulphur varied from 3·5 to 13·8%, while the missing percentages in the stack ranged from 12·6 to 21·4. Some of these figures are of doubtful interest in the investigation of the Battersea problem, but even when allowance is made for the different classes of coal employed, consideration of the figure representing the residuary sulphur content discharged to the surrounding air emphasises the magnitude and urgency of the problem with which the Power Co. is faced; other very pertinent points were raised by Prof. M. W. TRAVERS in a letter to the "Times" on Wednesday.

An Alternative Site.

THE other main point in Mr. FLADGATE'S statement is the argument adduced against the various suggestions that have been made, notably by Sir BASIL BLACKETT, that apart from nuisance considerations, the Battersea project is uneconomic. It is difficult to form a definite opinion on this aspect of the matter without fuller knowledge of the basis on which Mr. FLADGATE'S figures are founded, but on the whole we feel that the alternatives fully deserve the most careful and unbiased consideration. The contractual obligations are resolutely put forward as an insuperable obstacle to a modification of the present plan, but if everyone were permitted to carry such a reason to its logical conclusion life in this country would be insupportable. Before there is any talk of prior commitments it should be clearly established, either that the sulphur problem is definitely solved, or that the present scheme is economically better than the alternatives. Decision on these points would be greatly facilitated by holding an independent inquiry without further delay.

Utility Advertising.

ONCE again the columns of the daily papers find themselves adorned with delightfully produced large-scale advertisements of gas, with particular reference to domestic water heaters, but there is a remarkable lack of counter-publicity for electricity. Though we have raised the point times out of number we feel we must repeat that the electrical industry's timid essays in co-operative advertising are pitiful compared with the publicity activities of the rival industry. We attach no blame to the Electrical Development Association, which is responsible for the electrical advertising, for the Association obviously makes the best possible use of a very limited appropriation. The industry as a whole is the real culprit for failing to provide the money for sustained publicity on a large scale. If every electrical undertaking and firm would subscribe each

Digitized by Google

year only 0·1 per cent. of its annual revenue, the E.D.A. would have the wherewithal to make a much better showing. There are still to be found people who daily derive benefit in one way or another from the work of the E.D.A., but withhold the practical support to which it is entitled, and most of us have come to think of this co-operative publicity in a small way, which is quite inadequate for an industry of enormous potential size and importance. Let us envisage this industry-publicity in a really big way and each contribute our small quota of the cost.

An Electrical Luncheon Club.

AT various times we have heard electrical engineers voice the desirability of having a sort of Electrical Luncheon Club, similar to the gatherings of the Rotary movement, in that there would be at each meeting only one speech, and that in the form of a short address by some notable man, possibly engaged in another, but related, sphere of activity. There is much to be said for the usefulness of such gatherings, as distinguished from the usual luncheons at which a number of speakers address themselves to a toast list, and the increasing popularity of the periodical luncheons of the Batti-Wallahs Society suggests that the idea is capable of development. From small beginnings, deriving its membership mainly from a definitely restricted circle, the Society has greatly extended its interests and influence, and is now at a stage when it is, in fact, if not in name, a well-attended Electrical Luncheon Club. It therefore seems to us not altogether impossible that a scheme may ultimately be evolved which, while maintaining the traditions and exclusiveness of the dwindling band of authentic Batti-Wallahs, will make provision for official participation in the Society's proceedings by those mere landlubbers who at present must consider themselves, both literally and metaphorically, as stowaways.

A Fishy Story.

A NEW use of electricity is envisaged for the coming whale-hunting season in the Antarctic. Ordinary harpooning methods are both cruel and uneconomic because of the whale's great loss of blood before death, so electrocution is to be tried. According to the " Observer," the harpoon will be attached to a wire along which a strong current will be sent when the harpoon is safely lodged in its objective. But while electricity is destined to play a lethal part in the whaling fields it will provide the latest amenities of civilisation in another part of the fishy world, the Farrar River, where, according to the Grampian Electricity Supply Bill (recently before the House of Commons), an electric lift will be installed to hoist salmon over a 100 ft. high waterfall.

Rural Development.

IN choosing a rural area for the purpose of his attempt to see what results may be expected from the development of electricity supply in such areas, the Minister of Transport has done well to pick upon a portion of the Bedford Corporation's supply area, as this is a district in which notable progress has already been made without any outside assistance. But unless it is understood at the outset that the experiment is not being made upon virgin territory there is a danger that some unduly optimistic conclusions may be drawn concerning the time needed to bring such developments to fruition and commercial success. So long ago as 1927, when Mr. R. W. L. PHILLIPS, Bedford's borough electrical engineer, was President of the I.M.E.A., we were able to report that in addition to supplying a number of outlying industrial establishments the undertaking was giving supplies to adjacent villages, and had in hand schemes to extend this service to several other villages in its area. Special efforts were being made to encourage electric cooking, and a picture, showing its employment in a typical small country inn, was reproduced in these columns to show that the development was not confined to the well-to-do residential population. There is, therefore, every reason to expect that Col. ASHLEY's much talked-of experiment will be an unqualified success, but we hope that other undertakings which are in a position to undertake rural development will press forward with the work as and when possible without waiting to hear the results of the Bedford demonstration.

Apprenticeship in the Electrical Industry.

WE recently referred to the excellent progress that has been made by the Electrical Contractors' Association in the training of apprentices for the installation trade, and we are glad to have further information regarding the wider scheme, designed to cover all branches of the industry, which was put forward by the Association of Supervising Electrical Engineers last October. The main principle of the A.S.E.E. scheme, it may be recalled, was the appointment of a Central Apprenticeship Board, representative of the various interests in the electrical industry, which was to be responsible, through Local Committees, for the general management of the scheme, including the regulation of the number of apprentices coming into the industry, and the formation of machinery to deal with the many points which would naturally arise

Practical and Technical Training.

AN important part of the A.S.E.E. scheme was that which provided for a linking-up of practical and technical training. The boys were to be allowed certain time off during the working day for attendance at technical schools, and this was to be dovetailed into a scheme of practical training which would give the boy an all-round industrial experience. For instance, a boy, who was to receive training for contracting and installation work, would get an insight into workshop and power station practice, with the result that, when he had finished his apprenticeship, he would become a skilled worker in the true sense of the term. It was pointed out, at the time the details were published, that it would be necessary for many conversations to take place between the promoters and those organisations in the industry which would ultimately control the scheme, and whose co-operation was so essential to make co-ordinated apprenticeship a success. We are, therefore, glad to learn that a number of the organisations have expressed interest in the fundamentals of the scheme, and that meetings are being arranged with those who have not yet arrived at a definite decision. It will be remembered that the particular organisations in the industry directly affected were six in number, and the Committee of the A.S.E.E. has progressed so far that 50% of those organisations have signified their favourable interest. It was to be expected, however, in view of the many schemes which are already in operation, that difficulty would be experienced in finding common ground for the linking-up of the ideas underlying present schemes, with the new suggestions. It is gratifying to record that headway has been made, and, if all interests are prepared to sink their individual outlook for the good of the industry, there is no reason why a scheme should not be evolved from the suggestions put forward by the A.S.E.E. which should guarantee for the future a supply of fully-qualified men for the electrical industry.

An Economist on Hire-Purchase.

THOSE who are interested in the economics of hire-purchase trading will have the opportunity of hearing the views of a distinguished economist when PROF. SELIGMAN, of Columbia University, New York, addresses the Individualist luncheon on June 19th. PROF. SELIGMAN was chairman of the committee which was set up in America to investigate the possibilities of hire-purchase, and the Seligman Report undoubtedly put the business on a sound basis. Subsequently he published " The Economics of Instalment Selling," which is, and will probably remain the standard work on this subject. Prof. SELIGMAN is responsible for the view that instalment buying is not, as many people think, a mere trading device, but is, in fact, the beginning of a complete new banking system.

PRACTICAL USE OF CONCRETE POLES.

Test Reports on Overhead Systems in the U.S.A.—Causes of Deterioration—The Question of Cost—The Factor of Safety Problem—Employment of Colouring Matter.

AT a meeting of the Overhead Lines Association, on April 24th, Mr. W. Fennell (the president) read a paper on "Practical Uses and Tests of Concrete Poles in U.S.A.," which was based on a report of the Overhead Systems Committee of the N.E.L.A.

Mr. Fennell said the position of anyone writing a paper on ferro-concrete poles in England was similar to that of the writer of the mythical book on "Snakes in Ireland." We were, therefore, forced to go abroad for our experience. Much had been heard about concrete poles in France, but there was a strange shortage of data. One could not, in England, obtain a quotation for poles to resist any particular stress. A committee had been formed by the British Electrical and Allied Industries Research Association charged with the duty of testing ferro-concrete poles. The O.L.A. had appointed Mr. Swarbrick as representative on this committee—but no one seemed to know quite how to commence this British investigation.

Turning to America, the report of the Overhead Systems Committee of the National Electric Light Association stated that the electric railway companies had made considerable use of these poles, but there had been relatively little use of them by power companies. Shortage of timber of suitable size had now made the subject a live one. Over 300 questionnaires were sent out, and 202 replies were received. The following was a summary of the results :—

Fig. 1.—Combination steel and concrete poles made of two channels with concrete between, at Adelaide, Australia. A 36 ft. pole supports 11 000 V, 7 000 V and 400 V lines.

Thirty-three companies use concrete poles; 169 do not. Of the 33 companies, 11 make their own, and 5 purchase them, for line poles, while the remainder use them for street lighting standards. There are thus 16 cases of line poles, subject to stress, and most are made where used, because of the weight and difficulty in shipping them. All information furnished seemed to indicate a tendency to use concrete poles for fairly low voltages (600 V).

This, said Mr. Fennell, appeared to be due to the reliance in the U.S.A. upon the pole itself to assist the insulator, so that in the U.S.A. earthing of metal-work was not usual, and a conducting pole was avoided for high pressure work. As we must earth the insulator pins and must also be prepared to earth the ferro-concrete pole at pressures above 600 V, its conducting qualities were no disadvantage.

After giving a good deal of detailed information on the construction of various types of pole, Mr. Fennell then dealt with the important question of deterioration. Twenty users reported on deterioration experienced with various kinds of concrete poles. Thirteen users reported poles satisfactory, showing no deterioration in from five to seventeen years. Two poles were reported in Schenectady which were 30 years old and still in good condition. Seven users reported some deterioration, the causes being :—

1. Steel reinforcing too close to the surface, i.e., less than ¾ in.
2. Porous concrete, due to the use of too much water at time of mixing.
3. Voids in concrete due to insufficient working or puddling of concrete after placing in forms.
4. Improper curing, i.e., allowing poles to dry instead of keeping them wet for the first ten days after manufacture.

Fig. 2.—A 40 ft. strain type concrete pole at Richmond, Virginia.

5. Overloading, which is shown up by the appearance of evenly distributed cracks across the pole on the tension side, usually at or slightly above the ground line.

The first four items all caused spalling or cracking of concrete away from the reinforcing. When cracking had commenced, frost action caused progressive deterioration.

The remedies for these causes appeared to be :—

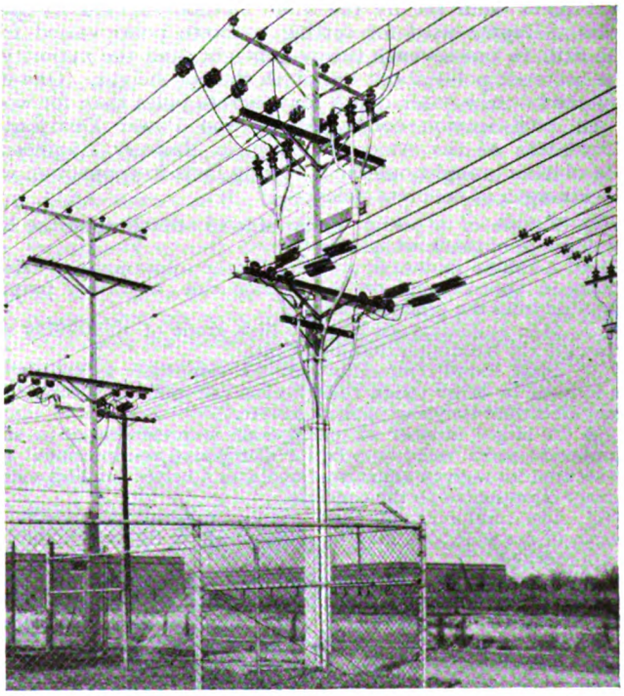

Fig. 3.—Another example at Richmond, showing terminal arrangement on concrete poles.

1. Steel should be at least ¾ in. below the surface, preferably 1 in.
2. Concrete mixture should be waterproof, i.e., by designing the mix for a compressive strength of 3 000 lb. per sq. in.

Digitized by Google

3. Concrete should be worked and puddled after placing in forms, to prevent voids.

4. Poles should be cured damp or wet for at least 10 days after initial set; this alone strengthens the concrete 75% over dry unprotected curing.

5. Poles should not be loaded beyond the strength for which they are designed.

With regard to methods of transportation and setting,

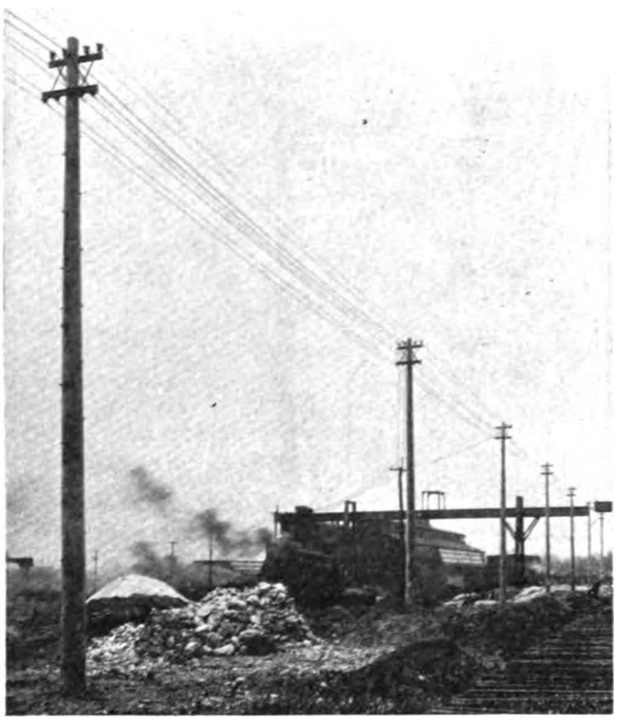

Fig. 4.—Westinghouse hollowspun concrete poles at a steel works.

concrete poles were generally transported on trailers, similar to wood poles. Long poles might have a stiff, wooden member placed between trailer and truck to prevent excessive deflection. Eight of the users reported that poles were set by using a gin pole or derrick. Five of the users reported that poles were set by the same method as used for wood poles. Depths used for setting concrete poles varied from one-fifth to one-seventh the pole height, and the majority of the users set poles about one-sixth the pole height. One user reported 6 in. greater depth for concrete poles than for wood.

An investigation conducted by the Power Distribution Committee of the American Electric Railway Engineering Association brought out the following facts in connection with the strength of concrete poles:—

(1) Failure of a pole is always due to stretching of the reinforcing rods of the tension side.

(2) A failure is always preceded by the appearance of hairline cracks in the concrete on the tension side, at rather frequent intervals from the ground line up.

(3) It is advantageous to use a high grade of reinforcing steel to secure the maximum tensile strength.

(4) Plain round reinforcing rods are essentially as satisfactory as twisted or other rough rods, because, in general, the rods will elongate before they slip in the concrete.

(5) A larger number of small rods is preferable to a small number of large rods, as a better distributed reinforcement may be secured for a given amount of steel and a better bending contact surface is presented to the concrete.

(6) The reinforcement need not be uniform throughout the length of the pole, but may be snapped off as the top of the pole is approached.

(7) A pole with uniform reinforcement will break at the ground line, while one with tapered reinforcement will break at some point above the ground, depending upon the taper of the reinforcement.

(8) A concrete pole has an element of safety in it, as a failure of the pole will not, in general, allow it to fall to the ground. It is difficult at times to pull over a pole after failure, even though it is inclined at a large angle from the vertical.

Coming to the question of cost, the lecturer said that concrete poles appeared to cost one-and-a-half to three times as much as wood poles. One user reported the cost as 30 dollars more than wood poles, another reported from three to fifteen times the cost of wood poles. Westinghouse hollowspun poles were reported to cost approximately the same as tubular steel poles.

Continuing, Mr. Fennell said the question arose: Could we afford the luxury of concrete poles over here? Making full allowance for the slightly higher cost of wood poles over here as compared with U.S.A., due chiefly to our more elaborate creosoting, it was clear that for equal strength and height they were dear, especially in the smaller sizes. They began to come in, as did steel, for long spans and heavier stresses, but never seemed to approach the wood pole for any but heavy or "town" work." We were not, and never would be, allowed to run heavy lines along over medium-sized town streets, the tendency here being to reserve overhead work for outer suburbs and rural areas, so that unless a ferro-concrete pole was offered at about 1½ times the cost of a similar "medium" wood pole, delivered on site, there was every reason why it should not be used. Its hypothetical extra life might be worth that extra cost. There was nothing in his mind to warrant asking for a factor of safety of 2½, that allowed for steel, based upon the combined tensile strength of steel and concrete, unless someone could produce a design in which the concrete and steel combined took the tension stress, and it could be proved that we had a pole as safe and reliable as steel.

According to his judgment the ferro-concrete pole would not enter into our rural schemes. Its weight and cost of handling must be heavy, and the total cost prohibitive; moreover, its surface weathered in a rather disagreeable way. Its finish was associated with that of "artificial" stone. It did not blend well into the landscape of England, as did a light brown creosoted pole, nor was it suitable for a country town. It might be acceptable in a housing scheme or at a new seaside watering place, or along a railway or in a power station yard, and in the vicinity of concrete fencing posts.

THE DISCUSSION.

Major T. Rich considered it unfortunate that the President should have examined the subject of concrete poles in relation to a country—the U.S.A.—which, in this respect, was now in the position reached by some of the Continental countries about fifteen years ago. A concrete pole, if properly designed,

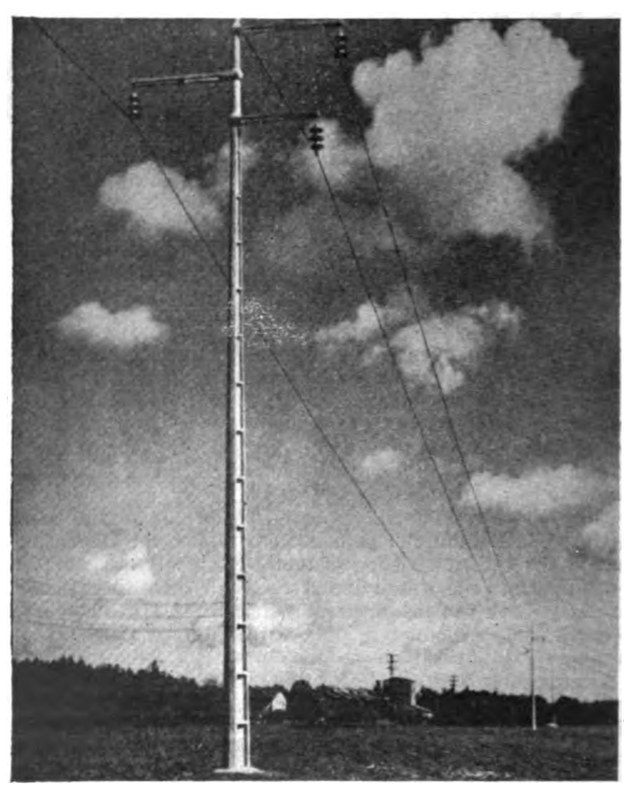

Fig. 5.—A Kiese pole in service on a 50 kV transmission line. The top of this pole is approximately 50 ft. above ground.

was not necessarily exceedingly heavy; when one bore in mind that there were 750 000 concrete poles in use in France—a country with a very material amount of timber available—one would come to the conclusion that there must be something wrong with the suggestion that concrete poles were impracticable. The reason why there were so many of these

Digitized by Google

poles in France was that they were properly designed as structures. Centrifugally made concrete poles as high as 90 ft. had been made; centrifugal posts were used in Italy for 240 000 V transmission. Messrs. Dyckerhoff and Widmann were about the earliest makers of centrifugal concrete posts, and they were making such posts from 60 ft. to 70 ft. long.

The PRESIDENT said the makers of the Kisse poles were making them up to 40 ft. long. We did not want 90 ft. poles.

Major RICH, discussing the manufacture of the centrifugally made concrete poles, said that if the concrete were used in the form of a "pudding" there was no necessity for a core at all. The method of the Westinghouse Co. seemed distinctly crude as compared with the German method. With regard to the weights of concrete posts, he said there were some concrete posts used in France for h.t. light rural lines, having a height of about 10 metres (33 ft.) and weighing about half a ton. If we in this country were allowed to adopt the same factors of safety as had been found to be satisfactory in other countries, he saw no reason why we should not obtain concrete poles in this country at a cost of less than one-and-a-half times that of the foreign wooden poles.

With regard to factors of safety, he said that in England it was 2½ or 3½, based on the elastic limit, and it was the same for wood as for concrete. Wood had practically no reserve of strength beyond the elastic limit; concrete had a big reserve beyond that elastic limit, but it was given no credit for that in the factor of safety adopted. Discussing the question of the development of cracks in concrete, he said he believed it was the policy of some German makers to test every pole before it was despatched from the works. With regard to curing, he had seen posts made with aluminous cement concrete taken out of the moulds seven hours after casting; in summer time a high-class Portland cement was used, and the poles were taken out regularly once a day.

Mr. W. A. TURNBULL expressed himself as being in agreement with the President throughout. Commenting on the President's remark that the steel in reinforced concrete poles did not get a chance of taking the strain, he suggested subjecting the rods to initial stress.

Mr. F. SWARBRICK, who declared himself to be an enthusiast in regard to concrete poles, said that one important aspect of the development of these poles was the possibility of the establishment of a new industry in this country. In his opinion the Continental concrete pole was of very much better appearance than the creosoted wooden pole. He agreed with the remarks of Major Rich with regard to the light concrete pole. The prices mentioned by the President were certainly prohibitive, and not comparable with the prices of the French poles. Before the end of the present summer there would be in operation in this country an experimental line constructed on the Continental basis, with concrete poles. As a country we could not afford so conservative a factor of safety as 3½, when we had evidence that on the Continent a factor of safety of 2½ or less filled the bill.

A South Wales Example.

Mr. H. W. GRIMMETT said that in South Wales there was a very good double-circuit line on concrete poles, erected in about 1919. The cost of the poles at that time was about five times the cost of wooden poles to-day. The concrete poles used had bevelled corners, there being reinforcing rods at each corner. They were made locally and carted to the points at which they were erected.

Mr. MOLLE confirmed Major Rich's remarks as to the enormous number of concrete poles used in France. When he was at Grenoble University about eight years ago a long course of instruction had been given on the manufacture of concrete poles. Five or six years ago concrete signal poles were used on the railways in India, but they had not much pull imposed upon them when used for that purpose; they were used widely on the railways in this country to-day. He asked if anyone had had experience of the Marriott pole, which was invented by a railway engineer in this country. The pole consisted of a series of hollow sections, each section being cast separately, as drain pipes were cast. In the walls of the pole there were holes running throughout the whole length, at intervals round the circumference, and through these holes reinforcing rods were threaded. Each section of the pole could be carried to the site on a bar held by two men; the reinforcing rods were threaded through the sections, to make the complete pole, and were bolted up at each end, so that the complete pole was a hollow tube held together by half a dozen or so reinforcing rods.

Mr. MINTON asked if consideration had been given to the problem of adding colouring matter to the concrete. Green was about the cheapest colouring matter. Experiments showed that 1 lb. would be sufficient for about 2 cwt. of concrete.

Major RICH said that several of the Continental firms producing concrete posts were also making concrete candelabra for streets. They decorated them by making rings or decorations of coloured concrete on the outside.

Mr. H. NAPIER PRENTICE said he could not help feeling that there was a great future for ferro-concrete poles. This country was not yet electrified; we did not yet know where the loads would be and where the lines were going. We ought to give every consideration to ferro-concrete poles for the future, but we ought to develop the country on wooden pole lines, and build up a load which would enable us to afford the expenditure on the more permanent and possibly more beautiful ferro-concrete pole lines.

Mr. Fennell's Reply.

The PRESIDENT, replying to the discussion, said he wished we could obtain figures and information as to the French construction methods and the results of tests on the French poles. In his heart he agreed with a good deal of what Major Rich had stated, but he had considered the problem from the point of view of a body of Electricity Commissioners, and bearing in mind the factors of safety that were specified. The details of proposed schemes had to be "quizzed" by the Commissioners, and stress diagrams had to be produced. It must be shown that on the tension side the loads which would be applied by hypothetical gales and hypothetical ice would be well below the breaking stress or elastic limit. That was the basis we had to work to; we might discredit that basis by showing that it did not allow us in this country to do what was done in others with apparent safety. In regard to underground lines, leading principles were laid down, and the responsibility was left to the engineer concerned, and if that were done in regard to overhead work we should be able to make more progress. In connection with underground lines, one was an engineer, and one accepted the risks and responsibilities; in overhead work one was not allowed to be an engineer, notwithstanding one's training, and one had to do what one was told to do. Perhaps it was not fair to blame the Commissioners, at the present stage, and one of the principal objects in investigating these matters was to demonstrate that in regard to overhead lines engineers could be treated as they were in regard to underground lines, and that they were men who knew their jobs. While they did not object to a factor of safety of 2½ in the case of a steel pole, they could not expect to be allowed a lower factor of safety for a ferro-concrete pole.

Major RICH said that a concrete pole was stronger than a steel pole in compression. The PRESIDENT replied that one must demonstrate that. Mr. NAPIER PRENTICE pointed out that in the ferro-concrete pole the steel was protected from corrosion. The PRESIDENT replied that, under the regulations, the steelwork must be painted regularly. The factor of safety of 2½ was demanded not merely when the pole was new, but always. Major RICH said the factor of safety for ferro-concrete was 3½, compared with 2½ for steel. It should be the other way.

The PRESIDENT agreed that the higher factor of safety for ferro-concrete was a handicap, and that was what he had wanted to emphasise in the paper. With regard to centrifugally-made poles, his view was that they should be spun so quickly that some real action was exerted by centrifugal force, and not merely by compression of the concrete in the early stages of setting. Referring to the very light pole, weighing less than half a ton, mentioned by Major Rich, he said that would not meet the requirements with regard to factor of safety. A 33-ft. pole weighing half a ton would break during the first ordinary gale, according to the calculations.

The point made by Mr. Swarbrick with regard to the establishment of a new industry in this country was an important one. If anyone could show him a ferro-concrete pole made in this country, even though it were 50% more expensive than an imported wooden pole, he would think about it very seriously.

With regard to the high cost of the concrete pole line in South Wales, referred to by Mr. Grimmett, he said the installation was probably much stronger than it need be, and the high cost was due to that fact. Those who erected the line were pioneers, and were anxious to ensure that it would not fail.

He would be glad to have some further information with regard to the Marriott pole. The trouble with regard to the use of colouring matter in concrete was that it would fade when exposed to sunlight.

ELECTRICITY IN RURAL AREAS.

Discussion at National Conference on Agriculture—Farmers' Proposals for Expediting Development—Practical Aspects of the Problem.

SOME idea of the interest which British agriculturists are taking in the possibilities of rural electrification may be gained from the fact that the recent National Conference on Agriculture devoted a considerable amount of time to discussion of a resolution by the Rural Reconstruction Association:

"That in order to secure the economic reconstruction of rural England it is essential that there should be an immediate and widespread development of electricity in rural areas, and as such development must depend upon the co-operation of the user and the supplier it is desirable that the local branches of the National Farmers' Union and other agricultural organisations should meet the local electricity supply undertakings in conference to discuss the possibilities of supply in each area, and that copies of this resolution be forwarded to the Ministries of Transport and Agriculture, the Electricity Commissioners, the Central Electricity Board, the British Electrical Development Association, the National Farmers' Union and other agricultural organisations concerned."

Mr. R. Borlase Matthews, in moving the resolution, said its object was to give the interested parties an opportunity to inaugurate an era of co-operation. Rural electrification was a national matter, and no effort towards the economic reconstruction of rural England could be successful unless an immediate supply of electricity was available. It had long been recognised in industrial areas that electricity provided the cheapest and most convenient form of power. Why should not the rest of the country partake of its advantages? Until the farmer and the rural worker were in a position to obtain a supply they must be handicapped in any effort to reduce the cost of production.

Electricity was no new thing for the farmer. More than a million farmers in the world were using electricity as an aid to their work. In England alone over two thousand were employing it. Electricity could be supplied to the farmer more cheaply than any other form of power. People asked, "How about the oil question?" But they mostly meant the cost of the oil, which was but a fraction of the whole matter. Horse-power cost the farmer the equivalent of about two shillings per unit. A man's labour cost about ten shillings per unit. A progressive electric supply undertaking providing current on the modern telephone tariff system at, say, one penny per unit offered a very valuable proposition. He had found the Continental farmer only too thankful to pay fourpence per unit, for the simple reason that it paid him better than other methods.

The main advantages to be obtained from the use of electricity were: First, the substitution of electricity for horse and manual labour lowered the cost of production. Secondly, the application of electricity to agriculture had a direct bearing on the production of the farm worker.

Typical Farm Costs.

Dealing with a typical farm of seventy acres where electricity was installed, not completely, but for a few general purposes, Mr. Matthews said the cost of lighting for twelve months was £5, whereas the previous cost, when fifty gallons of oil were consumed, was £2 10s., but it took one hundred and fifty hours of labour to clean, trim, and fill the lamps. Putting that at the low figure of 6d. an hour, it amounted to £3 15s., so that the cost for lighting by oil was really £6 5s., as compared with £5 for electric light.

The farmer had a milking machine which cost him £4 3s. 4d. a year for current. The milking machine required looking after, and that cost nearly £16. His hand milking had cost him £31 a year.

His cream separating by electricity, apparently a trivial job, cost him £1 4s. for current and £1 for labour. When done by hand, at the low rate of 6d. per hour, it cost him £8 a year. Pumping water electrically cost £1 1s. a year, whereas pumping by hand, again taking labour at 6d. an hour, occupied three hundred hours a year and cost £7 10s. Chaff cutting cost 18s. when done electrically, as against £2 10s. when done by hand. Under the electrical method all those operations cost him nearly £12 for current and nearly £18 for labour, a total of £29, whereas under his former methods those operations cost him £56. The capital cost of putting in the installation was about £120. Allowing for interest and depreciation at a good rate, say, 15%, there remained a net profit of nearly £9. That was typical of many cases.

Then, in connection with the farmhouse, there was the pumping, which meant a lot of work during the year. Then, too, the farmer's wife used an electric iron instead of an ordinary iron. It was found that a woman ironing at a table only 5 ft. from the fireplace at which she heated the iron had to walk a quarter of a mile during a given period simply in getting hot irons. She would have been saved that had she had an electric iron.

Another illustration which applied to the farm was in regard to oil lamps. A weekly record was kept of the time spent by a woman in cleaning and filling oil lamps, and it was found that during forty years she had spent no less than one year working twelve hours a day in carrying out that menial task.

Electrified Rural Industries.

A farmer had to be associated with rural industries, because they worked in as part and parcel of his undertaking. There were a number of people who said that such industries must be added to the ordinary work. He had come across a number of farms, more especially on the Continent, which ran auxiliary rural industries, such as brewing, the manufacture of sugar from sugar beet, and other things, which worked in very well with farming operations. More electricity in the country would attract a number of minor industries from the towns, which would give the farmer more labour to draw from and remove a great deal of overcrowding in the towns. There were also rural industries such as those carried on at brickworks, in potteries and wheelwrights' workshops, and there electricity enabled the country dweller to produce what was really worth while.

The question arose, "It is all very well to talk about these advantages of electricity, but what about finance? You cannot instal new machinery without somebody finding the capital." The return on capital for the electrification of farm machinery was so good that it greatly facilitated finance. The amount saved on labour in one year in operating an electrical cream separating machine would buy a motor. In many farm operations it was possible to recover the cost or its equivalent in about three years. The average industrial manufacturer was very well satisfied if he could recover capital expended on new machinery in ten years.

There were two main methods of obtaining this extra capital. One was taking advantage of the facilities provided by the electricity supply undertakings and other associations for the hire and hire purchase of apparatus. As far as agriculturists were concerned, there were the facilities offered, under the Agricultural Credits Act, 1928, by the Agricultural Mortgage Corporation for long term loans at a low rate of interest, and the scheme of the Ministry of Agriculture. When the returns were good, it became easy to obtain money.

There were certain difficulties to be overcome, and that was why he put forward the idea that there must be a little more co-operation between the parties concerned.

Over 53% of the rural area of England and Wales, containing upwards of 69% of the population, came within the area of supply companies; but he would be ashamed to say how many of the 69% of the population could really obtain a supply of electricity to-day, because only a small percentage of the undertakings that had exclusive powers for supplying those areas were making any serious effort to do so. The people residing in those areas were in the unfortunate position of being wedded to undertakings who refused to maintain them, and from whom they were unable to obtain a separation. In such cases the Electricity Commissioners should see that those undertakings met their responsibilities. No authorised undertakers who were indifferent to the needs of the rural population would ever supply electricity at an attractive price, but an attractive price was necessary for the success of an undertaking as well as for those who were going to use the current.

The electricity supply undertakings had also a case. At present the farmers did not to any serious extent ask for supplies of electricity, and so we were at a deadlock. Electricity companies also complained that they were hampered by obsolete legislation and antiquated rules. Obviously they must be modified in accordance with modern needs.

Digitized by Google

Before any alterations of existing legislation and methods could be made, there should be conferences representative of the electricity supply undertakings, the National Farmers' Union, and other agricultural and electrical engineering organisations, so that those who were familiar with the practical problems and difficulties of rural electrification could discuss them in the light of present-day experience. Such a meeting should produce sufficient evidence to convince the powers that be as to the alterations that were required. The farmers, the suppliers, and the legislature should all work together to arouse interest, so that difficulties might be removed. The difficulties had been removed in parts of this country and in many parts of the Continent.

Col. Crompton's Views.

COL. R. E. B. CROMPTON, who seconded the resolution, said that if, as was intended by Mr. Baldwin, when he so strongly advocated the new Electricity Act, facilities were given for a cheap supply of electricity in the rural districts we could transform those districts. In other countries they had already been transformed. Anybody who travelled in Lombardy, the South of France, parts of Switzerland, Sweden, Denmark, and elsewhere could see the marvellous things that a proper electricity supply had done.

A Central Board with enormous powers was formed under the Act of 1928. Its powers were almost dictatorial. It had not to refer back to Parliament, and it could carry out anything that was recommended with a reasonable probability of a return to the Commission. We should be doing yeoman service to the rural community, to the landowners, and the farmers and labourers on the land of England if we did our utmost to supply rural England at as low a rate as possible and to give that supply as early as possible. We should realise that the supply would not be given on the Fringe Orders that were already granted to large towns. The Central Board was very approachable, and if a deputation went from this Conference it would start a ball rolling which would assume gigantic proportions and would do more than anything else to make farming pay.

In his opinion a very large proportion of the arable land of England would yield four times as much food as at present, if intensively cultivated, as would be possible with electric power. Thousands of acres of land that yielded ordinary crops in rotation could be converted practically into market garden land. A great deal of the food grown intensively would be perishable. Hitherto the means for the carriage and distribution of perishable goods had been so infamously bad that it had not paid either the farmer or the cottager to produce such goods. That could be remedied under our splendid modern system of road transport.

MR. TOM THOMSON supported the resolution as a practical farmer who was anxiously awaiting the arrival of electricity in his own district, not merely for himself and his neighbours, but in order that it might recreate industry there. One of the things that farmers might anticipate from electricity was that markets would come to them instead of their having to seek them. Shropshire had been waiting for two or three years for the development of a very large scheme which seemed to hang fire in a most extraordinary fashion. He hoped that some effort would be made to encourage the authorities to take more drastic steps to further the scheme.

MR. MONTAGUE FORDHAM, speaking with regard to electricity and the position of the labourer, said that the Rural Reconstruction Association advocated the development of electricity in conjunction with a general national policy of rural development. Naturally, the first point was, what was going to be the effect on labour? The economic position of labour was fundamental from the point of view of the labour itself and of national development. They came to the conclusion, and on this they supported electrification, that electrification and the use of electrified machinery, if carried through with a good scheme of national development, meant double production and the employment of an extra million people on the land. This would be possible with electricity, and would not be inconsistent with the payment of labour at 1s. an hour. They entirely recognised the danger of the introduction of power in relation to labour; but, while they were very doubtful about the introduction of power and the rationalisation of industry, they thought that electricity in agriculture would not have the evils of a similar policy in ordinary industry.

MR. W. J. SHINGFIELD (the Workers' Union) said he had been connected with a municipal electricity supply and he was very interested to hear Mr. Borlase Matthews referring to 1d. per unit for power. He did not know how this could be done in rural England. He (Mr. Shingfield) happened to belong to a municipality that was exceedingly anxious to take its supply into the villages. Not only was it anxious, but it actually canvassed the villages. They were met by the fact, when they canvassed the farm workers, that their actual lighting expenditure had to be considered as somewhere about 10d. or 1s. a week. The farm labourer, they found out, went to bed at nine o'clock and sometimes before. So, as far as light was concerned, this was more or less cut where the labourer was concerned.

If one went further into rural England, into West Suffolk, where there were places ten miles away from a railway station, the power unit was somewhere about 8d. He was very keen on electricity, and wanted to see it developed. He wanted to see the farm worker cooking by electricity, and he wanted to see his house warmed by electricity, if necessary. But it all came back to the eternal question of finance.

So far as he could discover, we were making a dreadful mess of this electricity problem. We were handing it over to companies, who were getting powers for a number of years, and who had no intention of going out into rural England, and supplying electricity that was going to cause them financial risk.

COL. R. E. B. CROMPTON said the real reason why they were obliged to charge high prices on these Fringe Orders was because the farmhouses were considerable distances apart, and the villages few and far between, and, consequently, the overhead wiring system that must be adopted involved a difficult problem. The towns had not seen it worth while to spend money which might not yield a return for several years, whereas the large supply companies were waking up to the fact that they must develop rural England, and that they must put up with a few lean years during the first few years of supply.

The Financial Side.

He had gone very carefully into the figures, and was entirely convinced that the country villages could be supplied with light for about 30s. per annum for a cottager, and that for the first few years heating, cooking and farming processes could be carried out at 3d., and after three years that price might be reduced successively to 1d. That was a process that had been followed in our large towns, and that would have to be followed in the country. The reason why very high prices had been quoted—8d., 1s., and all that kind of thing—was because electricity was only used to a very limited extent for lighting in those places. Directly the demand for electricity during the off-peak hours arose the price would come down.

He had not mentioned the most important thing of all that was before the engineers, namely, the fixation of nitrogen. Once they hit upon a method of using electricity upon a small scale to take nitrogen from the air, it would be possible to produce the most valuable manure that they could possibly have. He had every hope that we should do that in the rural districts close to the farmer, so that he could send his motor car for a few tons of nitrate instead of having to take it from the great factories.

MR. R. BORLASE MATTHEWS said the electricity supply side, the agricultural side, and the legal side were all working separately at present, and not paying sufficient attention to each other. There was a lack of uniformity, and there was a lack of knowledge as to what could be done.

The figure he had given of 4d. per unit was the figure that the Continental farmer found would pay him in order to do his work more cheaply than he could do it with other power. The British farmer, when he got a horse to do his work, was paying 2s. a unit, and when he got a man to do his work he was paying 10s. a unit. Anything that he could get under that 10s. or that 2s. meant so much more profit.

In his scheme for the rural electrification of about 1 800 square miles in Lincolnshire the rate at which it was proposed to supply the farmer was 2s. 6d. per acre of arable land, plus 1d. per unit for all the electricity he used for any purpose. In the villages and hamlets, the initial charge would be based on so much per room plus 1d. per unit.

He was perfectly aware of the figure of £2 10s. which was all that a farm labourer paid for lighting. It was a figure which seems fairly characteristic all over the country. It was a rate at which it would pay a supply undertaking if it got the greater part of the village. It would do that when the people found it was more convenient to use electric light.

The motion was put to the meeting and carried unanimously

ELECTRICITY SUPPLY IN LONDON AND THE HOME COUNTIES.

Acquiring Transformer and Sub-Station Sites—Distribution the Big Problem—Supply Engineers as "Juice Merchants"—Static Rectifier Improvements.

AT a recent meeting of the London Local Technical Group of the Electrical Power Engineers' Association Mr. F. W. Purse discussed the question of "Electricity Supply in London and the Home Counties." He prefaced his lecture with a survey of the legislation relating to the electricity supply industry from 1882 onwards, and pointed out the many respects in which the provisions of the various Acts had hindered electricity development in London. One of his reasons for giving this survey was that in his experience there was not a real appreciation of the duties and obligations which Parliament had from time to time placed upon the electrical industry. As one example of the provisions which had proved to be hindrances, he mentioned that which prohibited the use of electric lines above ground without the consent of the local authority, whilst another was the provision which had prohibited electricity supply authorities in the early days from supplying outside their own areas, or co-operating with neighbouring undertakings.

House-to-House Transformers.

Dealing with the conditions in the industry generally, Mr. Purse suggested that in the rural and sparsely populated areas at any rate the house-to-house transformer system was likely to be adopted; or perhaps one transformer for every three houses, or something of that order. In some other places there would be at least one transformer in each street, and he urged the necessity for securing transformer and sub-station sites now and holding them until required, in view of the increasing difficulties of obtaining such sites.

With regard to distribution, he said the 1926 Act had not interfered with the various undertakers in that respect, and so far each local authority and company had been allowed to retain its rights of distribution, though how long that state of affairs would obtain he would not like to say. He ventured to think the indications were that in perhaps 10 or 15 years' time there might be a move to combine in respect of distribution; possibly by that time there might be some standardisation of voltages.

Under the new scheme, by which generation was to be controlled by the Central Board, it could not be imagined that the super-stations would do anything but carry the base loads. Certain other stations, of course, would be used to meet the peaks. It was idle for engineers to say that they could carry on just as well with their small stations; anyone who said that he could was denying his own faith. Quite a number of the smaller stations would in a few years drop out of existence as far as generation was concerned.

Apart from the economy in coal and in generation costs generally, great economy would be effected, or it was supposed that it would be effected, by the reduction of the percentage of spare plant. He believed that at present between 50 and 60% of the plant was in the nature of spare plant, and it was hoped that that proportion would be reduced to 20 or 25%. That would raise a very interesting problem. It would present quite a new problem to have 20, 30, or 40 stations running together in parallel. He was not pessimistic enough to think that the troubles would not be overcome, however. It might be that, in order to get over the "teething" troubles, at times of full load a group of half a dozen stations might have to be split off from the rest of the group, and a connection thrown in if there were unexpected trouble in any group. Later on, of course, the number of stations would be reduced.

Generation, of course, would become highly specialised; it was becoming so already, and, with the reduction of the number of stations, the one-time chief engineers and managers, as such, would lose their interest in it. Their successors might not have any interest or any training on the generation side, and the distribution and sales men would come into their own.

The problem of generation at high voltages was an important matter to be considered, and in connection with that was the problem of getting the load out of the stations. We might be limited unless we were given facilities for bringing the energy out of the stations on overhead lines at high voltages, and that was a difficult matter in the London area.

The fact that the underground system for the grid in London was to be 66 000 V would give rise to some very interesting problems. Every station connected to the grid would have to have very special protective gear; they might have to have some very elaborate reactances and controls, and might have to renew the whole of the switching. Some of the mains engineers would probably get some jumps at the sub-stations when they had something like 300 000 or 400 000 kW of the grid trying to push in behind a fault, and there would be a few troubles in that direction.

Another problem was that of the effect of troubles at one part of the system upon the other parts, whilst still another was that of metering. He gathered that the meter makers had evolved some most interesting apparatus and instruments. There would have to be a new class of assistant—a meter-reading assistant—to take readings, as they changed from hour to hour on each particular panel. Quite a big installation would be required in some stations for dealing with meter problems, he believed.

There was no doubt that the time must arrive when electricity supply engineers would become "juice merchants," and the sooner they realised it and faced the new position, the better for their peace of mind. They would then have to concentrate upon the problems of salesmanship and distribution.

The biggest of all problems was that of distribution. What was the use of struggling to reduce the cost of generation to the very minimum when one knew that the reduction could not be reflected in the price charged to the consumers? Cost of services and standing charges to consumers must also be dealt with. The provision of more prepayment meters was necessary, because electricity was being supplied to the grade of consumer who lived from hand to mouth, and could never save enough money to pay their accounts quarterly. Experience had shown that in certain classes of property more electricity was consumed if the consumers were provided with penny-in-the-slot meters than if they were provided with shilling-in-the-slot meters, because frequently they had not a shilling to put in.

Efficient Converting Plant.

Until recently he would have said that, in view of the grid system and the decision to supply a.c., there was no practical alternative, for those undertakings at present distributing d.c., to changing over to a.c., but his views were changing as the result of the great improvements that were being effected in converting plant. He referred particularly to static rectifiers. Experience had shown that they were very reliable, they did not require constant attention, they could be shut up in their sub-stations as could the ordinary static transformers, they could be switched in by remote control, or time control, or automatically according to load. He ventured to think that, in view of the high efficiency now obtainable at comparatively low cost, many undertakers who were distributing d.c. would think twice before embarking upon a change over to a.c., particularly when they appreciated what the costs of changing over would be. The change on one system to an increased voltage had involved an expenditure of many thousands of pounds. In one district in which it was proposed to change from d.c. to a.c., the expenditure estimated in the first place was £25 000, and there were considerable other costs in addition. It was difficult to see how electricity could be supplied more cheaply under such circumstances.

The acid test of the whole matter was whether the consumer was going to benefit. Benefit would be derived by proper regulation of the load between stations, and by a very carefully thought out rearrangement of the whole of our distribution. If the position were not pushed too far, from too highly academic a point of view, there must be a substantial reduction in the cost of production which could be reflected in the charge to the consumers. It was possible, however, to push it too far.

DISCUSSION.

The CHAIRMAN (Mr. J. R. Cowie) said that, in view of the scarcity of sites suitable for large buildings on the river in London, it was not impossible to conceive that some day seaboard stations, and stations on the banks of the large inland waterways, might be the main stations for feeding London.

Digitized by Google

Mr. GILBERT said he could hardly appreciate how a super station was going to have a base load the same at midnight as at midday, unless there was a very considerable number of other stations available to help in the distribution. With regard to the suggestion that within 10 or 15 years distribution might be taken over by some governing body, and that an endeavour would then be made to standardise distribution to one type and voltage, he said that surely, if that were contemplated, the sooner it was done, the better. If we were to wait 10 or 15 years, and if the demand increased as anticipated, it would be more difficult to convert the systems existing then than now.

Mr. WALLIS asked whether the London and Home Counties Joint Electricity Authority would take over the company undertakings in 1971 without further payment. If the sinking funds which had been arranged for were to pay for all the stations, and if those stations were supposed to be valueless in 1971, the companies might not spend further money on their undertakings during the last 20 years or so prior to 1971, but would simply allow them to become obsolete. He asked how that was to be avoided.

Mr. WALTER J. JEFFERY pointed out that one of the disadvantages suffered by the London undertakings was that London was composed of three main types of area—the manufacturing, residential, and amusement areas—and each individual undertaking supplied practically an area of one of these types. There was no doubt that because these three types of area had never been worked together, the price of electricity in certain areas had been much higher than it should have been. The problem of standardising distribution in London was at least as important as that of standardising generation. The maintenance of many different voltages and types of supply would be very disadvantageous as demand increased, and if one could buy from any store a standard electrical appliance which could be used on any supply in London it would be all to the good. It would certainly tend towards the cheapening of apparatus. He also drew attention to the fact that in some parts of London two companies were supplying in the same area, and in one case three companies were supplying in the same street. In view of the crowding of London streets, that was an anachronism, and should not be tolerated. With regard to the position of the companies, he emphasised that they were tied down completely by recent Acts of Parliament, and there was no doubt that, by reason of the sinking funds which had been instituted, the assets of the companies would be handed over to the Joint Authority in 1971 without any charge being incurred by that body.

Mr. BRETELLE emphasised, in connection with the development of large stations, that although, if costs could be reduced by a very small percentage, one could not immediately hand on that reduction to the individual domestic consumer, one could effect a reduction in charges to large power consumers. The effect of that would be cumulative; one would be able to generate on a far better scale as the result of these big supplies, and by developing the power load one would be able to reduce the cost to the domestic consumers as well. It must be borne in mind that power consumers made a big contribution towards meeting standing charges.

Domestic Load Problems.

Mr. W. J. OSWALD, referring to the development of the domestic load, indicated some of the problems to be met in this connection by reference to his experience during the severe weather experienced in February of this year. In one particular week the output was 128% above that of the corresponding week of the previous year, and the top load was 84% above that of the corresponding week of the previous year. In abnormal weather the one-shift and two-shift stations would be called upon to meet unexpected demands.

Mr. HENWOOD, commenting on Mr. Purse's reference to meters, pointed out the great importance of accuracy, and said that an error of 1% on a set of meters metering considerable quantities of power would nullify the extra efficiency obtained by the engineers in the power stations.

Mr. D. KINGSBURY, discussing the question of voltage, said it seemed to him that a number of undertakings laid out many years ago with a view to supplying electricity purely for lighting purposes would have to spend a lot of money in order to provide sufficient copper to enable them to supply at a decent voltage. That was linked up with the problem of sub-station sites, and he could not help thinking that we should have to contemplate the use of underground sub-stations at comparatively frequent intervals.

Mr. PURSE, in his reply, said that when one realised that some of the large undertakings in the country were erecting large windmills and concrete cooling towers, one appreciated that seaboard sites were perhaps not all they were claimed to be. Dealing with the problem of obtaining sub-station sites, he said that they could be purchased compulsorily, but the purchasers had to obtain a Special Order from the Commissioners and had to publish notices, and so on, and by the time the sites had been purchased one wished one had not done so. There were restrictions, of course, with regard to underground sub-stations. For instance, the maximum power supplied to any underground sub-station or street box must not, without the consent of the Commissioners, exceed 30 kW in the case of a sub-station or street box containing a single transformer, or 75 kW in the case of one containing two or more transformers. Again, sub-stations constructed below the surface of any street, to which an extra high pressure was to be given, must not contain switches or other apparatus than transformers.

Standardised Distribution Needed.

With regard to the purchase of the company undertakings in London, he said every company had to set aside a sinking fund according to a scale of depreciation, so that the assets would be liquidated within the time decided upon. In 1971 it would probably be found that new plant, machinery, etc., which had been installed during the last few years prior to that date had not been fully liquidated, and the balance would have to be paid. The company undertakings would be transferred to the Joint Authority practically debt free.

One of his criticisms of the 1926 Act had been that it had not provided for the standardisation of distribution, and that problem should have been tackled as fearlessly as that of standardisation of frequency had been tackled.

AUSTRALIAN LETTER.

Opening of the Victorian Commission's Sugarloaf Station.

By WILLIAM DAVEY (Managing Editor, "Australasian Electrical Times.")

MELBOURNE, April 3rd.

THE most interesting event of March for electrical people was the official opening of the Victorian Electricity Commission's Sugarloaf power station on the 20th. This station, which is equipped with two 9 000 H.P. Brown-Boveri units, is unique in that it will be almost entirely a summer station. It is situated on the Eildon Weir, which has been thrown across the Goulburn River at a point about 100 miles from Melbourne to impound 306 000 acre-feet of water for irrigation purposes; and this water, released during the dry months to irrigate the farms of the upper Goulburn valley, will first be employed for the generation of power in the Sugarloaf station. As a complement of this station the Commission has already opened four smaller ones, which have a combined capacity approximately equal to that of Sugarloaf, and the maximum output of which will be available in the winter months when the mountain streams are high and power will not be available on the Eildon Weir, because water storage will be taking place for the dry season.

All of these mountain streams are operated in all details, both electrical and hydraulic, by supervisory control, from a sub-station known as Rubicon A, centrally situated to the system. An interesting detail is that no overhead construction has been required for the control wires over the greater part of the system, lead-covered cable being employed and laid along the bottom of the concrete aqueducts, which carry water from station to station. At a later date the storage capacity of the Sugarloaf reservoir will probably be increased to 900 000 acre-feet.

The Institution of Engineers, Australia, carried out a novel experiment with great success on March 26th. The electrical branches of the Melbourne and Sydney divisions held a joint meeting; the former sitting in Kelvin Hall, at the Allied Society Trust Building, Melbourne (a fine building owned by the technical bodies of the State); and the latter in the P. N. Russell School of Engineering, Sydney, 600 miles distant. The two meetings had full two-way communication by means of the Sydney-Melbourne carrier-current telephone service and loud speakers. Mr. R. M. Harvey, of the Victorian Railways Department, was unanimously elected chairman, and the meeting was conducted as if all were housed under the same roof. Two short papers were read, both dealing with recent

Digitized by Google

telephone developments. The first was delivered in Melbourne by Mr. J. M. Crawford, Chief Engineer, P.M.G.'S Department; and the second in Sydney, by Mr. Robert Lawson, State Engineer of the Department in New South Wales. A discussion followed in which participants both in Melbourne and Sydney joined freely.

The whole of the proceedings were not only heard clearly by those present at both meetings, but were broadcast and heard clearly throughout the whole of Australia.

Among English electrical people who are at present in this country are Mr. G. B. Richards, representing Higgs Motors; and Major J. M. MacLulish, director of the Baird Television Co., who will organise the marketing of his company's system in Australia.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

132 000-Volt Cables.

[To the Editor.]

Sir,—In recent correspondence on the Battersea station it seems that the risks of employing these cables are quite unduly magnified. To anybody who has got the least foresight, cables of 132 000 V must come, as surely as steam pressures and hydraulic pressures—and now, even town-gas pressures—must go up, and the sooner we get experience with them the better.

What are the risks? The Pirelli cable in Italy has been working continuously the last eight years; two 90 000 kVA transmissions—one in New York and one in Chicago—have now been working practically two years; and I have private information which shows that American cable manufacturers are tendering for, and guaranteeing performance of, other large installations in U.S.A. with these cables. Indeed, so confident are they, that one of the very foremost of them is, to my own knowledge, ready to put down such cables in London under a two-year guarantee.

However, let us consider the risks. According to "Engineering's" estimate for Battersea, it will cost £2 700 000 to run perhaps 15 miles down the river, or say, £180 000 per mile of route.

Now, the 66 000 V cables cannot cost more than £3 000 per single-core cable per mile; so that there must be at least 60 cables (20 circuits, each a complete unit).

I suppose I shall hardly be believed when I say that 300 000 kW could be transmitted by twelve 132 000 V pressure-oil-filled cables, costing, on reliable information in my possession direct from the manufacturers, not greatly over £1 000 000 even for 15 miles (I submit that ten miles, however, is amply sufficient; it would carry us down past many possible sites).

Whether this figure be accepted or not, I am prepared to demonstrate (in the right quarter) that 12 cables would do the job with the amplest possible margin for spares.

Now if a (66 000 V) cable breaks down—and they will only go down one at a time—we have 57 cables still in parallel to carry the load. Only ten years ago a certain prominent engineer was criticised for being ultra-conservative because he preferred ten small generating sets in his station to, say, three large ones and one spare. But 20 sets! How ridiculous!!

Now take the 132 000 V side. In the above 12 cables there is a provision equivalent to two large generating station sets and four full-sized spare, or standby, sets. (This may not be clear in certain quarters, but let it stand—I can justify it.) What generating station engineer would not be delighted if he could have such a standby equipment and at such a relatively low cost?

The fact that the New York and Chicago installations have now been running without any hitch for nearly two years under strenuous conditions as regards load, is conclusive proof that they are going to stand—that nothing short of the perforation of the lead sheathing or the gradual failure of the dielectric can put them permanently out of working.

In the early days of 33 000 V cables, the mistake was made of not testing the cables under heavy overloads. We have learnt our lesson, and it will not occur again.

On the question of any radical changes, developing with time in the dielectric (apart from loading), that is settled for us by the eight years of experience on the aforesaid Italian line.

If we save £1 700 000 by using pressure oil-filled cables, and if—to assume the worst case conceivable—these began to go wrong after eight years, and if we had to replace the whole lot, bit by bit, within 12 years (total), we still have that £1 700 000 (plus the saved interest and depreciation over eight years) with which to buy two complete sets of new cables, extending the equivalent life to 36 years at least.

Who is to say that 66 000 plain-impregnated cables will last longer than 36 years?

Again, quite apart from Battersea, we must face the need for crosslinking in London. They are already doing it in New York.

Only a fortnight ago came a report across that owing to a heavy thunderstorm, the load at one part of New York went up suddenly by 300 000 kW.

This cannot be met with 66 000 V cables without great expense, owing to the congestion of our streets and the annual losses in the cables. What a gain in relieved street congestion would be effected by reducing the 60 cables to 12 (spread over four different routes)!

It seems to be pretty obvious that our British cable manufacturers are now discountenancing the employment of 132 000 V cables. This, however, is a dangerous proceeding.

One of these days we shall have one of the more enterprising American cable companies—in fact they are ready now—actually offering to lay and guarantee, in London, pressure-oil-filled cables at a cost not much more than one-third of that with 66 000 V cables.

Are we going to hamper British industry and lose, annually, hundreds of thousands of pounds (it will come to this, shortly), waiting for these cables to have had two or three more years' "experience"—at somebody else's expense—while meanwhile the American and Italian manufacturers will reap the reward of that enterprise which used to be considered an exclusively British possession?

In conclusion, I commend the extract from Sir John Snell's statement before the Parliamentary Committee in 1927, quoted in the "Electrical Times" of May 16th, 1929, to your readers, as showing what we have got to face in the way of increased power loads in the West End of London.

What if the E.D.A. should succeed in its efforts to increase the loads? Even Sir John Snell's estimates might then be upset; and my case would be all the stronger.

This letter is neither a plea for, nor against, shifting the Battersea station—it is solely a plea for giving pressure-oil-filled cables a thorough trial at as early a date as possible. Reference has been made to Battersea merely as a convenient exemplification of the issues involved.

As I can claim to be the only engineer who has had made, and successfully tested (up to 720 000 V) at his own expense, a super-tension cable intended for 150 000 V working, I hope I may be considered as entitled to say something on this subject.—I am, etc.,

A. M. Taylor.

Erdington, Birmingham.
May 17th.

Battersea Power Station.

[To the Editor.]

Sir,—The long letter by Mr. W. F. Fladgate, Chairman of the London Power Company, renders it imperative, in my opinion, that a proper inquiry into the whole circumstances of this station should be held immediately, and that the electrical industries themselves, in their own interests, would be well advised to be active in the matter.

It is, of course, impossible to deal with all the points raised by Mr. Fladgate, but I hope you will allow me to consider two of them. The first concerns the Klingenberg power station in Berlin and the argument that this supports the Battersea site. The facts are that Klingenberg, generally acknowledged to be the world's finest power station, is already in difficulties with regard to coal dust flying about all over the place, due to the wind, in connection with the handling and storage dumps, quite apart from the question of sulphur from the chimneys. In addition to Klingenberg, Berlin is being partly supplied from two stations, both burning lignite, that is Tschornewitz between Bitterfeld and Wittenberg, 85 miles from Berlin, which is now nearly 300 000 kW, and one of the largest power stations in the world; and Golpa, 60 miles away, which supplies to Berlin, apart from other consumers, approximately 40 000 to 50 000 kW.

In connection with the Yallourn power station in Victoria, now having 75 000 kW installed plant, the exact distance by the overhead transmission lines to Melbourne is 110 miles, and it is late in the day indeed, to infer that the extended grid system of electrical distribution is not a practical proposition.

Digitized by Google

Also one need, perhaps, hardly emphasise that the Manchester Corporation is already involved in serious litigation with regard to the Barton power station, which is actually outside the city area.

Secondly, Mr. Fladgate states "it is practically possible to render innocuous the fumes which arise in the process of generation," whatever this may mean exactly. Apparently, he has no room to explain to us what is this entirely new method of eliminating sulphurous and sulphuric acid from chimney gases. At the present time there is no station in the world adopting any such methods, and I suggest that this will apply also to Battersea. If not, will Mr. Fladgate give us details of the new method for which the world is waiting, and also the nett cost of the same, while, if it involves the general principle of washing the gas with sprays of water, will he tell us whether all the sulphuric acid will be discharged into the Thames?

Finally, I should like to emphasise again, most strongly, that it seems to me to be stark madness for the electrical industries, in this way, to incur the active hostility of almost every section of the community, that is, of course, its own potential customers, and sooner or later the British Government, although it has successfully evaded the question ever since the first House of Commons Committee, will be forced to take proper steps in connection with the whole subject of the pollution of the atmosphere.—I am, etc.,

DAVID BROWNLIE.

London, W.5.
May 20th.

"The Wireman's Viewpoint."

[TO THE EDITOR.]

SIR,—In reply to "Wireman" in to-day's correspondence column, I would say that his remarks as to builders, plumbers, gasfitters, etc., who are also electrical contractors, are too general. I was apprenticed as plumber and gasfitter over 40 years ago, and I, like many others at that time, had occasionally to turn to the electrical branch when required. My reply to that was to attend evening classes to make myself efficient on the theoretical side, and, as I possess City and Guilds' certificates, I consider I am qualified.

In reference to the term "electrical engineer," any wireman who has been in the trade a short time classes himself as such. I have personally come across men who have been in the trade a considerable time who do not, or cannot, calculate the amperes on a circuit, and who do not trouble to see whether a circuit or meter is overloaded. Personally, I consider the I.E.E. is to blame for this. They should have had a law passed to prevent unauthorised persons using the term.

In his references to shoddy wiring, "Wireman" is quite correct, but again the employer who does this sort of work sacrifices his name; personally, I prefer to lose a job rather than run the risk. Compulsory registration and the National Register will cure a lot of shoddy wiring, and it behoves us all to help it forward, whether employer or employed.

Again, in reference to price, I have come across many clients who want an installation done, who get perhaps three estimates and select the lowest price. They do not even read the quotation to see what is going to be done, or what they will get for their money.

Finally, a word to "Wireman." Do not sacrifice quality work for slops, and keep on pegging away. You may get the sack for being termed slow, but even then, if a firm are shorthanded they will put up with that in preference to incompetent work, and you will eventually fall in with an employer who values his name.—I am, etc.,

"CONTRACTOR."

London, E.17.
May 17th.

"Advertising Abuses."

[TO THE EDITOR.]

SIR,—May I congratulate "Advertising Manager" on his letter in your issue of May 17th? He ably weaves into his compliment to Mr. Charles Pinkham—the General Electric Co.'s representative to the Incorporated Society of British Advertisers—a crisp summing-up of the real difficulty and evil that attach to the unfair system of "Advertising under Duress," or "Camouflaged Blackmail Soliciting."

The whole subject was officially dealt with in "The British Advertiser" some short time ago, and at a recent meeting of the Executive of I.S.B.A., the following resolution was passed and forwarded to members for their guidance and strengthening in withstanding this abuse:—

That this Executive regards with apprehension the fact, indicated by complaints recently received, that the practices described in the article entitled "Advertising under Duress," in "The British Advertiser," No. 3, Vol. 1, are extending. The Executive therefore wish to place on record their disapproval of this kind of solicitation, whereby the name of an advertiser is used as a lever to persuade other firms who are customers of such an advertiser to take advertising space on a special page or in a special issue. Advertisers generally, and members of the I.S.B.A. in particular, are earnestly requested not to lend themselves to such schemes.

I would add in conclusion that my Executive are so much alive to the serious nature of this new and unfair handicap with which advertisers are being saddled, that they have arranged that it shall be the principal subject dealt with by one of our leading speakers at the I.S.B.A. Session, under the chairmanship of Mr. Angus Watson, at the Advertising Association Convention at Newcastle-on-Tyne on June 18th. "Advertising Manager" will see from this that the I.S.B.A. is already taking collective action to put an end to this coercion, and I am sure we shall have his good wishes for complete success. I hope we shall have his co-operation as well.—I am, etc.,

ALFRED H. ANGUS,
General Secretary, I.S.B.A.

Aldwych House, W.C.2.
May 21st.

[TO THE EDITOR.]

SIR,—I agree with "Advertising Manager" as to the difficulty which the small firm experiences in withstanding the advances of the advertising blackmailer. I should like to say, however, that the Incorporated Society of British Advertisers has already taken certain action to put an end to this abuse. If "Advertising Manager" cares to communicate with me, I should be pleased to give him particulars, and also my opinion, as to what it is that prevents stronger action being taken.—I am, etc.,

H. M. GOODY.

Well Lane, Chester.
May 21st.

Wiring Regulations.

[TO THE EDITOR.]

SIR,—Adverting to the article on Wiring Regulations under "Current Topics" in your last issue, it may interest you to know that the I.E.E. Wiring Regulations have been incorporated in our conditions of supply since 1925.—I am, etc.,

W. H. COOKE,
Electrical Engineer, Borough of Luton.

Luton.
May 17th.

[We are glad to add Mr. Cooke's name to the list of supply engineers who have made compliance with the I.E.E. Regulations obligatory.—ED.]

STANDARD DISTRIBUTION BOARDS.

Requirements as to Design and Construction of Cases.

BRITISH Standard Specification No. 214-1929, is a further addition to the series of British standard specifications for electrical accessories and installation materials. The specification relates to two-pole distribution fuse-boards and distribution switchboards for ordinary duty with working currents not exceeding 30 A per way, and for use in circuits the voltage of which does not exceed 250 V.

The boards are rated in terms of the largest current per way which can be carried continuously without the temperature-rise of any of the parts exceeding a specified amount. There are three standard sizes, namely 5, 15 and 30 A per way.

The specification lays down requirements as to design and construction of wood and metal cases, the performance of the switches (if any) and fusible cut-outs, and details of tests to be carried out on completed distribution boards.

Copies of this Specification (No. 214-1929) can be obtained on application to the Publications Department, British Engineering Standards Association, 28, Victoria Street, S.W.1, price 2s. 2d. post free.

We want to see every girl a household electrician.—*Miss C. Haslett.*

NEWS IN BRIEF.

Plymouth Wiring Scheme—New German Submarine Telephone Cable—Resumption of Imported Glassware Inquiry—French Hydro-Electric Project.

THE annual meeting of the Illuminating Engineering Society will be held on June 4th.

The Swedish Industries Fair will be held in Gothenburg from May 26th to June 2nd. Electrical and wireless apparatus form part of the exhibits.

Leeds Housing Committee has arranged to let to the Electricity Committee two shops in Guildford Street, adjoining the present showroom premises.

Addressing the members of the Brighton Round Table Society, on May 16th, Mr. John Christie, borough electrical engineer of Brighton, said the Corporation's electricity undertaking was an enormous asset to the borough, the revenue during the past year being £260,000. It served 30 000 consumers.

The I.E.E. Annual Conversazione will be held at the Natural History Museum, South Kensington, on July 4th.

St. Pancras (London) Electricity Committee is to instal an additional 1 000 kW rotary convertor at Grafton Road sub-station.

"Should Ironmongers Develop the Electrical Department?" was one of the questions for discussion at this week's conference of the Ironmongers' Federated Association at Cromer.

Approval has been given for the formation of a Hampshire Sub-Centre of the Institution of Electrical Engineers, which will probably hold its meetings at Portsmouth and Southampton.

Plymouth Electricity Committee has referred to a special committee the question of payment of standard rates of wages by certain contractors supplying installations under the Corporation wiring scheme.

Lowestoft Electricity Committee is to appeal against the proposal of the Assessment Committee to increase the assessment of the electricity undertaking from £800 to £2 000 per annum, contending the increase to be inequitable.

LOOKING BACKWARD.

FIFTY years ago, according to THE ELECTRICIAN *for May 24th, 1879:—*

Mr. James Adams, Edison's English representative, died in Paris.

The Cape cable was being manufactured at Greenwich by the Telegraph Construction and Maintenance Co.

Reports from Sumatra complained that frequent disturbance of telegraphic communication was caused by elephants who hid the wires and insulators in thickets.

* * *

TWENTY-FIVE years ago THE ELECTRICIAN *of May 27th, 1904, reported that:—*

The Hanover tramways were being converted from the accumulator to the overhead system.

Favourable reports were made on the efficacy of the Druitt Halpin thermal storage system at the Kensington and Knightsbridge Co.'s Wood Lane station.

Mr. L. L. Robinson issued a pamphlet providing intending consumers with a list of streets in which mains were laid, and the exact lay of the mains.

* * *

TEN years ago it was stated in THE ELECTRICIAN *of May 23rd, 1919, that:—*

The Ministry of Munitions refused to sanction power station extensions at Birkenhead.

A step was taken by the British Westinghouse Co. towards the establishment of mutual confidence between employers and employed, in the holding of a meeting at which nearly 4 000 of its workpeople were present.

About 60 delegates from Sussex, Dorset and Hants. of the District Joint Industrial Council (No. 11) and the District Joint Board (No. 11) of the South Coast Area of the Electricity Supply Industry, held their annual meeting at Brighton Royal Pavilion last week when Coun. Cochrane, of Brighton, was elected Chairman of the Council in succession to Ald. Ainger, of Aldershot.

The number of persons insured under the national unemployment insurance scheme as workers in electrical engineering numbered 79 770 in July, 1928. The percentage of such persons unemployed on April 22nd, 1929, was 4·9, an increase of 0·2 compared with April 23rd, 1928. Under electric wiring and contracting, the number insured was 15 530, and the percentage unemployed 7·1 (increase 0·6), and under electric cable, wire and lamp manufacture, insured 86 180, and unemployed 6·1% (decrease 0·1%).

According to a "Times" message, Dr. Georg Zapp, director of the Felten and Guilleaume Carlswerk A.G., has designed for telephone purposes a new submarine cable, of which the four 3.3 mm. copper lines are contained in a flexible tube made of light metal, and covered with a lead envelope. It is claimed that this construction enables rubber insulation to be superseded by ordinary paper insulation. Pupin loading coils are inserted every two kilometres. It is claimed that the cable would withstand the pressure of the sea at a depth of 6 000 metres.

The annual conference of the Electrical Trades Union opened at Blackpool on Monday. Mr. J. W. Ball, president, said the progress of the Union had been cramped by the question of finance. A strong financial position was essential if they were to obtain equitable service for their members. Mr. J. Rowan, general secretary, said there were improvements waiting for workers in the electrical trades if they would organise to get them.

A recent report in "The Times" Trade Supplement states that in British West Africa railway and tramway machinery is in request. The market for electrical machinery and equipment is of growing value. Electricity supply schemes have been developed in some of the chief towns, and electric cranes have been installed in Takoradi harbour. Experiments are being made in the development of hydro-electric power. Electrical and telegraph apparatus and scientific instruments are obtained almost entirely from the United Kingdom.

At a recent meeting of the Royal Society of Edinburgh, Mr. Geo. Redington read a paper on "The Effect of Diurnal Periodicity on Plant Growth." Electric light was used in the experiments upon which Mr. Redington reported. The periods of lighting were (1) continuous light; (2) eight hours light per day, and (3) 16 hours per day, and the 16 hours' period produced the best results. Mr. Redington said healthy plants could be grown in artificial light, and if electricity could be supplied at a sufficiently low price it could be used in greenhouse work.

Torquay Electricity Committee has received a statement from the Borough Electrical Engineer on the result of inquiries made by the I.M.E.A. from the various municipal undertakers in the country regarding the sale of fittings and apparatus. Of the 119 undertakers who replied to the questionnaire, 69 are exercising the powers conferred upon them by Section 48 of the Electricity (Supply) Act, 1926, and of these all but two sell fittings and apparatus direct to the consumer without concessions to contractors. The remaining two have working arrangements with the local contractors.

The joint summer meeting of the N.E. Coast Institution of Engineers and Shipbuilders and the Institution of Engineers and Shipbuilders in Scotland, will be held at Newcastle-on-Tyne, from June 2nd to 4th. Mr. R. P. Sloan will read a paper entitled "Developments in the Uses of Electricity."

The Standing Committee appointed by the Board of Trade will resume their inquiry as to whether imported glassware (other than lamp-blown glassware and scientific glassware) should bear an indication of origin on May 27th. The inquiry in regard to lamp-blown glassware and scientific glassware will be held on June 3rd and June 4th.

A correspondent of "The Times" states that work will begin soon in the Val des Dix, south of Sion, in the Valais, in preparation for the erection of a large hydro-electric plant. The works will include a dam across the higher part of the valley which will make it possible to form an artificial lake containing about 150 000 000 cu. ft. of water. The water will be led through pipes to the Rhône valley, where, after a fall of 5 300 ft., it will drive the turbines of a power station situated near Champsec. It is estimated that the plant will generate 120 000 kW, and the cost will be nearly £2 400 000.

LEGAL INTELLIGENCE.

The Loewe Radio Licence—Another Marconi Appeal.

MR. Justice Luxmoore, in the Chancery Division on May 16th, began the hearing of an appeal by Marconi's Wireless Telegraph Co. from a decision of Mr. W. S. Jarratt, Comptroller-General of the Patents Office, and his assistant, Mr. H. C. Haycroft, who had decided that a licence should be granted to the respondents, the Loewe Radio Co., to manufacture in this country triple and double valves for wireless sets, on paying to the Marconi Co. a royalty of 10s. for the three-valve set and 7s. 6d. for the two-valve set.

In other forms of multiple valves the royalty was to be on the basis of 5s. for the first valve and 2s. 6d. for each additional valve. The Marconi Co. had offered to grant a licence at a royalty of £1 17s. 6d. for the three-valve set, £1 5s. for the two-valve set and £3 2s. 6d. for long range sets. The Comptroller and his assistant were of opinion that to insist on these prices meant substantially refusing to grant a licence, thereby prejudicing the establishment of a new trade and industry in this country.

Sir Duncan Kerly, K.C., and Mr. Trevor Watson were for appellants and Mr. Stafford Cripps, K.C., and Mr. E. McEwen were for the respondents, while Mr. Crossman represented the Attorney-General.

Sir Duncan Kerly said the Loewe Radio Co. was the creation of a German company, which was carrying on a business in the manufacture of these goods in Germany.

Mr. Cripps said the company concerned in this matter was English.

Sir Duncan said the Loewe Co. applied for a licence for the three-circuit patents, and the Marconi Co. replied they would be infringing other patents, in particular, the two-valve patents. The Loewe Co. then said they would like a licence for four or five valves, and the Marconi Co. said they were prepared to discuss terms. The Loewe Co. then went to the Comptroller without any further correspondence. He contended there was absolutely no case for interference by the grant of a compulsory licence on the ground that a licence had been refused. His case was that the Comptroller had proceeded on unverified if not unverifiable assumptions. He was wrong in his assumption that the grant of the licence would create a new trade and industry in this country. All it did was to give another person the opportunity of entering an existing trade in which there were over 2 000 manufacturing under various patents.

For the Respondents.

Mr. Stafford Cripps, K.C., for respondents, said this case had been wrongly represented as an attempt by a German company to "try on" something in the English market. The Loewe Co. had been for many years known to the Marconi Co., and Dr. Loewe was not a German, but an American citizen. The fundamental distinction between this case and the Brownie case was that the Loewe Co. were owners of some twelve or more British letters patent, and the Crown had granted a monopoly to them, and the basis on which that monopoly had been granted was the Statute of Monopolies. That was to say, the monopolies had been granted as a reward for the introduction into this country of new manners of manufacture. They were paying large sums in order to preserve their monopolies in this country.

It was common ground for the purposes of the present case that those monopoly rights could not be exercised in this country without a licence from the Marconi Co. The Marconi Co. did not manufacture themselves, but granted licences, but none of their existing licensees could manufacture this particular article in this country. No one could manufacture it here except the Loewe Co., and if they were not permitted to make it, this country must inevitably go without it. The Loewe Co. did not ask for 10s. to be charged for the licence. They put forward a suggestion of 10% on the wholesale price, and they were asked by the Marconi Co. to pay 37s. 6d. for the valve holder. He submitted that on the correspondence there was a refusal by the Marconi Co. to grant a licence, but that if there was not a definite refusal there was a refusal to grant a licence on reasonable terms.

The Loewe Co., concluded counsel, were quite prepared to pay a reasonable minimum royalty and were willing that the licence should be limited to the particular form of multiple valve that had been shown to the Court and to any reasonable limitation as to price.

His Lordship suggested that it might be possible for the parties to agree to a form of licence.

Sir Duncan Kerly said he was unable to do that on his present instructions, but he was authorised to say that his clients fully anticipated that there would be a licence and they were prepared to grant a licence.

Mr. Cripps said the only obstacle arose from the difficulty of getting instructions from Sir Duncan's clients.

The suggested terms of agreement were written down and handed to his Lordship, but were not disclosed.

His Lordship reserved judgment, remarking that he would give judgment in this and the Brownie case on the first day of next term.

Cooper Roller Bearings *v.* Power Plant.

Legal arguments were heard before Mr. Justice Talbot, in the King's Bench Division, on May 17th, in the action brought by the Cooper Roller Bearings Co. against the Power Plant Co., in which, on April 12th, his Lordship held that the plaintiffs had established a prima facie case for the recovery of about £800 for work done in maintaining certain friction clutches supplied at rolling and other mills at the order of the defendants.

Mr. Slade, for the plaintiffs, now asked that judgment should be entered for his clients for an amount to be determined by the Official Receiver and for the taxed costs of the action and that a counterclaim should be dismissed with costs. He also asked for liberty to apply to the Court again when the amount had been ascertained.

His Lordship acceded to this, but said that the defendants' right to appeal would not be prejudiced.

Compulsory Winding-up.

Mr. Justice Maugham, in the Companies Winding-up Court, on May 13th, heard the petition of the Albion Iron Co. (London), Ltd., for an order for the compulsory liquidation of Swinden and Co., Ltd., makers of mining and electrical plant, which is in voluntary liquidation.

His Lordship said the evidence showed that the company had a nominal capital of £500, with only £72 paid up, and it had been carrying on business on a large scale, purchases of goods amounting to £60 000 being made in three years, while debts amounting to £1 300 were incurred within four months of liquidation. These facts showed that the company had not been properly conducted and he thought it would be better liquidated with the help of the Official Receiver. He accordingly made the usual compulsory order.

THE "NEOPHONE."

Details of the New Telephone Instrument Adopted for Public Use by the Post Office.

THE illustration of the new Post Office telephone which appeared in THE ELECTRICIAN of May 10th has created considerable interest, and we are now able to give additional particulars.

The new instruments were produced by Siemens Brothers and Co., Ltd., Woolwich, in co-operation with the Post Office engineers, and consist of an immersed electrode inset transmitter which, in conjunction with a special anti-side tone circuit, is said to eliminate the howling, frying and excessive side-tone not uncommon with this type of microphone, and to maintain its efficiency irrrespective of position. The instrument is said to be superior as regards articulation and better in speech transmission efficiency than the standard solid back transmitter.

The makers point out that this development constitutes an important advance in telephone technics, the increased efficiency incidentally enabling higher resistance local lines to be employed without reducing the speech transmission efficiency, and on this account far reaching economies in line plant may be effected.

It is interesting to note that in the construction of the "Neophone," as the new telephone is called, a moulded insulating compound has been largely employed, the case, micro-telephone handle and the cradle all being made of this material.

The pattern adopted by the Post Office uses a separate bell set, but a special design of bell set which can be used as a base on which to mount the telephone piece, makes provision for a complete instrument for those who prefer the combined type. The Post Office has placed a contract with the manufacturers for 50 000 instruments.

PERSONAL.

SIR Harry Brittain has been elected president of the Wireless Retailers' Association.

Mr. J. S. Highfield's "Cyra" raced in the Upper Thames Sailing Club's meeting at Bourne End on Tuesday.

Mr. W. G. Bedford, electrical engineer, has been elected a member of the Executive Committee of the Slough and District Chamber of Commerce.

Mr. A. C. Watts, of the Premier Electrical Co., has been elected chairman of the Sussex branch of the Electrical Contractors' and Allied Associations.

Mr. A. Brammer, general secretary of the Association of Supervising Electrical Engineers, is now back at his duties, though not yet fully recovered from his recent illness.

Mr. F. Favell, engineering assistant at Stoke-on-Trent electricity works, has been appointed power-house superintendent, in succession to Mr. G. A. Vowles, who has become engineering assistant at Hull.

Mr. H. W. Albrow, chief electrician at the works of Smeed, Dean and Co., of Murston, Sittingbourne, who is leaving the district, has been presented by the electricians and other employees with a gold watch.

Bedford Electricity Committee has appointed Mr. J. R. Blaikie as constructional engineer in connection with the preparation of plans, etc., for the erection of the proposed switch house, at a salary of £32 per month.

Miss E. L. Calligan, who is employed as a shorthand-typist by the Liverpool Branch of the General Electric Co., Ltd., won the £10 prize on May 9th offered by the "Liverpool Evening Express" and Lewis's, Ltd., in an open typing competition. She attained a speed of 71·3 words a minute.

The Committee of Award for the Commonwealth Fund Fellowships have appointed Mr. D. M. Robinson, of London University, to one of the 24 Fellowships tenable by British graduates in American Universities for the two years beginning September, 1929. These Fellowships are offered by the Commonwealth Fund of New York, of which Mr. Edward S. Harkness is president, and Mr. Robinson has been appointed to Massachusetts Institute of Technology in Electrical Engineering.

INLAND TELEGRAPH SERVICE.

Post Office Reply to Report of Hardman-Lever Committee.

THE Postmaster-General has sent to the Council of the Association of British Chambers of Commerce a letter which is a reply to the recommendations contained in the Report of the Hardman Lever Committee on the Inland Telegraph Service. The reply deals with 12 of the 17 recommendations made by the Committee, and it is stated, *inter alia*, in the Post Office reply that arrangements have been made to facilitate the more frequent adjustments of staff to traffic in the larger telegraph offices. Some alterations in the grading of work are being introduced; in regard to the "walk" system of delivery, improvements are being effected where necessary; considerable progress has been made in overcoming maintenance difficulties in connection with teleprinter (start-stop) apparatus; the replacement of Morse by teleprinter apparatus is being carried out as rapidly as possible; the question of concentration of traffic is being pursued and unnecessary circuits are being suspended; the inland telegraph tariff is not to be altered for the present; the rate for telegrams between Great Britain and the Irish Free State has been increased to a minimum of 1s. 6d. for twelve words; a Commission of Inquiry has recently made an exhaustive study of the organisation and methods of the telegraph companies operating in the United States of America; progress is being made in the concentration on fewer types of apparatus. The remaining recommendations are stated by the Post Office to be under consideration.

THE SOCIAL SIDE.

The St. Helen's Cable Co., Slough, cricket club, are among those who are founding the Slough Estate Cricket League this season.

Reading Corporation Tramways were champions of Section B, Division II, of the Reading and District Billiards League.

The Oxford Electric Co., football club wound up their season with the annual match between "married and single." The bachelors were successful by 4 goals to 2, and they received the challenge cup from the hands of the president, Ald. W. H. Perkins.

BUSINESS ITEMS.

THE DEVON RADIO AND ELECTRICAL CO. has opened a showroom at 331, Torquay Road, Paignton, under the management of Mr. E. White.

The Glasgow office of the ENGLISH ELECTRIC CO., LTD., formerly situated at 40, Wellington Street, is now removed to 200 St. Vincent Street.

The new premises which have been opened by Siemens Electric Lamps and Supplies, Ltd., at 4, Castle Boulevard, Nottingham.

Mr. Colin H. Campbell, managing director of Campbell Walker and Co., of Melbourne, Australia, who is now in this country, desires to hear from manufacturers of electrical appliances. His address is 58, Basinghall Street, London, E.C.2.

The INTERNATIONAL TELEPHONE AND TELEGRAPH CORPORATION, through its subsidiary, the International Standard Electric Corporation, is entering into the field of the manufacturing of electrical communication apparatus in Germany by the purchase of a substantial interest in the Ferdinand Schuchhardt Berlin telephone and telegraph works.

The "Orvieto," the "Avilla," and the "Minnewaska" have been fitted with picture-receiving apparatus, and with special sets designed by the Marconi International Marine Communication Co., Ltd., whereby typewritten lists of Stock Exchange quotations can be received by facsimile transmission. The Wireless Press, Ltd., and Wireless Pictures, Ltd., maintain the service through the Rugby station.

H. W. Young, president of the DELTA-STAR ELECTRIC CO., Chicago, Ill., advises that the CHAMPION SWITCH CO. has been purchased, and the Kenova, West Virginia plant will continue manufacturing its present lines of equipment in addition to several new designs. Manufacturing arrangements have been completed with the SOCIETE D'INSTALLATIONS ET DE CONSTRUCTIONS ELECTRIQUES ET MECANIQUES, Boulogne-sur-Seine, to manufacture and distribute "Delta-Star" equipment in France and its colonies. An interest has also been acquired in the MONARCH ELECTRIC, LTD., St. Johns, Quebec, which will soon be operated as the Monarch Delta-Star Co. At the Canadian factory will be manufactured a complete line of "Delta-Star" equipment—in addition to the present switching equipment, switchboards, oil circuit breakers and oil switches. New designs of large capacity oil breakers for voltages up to 132 kV will be added shortly. Mr. Young states that the equipment will be handled by its established sales organisation and the Kenova Champion works will be operated as a separate unit with its own sales organisation. The St. Johns factory will handle all business for Canada and the British possessions and the French factory will have its own sales organisation.

LIVERPOOL ELECTRO-HARMONICS.

Arrangements for Next Season's Concerts.

NEW rules were approved by members of the Liverpool and District Electro-Harmonic Society at the recent annual meeting, with Mr. A. T. Hillman in the chair, whereby friends of members may join the society, and members will receive a limited number of tickets for the invitation of guests to next season's concerts. These functions will be held at the Angel Hotel, Dale Street, Liverpool, on the fourth Friday in every month from October to March inclusive, and will be preceded by a dinner instead of a "hot pot" supper as in previous years.

The annual golf competition for the Allied Electrical Trades Challenge Cup will be held at Childwall on June 11th.

Mr. P. J. Robinson was re-elected president, Mr. E. G. Pulford hon. secretary, and Mr. W. A. Sloane assistant hon. secretary. Mr. L. F. S. Sington has resigned the office of hon. treasurer, and is succeeded by Mr. B. L. Myer. A committee of eighteen members was appointed.

D

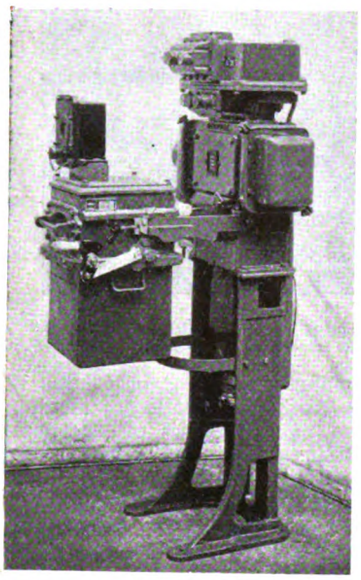
N.-E. COAST EXHIBITION.

A Brief Review of Some of the Exhibits of Electrical Interest.

AMONGST the varied exhibits which may be seen at the North-East Coast Exhibition, which opened at Newcastle-upon-Tyne on May 14th, are a number which bear upon the electrical industry. The E.L.M.A-E.D.A. stand, for instance, has been designed to indicate how the lamp of the present day, which has evolved so rapidly from Swan's first lamp, may be employed to the greatest possible advantage in every field of lighting service. The stand is divided into three interiors, consisting of two outer rooms and a central entrance hall, known as the "Hall of Light," where novel uses of electric light are displayed.



A 3 300 V, 200 A, 3-phase, flame-proof mining pillar, by A. Reyrolle and Co.

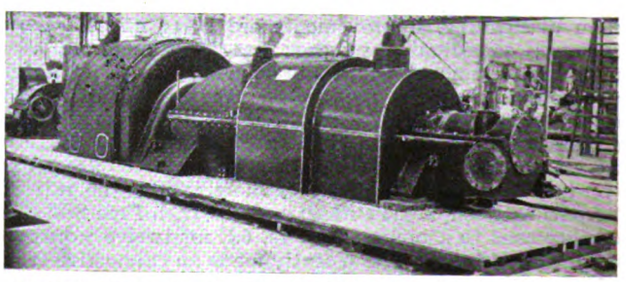
The exhibit of the BRITISH THOMSON-HOUSTON CO., LTD., is also devoted to light, including as it does some 100 fluted standards which support "Alabas" lanterns for lighting the grounds, and special globes housing floodlight projectors for the supplementary floodlighting of buildings. A "Mazdalux" fountain is another example of what can be done with electric lighting. Approaching the exhibition pavilions, there may be seen a striking effect produced by means of B.T.-H. floodlight projectors concealed at ground level in the foliage around the buildings. These projectors, 50 of which are employed, enable main buildings and towers of the Grand Court to be panelled in coloured light. The windows of the towers release beams of ultra-violet light from banks of mercury vapour lamps suspended in the centre of each tower, while above these, in the lantern tower, floodlight projectors throw moving beams of light upwards. In the club house, decorative and standard enclosing units with "Ace," "Keldon" and "Trojan" glassware are employed for interior lighting, while coloured lamps outline the pergola on top of this building. The bandstand is illuminated by means of flush ceiling units.

Amongst the exhibitors of domestic electrical apparatus and appliances may be mentioned PETTERS, LTD., who are showing a complete range of country house lighting equipments, including plants up to 3 kW capacity, while the REVO ELECTRIC CO., LTD., are showing water-tight lighting fittings, street lighting fittings, domestic fittings and appliances, cookers, fires, etc. BELLING AND CO. are exhibiting a range of electric fires, including portable designs and imitation coal fires. For industrial purposes there are totally enclosed and fireproof air warmers, pipe heaters and electric hot water radiators. A series of electric cookers is also on show, ranging from the "Baby Belling" cooker, suitable for small families, up to full size models. There are also electric water heaters suitable for fixing into existing tanks or cylinders and for use in conjunction with the ordinary domestic hot water system. Practical demonstrations are given of the new "Parmotor" relay, which is on show for the first time. This has a wide application, including the thermostatic control of water heaters, cookers, street lighting, etc.

The exhibits of FALK, STADELMANN AND CO., LTD., embrace specimens of modern lighting styles, "Efescoal" electric fires, complete ranges of "Ideal" table apparatus, "Nova" and "Efesca" switches, together with specimens of plates, and silk, nacrolac and parchment shades. The JACKSON ELECTRIC STOVE CO., LTD., is featuring a complete range of small and other domestic appliances, as well as cookers, fires, water heaters, etc.

On the industrial side, the YORKSHIRE COPPER WORKS, LTD., are exhibiting tubes of every description of interest to the industry, while for the convenience of visitors the stand of A. REYROLLE AND CO., LTD., is arranged as a lounge in its central part, with exhibits suitably disposed round its outer border. The whole of the main h.t. and l.t. switchgear required in the exhibition is of their manufacture, while included in the stand are selected examples of the smaller varieties of switchgear, such as mining switchgear, industrial switchgear, and plugs and sockets. Metal-clad switchgear, in earthed enclosures, and adequate protective systems for isolating faulty sections of an installation, are also included. The main exhibit of C. A. PARSONS AND CO., LTD., is a 3 000 r.p.m. reaction turbine, supplied with steam at 165 lb. per sq. in. absolute and coupled to a 6 250 kW alternator and exciter. The growth in turbine manufacture and design is shown by a comparison with the small set, built 44 years ago. This little machine ran at 18 000 r.p.m and developed 4 kW, and is similar in type to those which supplied current for lighting the Newcastle Exhibition in 1887. Among the exhibits is a turbine made in 1891, which generated 100 kW, running at 4 800 r.p.m. and 140 lb. per sq. in. steam pressure. Shaft adjusting gear to reduce the blade clearance to 0·01 in. and steam jacketed diaphragms for the fixed blades were, we are informed, both innovations at that time. It ran as a condensing turbine and when officially tested the consumption per kWh was 27 lb. A transformer built in 1890, and in service until a few years ago, is shown, also a section of h.t. and l.t. winding for a present-day 11 000/400 V transformer, and a tapping switch for a 20 000 V 200 A transformer. Two searchlight reflectors are also exhibited, one of 90 cm. diameter and the other of 220 cm. diameter. Various types of blades and blading, from those made for the first turbine in 1884 up to those used in present-day machines, are also displayed.

The exhibit of the NEWCASTLE-UPON-TYNE SUPPLY CO., LTD., AND ASSOCIATED COMPANIES is surrounded by a scale model of a 66 000 V overhead transmission line. The industrial heating apparatus displayed includes a 27 kW and 9 kW electric furnaces by the Birmingham Electric Furnaces, Ltd.; one 3·75 kW magnetic steel hardening furnace, by Wild-Barfield Electric Furnaces, Ltd.; a Vickers-Armstrong's hardness testing machine; and 18 kW immersion type electrical water heater for steam raising, by A. Reyrolle and Co., Ltd.; and miscellaneous heating apparatus, such as solder bolt heaters, babbitt metal pots, etc. In the colliery machinery section are shown a 2 000 g.p.m. centrifugal pump, by Mackley and Co., with direct-coupled high torque squirrel cage motor, by Veritys, Ltd., and with Ellison control apparatus; an endless rope hauler by John Wood and Sons, Ltd., incorporating worm and spur reduction gears by David Brown and Sons, Ltd., a 22½ B.H.P. slip-ring induction motor and a flame-proof mining type switch panel by the English Electric Co., Ltd., and with airbreak flame-proof drum type reversing controller with independently mounted resistances, by Allen, West and Co., Ltd.; an explosion-proof portable gate-end sub-station designed for the remote control of coal face machinery with incidental apparatus for demonstration purposes. General industrial machinery exhibits are also shown, and are seen in operation. Reference should also be made to a device which is shown and which has been given the name of the "Synchro-Vane." It consists of two motors, each fitted with a four-bladed propeller, each of which is revolving in opposite planes at a speed of 1 200 r.p.m., thereby producing a peculiar optical effect. Situated in the Tower Entrance of the Palace of Industry is a group of exhibits known as Switchcraft Corner. One stand shows in a modern setting the domestic uses of electricity; another stand is devoted to four large tableaux showing lighting effects, while a third room is designed as a rest room. Another exhibit, "Rooms of Today and Yesterday," shows how the rooms of a few years ago may be made artistic and comfortable with modern furnishings and electric fittings.



A 6 250 kW turbo-alternator and exciter, 3 000 r.p.m., steam pressure 165 lb., 11 000 V, 50 periods, 0·9 power factor, by C. A. Parsons and Co., Ltd.

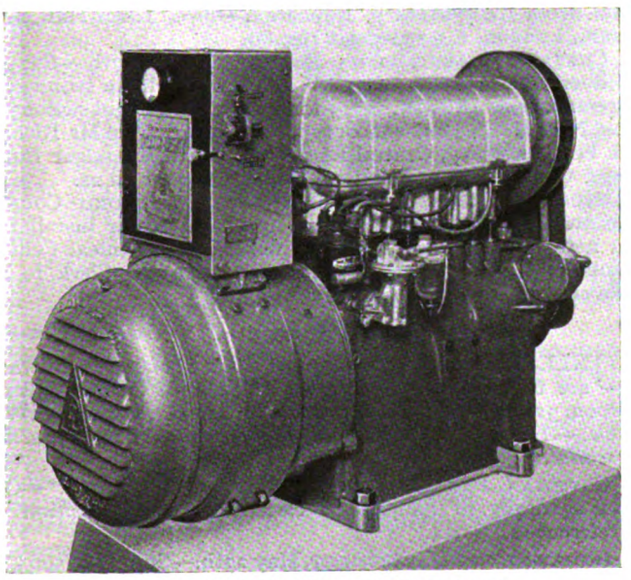
LIGHTING PLANTS.

Brief Particulars of New Lighting Plants for Country Use.

AT this season, when many of the public are considering installing small lighting plants in their summer dwellings and houseboats, it may interest contractors and others to know that several improved models are being put on the market by various firms, including R. A. LISTER AND CO., LTD., of Dursley, Gloucestershire, and 5, Tothill Street, Westminster, S.W.1, whose new lighting plant is illustrated in this column. This plant, with an output of 800 W at 110 V, has been designed to give a supply without the use of a storage battery, and will be found to meet the requirements of isolated buildings such as shooting boxes, seaside bungalows, etc., where current is generally only intermittently required. The standard equipment includes two control switches and an additional switch on the plant. The control points consist of a push button switch for starting and a tumbler switch for stopping, arranged in any convenient position. Starting is effected by a combined dynamotor and a 12 V battery of the car starting type, special provision having been made for reducing the charging rate to the battery when the latter becomes charged. A small switchboard carries the necessary meters and the switchgear, which is enclosed by a metal cover. The engine is 2-H.P. vertical water-cooled, four-stroke, with overhead valves. The fuel tank provides for 13 hours running on full load.

The "XL" patent combined lighting set produced by CAPEL AND CO., LTD., Engine Works, Dalston Lane, London, E.8, can be run on petrol, paraffin, alcohol, naphtha, methylated spirit, gas or suction gas. The chief features of the plant are that the half coupling of the dynamo is bolted to the single disc flywheel and that the carburettor is of special design. Centrifugal lubrication is used in the crank case, and sight-feeding lubricators are also given for the cylinder and gudgeon pin. The makers state that the engines are tested at the works with a full load for six hours, and run for two or three days under all conditions, records of such tests being kept for future reference. Messrs. Capel also offer the "Excelite" complete electric generating plant, which is sold to include switchboard and battery. The engine and dynamo are mounted on a common bedplate. An alternative model has a belt-driven dynamo.

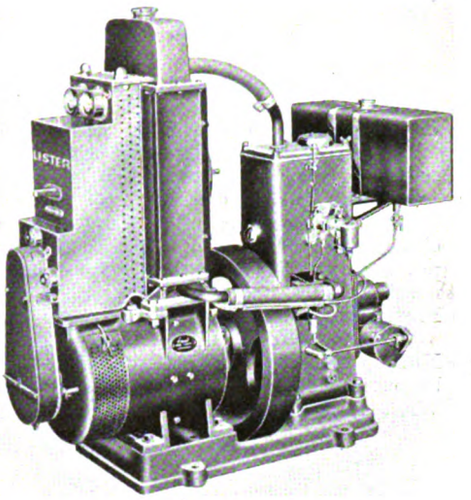


The recently developed "Delco-Light" equipment.

No new models are announced by the HEATLY-GRESHAM ENGINEERING CO., LTD., of Letchworth, Herts, and 40, Wood Street, Westminster, S.W.1, who continue to concentrate on their "Rational" vertical oil engines, applied to lighting and pumping sets, etc. They state that the latest range of "Rational" engines embraces units from small sizes up to 30-B.H.P.

PETER BROTHERHOOD, LTD., of Peterborough, and 34, Victoria Street, London, S.W.1, also manufacture home lighting sets.

FRIGIDAIRE, LTD., of Chapter Street, London, S.W.1, are marketing a new "Delco-Light" plant known as model 152. The plant is sold complete with Delco-Chloride storage battery, and is of the automatic type which operates without special control switches. When the load exceeds 300 W, the circuit through the self-starter is closed, and the engine continues to operate until the load falls below 175 W, at which point it is automatically shut down. The 16-cell battery has a capacity of 90 Ah at the ten-hour rate, and is equipped with floating hydrometers. Ordinarily this battery is automatically trickle-charged. If in exceptional circumstances current be taken at a relatively low rate for a long period, so that the engine remains inactive and therefore the battery becomes nearly discharged, an automatic cut-out opens the lighting circuit. Closing a switch on the control panel then starts the engine, and the lighting at once returns to normal, while the battery charge is brought back to a safe level. The four-stroke air-cooled engine—which is fitted with a pulley available for 3 H.P.—has four cylinders, copper-finned, one-adjustment carburettor and a.c. fuel pump. The generator is direct connected to the engine for 32 V service, the full load output being 1 500 W. The dimensions of the plant are: height, 27 in.; length, 33½ in.; width, 17 in. The floor space required for installation is 36 in. by 24 in. A further automatic feature is provided by warning of fuel shortage. Should the plant be out of fuel the cranking circuit will become disconnected after approximately one minute. Exhaustion of the battery is thus eliminated. The lubrication of the engine is effected by a combination of the positive pump and splash methods.



A new plant by R. A. Lister and Co., Ltd.

A smaller Delco-Light is model 752, also new, which has a full load capacity of 750 W. The generator is again direct connected to the shaft and gives 32 V service. This plant, which, in respects not mentioned here, is similar to model 152, has a single cylinder, five gallon petrol tank, and the splash system of lubrication. The capacity of the battery at the ten-hour rate is 60 Ah. This plant starts and stops automatically when the current requirements exceed approximately 200 W. Frigidaire, Ltd., are also offering several water pumping plants suitable for country house use and for other purposes.

In THE ELECTRICIAN of April 26th we described the new 5 kW automatically operated lighting plant manufactured by PETTERS, LTD., Yeovil, and another automatic and recently announced plant is the "Auto-Petter-Light," sold in three capacities of 700, 950 and 1 450 W. This plant is used without storage batteries and is designed for automatic control. The Petters 2-stroke water-cooled engine is used and a "Wico" magneto and fan-cooled radiators are fitted. The engine and dynamo are separate units. Mechanical lubrication is employed.

THE ROYAL INSTITUTION.

At a general meeting of members on May 6th, Sir Robert Robertson, in the chair, announced that the following had been nominated as vice-presidents for the ensuing year: Lord Blanesburgh, Sir James Crichton-Browne, Dr. W. H. Eccles, Sir Arthur Keith, Mr. C. H. Merz, Dr. G. C. Simpson, Sir Robert Robertson (Treasurer) and Major C. E. S. Philips (Secretary). The thanks of members were returned to Sir Dugald and Lady Clerk, Lady Dewar, Mr. T. H. Sowerby and Mr. A. A. Campbell-Swinton for their donations to the special fund for the alterations in the building. Sir J. J. Thomson was elected Honorary Professor, and Sir Ernest Rutherford, Professor of Natural Philosophy. Mr. C. E. R. Brocklebank and Mr. F. L. Pearson were elected members.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, when available.

DUNDEE CORPORATION.—Electric lighting of Ashludie Sanatorium. Particulars, etc., from Mr. George Baxter, city engineer, 91, Commercial Street, Dundee.

PORTCAWL URBAN DISTRICT COUNCIL.—Transfer of Electricity Special Order to a company or persons. Forms, etc., from Mr. E. Davies, clerk to the Council; deposit £5 5s.

ST. PANCRAS (LONDON) BOROUGH COUNCIL.—Supply of electrically-driven pumps, for discharging 1 500 000 gallons per hour of gravel water for condensing purposes. Specifications, etc., from the Borough Electrical Engineer, 57, Pratt Street, London, N.W.; deposit £1.

WREXHAM TOWN COUNCIL.—Wiring of 36 houses on the Huntroyd Estate. Specifications, etc., from Mr. J. W. Williams, borough electrical engineer, Electricity Works, Willow Road, Wrexham.

Corporation House Wiring.

BOOTLE CORPORATION, May 24th.—Electrician's work in connection with erection of 122 houses, under the Northfield Road housing scheme. Specifications from the Borough Engineer, Town Hall, Bootle; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, May 25th.—Supply and erection of 33 000 V metal clad switchgear, in connection with South-East England Electricity Scheme. Specification (No. S.E.E.—G.S.1) from Mr. Richard H. Fox, secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

EPSOM URBAN DISTRICT COUNCIL, May 25th.—Supply and erection of l.t., d.c. switchboard, with the changing over of connections, with certain instruments and gear from the existing switchboard. Specification, etc., from the Resident Electrical Engineer, Electricity Works, Depot Road, Epsom; deposit £3 3s.

MANCHESTER TOWN COUNCIL, May 28th.—Supply of electrical equipment for tramways. Form of tender, etc., from Tramways Manager, Manchester.

ECCLES CORPORATION, May 29th.—Electric lighting installation and fittings for 68 houses at Westwood Park, Manton. Forms of tender, etc., from the borough Electrical Engineer's Office, Cawdor Street, Patricroft, Eccles; deposit £1 1s. (returnable).

METROPOLITAN ASYLUMS BOARD, May 29th.—Supply of electric cables and lamps. Forms of tender, etc., from the Board's Office, Victoria Embankment, London, E.C.4.

SALFORD CORPORATION, May 29th.—Electrical installation in 76 houses in Gerald Road, Pendleton. Particulars from the City Electrical Engineer.

DONCASTER EDUCATION COMMITTEE, May 30th.—Electric light installation at Hexthorpe Infants' Schools. Particulars from Secretary, Education Offices.

GEORGE HERIOT'S SCHOOL, EDINBURGH, May 30th.—Electrical installation. Specification, etc., from Mr. John Anderson, superintendent of works, 20, York Place, Edinburgh.

MASSEREENE HOSPITAL, ANTRIM, May 30th.—Electric power plant and lighting installation for laundry. Specification D from Mr. F. D. Brown, consultant, 93, Ann Street, Belfast.

BELFAST CORPORATION, May 31st.—Electric lighting installations at York Street School, and Belvoir Hall, Donegall Road, Hillman Street, Springfield, and St. Mark's P.E.S. Schools. Specification, etc., from the Education Architect, Education Offices, Victoria Street, Belfast; deposit £2 2s.

OGMORE AND GARW URBAN COUNCIL, May 31st.—Supply, delivery and erection of (*a*) short length 11 000 V transmission line, and (*b*) l.t. overhead and underground distribution mains. Specifications, etc., from Messrs. A. Ellis and Partners, 9, Park Place, Cardiff; deposit £1 1s.

GRIMSBY TOWN COUNCIL, May 31st.—Supply of electrically-driven boiler feed pump. Forms of tender from Mr. S. R. Windle, borough electrical engineer, Electricity Works, Grimsby.

SALFORD CORPORATION, May 31st.—Four 216 kVA power transformers. Particulars from the City Electrical Engineer.

WEST RIDING ELECTRICITY COMMITTEE, May 31st.—Electric lighting of Maltby Crags and Aston Schools. Forms of tender from Mr. A. Adcock, Craigmoor, Godstone Road, Rotherham.

COMMISSIONERS OF H.M. WORKS, ETC., June 3rd.—Fuse boards and switches. Forms of tender, etc., from the Controller of Supplies, King Charles Street, Westminster, London, S.W.1.

CROYDON CORPORATION, June 3rd.—Supply and erection of (*a*) one 20/25 000 kW turbo-alternator, with condensing plant, pumps, etc.; (*b*) boiler house extensions, with two 100 000 lb. per hour boilers, stand-by coal conveyor from siding, coal-handling plant at siding, steam piping and receiver, etc.; (*c*) engine room extension, switch house, bridges, and pump house; (*d*) 6 600 V switchgear, transformers, etc. Specifications, etc., from the Engineer and Manager, "Electric House," 38, High Street, Croydon; deposit £1 1s. for each section.

THURROCK, GRAYS AND TILBURY SEWERAGE BOARD, June 4th.—Supply of a.c. motors, pumps, wiring, etc. Specifications can be obtained at the Sewerage Works, Marsh Farm, Tilbury.

ST. PANCRAS (LONDON) BOROUGH COUNCIL, June 6th.—Supply of 1 000 kW rotary convertor. Forms of tender from the Borough Electrical Engineer, 57, Pratt Street, London, N.W.; deposit £1.

HALIFAX TOWN COUNCIL, June 7th.—Electrician's work in connection with extension of Shelf Sanatorium. Forms of tender, etc., from the Borough Engineer, Halifax; deposit £1 1s.

SUTTON AND CHEAM URBAN DISTRICT COUNCIL, June 7th.—Installation of fire alarm system, connected with the fire station. Plans showing positions of fire alarm boxes, etc., from the Engineer and Surveyor.

METROPOLITAN ASYLUMS BOARD, June 12th.—Two electric passenger lifts at Colindale Hospital; fire alarm system at High Wood Hospital for Children, Brentwood; and electric bell system at Casual Ward, Swaffield Road, Wandsworth. Specifications from the Board's Office, Victoria Embankment, London, E.C.4; £1 deposit in respect of each work.

EAST HAM EDUCATION COMMITTEE, June 12th.—Electric lighting installation at the Salisbury School. Specification, etc., from the Secretary, Education Office, Town Hall, East Ham, London, E.6; deposit 10s. 6d.

CENTRAL ELECTRICITY BOARD, June 17th.—Supply, delivery and erection of 33 kV and lower voltage switchgear. Specifications (N.W.E. S.S.3 for indoor metal clad switchgear and N.W.E.S.S.4 for outdoor type switchgear), from Mr. Richard H. Fox, secretary, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2; deposit £2 2s.

STOKE-ON-TRENT CORPORATION AND STAFFORD COUNTY COUNCIL, June 22nd.—Electric light and power installation in new buildings at North Staffordshire Technical College, Stoke-on-Trent. Further particulars from the Clerk to the Governors, Town Hall, Hanley; deposit £5 5s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

EGYPTIAN PRISONS ADMINISTRATIONS, May 25th.*—One year's supply of lamps and electrical articles (section 7). (Reference C. 3 022.)

INDIAN STORES DEPARTMENT, May 27th.—Supply of 500 kW, six-phase rotary convertor, starting panel, etc. (order No. N./9 736). (Reference B.X. 5 279.)

PRETORIA MUNICIPALITY, May 27th.—Supply of transformers required in connection with extensions of e.h.t. system. (Reference B.X. 5 258.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, May 28th.—Supply of telephone jacks and number plates (schedule C. 417). (Reference B.X. 5 202.)

GREAT SOUTHERN RAILWAY CO., IRELAND, May 29th.—Six months' supply of electric lamps, porous pots, cells, cables, etc. Forms of tender from the Stores Superintendent, G. S. Railways, Inchicore, Dublin.

CLUJ (ROUMANIA) MUNICIPALITY, May 30th.—Compressor for cooling plant of ammonia system, with air-cooling coils

Digitized by Google

and a.c. motor and condenser, at the Slaughter House. (Reference A.X. 7 838.)

SOUTH AFRICAN POSTS AND TELEGRAPHS, May 30th.—Supply of telegraph materials, tubular arms, crossheads, bases, stay plates, etc. (tender No. 152). (Reference A.X. 7 767.)

SOUTH INDIAN RAILWAY CO., May 31st.—Supply of (1) spare parts for train lighting cells; (2) V.I.R. cotton and silk covered copper and galvanised iron wire. Forms of tender from the Managing Director, 91, Petty France, London, S.W.; deposits (1) 10s. and (2) 5s.

JOHANNESBURG MUNICIPALITY, June 1st.—Supply and delivery of oil switches. (Reference B.X. 5 283.)

JOHANNESBURG MUNICIPALITY, June 1st.—Supply and delivery truck type cubicles. (Reference B.X. 5 285.)

TANGANYIKA GOVERNMENT, June 1st.—Concession for utilisation of Pangani River Falls for the development of electric power. Copies of the draft concession may be obtained from the Crown Agents for the Colonies, 4, Millbank, London, S.W.1.

Electric Cranes for Valparaiso.

VALPARAISO PORT ADMINISTRATION, June 1st.—Four electric travelling cranes of portal type (capacity 3 metric tons each). (Reference A.X. 7 892.)

AUCKLAND ELECTRIC POWER BOARD, June 3rd.—Supply of cables and accessories. (Reference B.X. 5 248.)

NEW SOUTH WALES PUBLIC WORKS DEPARTMENT, June 4th.—Supply of 18 electrically-operated water level indicators (contract No. 61/1928-29 W.S. and S.). (Reference B.X. 5 233).

VICTORIAN ELECTRICITY COMMISSION, June 4th.—Supply of 22 000 V transformers and spares (specification No. 29/36). (Reference B.X. 5 216.)

HAMILTON MUNICIPALITY, June 5th.—Supply and delivery of 400 H.P. Diesel engine and a.c. generator. (Reference B.X. 5 287.)

VICTORIAN RAILWAY COMMISSIONERS, June 12th.—Supply and delivery of track reactors for power signalling. (Reference B.X. 5 302.)

ANTWERP MUNICIPALITY, June 17th.—Supply of 32 electric travelling cranes for new dock. (Reference A.X. 7 924.)

NEW ZEALAND POSTS AND TELEGRAPHS, June 18th.—Supply of telephone cords (No. P. and T. 151/1425). (Reference B.X. 5 251.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, June 18th.—Supply of switchboard cable (contract C. 427). (Reference B.X. 5 228.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, June 20th.—Two 5-ton electrically driven hoist blocks, with overhead conductors, runway girders and switches (tender No. 1 446). (Reference T/A.X. 7 867.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, June 20th.—Supply of one 10-ton and three 4-ton electric level luffing cranes (tender No. 1 437). (Reference A.X. 7 828.)

NEW SOUTH WALES PUBLIC WORKS DEPARTMENT, June 22nd.—Supply and erection of transformers, with certain spares, for Burrinjuck hydro-electric development (contract No. 29/29). (Reference B.X. 5 230.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, June 25th.—Supply of protected type telephone cable terminal boxes (schedule C. 430). (Reference B.X. 5 231.)

NEW ZEALAND GOVERNMENT RAILWAYS DEPARTMENT, June 26th.—Supply and delivery of trailing cables for portable electric machines. (Reference B.X. 5 277.)

VICTORIAN RAILWAY COMMISSION, June 26th (extended from May 15th).—Supply of geared three-phase, electric winding engine. (Reference A. 7 650.)

SOUTH AFRICAN POSTS AND TELEGRAPHS, June 27th.—Automatic wall and table pattern telephones (tender No. 158). (Reference B.X. 5 273.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, June 30th.—Supply of two 5-ton electrically driven hoist blocks, complete with overhead conductors, and switches. (Reference A.X. 7 867.)

VICTORIA STATE ELECTRICITY COMMISSION, July 1st.—Supply and delivery of 44 000 V transformers. (Reference B.X. 5 293.)

STATE ELECTRICITY WORKS, MONTEVIDEO, July 8th.—Construction and equipment of 50 000 kW power station.

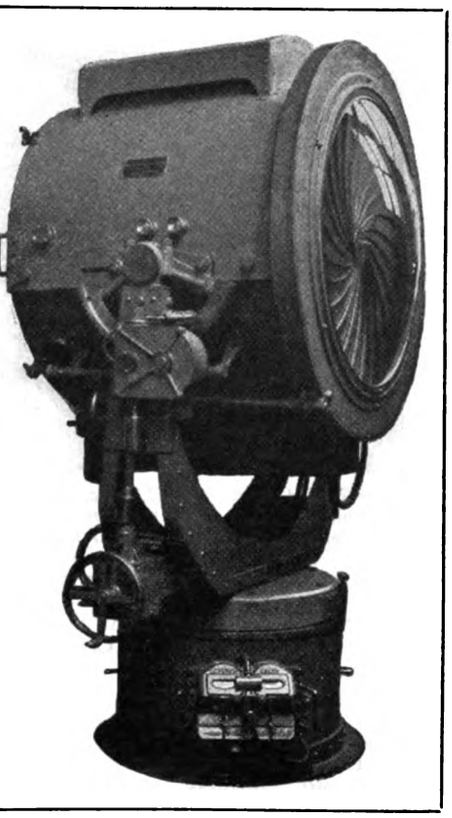
POSTMASTER - GENERAL'S DEPARTMENT, MELBOURNE, July 9th.—Resistances and reactances (schedule C. 426). (Reference B.X. 5 281.)

NEW SOUTH WALES GOVERNMENT RAILWAYS, July 10th.—One 750 kW turbo-alternator; 2 200 V ironclad switchgear; two switch operating batteries; and two motor generator sets. Specifications from the Chief Electrical Engineer, 61, Hunter Street, Sydney.

NEW ZEALAND PUBLIC WORKS DEPARTMENT, July 16th.—Supply of 250 galvanised steel transmission line towers to carry copper conductors, or 190 towers to carry steel-core aluminium conductors. (Reference A.X. 7 735.)

NEW ZEALAND POSTS AND TELEGRAPHS, July 16th.—Telephone bells (P. and T. No. 151/1 444). (Reference B.X. 5 272.)

THE general appearance of the searchlights which are being used at the N.E. Coast Exhibition. They are 36 in. diam. and of semi-portable pattern. The usual horizontal and vertical motions are fitted, to enable the searchlight to be trained and elevated, and each light is capable of being controlled electrically from a distance. The London Electric Firm were the manufacturers.



MONTEVIDEO PORT AUTHORITY, July 22nd.—Supply of 300 kilo. electro-pneumatic hammer. (Reference A.X. 7 974.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, August 6th.—Supply of 120-ton, four-motor, overhead travelling crane and runway (specification No. S.M. 358). (Reference A.X. 7 810.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, August 13th.—Water turbine driven generating sets and switchgear, for Waitaki power development (section 2). (Reference B.X. 5 278.)

NEW ZEALAND GOVERNMENT RAILWAYS, September 4th.—Supply of motor generator (specification 287). (Reference B.X. 5 308.)

Tenders Accepted.

GENERAL POST OFFICE.—Edison Swan Electric Co., Ltd., telephone switchboard lamps.

SOUTHWARK (LONDON) BOROUGH COUNCIL.—Vickers Boiler Co., Ltd., boiler repairs, £355.

PORTSMOUTH CORPORATION.—Johnson and Phillips, transmission lines to Emsworth, £25 268.

ASSAM BENGAL RAILWAY CO., LTD.—Omega Lampworks, Ltd., supply of train-lighting lamps.

EASTBOURNE CORPORATION.—British Electric Transformer Co., Ltd., supply of 20 transformers, £2 456 5s.

DEWSBURY CORPORATION.—Beaumont and Blackburn, electric light wiring of 37 houses, £221 4s. 9d.

ILFORD CORPORATION.—Crompton Parkinson, Ltd., supply of 500 kW transformer, £243. (Recommended.)

STIRLING CORPORATION.—Graham and Morton, Ltd., electrical work at houses in Burnside Street, Stirling.

LANCASTER CORPORATION.—Alton Battery Co., battery, booster and switchgear, £6 335. (Recommended.)

SOUTHEND CORPORATION.—Standard Telephones and Cables, Ltd., three fire alarm standards, £96. (Recommended.)

IRISH FREE STATE PUBLIC WORKS DEPARTMENT.—McDonald and Creswick, Ltd., one year's supply of electric fittings.

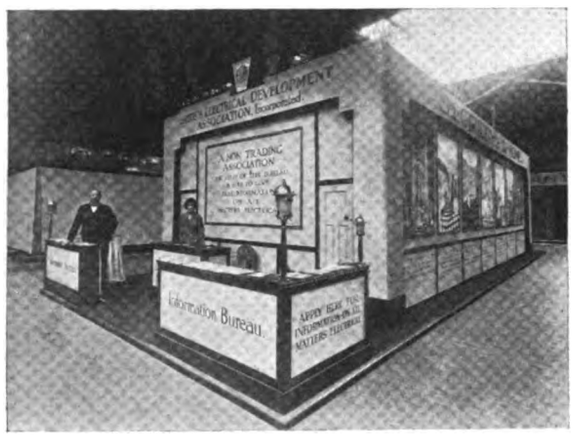
CAPE TOWN CORPORATION.—Albert Vaux, Ltd., supply of steel pillar boxes, for the electricity department, £788 2s.

Digitized by Google

ERITH URBAN DISTRICT COUNCIL.—Dickinson and Co., electrical installation at Sheridan Road site, £180. (Recommended.)

ADMIRALTY.—Edison Swan Electric Co., Ltd., w/t combined switch and plug, switches non-w/t, steel springs and gangway reflectors.

DOUGLAS (ISLE OF MAN) CORPORATION.—New Switchgear Construction Co., Ltd., h.t. panel for Tromode Road sub-station, £96.



THE joint stand of the Electrical Development Association and the E.L.M.A. at the North-East Coast Exhibition. Brief descriptions of some of the stands are given on page 620.

METROPOLITAN ASYLUMS BOARD.—Hendon Electric Supply Co., Ltd., laying cables to Colindale Hospital, Hendon, £153 14s. 8d.

LONDON COUNTY COUNCIL.—Siemens Electric Lamps and Supplies, Ltd., supply of electric incandescent lamps for twelve months.

WIMBLEDON CORPORATION.—Siemens Brothers and Co., Ltd., supply and laying 11 000 V and pilot cables, £7 500 11s. 10d.

HASTINGS CORPORATION.—Mirrlees Watson Co., Ltd., supply of electric pumping plant at Kent Street waterworks, £2 000. (Recommended.)

CROSSLAND MOOR, HUDDERSFIELD.—W. R. Bottomley, electrician's work in connection with erection of a pair of houses at Blackmoorfoot Road, Crossland Moor, £34.

DURHAM COUNTY EDUCATION COMMITTEE.—F. Reid, Ferens and Co., electric lighting installation at the new council school, Billingham, £404 10s. (Recommended).

HULL CORPORATION.—A. Shaw and Sons, electric light and bell installation, at Hedon Road maternity home, £2,079 18s., Clark and Graham, microphone equipment for city hall, £125.

ILFORD CORPORATION.—Long and Crawford, Ltd., three panel switchboard (£170 15s.); Foster Engineering Co., Ltd., transformer (£104) for Claybury Asylum. (Both recommended.)

LUTON CORPORATION.—Braithwaite and Co., Ltd., steel construction work, £10 960; Herbert Morris, Ltd., travelling crane, £1 530; Henry Lees, coal tipper, elevator and conveyor, £4 550.

BECKENHAM URBAN DISTRICT COUNCIL.—New Switchgear Construction Co., Ltd., e.h.t. switchgear, £188 10s.; British Insulated Cables Ltd., l.t. switchgear at Eden Park sub-station, £103.

Switchgear Contracts.

EAST HAM CORPORATION.—Bertram Thomas, supply of l.t. switchgear for generating station, £309; A. Reyrolle and Co., Ltd., supply of h.t. switchgear, £1 438—revised tender. (Both recommended.)

ISLINGTON (LONDON) BOROUGH COUNCIL.—Hayward Co., electrically driven addressing machine, £203 13s. 6d.; D. P. Battery Co., Ltd., new lead battery, for electric vehicle, £189. (Both recommended.)

DARTFORD URBAN DISTRICT COUNCIL.—Johnson and Phillips, Ltd., provision of feeder pillar in Miskin Road, £71; and supply of switchgear for Lowfield Street Housing Estate sub-station, £108 (recommended).

VICTORIAN ELECTRICITY COMMISSIONERS.—Australian General Electric Co., Metropolitan-Vickers Electrical Co., Ltd., and Gibson, Battle and Co., switchgear and electric feed pumps, for Yallourn power station. Total cost, £50 000.

GLASGOW CORPORATION.—J. Kilpatrick and Son ,Ltd,. electric lighting installation at Mearnskirk sanatorium grounds, £2 991 11s. 2d.; Bolckow, Vaughan and Co., Ltd., tramway rails; British Ropes, Ltd., and Jos. Cookson, Ltd., trolley cord. (All recommended).

SMETHWICK CORPORATION.—Walker and Co., electric lighting installation at the slipper baths, Mallin Street, Smethwick, £45. Also tendered: T. Glover, £48; Carr Bros., £48; Electromobile Engineering Co. (West Bromwich), Ltd., £49; Francis, £50; Simpson, £53.

GLASGOW CORPORATION.—James Allen and Son, Ltd., 100 iron bases; Greenwich Cable Works, Ltd., and Metropolitan Electrical and Cable Construction Co., Ltd., cables; Bromford Tube Co., Ltd., 350 steel poles; British Insulated Cables, Ltd., insulated bolts; Hadfields, Ltd., for special tramway track work.

Plant, Cables and Wiring.

STOKE-ON-TRENT CORPORATION.—National Gas Engine Co., Ltd., supply of heavy oil engine electric lighting plant at Stallington Hall, £898; Overhead, Ltd., erection of overhead transmission lines for 12 months; A. Bew, erection of overhead electricity cable to laundry at Stanfield Sanatorium, £105 1s.; E. Holloway, electric wiring of 16 houses at Eaton Street, Hanley, £93 6s. 8d.

HACKNEY (LONDON) BOROUGH COUNCIL.—C. A. Parsons and Co., Ltd., supply of turbo-alternator and condensing plant and accessories, £104 052; A. Reyrolle and Co., Ltd., supply of extra high pressure switchgear, switch house crane and accessories, £62 200; Babcock and Wilcox, Ltd., boiler house alterations, £2 000 (estimated); Tudor Accumulator Co., Ltd., repairs and renewals to battery at power station, £990. (All recommended.)

CAPE TOWN CORPORATION.—A. Vaux, Ltd., supply of switchboards manufactured by A. Reyrolle and Co., Ltd., £11 391; Paul Gregson, Urquhart and Co., cable manufactured by Craigpark Electric Co., for lighting new pavilion at Muizenberg, £340 4s. 2d.; Albert Vaux, Ltd., 30 tons of bare copper wire, £110 10s. per ton; British Insulated Cables Ltd., 50 miles of insulated wire, £23 5s. per mile; Griffin Engineering Co., Ltd., half ton of binding wire, £114 6s. 8d. per ton. (All recommended.)

CROYDON CORPORATION.—British Electric Transformer Co., Ltd., supply of 1 000 kV transformer for Craven Street sub-station, and two 400 kVA transformers, £337 each; Metropolitan-Vickers Electrical Co., Ltd., extension of main switchboard at power station and supply of two new switches, £2 330 14s.; Davenport Engineering Co., Ltd., cooling tower repairs, £345; A. Reyrolle and Co., Ltd., supply of sub-station switchgear, £1 546 14s.; W. Lucy and Co., Ltd., 133 lamp brackets, 34s. each. (All recommended.)

LEEDS CORPORATION.—General Electric Co., Ltd., supply of sub-station switchgear, £7 235 5s. 3d.; Parmiter, Hope and Sugden, 30 fuse panels, £350 5s.; Park Royal Engineering Co., Ltd., 24 circuit breakers, £396; Isles, Ltd., switch house crane, £698; F. W. Brackett and Co., Ltd., four circulating water screens, £2 703. Cables: W. T. Henley's Telegraph Works Co., Ltd., £867; Enfield Cable Works, Ltd., £1 146 10s.; Macintosh Cable Co., Ltd., £215 10s.; Hackbridge Cable Co., Ltd., £1 170 15s. Transformers: British Electric Transformer Co., Ltd., ten 100 kVA and ten 200 kVA, £104 and £172 each respectively; English Electric Co., Ltd., six 100 kVA, £83 each; Hackbridge Electric Construction Co., Ltd., ten 100 kVA and twenty 200 kVA, £77 and £112 each respectively.

LONDON COUNTY COUNCIL.—Stegman and Co., electrical installation at Beaufoy Institute extension, £390; Eons Electrical Co., wiring and fittings for electric lighting at Bethnal Green Coroner's Court, £189 3s.; Premier Electric Welding Co., Ltd., and Quasi-Arc Co., Ltd., electrodes; British Insulated Cables, Ltd., copper bonds; Dyer and Young, Ltd., commutators; Metropolitan-Vickers Electrical Co., Ltd., 100, and Beardmore and Co., Ltd., 150 gear wheels; G. D. Peters and Co., Ltd., upholstered seats for 520 tramcars; Nesta, Ltd., saloon seats for 35 cars; Pickerings, Ltd., provision of electric goods lift at Hammersmith Building Trade School, £523; also tendered: E. A. Foulds, £550; R. A. Evans, £599; J. Bennie, Ltd., £695; Smith, Major and Stevens, Ltd., £698; less 2½% cash disc.; Marryat and Scott, Ltd., £700; Rawlinsons, Ltd., £702; H. Morris, Ltd., £734; Medway's Safety Lift Co., Ltd., £791.

WORK IN PROSPECT.

AMERSHAM.—Houses. Particulars from Sherren, Ltd. (68 at Chalfont St. Peter), and Brown and Co. (10 at Holmer Green).

AMPTHILL.—Houses (62). Contractors, Mr. W. H. King, Seymour Bros. and Tookey, Mr. J. Putman, and Matthews and Welch.

AYRSHIRE.—Extensions, Whitletts and Ballantrae Schools. Particulars from Mr. W. Reid, Education Offices, Ayr.

BARNSLEY.—Mining and technical college. Particulars, Director of Education.

BEXLEY.—Houses (50). Contractors, Blackwell and Meyer.

BISHOP'S CASTLE.—Houses, for the Town Council. Particulars from Mr. P. W. Cooper.

BROMLEY (KENT).—Reconstruction, Grand Theatre, for Mr. F. C. Mitchell.—New St. Andrew's Church. Particulars from Sir Charles Nicholson.—School (250 places). Particulars from Rev. Father Cox.—Extensions, County school for boys. Particulars from Mr. H. P. Burke Downing.—Houses, Pratts Bottom. Particulars from the Surveyor.

COOKHAM.—Houses, Cookham Rise. Particulars, the surveyor, 1, Park Street, Maidenhead.

COVENTRY.—School (440 places). Briton Road. Particulars, Mr. Frederick Smith, Education Committee.

DUKINFIELD.—Houses (32), for the Town Council. Particulars, Mr. A. Tomkins, Salford.

DURHAM.—Central school, Whinney Hill. Particulars from the Director of Education.

EARLS BARTON.—Houses (24). Particulars, the Surveyor.

EDINBURGH.—Nursery school. Particulars from the Clerk. —Picture house, Laurieston Street, for the Blue Halls (Edinburgh) Co., Ltd.

FOXTON.—Village hall. Particulars, Rooke and Sons, Saffron Walden.

HARPENDEN.—Houses (30). Contractors, Messrs. Hardy and Webster.

HATFIELD.—Public offices, to cost £5 298. Particulars, Mr. W. F. Bailey.

HITCHIN.—Houses (45). Particulars, Mr. A. Carter, Luton.

HODDESDON.—Additional housing scheme, Rye Park. Particulars, Mr. W. Plumpton.—Hall, Lord Street. Particulars from Mr. H. C. Lander.—(Houses 31), Rye Road, for Homemakers, Ltd.

LLANDUDNO.—Reconstruction of Links Hotel, for Mr. W. H. Parry.

MERTHYR TYDFIL. — Smallpox Hospital. Particulars, Borough Surveyor.

MOTHERWELL.—Housing scheme (108). Particulars, Burgh Surveyor.

NEWMILNS AND GREENHOLM.—Housing scheme (17). Particulars from the Burgh Surveyor.

NORTHALLERTON.—Extensions, County Hall. Particulars, County Architect.

OAKHAM.—Houses (16). Particulars, Mr. F. W. Porter, Colsterworth.

READING.—Hall, for the Trustees of Caversham Heights Wesleyan Church. Particulars from Secretary.—Houses (22), Wendover Way, Tilehurst, for Mr. R. J. Haddock.—Houses (165), for the Town Council. Particulars from Mr. A. A. Moynihan, Theale.

REDRUTH.—Housing scheme (58), for the Urban Council. Particulars, the Surveyor.

RICCALL.—Housing scheme, Cliffe, for the Rural Council. Particulars, the Surveyor.

SOUTHEND-ON-SEA.—Church, to cost £8 500. Contractors, J. Flaxman and Sons, Ltd., Southchurch Road.

SOUTH MIMMS.—Houses (120). Particulars, Blackwell and Meyer, Bexley Heath.

ST. ALBANS.—College of housecraft, for Herts Education Committee. Particulars from Clerk.

ST. ALBANS.—Houses. Particulars, A. Ivory and Son, London Colney, and Bennett Bros., Leverstock Green.

STRATFORD-ON-AVON.—Housing scheme (100), Clopton Estate. Particulars from Borough Surveyor.

SUNBURY.—Housing scheme (32), for the Urban Council. Particulars from the Surveyor.

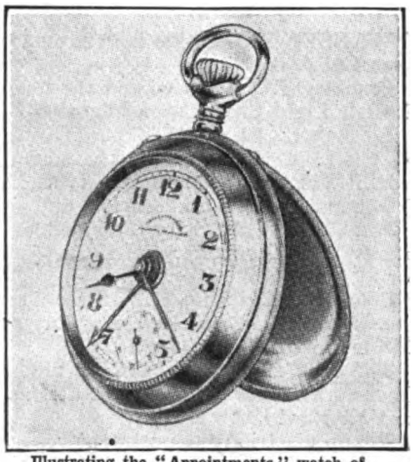
WARRINGTON.—Bus garage. Particulars, borough engineer, Mr. A. M. Ker.

WARRINGTON.—Extensions, library and museum, to cost £8 300. Particulars from the Borough Surveyor.

WARWICK.—Housing scheme (106). Particulars from Mr. R. Wormell, The Butts.

ALARM WATCHES.

ANOTHER watch just placed on the market by A. ARNOLD AND CO., of 17, Elmcroft Avenue, Golders Green, London, N.W.11, is an "Appointments" watch, the special feature of which is that it may be set to ring an alarm at any stated time to give notice, for example, that an appointment is due or that a specified period for some special manipulation has elapsed. The alarm mechanism may, of course, be put out of action when the instrument is merely in use as an ordinary timekeeper. At one winding the watch mechanism is set for 30 hours, and simultaneously the alarm mechanism for a single operation only, so that rewinding is needed for each appointment indicated. The rear cover of the watch is made to open backwards so that the watch will stand conveniently on a desk if so desired.



Illustrating the "Appointments" watch of A. Arnold and Co.

AUTOMATIC TELEPHONY.

Inauguration of New System for Cardiff Corporation.

AS announced in THE ELECTRICIAN of May 10th, the private automatic branch telephone exchange of the Cardiff Corporation was opened by the Lord Mayor, Ald. W. R. Williams, on May 8th. The exchange was installed by the Relay Automatic Telephone Co., Ltd., of Relay House, Streatham Hill, London, S.W.2, and consists of four switchboards, one at the City Hall, one at the Law Courts, and one each at the Electricity Departments, at the Hayes, and at Ninian Park Road. By this means all municipal departments are able to communicate with each other automatically in three seconds. The services of only one operator at each exchange are required as against two with ordinary manual handling.

In a speech following the opening ceremony, Mr. B. B. Johnson, chief engineer of the Relay Automatic Telephone Co., said that the exacting nature of the Post Office in relation to telephone apparatus was a blessing to those British manufacturers who were suppliers to the Post Office, in that if their products were accepted by the British authority they would meet the requirements of any other administration in the world. Equipment had been installed in India and Colonies, South America, Japan and Czecho-slovakia. There were in the latter country 80 exchanges working, which had been considered a triumph for British engineering, bearing in mind the proximity of that country to Germany. Although the first in Wales, Cardiff was the fiftieth municipal body in Britain to adopt the "Relay" system—that installed being identical with the equipment serving Manchester, Glasgow, Newcastle, Plymouth and Bristol.

AMERICAN POWER PRODUCTION.

The United States Census Bureau summaries show a continuing trend toward fewer and larger power stations and the rapid disappearance of many of the smaller, isolated plants. The following figures relate to the first 29 States reported by the Census: Total number of systems, 3 881 in 1922 and 2 632 in 1927; number of generating plants, 3 516 and 3 078; capacity of generators, 6 421 725 kW and 11 133 640 kW; average capacity of plants, 1 826 kW and 3 617 kW. Reports have also been made on six more States, and these show that in Alabama and Georgia the number of power stations has declined by 28, although their capacity has grown from 368 644 kW to 729 557 kW; in Nebraska, there has been a drop of nearly 25 % in the number of power stations, but an increase of more than 50% in their capacity; in New Mexico, the number of enterprises has decreased from 31 to 20. In Utah, the capacity has risen from 81 347 kW to 132 755 kW; and in Vermont, from 96 866 kW to 141 420 kW.

ELECTRICITY SUPPLY.

Electric Street Lighting at Brackley—Irish National Scheme—Lancashire Rural Scheme Approved—Loans for Mains, Etc.—Meters for Shipley—Birmingham Extensions—The Experimental Supply Scheme in Bedfordshire.

SWANSEA Corporation is to extend mains to Ynystawe, at a cost of £2 000.

Brackley T.C. has accepted the tender of the Northampton Electric Light Co. for street lighting.

Birkenhead Electricity Committee has reduced charges by ½d. per kWh, the revised flat rate being 4½d.

Hull Electricity Committee is seeking sanction to borrow £100 000 for mains and services and £50 000 for sub-stations.

Dorchester Electricity Committee is seeking sanction to borrow £520 for battery renewals, £500 for services, and £250 for meters.

Colchester Housing Committee is considering asking for the substitution of electricity for gas in council houses in Irvine Road.

The first supply via Dublin under the Irish Free State Government's national electrification scheme was transmitted to Waterford last week.

Bacup electricity department reports that about 180 new consumers have been obtained within the last 12 months, bringing the total to over 1 450. An assisted wiring scheme is in force.

Peterborough T.C. has adopted a scheme of assisted wiring for small houses. A deposit of 2s. 6d. per £1 of the cost will be payable, and the balance is to be repaid by quarterly payments of 1s. 2d. per £1.

Carlisle Electricity Committee is to extend mains at a cost of £465.—An additional feeder is to be laid between Willow Holme and Holme Head Works, and sanction to borrow £3 500 to cover the cost is asked for.

The Electric Supply Corporation has informed Chelmsford T.C. that as the old street lighting equipment has been dismantled, the company is willing to supply current, leaving the Council to provide the necessary equipment.

Fulham (London) Works Committee recommends the erection of a sub-station at West Meadow, Bishop's Park.—The Electricity Committee has authorised expenditure of £2 214 for a sub-station on the Harwood Road School site.

In order to deal with the immediate requirements of the North Staffs Technical College, Stoke-on-Trent, the 30 kVA single-phase transformers in the sub-station are to be replaced by two 60 kVA transformers, at an estimated cost of £150.

Electricity was transmitted over the section of the Central Electricity Board's grid between Bedford and Little Barford last week. This is the first portion of the Board's transmission system to be used in England, and its length is about nine miles.

Newbury Board of Guardians has appointed a sub-committee to consider a report on the electric lighting installation in the institute. The recommendations involve a new 20 H.P. engine and dynamo, leaving the old engine to drive the laundry.

Chesterfield Electricity Committee is seeking sanction to borrow £43 355 for mains and services.—The Water Committee has decided to duplicate the pumping plant at Whispering Well, and an electrically driven borehole centrifugal pump is to be installed.

Schemes for extensions in rural districts near Preston which are being undertaken by the Lancashire Electric Power Co., Ltd., have been approved by the Minister of Transport. It is intended to lay cables in the areas of Preston and Chorley R.D.C., and Withnell U.D.C.

Colchester Electricity Committee has obtained sanction to borrow £4 776 for the main transmission line to Wivenhoe, switchgear, etc., and £28 670 for generating plant for the Hythe station. The Committee seeks sanction to borrow £50 000 to meet costs of prospective unspecified works of extension.

Sanction to borrow £20 000 for estimated expenditure on transformers and sub-station switchgear during the next three years has been asked for by Bradford Electricity Committee.—A further expenditure on extensions of mains, etc., up to a total of £20 000 has been sanctioned by the Committee.

South Shields Lighting Committee has received a report from the Engineer that he has reviewed the charges for public street lamps. The present charge for ordinary small street standards has been reduced from £4 6s. 2d. per standard to £3 15s. 3d., other street lighting units being reduced in proportion.

Shipley Electricity Committee has obtained sanctior to borrow £9 861 for mains.—The Committee has decided to place contracts for all-British medium size meters at the following prices: a.c. £1 5s. each, d.c. £1 15s. each. The selection of the firms with whom orders are to be placed is left with the Chairman and Engineer.

Exeter City Council has authorised the appointment of an assistant electrical engineer. Mr. A. E. Brock, chairman of the Electricity Committee, said he hoped to make an announcement shortly regarding a decision under which the Council would secure very big business, which, in a few years, would take practically half the present output of their station.

Birmingham Electricity Supply Committee estimates that it is necessary to apply for sanction to borrow £300 000 to meet the cost of extensions of the distribution system to the end of December, 1930. Approval is also sought to the financing of expenditure that has been and will have to be incurred for additional sub-station buildings, plant, switchgear, etc. These requirements need a further sum of £300 000.

Mr. A. J. Bridge, publicity and development manager of the Western Electricity Supply Co., recently addressed a meeting in the Weyland Hall, Bicester, on a scheme for supplying the town. There was no definite scheme for that district at present, as the matter was being considered in conjunction with the U.D.C. He emphasised the effect of a large and varied load in keeping prices down, and said the company had decided to quote special terms for wiring during the summer.

Mr. A. H. Shaw, borough electrical engineer, Ilford, has received applications from various cinemas for a reduction of rates. A cinema is in course of erection at Goodmayes, and the promoters have asked for terms. He recommends that the primary charge per kW of m.d. per week be reduced from 5s. to 4s. and that the secondary charge up to 20 000 kWh per quarter be 1½d. and for over 20 000 kWh, 1¼d. per kWh.—The Electricity Committee has obtained sanction for a loan of £50 000 for mains and services and £5 000 for hired wiring.

Torquay Corporation is opposing the application by Mr. W. G. Heath for a Special Order to supply the urban district of Ivybridge and certain parishes in the Kingsbridge and Totnes rural districts so far as the latter rural district is concerned. The Corporation will apply for an Order extending its area of supply so as to include the whole of the Totnes rural district. —An agreement has been arrived at between the Torquay Corporation and the Teignmouth Electric Lighting Co., for the purchase by the former, at £10 500, of the Buckfastleigh electricity undertaking, subject to the sanction of the Electricity Commissioners.

Swansea Electricity Committee recently agreed that the Corpo ration should take over the supply to the Ynystawe area, now being supplied by Messrs. John Player and Sons. Mr. Burr, borough electrical engineer, reported that he had discussed the question of a supply to Richard Thomas and Co., in respect of new plant being installed at Swansea. It would mean, he said, the consumption of some 3 000 000 kWh per annum. There was also, he indicated, a proposal to supply the existing plant with power, which would ultimately mean a consumption of 7 000 000 kWh per annum. The Committee decided to accept Mr. Burr's figures for the supply to the new plant. The question of the larger supply was left over for further negotiation.

The Minister of Transport has issued an announcement regarding the experiment to be made to ascertain what results may be expected from the development of supply in a typical rural area, if proper means of canvassing are adopted, and facilities for wiring, and for obtaining apparatus on a deferred payment system are afforded. It is stated that the district within Bedford Corporation's supply area which has been selected for the experiment is of about 100 square miles in extent, and that as a result of an application made by Bedford T.C. to the Development Commissioners, the Treasury has agreed that for a period not exceeding 10 years, advances shall be made from the Development Fund to the Town Council, of such sums (not exceeding £8 000) as may be required to meet 75 % of the actual annual deficits on the working of the scheme, if any—such advances to be subsequently repayable out of surpluses.

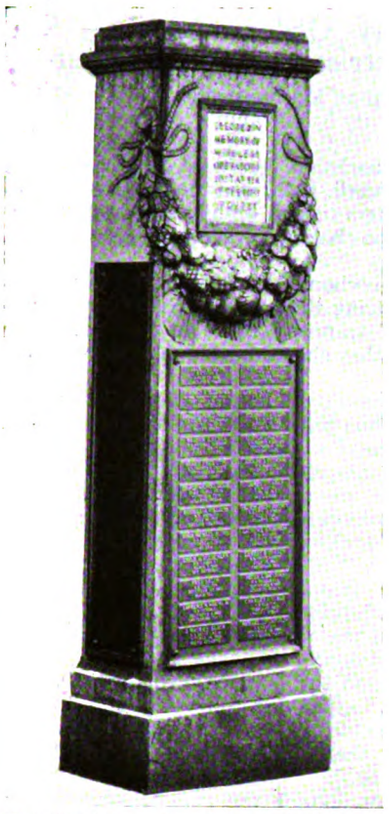
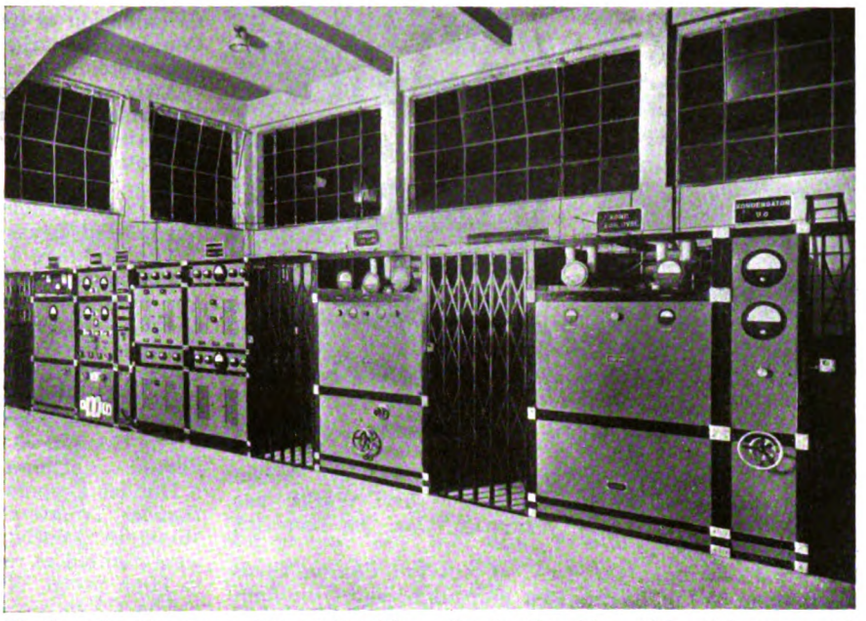
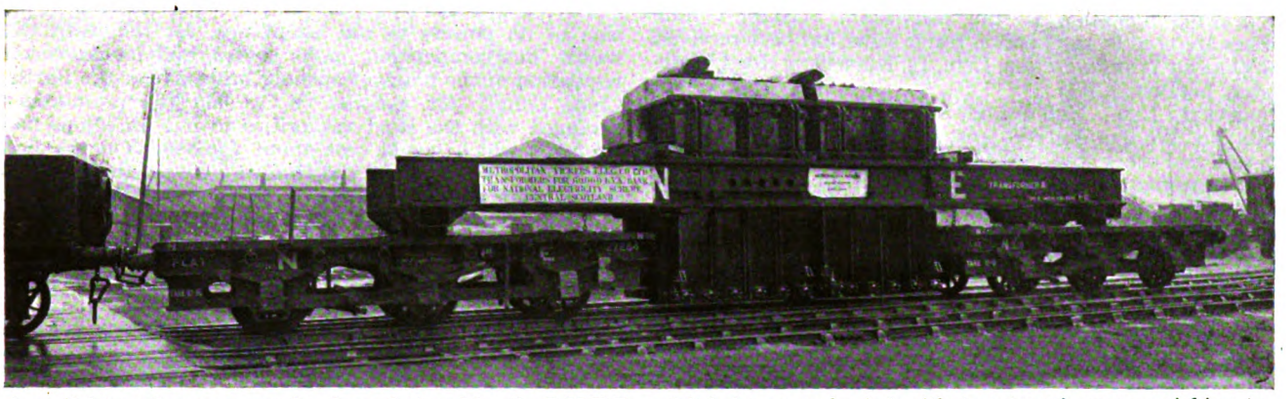
ELECTRICAL NEWS OF THE WEEK IN PICTURES.



The lettering on the memorial, in New York, perpetuating the memory of wireless operators lost at sea, has suffered very considerably from the action of the weather, and, in order that the names may be preserved, engraved bronze tablets have been added.



The broadcasting transmitter at Bratislava, Czecho-Slovakia, which, with a power of 12 kW in the aerial, may be heard in this country. The station, which works on 277·8 metres, is of Marconi design, and is intended to cover an area of 15 625 square miles. The photograph reproduced shows, left to right the rectifier and selector panels, the control board, the drive and modulator amplifier, the main amplifier, and the closed control circuits. The transmitter, we understand, is operated on the low power modulation principle.



A special transformer wagon has been designed by the L.N.E.R. and it is here seen loaded with two transformers, weighing together 64 tons, for the Central Electricity Board, on their way to Dalmarnock, Glasgow. The load was despatched from Metropolitan-Vickers works, at Trafford Park, Manchester, recently, and other similar consignments are passing periodically.

Hambledon R.D.C. has received from the Aldershot Gas, Water and Lighting Co. revised plans of the proposed electric cable to Hindhead, stating that the line would be laid underground through the village of Elstead, and that where it was overhead it would, as far as possible, be placed out of the sight of the roads. The Council decided to ask the company to place the cable underground along the proposed route in the vicinity of the Punch Bowl, Hindhead.

Torquay Electricity Committee recommends the adoption of an assisted wiring scheme submitted by the Electrical Engineer. Installations are to be limited to not less than four and not more than 10 lighting points, one cooking point being provided free for installations of 4 to 8 lighting points, and an additional heating point for installations of 9 and 10 lighting points; the work of installations is to be let to contractors at a priced schedule, to a specification to be prepared by the Engineer. The occupier is to pay £1 deposit on the signing of the agreement, and 1s. 6d. per lighting point per quarter for five years.

The Hull City Architect has estimated the cost of fixing plugs on the West Hull Estate at 30s. each. Half the cost of installing is to be borne by the Housing Committee, work to be carried out by the Corporation.—The Commissioners have sanctioned borrowing £73 618 for conversion of boilers and boiler house building, cooling tower superstructures, etc. The Commissioners have also approved of a balance in hand of £90 973 in respect of the £200 000 plant sanction of 1925 being applied towards plant under the £481 500 scheme.

Fulham (London) B.C. is to erect a sub-station in West Meadow, Bishop's Park, at a cost of £2 118, and a sub-station at premises of Peugeot (England), Ltd., Filmer Road, at a cost of £1 885. The number of units sold during 1928/29 was 18 997 575, as against 16 937 008 for 1927/28, an increase of 2 060 567. The total income for the year was £141 612, against £145 718 last year. The price reductions during the year have resulted in a saving to consumers of over £25 000. The Electricity Committee has authorised mains extensions at a cost of £1 400.

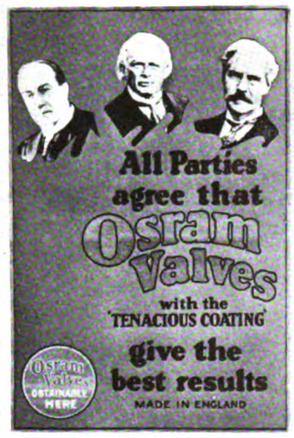
TRADE PUBLICATIONS.

WE have received from W. CHRISTIE AND GREY, LTD., 4, Lloyd's Avenue, London, E.C.3, a new leaflet dealing with the subject of vibration and its prevention.



Two topical window bills issued by the General Electric Co., Ltd

A pamphlet entitled "Swedish Lancashire Iron," issued by the Association of Swedish Lancashire Iron Works, has been received from ERNST B. WESTMAN, LTD., 39, Lombard Street, London, E.C.3.

The SUN ELECTRICAL CO., LTD., of 118–120, Charing Cross Road, London, W.C.2, has issued a gum-edged sheet, announcing the recent increase in prices of cables and flexibles, for inclusion in catalogue No. 600, to face page 151.

List 114 W.D., dealing with "M.S. Dual" temperature regulators, and list 120 W.D., dealing with "M.S. Duplex" temperature regulators, has been published by the DRAYTON REGULATOR AND INSTRUMENT CO., LTD., West Drayton, Middlesex.

A coloured mailing card, entitled "The Lights o' London," and drawing attention to the fact that "Venner" time switches are used in the London traffic signs, has been received from VENNER TIME SWITCHES, LTD., 45, Horseferry Road, Westminster, London, S.W.1.

FERRANTI, LTD., Hollinwood, Lancs, has sent us copies of lists No. Wc 412 and Wc 405, describing components for push-pull and other amplifiers. These lists enable the requisite output transformer ratio to be arrived at, in any particular instance, without loss of time, or calculation.

The NICKELOID ELECTROTYPE CO., LTD., 10, New Street Hill, London, E.C.4, has issued a number of booklets dealing with the "Wesel" final base system, the "Albert Galvano" electro, prices, etc. We have also received a copy of the current issue of "Nickeloid News." These publications give examples of the company's work, and are available to the trade.

The BRITISH ALUMINIUM CO., LTD., Adelaide House, King William Street, London, E.C.4, has published further leaflets for the handbook "Aluminium Facts and Figures." These include sheets A.73 and A.74, containing enlarged tables of the properties of stranded aluminium and steel-cored aluminium conductors, revised in conjunction with the B.E.S.A., and A.166, which is a new data sheet on expanded aluminium sheets.

The MULLARD WIRELESS SERVICE CO., LTD., Mullard House, Charing Cross Road, W.C.2, has issued leaflets V.R. 84, V.T. 34, V.T. 35, and V.M. 9, dealing with the P.M. 6, T. 22 C., S.W. 2 A, and M. 7 B, valves. In the case of V.T. 34 this replaces V.T. 15, while the valve takes the place of type T. 22. Leaflets V.R. 35/1a and V.T. 29/1a, dealing with D.F.A 6, 7 and 8, and S.W. 7 valves respectively, have been revised.

We have received from METRO-VICK SUPPLIES, Trafford Park, Manchester, a copy of a new wiring accessories catalogue. The reference for this new issue is No. 130/1, and the list cancels all previous issues. For the convenience of users, each classified heading, of which there are no less than eight, is arranged with a thumb index, while the inclusion of an alphabetical index as well, makes the finding of any particular information extremely easy. The publication, which is well illustrated, consists of over 160 pages, and is bound in strong board of a distinctive fawn colouring.

ELECTRIC TRACTION.

Scottish Tramway Orders Inquiry—Applications for Restrictions of Competition.

THE following application for Tramway Provisional Orders were considered recently by a Commission presided over by Lord Lamington :—

In presenting the Lanarkshire Tramways Co.'s application for an Order, Mr. M. Mitchell, K.C., said the company asked for an extension of its powers to run omnibuses throughout the County of Lanark, and to abandon, where necessary, the tramway system.

After evidence for the scheme had been heard, Mr. Graham Robertson, K.C., in putting the case for the opponents, said there were 28 miles of tramway route in Lanark, and the promoters claimed that they should have a monopoly over that mileage.

The Commissioners found the preamble of the Order proved, but deleted clauses dealing with restriction of competition.

The Rothesay Tramway Co. asked for powers for temporary discontinuance and permanent abandonment of tramways and for running omnibuses instead of tramcars. Mr. T. A. Gentles, K.C., for the promoters, explained that they wished to continue the tramway service in the summer and substitute buses in the winter.

Provost MacLachlan (Rothesay) said the Corporation's opposition had been withdrawn.

The Committee found the preamble of the Order proved, subject to certain restrictions.

Dundee Corporation and the Dundee, Broughty Ferry and District Tramways Co., asked for Orders to run 'buses to Monifieth jointly, in addition to tramcars. Both Orders were granted as regards the route from High Street, Dundee, to High Street, Monifieth.

The Commissioners in considering the Dunfermline and District Tramways Company's application for an Order to extend its powers of running omnibuses, and to restrict the running of rival omnibuses, found that the preamble had not been proved with respect to clauses intended to restrict the running of omnibuses in competition with tramways.

No Restriction of Competing Buses.

The Falkirk and District Tramways Co. asked for an extension of its powers to run omnibuses, for the restriction of motor 'bus competition on its routes, and for provision for regulation of the hours of opening bridges over the Forth and Clyde Canal. Mr. Gentles, K.C., said the promoters had arranged with the local authorities to put on a new fleet of tramcars which would cost about £30 000. On the Falkirk and Camelon section of the tramway routes three 'bus companies were running a three-minute service. A similar state of affairs existed on the Falkirk and Larbert route. Provost Smith, Falkirk, said it was the opinion of the Town Council that it was in the interests of the burgh that the tramway system should get reasonable protection. Evidence was given by 'bus proprietors, who said their 'buses had good support from the travelling public. The Committee found the preamble not proved as regards the part of the Order headed "Tramways and Omnibuses," the effect being that the powers sought for extension of powers for running 'buses and the restriction of competing 'buses have not been granted. The Committee recommended that the Minister of Transport be consulted as to the reduction of the hours of opening the bridges over the canal.

Bournemouth Corporation tramways undertaking is contributing £2 000 to relief of rates out of the past year's profit.

Edinburgh Transport Committee recommends the adoption of a scheme of the transport manager (Mr. F. A. Fitzpayne) for the construction and reconstruction of tramcars at an estimated cost of £80 000.

Particulars can be obtained from the Department of Overseas Trade regarding developments in connection with the proposal to replace the Kovno horse tramway service by electric tramways. (Reference A.X. 7 863.)

Glasgow Tramways Committee has fixed the following rates of depreciation for the current year: Permanent way, £1 000 per mile of single track; electric equipment of line, 5½%; power station and sub-stations plant, 10%; workshop tools and sundry plant, 5%; cars, 10%; electric equipment of cars, 15%; other rolling stock, 20%; miscellaneous equipment, 6%.

COMPANY NEWS.

Quiet Market in Electrical Securities—The Cables and Wireless Merger—Cable Company's Increased Receipts—Sphinx Electric's Expanding Sales—Calcutta Electric Supply Co.'s Good Progress—New Companies Registered.

STOCK markets immediately before and after the Whitsun holidays have been lethargic, and few changes in quotations are shown by our usual table of electrical share prices. General Electric ordinary shares are down to 55s., and W. T. Henley's are 1s. 3d. lower at 121s. 3d. British Electric Traction preferred ordinary stock is a point to the good at 129, and Metropolitan Railway ordinary stock at 61 is also a point higher. In the supply section, Metropolitan shares are 1s. 3d. lower and County of London 1s. Eastern Telegraph ordinary stock is just a trifle weaker.

BELL TELEPHONE CO. OF CANADA.—Net pfts. for past year equal to 10·14% on cap. stk., agst. 9·69%.

SOCIETA GENERALE ITALIANA EDISON.—Div. 50 lire, agst. 45 lire. Par value of shs. is to be raised from 375 lire to 500 lire, by capitalisatn. of reserves.

WESTERN TELEGRAPH CO., LTD.—Mtg. to consider alteratns. in articles of associatn. necessitated by merger of interests in ord. shs. with Cables and Wireless, Ltd., will be held on May 29.

MONTREAL TRAMWAYS CO.—Receipts for 1928, $14 938 678. Operatg., maintenance and renewal exes., $10 455 838, fixed charges, $3 435 363. Total paid to City of Montreal, $10 730 048.

INDIAN BROADCASTING CO.—Accts. for past year show loss of Rs. 215 000, total loss to date being Rs. 382 000. Directors attribute loss partly to the use of unlicensed wireless sets by listeners and to inability to collect all the amts. due as a 10% tax on wireless imports.

ILLINOIS POWER CO.—Gross earngs. for 1928, $2 732 116, agst. $2 637 187, net income $564 164, agst. $423 615. Div. on pfd. stk. $228 246; to retiremt. res., $150 000; blce. $185 917, agst. $44 877. Ratio of operatg. exes. and taxes to gross earngs., 65·19%, agst. 68·96%.

CALGARY POWER CO.—Gross earngs. for 1928, $949 422, agst. $494 908. Net operatg. rev. $517 173, agst. $336 219. Net income $251 198, agst. $129 594. Pfd. div. required $25 000, and common stk. div. $102 500. Total pft. and loss surplus for 1928, $622 096, agst. $689 894.

PENNSYLVANIA WATER AND POWER CO.—Gross earngs. for past year, $4 388 087, net earngs., $2 853 060. To equalisatn. res. acct., $300 000; to res. and depreciatn., $595 573, agst. $543 143. Divs. $2½ p. sh. of no par value, equal to 10% on old $100 shs. Surplus $350 918, agst. $23 051.

NEW YORK TELEPHONE CO.—Operating revs. for 1928, $180 908 591, agst. $186 495 378; net income $29 169 020, agst. $28 312 787. Pfd. stk. divs. absorb $1 625 000 and common stk. divs. (8%) $22 448 000 (both the same as last year). Blce. to surplus $5 096 020, agst. $4 239 787.

CENTRAL STATES ELECTRIC CORPORATION.—Earngs. for 1928, $8 877 907. Regular cash divs. at rate of $1 p. sh. p.a. have been paid, plus special stk. divs. at rate of 2½% for each of the last three quarters of the year. Directors propose special bonus div. of 100% on common stk., payable in common stk.

ABITIBI POWER AND PAPER CO., MONTREAL.—Net earngs. for 1928, $7 380 964, agst. $4 213 490, after deductg. income tax, special allowances, etc., after provisn. for net int. on debt, amt. available was $4 562 855, agst. $2 904 574. Pfd. stk. div. of $1 529 325 and common stk. divs. of $2 434 852 were declared and paid.

QUEBEC POWER CO.—Gross earngs. for 1928, $3 198 487, operatg. and maintenance cost $1 228 183, int. absorbed $620 580, and depreciatn. required $150 000, leaving net rev. $1 199 724, plus blce. brt. in, makg. $1 452 683. Divs. of $2 p. sh. amtd. to $901 985. To res. $300 000. Surplus, subject to tax, $250 698.

SHAWINIGAN WATER AND POWER CO.—Gross rev. for 1928, $11 562 331, agst. $93 62 828. Exes., $4 463 807, int. charges, $2 025 000, and other int. (on acct. still due to Laurentide Co.), $225 000, deprcn., $800 000. Net rev., $4 048 523, agst. $2 894 783. Divs. paid during year amtd. to $2 861 428. To res., $196 089; surplus, $1 928 344.

EASTERN TELEGRAPH CO., LTD.—Rev. for three mths. ended March 31st, 1928, £789 957; ord. exes., £571 710. After provisn. for income tax payable in England, int. on mtge. deb. stk. and divs. on pref. stk., blce. is £149 673, plus £525 765, makg. available blce. £675 437. Div. of 2½%, tax free. Blce. £550 437, transferred to gen. res. fund.

COMMONWEALTH POWER CORPORATION.—Earngs. of co. and subsidiaries for Jan., 1929, $5 548 084, compared with $5 025 241 in Jan., 1928. Earngs. for year to Jan. 31, 1929, $59 026 966, agst. $53 550 307. Applicable to div., after provisn. for retirement res., $12 510 310, equal to $25·02 p. sh. on 6% pfd. stk., and $5·78 p. sh. on common stk.

CENTRAL ILLINOIS LIGHT CO.—Gross earngs. for 1928. $4 765 844, agst. $4 391 161. After provisn. for operatg,

Digitized by Google

exes., taxes, int., amortisatn. of debt., etc., net income was $1 587, agst. $1 325 009. Divs. on pfd. stk. absorbed $408 837, agst. $413 462, and provisn. for retiremt. res., $304 800, agst. $256 800, leavg. surplus $874 221, agst. $654 747.

ALLIED POWER AND LIGHT CORPORATION.—First rpt. states that for period from May 5, 1928, to Feb. 28, 1929, divs. and int. received totalled $1 686 664, plus pft. on sales, fees, commissions, etc., $2 069 518. Exes., includg. taxes, etc., absorbed $1 043 931, divs. paid on $5 1st pfd. stk., $579 623 and on $3 pref. stk., $237 289. Blce. carried to surplus $1 895 238.

LANCASHIRE ELECTRIC LIGHT AND POWER CO.—Pft. for 1928, £238 515, agst. £203 734, plus £3 000 brt. in. Income tax, £13 927; depreciatn. and renewals, £50 000; paid to holdg. co., £174 401. Accts. of holdg. co. show blce. £150 885, agst. £143 621, after providg. deb. int. Additional div. of ½% on 7% pref. shs., makg. 7½% for year. Ord. div. 7½%. Fwd., £3 308.

TENNESSEE ELECTRIC POWER CO.—Operatns. of the co. and subsidiaries for 1928 resulted in gross earngs. $13 453 842, agst. $12 515 759. After provisn. for exes. and taxes, gross income was $6 488 489, agst. $5 743 393. Deductg. int., etc., left net income $4 309 844, agst. $3 520 390. Divs. on pfd. stk., $1 340 940, agst. $1 241 881; retiremt. res., $975 534, agst. £950 429. Blce. $1 993 369, agst. $1 328 078.

CONSOLIDATED GAS, ELECTRIC LIGHT AND POWER CO. OF BALTIMORE.—Operatg. rev., $26 126 194, agst. $24 657 001; net operatg. rev. $8 785 045, agst. $7 899 975. After addg. other rev. and deductg. fixed charges, net income was $6 173 640, agst. $5 177 370. Common stk. divs. were at annual rate of $2·50 p. sh. to Sept. 30, 1927, and $3 p. sh. after that date. After providg. for divs. on pfd. and common stk., and charging deductns. amtg. to $2 139 770, accumulated surplus is $11 421 464.

SIEMENS BROTHERS AND CO., LTD.—Pft. for 1928, £335 758; int. on and redemptn. of 4½% deb. stk., £67 439; div. for year on 10% cum. pref. shs. required £55 000, and intm. div. of 2½% on ord. shs., £50 000. Fin. div. of 5%, makg. 7½% less tax, for year. Blce. of pft., £63 319, plus £250 041 brt. in, makg. credit to pft. and loss acct. £313 360, wh. is carried fwd. Turnover, altho. below capacity, was well maintained. Slight fallg. off in pfts. attributed to increased proportn. of overseas business for wh. lower prices had to be taken than those for home orders.

NORTH AMERICAN CO.—The consolidated income statemt. of this co., which controls through stock ownership five main groups of electric supply, electric traction and gas undertakings in the United States, shows that in 1928 gross earngs. were $155 551 899 and total net income was $68 690 188. After deductg. int. charges, pfd. divs. of subsidiaries and minority interests, blce. was $38 677 417, agst. $31 736 580. To depreciatn. res. $14 274 664, divs. on North American pfd. stk., $1 820 032, divs. on North American common stk., $4 806 550; to surplus $17 776 172, agst. $13 092 854.

COMMONWEALTH POWER CORPORATION.—Gross earngs. of the Commonwealth Power Corporation and subsidiaries for 1928 were $58 504 122, agst. $53 172 976. After provisn. for operatg. exes., gross income was $28 440 059, agst. $24 741 603. Fixed charges, includg. int., pfd. divs., etc., absorbed $12 143 587, leavg. net income $16 296 471, agst. $12 413 628. Regular qrtrly. divs. of 1½% were paid on 6% cum. pfd. stk., div. of 62½ cents. p. sh. was paid on Feb. 1, 1928, on common stk., and similar paymt., with extra div. of 50 cents. p. sh., on May 1. On Aug. 1 qrtrly. div. on common stk. was increased to 75 cents. p. sh. and a like paymt. was made on Nov. 1.

MONTREAL LIGHT, HEAT AND POWER CONSOLIDATED.—Gross rev. for 1928, $21 235 991, compared with $20 314 902 in 1927 and $18 907 382 in 1926. Deductn. of operatn. exes, $7 059 911, and taxes, $2 123 599, left net rev. $10 794 978. Fixed charges $2 928 516, net income, $7 866 462. Deductn. of divs., $4 354 650, left surplus for year, $3 511 812, agst. $2 977 672 in 1927. Pensn. fund required $20 000 and contingent fund $465 997. Blce. $3 025 814 transferred to cap. and surplus. Net income was equal to $3·85 p. sh. on cap. stk., agst. $3·37. Net workg. cap. $19 480 590, compared with $14 717 487. Assets $102 967 792, compared with $97 087 627. Total cap. and surplus $66 485 108, against $97 087 637.

THE CABLES AND WIRELESS MERGER.—Circulars were issued on May 17th, to the ord. stk. and shholdrs. in the Eastern and Associated Telegraph Cos., and the pref. and ord. shhldrs. in Marconi's Wireless Telegraph Co., inviting them to exchange their securities for shs. in the merger co.—Cables and Wireless, Ltd. Accompanying the offer was a copy of the plan for merging the interests of the cos. in conformity with the rpt. of the Imperial Wireless and Cable Conference.—The Commee. representg. the £1 shhldrs. of Marconi's Wireless Telegraph Co. issued a circular on the same date, again urging £1 shhldrs. not to exchange their holdgs. for shs. in Cables and Wireless, Ltd., and statg. that the arrangemts. for the issue of units agst. the deposit of shs. with the Prudential Assurance Co., Ltd., have now been practically completed, and the necessary documents will shortly be issued.

Company Meetings.

PENARTH ELECTRIC LIGHTING CO., LTD.—The general meeting was held on May 14th, when it was decided to pay a dividend of 7% for the year on the preference shares and at the rate of 7½% on the ordinary shares. The report and accounts were adopted.

MERTHYR ELECTRIC TRACTION AND LIGHTING CO., LTD.—Mr. C. G. Tegetmeier (chairman) and Mr. C. H. Dade, the retiring directors, were re-elected at the thirty-second ordinary general meeting on May 14th. The directors' report and the statement of accounts were adopted.

WESTON-SUPER-MARE AND DISTRICT ELECTRIC SUPPLY CO., LTD.—The ordinary general meeting was held on May 14th, the chairman, Mr. C. G. Tegetmeier, presiding. The directors' report, recommending a dividend of 10% for the year on the ordinary shares, in addition to the payment of the dividend on the 6% preference shares, was adopted.

BARCELONA TRACTION, LIGHT AND POWER CO., LTD.—Mr. Miller Lash, presiding at the meeting in Toronto on May 16th, said owing to the increased demand for power, the consumption for the first four months of the current year showed an increase of 15 % over the corresponding period of last year and the prospects for the remaining months of the year were excellent. The work on the San Lorenzo plant was progressing satisfactorily.

DUNDEE, BROUGHTY FERRY AND DISTRICT TRAMWAYS CO., LTD.—Mr. G. Balfour, presiding at the meeting on May 18th, said no dividend could be paid at this stage, on either the pref. or ord. shs. During the 17 months under review, the number of passengers carried, 3 083 107, was the highest since the boom period of 1919–20, but fares had been reduced below, an economical level, and traffic receipts had fallen. The report showed pft. for the 17 months to December 31st, 1928, £2 780, including £495 brought forwd. Interest absorbed £1 611, and £1 168 was carried forwd.

SIMMS MOTOR UNITS, LTD.—Mr. F. R. Simms, presiding at the meeting on May 9th, said the net profit for the past year was £42 946, against £38 566 last year. The directors had pleasure in recommending a final dividend at the rate of 10%, making 15% for the year, less tax. Their Simms products and electric service throughout Great Britain, as well as overseas, continued to be highly appreciated. The Standard Insulation Co., Ltd., had proved an excellent investment. During the year they opened fully equipped branches in Aberdeen, Liverpool, Johannesburg, and Cape Town, making 20 in all. The report and accounts were adopted.

AEONIC RADIO, LTD.—An extraordinary general meeting was held on May 14th, for the purpose of submitting resolutions increasing the capital of the company to £450 000 by the creation of 2 250 000 additional Ordinary shares of 2s. each. Ald. Sir William Kay (chairman) said that the company's factory was producing over 1 000 sets per week, and with the addition of the new machinery that figure would be increased to 2 500. The anticipated profit from this manufacture would be easily reached, and the directors anticipated a figure in the neighbourhood of £200 000 as a result of the first full year's working. The company had secured the Kramolin factory in Berlin, which was capable of producing 1 000 wireless receivers per day. They had also acquired seventy-one English, German, and American patents, including one relating to an entirely new kind of wireless receiver. The German acquisition gave the company the right to manufacture and sell their portable receivers on the Continent.

ANGLO-AMERICAN TELEGRAPH CO., LTD.—Presiding at the ordinary general meeting on May 14th, Lord Cochrane of Cults referred to the death of Mr. Robert H. Benson, who had been associated with the company for thirty-two years and was chairman for the past three years, and said that his son, Major Reginald Benson, had been elected to fill the vacant position on the board. After reviewing the items of the

Digitized by Google

balance sheet, the chairman said their relationship with the Western Union Company continued to be harmonious. The past year had been one of great activity in the cable world, notably the merger of wireless and cables. Wireless telegraphy, he said, would never entirely supersede cable telegraphy. In support of that theory he pointed out that the cable receipts of the Western Union had increased during the past year, while the volume of traffic handled was greater than that of any other year.

SPHINX ELECTRIC, LTD.—Presiding at the statutory meeting on May 14th, the chairman, Sir A. Cecil T. Beck, said the progress made was in excess of the programme outlined in the prospectus. Sales for the week ending May 4th showed an increase over the preceding week of 33⅓., 150% over the corresponding week of 1928, and 52% over 1927, while for week ending May 11th the increase was 45% over the corresponding week of 1928. Negotiations had reached an advanced stage for the acquisition of a large provincial electrical manufacturing house, with a factory in Birmingham and branches in important industrial centres. The company was also in treaty for a controlling share interest in two associated companies manufacturing and selling patented electrical equipment, contracts now being negotiated in respect of which amounted to several hundreds of thousands of pounds. Should negotiations for the absorption of these additional businesses be satisfactorily completed, an increase in the share capitalisation will be necessitated.

CALCUTTA ELECTRIC SUPPLY CORPORATION, LTD.—Lord Meston, presiding at the meeting on May 8th, said the development of generating power and of the distribution network continued. The fourth 6 000 kW unit in the southern station took up its duties in July last, and one of the old Oerlikon sets at Cossipore was replaced by a 10 000 kW (rated at 12 500 kW) set. They had sold 148 000 000 kWh, compared with 127 000 000 in 1927. The divisible profit was nearly £261 000, against, roughly, £240 000. The board recommended, as a regular policy, a balance between a 12% dividend and a 3 anna domestic flat rate. If a bonus were added to the standard dividend some bonus, rebate or discount should be given to the consumer. While they proposed adding a bonus of 4d. per ordinary share to the dividend of 12%, they proposed to reserve an equivalent amount, £22 550, to give a special rebate or discount to domestic consumers before the end of the current year. They also proposed to reduce the kilowatt charges to large power consumers by roughly 10% all round. An increase of the share capital from 3 000 000 to 4 000 000 shares of £1 each was authorised by the shareholders.

BRITISH ELECTRIC TRANSFORMER CO., LTD.—Mr. A. F. Berry, presiding at the meeting on Tuesday, said there was a decrease of about £30 292 in the gross profit on trading, due to difficulties and price-cutting encountered during the year. It had been decided to postpone consideration of the payment of the preference dividend pending the sale of some of the company's properties. It was a matter of regret that there was no possibility of considering payment of an ordinary dividend. The balance carried forward would be £11 095, against £10 855. In the past three years they had each year turned out apparatus capable of dealing with more horse-power. In the past year they had done a great deal of additional work for a very poor return. Shareholders would, he hoped, find that the step back which they were now taking might prove to be one preliminary to making the biggest jump forward in years to come that they had ever known. They were steadily equipping themselves in their various lines of business to play a prominent part, and one worthy of their long and healthy past. The manufacture of special lamps for sunray "Tricity" radiators had been made necessary by the growing popularity of that section of the business. Consequently they now controlled an electric lamp business, in addition to their older established transformer, heating and cooking businesses. Incidentally, the manufacture of electric lamps had proved most profitable generally—so profitable in some cases that manufacturers of popular lamps had been able to invade the transformer business and cut prices seriously. He saw definite signs which led him to believe that years of great promise lay ahead of them. Their tremendous additional orders were of themselves an indication of great national activity, and they might expect in the next year to begin to share in that national prosperity which should come to the electrical and allied trades. The report and accounts were adopted.

URBAN ELECTRIC SUPPLY CO., LTD.—At the meeting on May 9th, Mr. P. D. Tuckett, chairman, said the total income of past year amounted to £154 323, a decrease of £4 431, which was more than accounted for by the loss, by compulsory purchase, of their Walton undertaking. In practically all their undertakings reductions in price had been made within a period which affected the results for 1928. The balance available in the net profit and loss account was £100 832, an increase of £2 083. The dividend recommended on the ordinary shares was the same as last year, 4% final, making 7% for the year. They proposed to carry forward £22 953, against £22 219 brought in. At the moment it appeared that no sale of their Godalming undertaking to the Aldershot Gas, Water and District Lighting Co. would take place. The Newquay Co. was in a satisfactory condition. It had paid 7% for 1928, and held a substantial balance of undistributed profits invested in Trustee securities. The Cornwall Power Co., in which they had a large interest, had had a setback owing to the shutting down of two large mines, and, although they thought it would recover from this setback, for a year or two it was likely to pay a smaller dividend than in previous years. The additional payment for rates in their undertakings would, under the new assessments, exceed £13 000 per annum. It meant that their profits would be £13 000 less on the business as it existed to-day. They hoped that the normal expansion of their business would in time offset this burden. They had received notice of the compulsory purchase of their Stamford undertaking and of part of the undertakings of the Twickenham Co. They would no doubt receive a satisfactory price for these undertakings, but it must result in a decrease of profits for some years. They did not doubt their ability to maintain their 7% ordinary dividend, but only their ability to increase it in the near future. The report was adopted and the dividend approved.

New Companies.

R. S. BROOKMAN, LTD.—Cap., £1 000. Electrical and genera engineers, etc. Solicitors: Slater, Brunton, Straw and Pearce Loughborough.

ELECTRIC SWEEPERS, LTD.—Cap., £10 000. Agents for and dealers in mechanical appliances, etc. Reg. Office: 405, Oxford Street, London, W.1.

FRANK WALL AND CO., LTD.—Cap., £1 000. Electricians, electrical engineers, suppliers of electricity, etc. Reg. Office: 25, Unino Street, Oldham.

JAMES MITCHELL AND SON (GREENOCK), LTD.—Cap., £15 000. Lighting, heating and electrical engineers, etc. Reg. Office: 7, West Stewart Street, Greenock.

ELECTRIC SUPPLIES AND REPAIRS, LTD.—Cap., £500. Electrical and radio engineers, etc. A director: C. V. Stead, 46, Cavendish Road, West Didsbury, Manchester.

EVERETT'S INTERNATIONAL ACCUMULATORS, LTD.—Cap., £1 000. To acquire and experiment with patents, etc. Reg. Office: Ulster Chambers, 168, Regent Street, London, W.1.

EASTNOR ELECTRIC CO., LTD.—Cap., £500. Electrical and radio engineers, specialists in tramway equipment, switchgear, patent trolley bushes, etc. Reg. Office: 11B, Eastnor Street, Old Trafford, Manchester.

ELECTRO-VORTEX, LTD.—Cap., £5 000. Patentees or manufacturers of plant relating to domestic laundry equipment, dealers in electrical appliances, etc. Solicitors: Sedgley, Caldecott and Co., Knutsford.

GOULD, HARPER AND CO., LTD.—Cap., £2 000. To acquire business of manufacturers of wireless and electrical apparatus now carried on by C. H. Gould and T. Harper at Tatnam Road, Poole, Dorset, as "Gould, Harper and Co."

STONE MANUFACTURING CO., LTD.—Cap., £1 000. Manufacturers and repairers of and dealers in electric batteries, electric lamps and torches, electrical instruments and novelties, etc. Reg. Office: 108/109, Great Saffron Hill, London, E.C.1.

TRI-SIGNS, LTD.—Cap., £600. Manufacturers of and dealers in electric illuminated and other devices, etc. A subscriber: R. E. Haykin, 64, Lower Hastings Street, Leicester, advertising specialist (permanent managing director and chairman).

ELECTRODE WELDING CO., LTD.—Cap., £500. Manufacturers and suppliers of and dealers in all raw materials for electric valve and lamp making industry, including supply of welded electrodes, etc. Reg. Office: 8, Regent Street, London, S.W.1.

CHROMO PROCESS SYNDICATE, LTD.—Cap., £3 000. To adopt agreement with A. A. Postnikow, to acquire patents relating to methods of electrolytically depositing chromium, etc. Solicitors: Arthur Veasey and Co., Aldwych House, Aldwych, London, W.C.2.

ECLIPSE AUTOMATIC DEVICES, LTD.—Cap., £50 000. Manufacturers of and dealers in plant, machines, appliances and apparatus, electrical and general engineers, electricians. Reg. office: Balfour House, Finsbury Pavement, London, E.C. (London Public Co.)

THORNBURY AND DISTRICT ELECTRICITY CO., LTD.—Cap., £15 000. To acquire business of an electricity undertaking carried on by F. H. Grace at Thornbury, Glos, and his rights under the Thornbury and District Electricity Special Order, and to carry on the business of an electric light company. Solicitors: Crossman and Co., Thornbury Glos. (Public co.)

County Court Judgments.

[NOTE.—*The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debt. They may be for actions. But the Registry makes no distinction. Judgments are not returned to the Registry if satisfied in the Court books within 21 days.*]

AVON ELECTRICAL CO., 313, Aigburth Road, Liverpool, dealers. £10 19s. 4d. April 5th.

FOOT, K., 26, New Road, South Chingford, wireless manufacturers. £42 4s. 7d. February 27th.

HERMANN RADIO SUPPLIES, 2A, Willesley Road, Wanstead. £34 17s. 7d. February 21st.

PERRIN, Mr. J., 23, Welderton Road, Stamford Hill, wireless dealer. £21 0s. 2d. March 8th.

RUDD, A. E., Long Ashton, electrical contractor. £16 13s. 6d. April 9th.

WHITEHEAD, Mr. B. J., 4, Queen's Terrace, St. Leonard's, Exeter, wireless dealer. £30 18s. March 11th.

WING, Mr., Radio Charging Depot, Dingwall Road, Croydon, wireless dealer. £38 9s. 7d. March 27th.

Deed of Arrangement.

JONES, Clarence Lionel Frederick, Colwyn Avenue, Rhos-on-Sea, and 14, Mostyn Street, Llandudno, electrical and wireless engineer. Dated May 13th, filed May 14th. Trustee, J. Sandford, Rhos Road, Rhos-on-Sea, accountant. Liabilities unsecured, £708; assets, less secured claims, £235.

Mortgages.

[NOTE.—*The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—allowed by the date of the Summary, but such total may have been reduced.*]

BOWER ELECTRIC (1926), LTD., London, W. Registered May 2nd, by order on terms, £19 992 debentures (secured by Trust Deed dated February 23rd, 1929), present issue £294; charged on certain signs, etc., also general charge. *£750. March 30th, 1929.

CLEETHORPES RADIO SUPPLY, LTD. Registered May 8th. £200 debentures balance of £500; general charge. *£300. June 22nd, 1928.

LISKEARD GAS AND ELECTRICITY CO., LTD. Registered May 9th, series of £6 000 debentures present issue £300; general charge (subject to 1st debentures). *£8 000. November 22nd, 1928.

Satisfactions.

RINGWOOD ELECTRIC SUPPLY CO., LTD. Satisfactions registered May 8th, £15 000 (not ex.) and £15 000 (not ex.), both registered March 10th, 1925, and July 17th, 1926.

TYCHE, LTD., London, S.W., electrical engineers. Satisfaction registered May 10th, £200 registered September 2nd, 1927.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

F. E. INDUSTRIALS, LTD., electrical appliance manufacturers, London and Glasgow. The statutory meeting of creditors in this voluntary winding up was held recently in Glasgow, when Mr. J. M'Connell, the liquidator, reported that the liabilities were £8 628 5s. 11d., made up as follows: Trade creditors, £2 611; cash claims, £3 095; and bank overdraft, £2 922. In addition there was a contingent claim to the extent of £1 000, which was not expected to rank. The assets were estimated to realise £3 314, from which had to be deducted £373 for preferential claims, leaving net assets of £2 941, or a deficiency of £5 687. The assets included stock at Glasgow, £901; stock in London, £1 008; book debts at Glasgow, £796, estimated to realise £630; London debts, £651, valued at £480; office furniture, £433, expected to produce £190; and patent rights £100.

It was reported that the company was formed rather more than a year ago for the purpose of selling washing machines and vacuum cleaners. It was further stated that the company purchased the patent rights of a certain machine, and that efforts were made to sell the continental rights to a German company, but the matter fell through. The company had agreed to pay £2 000 for the continental patent rights. Of that amount £1 000 only had been paid. A sales manager was appointed, but when he submitted his scheme to the directors, there were not sufficient funds to carry it through. Negotiations for the sale of certain rights took place, but they proved abortive, and liquidation took place. It was pointed out that the issued capital was £6 500, and the deficiency as regarded the shareholders of £12 187 was accounted for by the following items: Written off stock, £1 000; bad debts, £340; depreciation of office furniture, £250; loss on patent rights, £1 400; preliminary expenses, £260; cost of negotiations in Germany, £750; and loss on trading, £8 187. A resolution was passed confirming the voluntary liquidation of the company, Mr. T. D. Galbraith, accountant, of Glasgow, being appointed to act as joint liquidator.

London Gazette, etc.

Winding-up Petition.

TELEPHONES AND ACCESSORIES, LTD. A creditors' petition for winding-up has been presented by the Erewash Electric Wire Co., Ltd., Bennett Street, Long Eaton, Derby, and is to be heard at the Royal Courts of Justice, Strand, London, on June 4.

Company Winding-up.

WHITFIELD ELECTRICAL CO., LTD. Meetings, of creditors, May 27th, 2.30 p.m.; and contributories, May 27th, 3 p.m., 29, Russell Square, London, W.C.1.

Company Winding-up Voluntarily.

WORMIT ELECTRIC LIGHT CO., LTD.—By special Resolutions, April 25th, confirmed May 15th. W. Anderson and J. F. Fleming appointed as joint liquidators. Meeting of creditors, Newburgh Road, Wormit, Friday, May 31st, at 7.45 p.m.

Bankruptcy Information.

JOHN, Daniel Blodaufryn, trading as D. B. JOHN AND BROTHERS, 8, Commercial Place, Pontycymmer, and at the Nanthir Stores, Nanthir Road, Blaengarw, electrical engineer. Receiving order, May 13th. Debtor's petition. First meeting, May 30th, 12 noon, 34, Park Place, Cardiff. Public examination, June 20th, 11.30 a.m., County Court, Wyndham Street, Bridgend.

MARSDEN, Charles Bertie, rear of 60, Pisgah Street, Kenfig Hill, electrical engineer. First meeting, May 30th, 11.30 a.m., 34, Park Place, Cardiff. Public examination, June 20th, 11.30 a.m., County Court, Wyndham Street, Bridgend.

"EMPIRE" Lightning Arrestors allow a high rate of discharge, thus dissipating the abnormal conditions in the minimum time while the power current finally broken is reduced to such a low value as to prevent any secondary disturbance—two of the most important points in the design of the Lightning Arrestor. These Lightning Arrestors are suitable for voltages from 6,600 volts to 66,000 volts.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

308 641 H. Griffiths and E. Passburg. Process and apparatus for drying and impregnating in vacuo, particularly applicable to the manufacture of insulating-materials. (23/12/27.)
308 672 Creed and Co., Ltd., F. G. Creed, R. D. Salmon and S. E. Kirk. Electric telegraphic receiving-apparatus. (24/12/27.)
308 744 A. Reyrolle and Co., Ltd., N. Cooke and B. H. Leeson. Electric protective arrangements. (28/12/27.)
283 893 Siemens and Halske Akt-Ges. Luminous reproductions of circuits. (19/1/27.)
284 325 Siemens-Schuckertwerke Akt.-Ges. Electric bell installations fed from small transformers. (28/1/27.)
308 856 Igranic Electric Co., Ltd., and S. R. Wright. Slow-motion adjusting-devices for wireless instruments. (26/1/28.)
299 295 Siemens and Halske Akt.-Ges. System of connections for telephone installations. (22/10/27.)
308 876 H. Froger. Electrical remote-control systems. (1/3/28.)
308 879 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Electric discharge tubes. (5/3/28.)
297 311 Hirsch Kupfer- und Messing-werke Akt.-Ges. and M. Tama. Electric furnace for heating strip metal by induction currents. (17/9/27.)
308 888 P. R. Shackel and Ranton, Ltd. Cord grips for electric fittings and appliances. (16/3/28.)
308 892 Gramophone Co., Ltd. and E. M. Payne. Electromagnetic vibratory devices for use, for example, in reproducing or recording sound. (21/3/28.)
308 895 J. E. Brown, E. G. Anness and W. Meacher. Indicating or warning devices for excess electric currents. (27/3/28.)
308 902 E. H. Newman and M. Baynes (trading as Langham Radio) and V. S. Knight. Wireless apparatus. (5/4/28.)
290 157 N. V. Philips' Gloeilampenfabrieken. Resistance lamps and rectifying-installations embodying such lamps. (7/5/27.)
308 908 Best and Lloyd, Ltd. and W. Morris. Shade fittings for electric and other lamps. (21/4/28.)
308 910 A. Andersson, K. Ohlsson, G. Sanderson and B. Sanderson (trading as A. Sandersons Linjeringsmaskinfabrik). Electric flasher. (24/4/28.)
308 913 R. Amberton and Electrical Apparatus Co., Ltd. Electric resistances. (28/4/28.)
289 781 Soc. Belge Radio-Electrique. Variable electric condensers. (30/4/27.)
293 378 West Manufacturing Co. Test-sets for locating faults in electric transmission lines. (5/7/27.)
308 933 Automatic Telephone Manufacturing Co., Ltd. and G. W. Simister. Suction or blowing apparatus. (29/6/28.)
294 959 Electroacustic Ges. Sub-aqueous sound transmitting or receiving apparatus. (2/8/27.)
295 719 British Thomson-Houston Co., Ltd. Machines for forming rings of segmental pieces. (19/8/27.)
298 614 Telefunken Ges. fur Drahtlose Telegraphie. Frequency-changers for use in picture and other high-speed telegraph systems. (12/10/27.)
308 951 A. C. Wynne. Electric switches. (21/1/28.)
308 473 A. E. O'Dell (Deutsche Telephonwerke und Kabelindustrie Akt.-Ges.). Apparatus for electrically transmitting to a distance the indications of a measuring-instrument or the like. (24/10/27.)

Applications for Patents.

COMING EVENTS.

Friday, May 24th.

Institution of Electrical Engineers (Western Centre).—Queen's Hotel' Cheltenham. Summer meeting.

Physical Society.—Imperial College of Science, Imperial Institute Road, South Kensington. Paper by Dr. J. H. Vincent on "Experiments on Magneto-strictive Oscillations at Radio-Frequencies." 5 *p.m.*

Monday, May 27th.

Electrical Contractors' Association (Ealing Sub-Branch).—Ordinary meeting.

Tuesday, May 28th.

Electrical Contractors' Association (Chesterfield Sub-Branch).—Falcon Café. Ordinary meeting.

Wednesday, May 29th.

Electrical Contractors' Association (Croydon Sub-Branch.)—Ordinary meeting.

Electrical Association for Women.—Model Electric Kitchen, 46, Kensington Court, London. Lecture demonstration with a thermal storage electric cooker, by Mrs. H. Dover. 3 *p.m.*

Electrical Contractors' Association (Belfast Branch).—5, Bedford Street. Ordinary meeting. 3.30 *p.m.*

Polytechnic School of Engineering.—307–311, Regent Street, London. Lecture III (Course of six lectures) on "Thermionic Valves," by Mr. W. H. Date. 6.30 *p.m.*

Thursday, May 30th.

Batti-Wallahs' Society.—Hotel Cecil, Strand, London. Luncheon. Speaker, Mr. H. S. Horne on "A Layman's View of the Electrical Industry." 1 *p.m.*

The I.M.E.A. Convention.

NEXT week ushers in the Electrical Conference Month. Delegates to the thirty-fourth annual Convention of the Incorporated Municipal Electrical Association will assemble at Torquay, during Monday and the programme for the week clearly points to another very instructive and enjoyable conference. It would be difficult to imagine a more attractive centre for such a gathering, and a large attendance is definitely assured. With one exception, the papers for discussion are not strictly related to the engineering side of electricity supply, and may therefore be expected to prove of unusual interest to the chairmen and other representatives of Electricity Committees who, in some other years, have felt rather out of their element at the I.M.E.A. meetings. Mention of this fact should not be taken to mean that the subjects should not be of equal interest to the engineer-delegates, but rather that the discussions will be brought on to ground of more common interest to technical and non-technical men. Looking critically at the programme, we think there should have been at least one paper dealing with the distribution problem, than which there is none more important to supply authorities at the present time, but otherwise the subjects seem to be well chosen. Probably the paper most likely to be provocative of vigorous discussion will be that on "Standardisation of Methods of Charge," a matter which we believe to be only inferior in importance to distribution and salesmanship. The social side of the Convention is, if anything, stronger than usual, and the only feature we could wish to see altered is the policy of excluding manufacturers' representatives from full participation in the proceedings. Later pages of this issue contain articles relating to the President's undertaking, which the delegates will not see, and to the Torquay enterprise which will be officially open for inspection on the final day of the Convention. Next week, as is customary, we shall publish a very full and specially illustrated report of the entire Convention, including an account of all the discussions. Copies of this complete report will be available in Torquay **next Friday.**

The Torquay Exhibition.

FROM the advance information sent to us by manufacturers who are showing at the I.M.E.A. exhibition which opens at Torquay on Monday, it is apparent that this exhibition grows in popularity each year. Next week's exhibition will introduce a number of new lines in the way of heavy and domestic equipment, but what is still more pleasing is the fact that the list of exhibitors contains several names which have not appeared at this exhibition before. Of these may be mentioned one in particular which, though new to the electrical world, attaches such importance to the I.M.E.A. Exhibition, that Torquay will be the scene of its electrical debut. Domestic appliances will again constitute the bulk of the exhibits, and with the number of councillors and committeemen visiting the exhibition, manufacturers are wise to cater for a comparatively non-technical public. Such equipments as are suitable for load-improving, together with hiring or hire-purchase are of interest to both councillors and engineers, and though on the other hand the engineer may be equally interested in switchgear, many sales would be lost were the non-engineering visitors not adequately catered for. As we have already mentioned, the papers to be read at this year's Convention are of particular interest to members of Electricity Committees, and no doubt the number of visitors to the exhibition will, this year, be considerably increased by those, who, though of the electricity supply industry are not actually in it.

Mr. Purse's New Post.

MANY of our readers, and in particular those connected with the municipal electricity undertakings, will echo our congratulations to Mr. F. W. PURSE on his appointment as chief engineer of the London and Home Counties Joint Electricity Authority, and our cordial wishes for success in a task for which he is exceptionally well qualified. Up to now the history of the Joint Authority can hardly be described as epoch-making, but the mere announcement of Mr. PURSE'S appointment is sufficient guarantee that there will be no reason for such impressions in the future. The large and densely populated area with which the Authority is concerned is admittedly one which presents peculiar and difficult problems from the supply point of view, but at the same time it cannot be denied that in London itself electrical development is at present notoriously impeded by the high charges which consumers in certain districts must pay if they want a supply of electricity. By wise exercise of its functions the Authority

Digitized by Google

can materially improve matters, and though there are some parts of London enjoying a supply so cheap that no outside intervention can lead to still lower prices we feel confident that the higher-priced areas will now gradually be brought into line with their more fortunate neighbours. The problems to be tackled in bringing about this eminently desirable state of affairs are essentially concerned with salesmanship and distribution, as apart from generation, and the Joint Authority is fortunate in its choice of an engineer who was probably the first to emphasise the difference.

Fans and Refrigerators.

THE good weather which has prevailed throughout the current month will lend point to the E.D.A. selling campaign for June, in that the appliances which form subjects of the campaign are fans and refrigerators. The window displays for the month are again simple and attractive, and specimens of two layouts are illustrated elsewhere in this issue. With these windows in view, we published two weeks ago particulars of a number of new and improved fans for the coming season, and, after considering the information contained in our article, electrical contractors and supply authorities with showrooms should be in a position to design a fan window which will display not merely fans, but the latest models which the manufacturers have to offer. Intelligent use of the E.D.A. window and the manufacturers' propaganda may reasonably be expected to make the fan sales for June exceed those of a previous year. Although it is no new thing for the electrical manufacturer to issue special literature and advertising matter to the trade, the fact that this year such propaganda may be linked up with special window displays gives to the contractors an opportunity they have not previously enjoyed, and one which, if rightly used, should establish a fair trade throughout the whole of the summer.

More Poaching.

FROM time to time we have deplored the inroads which various classes of non-electrical retail traders have made into the shop side of the electrical contractor's business, and there are signs that our repeated warnings have not been lost upon those contractors who, through too much concentration on the wiring side, have tended to overlook the big potentialities of appliance sales. Not long ago we had occasion to refer to the activities of the ironmongers in this field. Now it appears that cycle dealers are casting envious eyes upon the electrical trade, and a writer in a cycle trade paper seriously suggests that cycle traders should now establish themselves as the source of supply of electrical fittings, and "get in ahead of the boom that is surely coming." Obviously the cycle dealers have not the technical qualifications which permit the electrical contractor to give sound advice and real service to his customers, but the public does not always realise this. The growing interest of the "dabblers" in the electrical appliance trade suggests that these outsiders are more fully appreciative of the possibilities than are some of the engineers who have grown up in the business.

The Ironmongers' Policy.

IF further evidence were needed of the consistent and growing interest which ironmongers are showing in regard to the retail selling of domestic electrical apparatus, it will be found in a short paper and discussion at the conference at Cromer last week, of the Ironmongers' Federated Association. Here the question: "Should Ironmongers Develop the Electrical Department?" was given a definitely affirmative answer, but we were interested to see that there is growing appreciation of the futility of going into the electrical business as a side-line. In fact, the author of the paper, who is a registered contractor, and has had twenty-five years' experience on the electrical side, made it perfectly clear that the ironmonger seeking to start in the electrical business to-day "will not find it worth while unless he can acquire the necessary adjuncts to commence right away as a first-class electrical contractor." The importance of placing the electrical business in the charge of a properly qualified manager was also stressed. If ironmongers proceed to develop the retail electrical trade on these lines, their activities will be placed on a proper competitive basis, which makes it all the more important for electrical traders to be up and doing, for they will no longer be faced with the unfair competition of the "dabbler" but with what will probably prove to be the still stronger effective competition of a class of trader which is and has for many years been in the most intimate contact with the members of the general public.

Needless Agitation.

WHILE we cannot bring ourselves to view with contempt and loathing those who have been so foolhardy as to raise objections to the erection of the new power station at Battersea, the protests which are now being made against the erection of overhead lines forming part of the "grid" in certain parts of the country leave us cold, because we know from actual observation that the fears of the objectors are quite without foundation. We have passed through some of the loveliest scenery in the British Isles and we have examined the steel tower lines which traverse that district—and are almost identical with those which are being erected by the Central Board—in a particularly critical spirit. We noted their effect against all kinds of background, backed by woods, and standing stark on barren rocks. In many cases the towers were hardly perceptible, but even where they were clearly visible they caused no serious disfigurement. In certain situations, in fact, they added interest to a featureless tract. During that same tour we could not fail to be impressed with the appalling sight of some of the ubiquitous Post Office pole lines. It is impossible to escape them for more than a few minutes at a time. They make possible a useful public service and are not objected to by rural preservation societies. The grid lines are infinitely better to look at, they do not cumber every lane, and they are the channels of a public service even more important than communication. Agitation against their erection is, therefore, pointless and unreasonable.

"Light's Golden Jubilee."

WE have been privately and gently reproved by one of our friends of the National Electric Light Association of America for our action in drawing attention to the fact that the late Sir JOSEPH SWAN was the inventor of the first commercial incandescent electric lamp. While we are sorry that our American friends seem to regard it in that way, we have already made it quite clear that in upholding the rightful claim of a British inventor we have no wish to depreciate the many other achievements of Mr. EDISON, whose first incandescent lamp was produced nearly a year later than SWAN'S. Our N.E.L.A. friend emphasises that they do not claim that EDISON invented the principle of the incandescent lamp, or even that he was the first to consider the use of carbon for this purpose, "the claim is made, however, with considerable assurance, that in 1879 he did devise a lamp which, together with his complete incandescent lighting system and his invention of a dynamo that would give a constant voltage, was the foundation of the electrical industry of to-day." In conclusion our correspondent says that as a practical system of lighting by use of the incandescent lamp was born in 1879, "the people of the United States are quite justified in celebrating its golden jubilee." If the celebration is to be confined to "the people of the United States," and it is clearly understood that the occasion is the fiftieth birthday of the first *American* lamp, we have nothing further to say. But we cannot help remembering that the celebration has throughout been planned as an international tribute with which the whole world would be associated. The change of front noticeable in the extracts quoted above shows that our protests have not been wasted, but a frank acknowledgment of SWAN'S priority, made publicly during the proceedings at Atlantic City, would be more to the point.

The I.M.E.A. President's Career.

MR. A. NICHOLS MOORE, M.I.Mech.E., M.I.E.E., President of the Incorporated Municipal Electrical Association, is Borough Electrical and Tramways Engineer of Newport. A brief sketch of his career is given on this page, and a descriptive account of the Newport undertaking begins overleaf.

MR. A. NICHOLS MOORE, this year's President of the Incorporated Municipal Electrical Association, was born at Cheltenham, educated at Whitgift School, and acquired his technical training at the Sheffield School of Technology, where he took the civil and electrical engineering course. He served as a premium pupil with the Brush Electrical Engineering Co., Ltd., and was also for a time in the office of Mr. W. J. Walker, consulting engineer, Westminster.

In 1902 he obtained his first appointment in the Manchester Corporation Electricity Undertaking, serving in various capacities under Dr. S. L. Pearce, and being more particularly associated with the development of the Stuart Street station. In 1906 he was appointed resident engineer to the Belfast electricity undertaking, in which position he was responsible for the supervision of the construction of their tramways power house. In the following year he became deputy city electrical engineer, a position which he occupied until 1912. It was whilst in Ireland that he first met, and subsequently married, the eldest daughter of the late Mr. Henry Ashbee, of Greystones, Co. Wicklow.

In the early part of 1912 he was appointed borough electrical and tramways engineer at Newport, where one of his first duties was the reorganisation of the Electricity Department and the preparation of a scheme of extensions. Since that time he has prepared and been responsible for several further large extension schemes.

Probably one of the most outstanding schemes which Mr. Nichols Moore has carried out at Newport is that for the utilisation of the River Usk for circulating water purposes.

Mr. Nichols Moore is a member of the Institution of Electrical Engineers and a member of the Institution of Mechanical Engineers, and was first elected to the Council of the Incorporated Municipal Electrical Association in 1921. As is well known, he, in conjunction with the immediate Past-President, Mr. F. W. Purse, has always been a strong advocate of greater representation on the I.M.E.A. Council of the smaller undertakings, and it was due to their joint efforts that the necessary alterations in the articles of association were secured which enabled such greater representation to be obtained. Mr. Nichols Moore has always taken a keen interest in the Association's work, and has for some years been chairman of the municipal section of the I.M.E.A.-B.E.A.M.A. Joint Committee, in whose work, as is well known, he has been particularly interested. He is the Association's representative on various outside organisations, and has more recently been appointed a representative of the Association on the Conjoint Conference of Public Utility Associations. He is also a member of the Electric Fittings Statutory Committee.

In addition to his official duties under the Newport Corporation and his work on the Council of the Incorporated Municipal Electrical Association, he has been actively engaged in many other directions. He was for nine years honorary secretary (provincial) of the Associated Municipal Electrical Engineers (Great Britain and Ireland) and is a Past-President of that Association. Its establishment in its present position as a representative body was due in considerable measure to his untiring efforts on its behalf. On account of increasing pressure of work he resigned the honorary secretaryship of the Associated Municipal Electrical Engineers last year.

During the war, although exempted for munition purposes from military service, he on two occasions offered himself under the Derby Scheme, but was rejected in view of the importance of the work upon which he was engaged under the Ministry of Munitions in connection with the carrying out of large extension schemes for the supply of electricity for war purposes. He acted as consulting engineer to the Newport Shell Factory and the Uskside National Works, was a Technical Adviser on the Board of Trade Tramway Committee (South Wales and Monmouthshire Area), and was appointed by the Coal Controller as District Engineer to advise on industrial coal economy. He was for some years one of the technical advisers in the South Wales and Monmouthshire Area in connection with the Ministry of Labour Training Scheme, and one of the original members of the committee appointed by the Electricity Commissioners to consider and report upon a scheme for the development of electricity supply in the South Wales and Monmouthshire Area under the Electricity (Supply) Act, 1919; at a later date, when the Advisory Committee was established, being co-opted a member of that Committee. He has also acted as consulting engineer to the Monmouthshire County Council and more recently to the Llantarnam U.D.C. in connection with their successful application for a Special Order.

THE I.M.E.A. PRESIDENT'S STATION.

Development of the Newport Electricity Undertaking—A Big Industrial Load—Brief Outline of Circulating Water Scheme—The Use of Submarine Cable—Remarkable Growth of the Cooker Load.

FOLLOWING our usual practice when the I.M.E.A. Convention is held away from the President's home town, we give below some details of the Newport undertaking, of which Mr. Nichols Moore has had charge since 1912. Newport is the chief town and port of Monmouthshire, and is situated on the River Usk adjacent to the Bristol Channel. Although in beautiful surroundings, it is essentially an industrial borough.

General view, from the river, of the East power station, Newport.

It has an interesting history, dating from the time of the Romans, but of its earliest days very little has been written. It is known that in the earlier centuries it was the centre of much fighting, in which its historical castle played an important part. The historical interest of Newport may possibly be said to have concluded with the Chartist Riots in 1839, concrete evidence of which may still be seen in a number of bullet holes in the entrance to the famous Westgate Hotel.

Newport has a population of 100 000, and was created a county borough in 1891, its present area being eight square miles. The district surrounding Newport is teeming with collieries, iron and steel works, blast furnaces, rolling mills, tinplate works, and other manufactories, whilst in the town itself are large sheet-iron rolling mills, bar mills, pipe mills, nail factories, chemical works, etc., and a large number of important and extensive ship repair yards. One of the principal features of the town is the docks, which are owned by the Great Western Railway Co., and which include one of the largest wet docks in the country with a sea lock 1 000 ft. long, 100 ft. wide, and 44 ft. 6 in. deep. The total water area of the docks is 135 acres. Owing to its geographical situation Newport is rapidly becoming the gateway to the Midlands for extensive exports, the admirable railway connections between Newport and the Midlands greatly facilitating this. Newport's chief exports are coal, iron, steel, patent fuel, and coke, and its chief imports iron ore, unwrought steel, manganese, timber, etc.

The Original Station.

The Newport Corporation electricity undertaking was first established in 1895, when the Llanarth Street works were erected on the western side of the Usk and a single-phase alternating current supply for private and public lighting was provided. These works are still in existence, but have been closed down as a generating station, and are now the principal sub-station and distributing centre in the heart of the town. The closing of the works as a generating station was made possible by the recent completion of a frequency-lowering scheme, by which scheme the old frequency of 87·5 has been dispensed with and the standard frequency of 50 substituted.

With the introduction of electric traction it became necessary to provide a new generating station, and the East power station, situated on the eastern side of the river, was erected in 1902. With the development of electricity supplies, however, it speedily became necessary to enlarge the station and make it the main generating station for all purposes, and in 1911 the extra high tension three-phase alternating system was introduced and the first turbo-alternator unit installed, this being a 1 500 kW Willans-G.E.C. set.

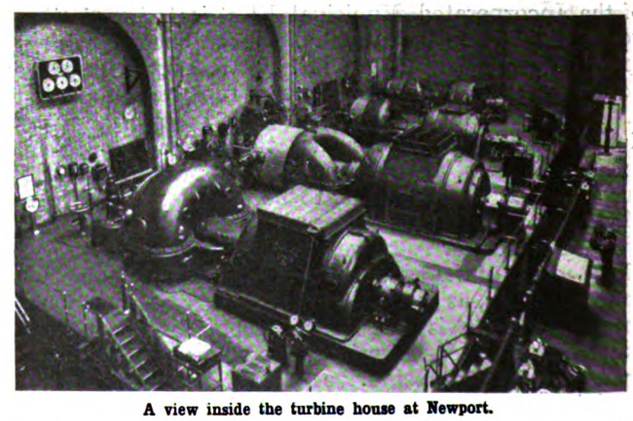
The subsequent development of the undertaking has been exceptionally rapid. At March 31st last the total output from the station in units generated was 41 301 191, the maximum demand 12 975 kW, the total kilowatts connected to the system 52 028, and the total number of consumers 13 293. The aggregate capital expenditure upon the undertaking was £1 150 000 and the net loan debt outstanding £867 897, the estimated income being £190 000.

Big Industrial Users.

The major portion of the supply is for industrial purposes, and with one exception all the large industrial works in Newport, including the G.W.R. Alexandra Docks, take their electricity supplies from the Corporation. In 1922 the Corporation obtained their Electricity (Extension) Special Order, which very considerably enlarged their electricity area, and it now embraces approximately 27 square miles. Much of the added area is rural, and is being actively developed.

The total installed generating plant capacity at the station is 34 500 kW, consisting entirely of turbo-alternator units, two of which have each a rated output of 10 000 kW, suitable for operation on a 6 000 V three-phase 50-cycle system. Both units consist of Escher-Wyss turbines, coupled in the one case to a G.E.C. alternator and in the other to a Brown Boveri alternator, with surface condensing plant in both cases supplied by Messrs. Worthington-Simpson, Ltd. For adequately handling the plant in the turbine house a 50-ton electrically-operated crane, manufactured by Messrs. Royce, Ltd., has been installed, in addition to which an old 25-ton crane is still available. For operating and controlling the generating plant and delivering the supply to the system very complete switchgear has been installed, consisting of direct current switchgear for dealing with the traction supplies and the direct current lighting and power supplies, and extra high tension ironclad cubicle switchgear, electrically-operated, for controlling the main alternators and the outgoing extra high tension trunk feeders. The whole of the switchgear is installed in an annexe adjacent to the turbine house, and most of it was supplied by the Metropolitan-Vickers Electrical Co., Ltd. The control board for operating the extra high tension switchgear is situated in a gallery in the turbine house. The works power transformers and reactors for the main generators are also installed in the annexe.

The steam-raising plant in the boiler house has a total normal evaporative capacity of 340 000 lb. per hour, and consists of a battery of two marine-type water-tube boilers,



A view inside the turbine house at Newport.

each having a normal evaporative capacity of 60 000 lb. per hour, and four similar boilers each having a normal evaporative capacity of 35 000 lb. per hour. The operating pressure of the four smaller boilers is 260 lb. per sq. in. but the two larger boilers have been designed for an ultimate working pressure of 300 lb. per sq. in. The remaining boilers are of the land type suitable for a working pressure of 160 lb. per sq. in., but these boilers will shortly be put permanently out of commission. The two larger units referred to were manufactured by Babcock and Wilcox, Ltd., and are of the very latest design. They are fitted with economisers, preheaters, mechanical stokers, forced and induced draught

Digitized by Google

plant, and Davidson grit arrestors, the draught plant being placed on the roof of the boiler house. There are a number of very interesting features attaching to these two larger units, and there is a slight difference between them. One unit has been fitted with a standard Babcock pre-heater, whilst the other unit has been fitted with a Carrier-Owen combined primary and secondary pre-heater, and it is anticipated that very interesting comparative data will be obtained when these two units are tested. The guaranteed efficiency on the first unit is 86 % and on the second unit (with the Carrier-Owen pre-heater) 88 %. The usual automatic coal conveyors and ash-handling plant are installed, and are of the very latest type. For handling the ashes and conveying them from the works an overhead telpher plant is provided, the ashes being removed from the concrete ash bunkers, which are placed below ground, and transferred to the dumps for ultimate disposal. Both steam-driven and electrically-driven feed pumps are in use, also evaporator and de-gassing plant supplied by Messrs. P. and B. Evaporators, Ltd., and, in addition, the other necessary auxiliary plants which are to be found in any modern high-efficiency station have been provided. The total storage capacity of the service bunkers in the boiler house is 2 500 tons.

Circulating Water Requirements.

Until recently cooling towers were the only means available for providing the necessary circulating water for condenser cooling purposes, but as a result of exhaustive experiments carried out with the approval of the Electricity Commissioners it was ascertained that the River Usk was entirely suitable for this purpose, although it had always been assumed in the past that such was not the case. To enable the experiments to be carried out, an experimental pumping station, now known as "No. 1 Pumping Station," was installed, and is at present in continuous operation, its capacity being 300 000 g.p.h. So satisfactory were the results obtained that the Newport Council unhesitatingly adopted the report and recommendations of Mr. A. Nichols Moore, their borough electrical engineer, and the Electricity Commissioners laid it down that all future circulating water requirements for the power house should be provided from the River Usk. To enable this to be done a large pumping station has been installed adjacent to No. 1 Pumping Station. The construction of this second pumping station involved a number of civil and mechanical engineering difficulties, which have been successfully overcome. The River Usk in the vicinity of the power house has a maximum tidal range of 33 ft. at ordinary spring tide, but at certain seasons of the year this is very much increased. The highest recorded tide is + 28·00 and the lowest —13·50, and these levels were used in designing the new pumping station.

The following brief general outline of the scheme may be of interest. It consists of the construction of an intake sump in the river, with twin culverts 42 ft. in length connecting the intake to the pumping station, which is built into the river bank, and contains an intake chamber, four screen chambers, and two pump chambers. To enable the pumping station to be constructed a steel caisson was built up on a prepared and levelled site on the river bank, and as the caisson was gradually sunk into the bank the concrete walls of the pumping station were formed. The caisson measured 47 ft. by 48 ft., and had a working chamber of 8 ft. high, with two connections in the roof for attaching the shafts by means of which the excavation was removed when the caisson was under air pressure.

At first very little headway was made owing to the constant flooding of the working chamber, and it was decided to erect air locks and work under continuous air pressure. Unfortunately during the period of sinking the caisson very considerable movement of it took place riverwards, and this gave rise to great anxiety, as it was essential that the caisson in its finished position should not project beyond the wharf line of the Harbour Commissioners. It was decided to carry on work continuously day and night, including week-ends and holiday periods, and ultimately the creepage riverwards was stopped, the caisson being founded on the marl at a level of — 36·50 and the working chamber sealed with concrete and grouted up with cement. On the top of this concrete chamber the pump house building was subsequently erected.

In order to provide the necessary pool at dead-low water and to ensure that there should be no appreciable rise in temperature in the river in the vicinity of the power house, it was essential to construct a discharge well and spillway further down the river, and this work is now proceeding, a temporary discharge in the meanwhile being used. The two pump chambers are designed to take a total of four units consisting of vertical spindle centrifugal pumps, and two units manufactured by Worthington-Simpson, Ltd., are now installed, each having a capacity of 1 000 000 g.p.h. against a head of 76 ft. They are driven by 550 B.H.P. G.E.C. motors at 320/520 r.p.m., fixed at the pump room floor level.

Screening plants manufactured by Babcock and Wilcox, Ltd., have been installed in two of the screen chambers, and consist of 48 in. band screens each capable of dealing with the necessary quantity of water under the lowest tide-level conditions, together with all necessary auxiliary plant. An interesting feature is the provision of penstocks in the screen chambers so as to enable any particular screen chamber to supply water to any individual pump.

The general scheme, including the whole of the pumping plant and other machinery, was prepared by Mr. A. Nichols Moore, and in connection with the civil works he had the valuable assistance of Major W. E. Lloyd, the borough engineer, who accepted full responsibility for this portion of the scheme.

The main contractors for the construction of the pump house building were Sir William Arrol and Co., Ltd., and for the whole of the pumping plant, screening plant, etc., Worthington-Simpson, Ltd. The ultimate capacity of the pumping station is not less than 5 000 000 g.p.h., and under low tide and dry weather flow conditions it has been ascertained that there will be ample water in the river to provide for this capacity.

An interesting feature in connection with the distributing system is the submarine cable scheme, which connects the power house on the eastern side with the western side, where a very large proportion of the industrial demand is situated. For this reason it was necessary to provide ample underground feeder capacity between the East power station and the western side of the river, and to avoid the heavy cost of laying underground trunk feeders over Newport Bridge and round into the western district, it was decided to lay down in the river four extra high tension 6 000 V submarine cables, together with pilot and telephone cables. These submarine cables are connected with the underground feeders at either end in disconnecting chambers provided with selective link gear, and, to provide for the possibility of increased transmission pressure at some future date, the cables were designed for an ultimate working pressure of 11 000 V. The submarine cable scheme involved very serious engineering considerations and great difficulties, but these were all successfully overcome, and the scheme carried out and completed well inside the contract period, the responsible contractors being Messrs. Callender's Cable and Construction Co., Ltd.

To enable the high tension supplies from the East power station to be stepped down and delivered for general purposes throughout the electricity area, a large number of static sub-stations have been erected in which the 6 000 V supplies are transformed down to 200/230 V, as may be required. In addition there are now being installed a number of kiosk transformer sub-stations in the more outlying districts where development is taking place, and ample area has been acquired to provide sites for the kiosk transformer sub-stations and to enable permanent sub-station buildings to be erected later where necessary.

Domestic Developments.

Mention may perhaps be made of two outstanding features of domestic development in connection with the Newport undertaking, viz., the remarkable development of the cooking load, and the assisted wiring scheme. The former has made astounding strides. It was introduced in 1923, and to-day the number of cookers on consumers' premises is over 3 000, whilst additional cookers are being installed at the rate of upwards of 30 per week. The assisted wiring scheme was introduced in 1926, and at March 31st, 1929, 3 742 installations had been connected. A very large number of these consumers are also users of electric cookers and other domestic apparatus, the total number of units supplied for domestic cooking and heating purposes for the year ending March 31st, 1929, being 5 300 000.

From the foregoing it will be seen that the undertaking is being rapidly and completely modernised so far as the power house is concerned, and that on the distribution side every opportunity is being taken to ensure a rapid development of electricity supplies and the provision of all possible facilities for those living within the Corporation's electricity area to make the fullest use of the energy provided.

THE TORQUAY UNDERTAKING.

Remarkable Growth from Small Beginnings—Bulk Supplies to Neighbouring Towns—The Distribution System—Progress in Development of Supply in Rural Areas.

OWING to the fact that the recent extensions to the Torquay Corporation's Newton Abbot station were extensively described in THE ELECTRICIAN of May 3rd, we are unable to follow the usual custom of giving in our pre-Convention issue a full account of the electricity undertaking at the Convention centre. On this and succeeding pages, however, we present some supplementary particulars and pictures which should prove of interest to I.M.E.A. delegates who will have an opportunity of making a personal inspection of the station next week.

Mr. H. F. G. Woods, Torquay's borough electrical engineer and manager, whose retirement (previously announced) is delayed until the close of the I.M.E.A. Convention.

The historical side of the Torquay enterprise is amusingly developed on a later page, but it may here be mentioned that the Corporation secured its Electric Lighting Order in 1891. At the outset the choice of a site suitable for a generating station presented formidable difficulties on account of the peculiar configuration of the town, and it was eventually decided to establish the works in certain stores and cellars on the harbour side at Beacon Quay.

The system of supply adopted was alternating, single-phase at 50 cycles, with a primary distribution pressure of 2 000 V for supplying at 200 V from street transforming stations.

The supply was commenced in March, 1898. From time to time various plant extensions were made to meet the growth of the business, and by 1910, the available space being fully occupied, the necessity for finding a new site became apparent.

The emission of smoke also from the works chimney, aggravated by the unavoidably cramped dimensions of the boiler combustion chambers, had become a pronounced nuisance, which rendered the removal of the station from its position on the sea front desirable.

Although careful consideration was given to various alternative sites, the increased size of the station had rendered the old problem even more difficult, and, as no immediate and satisfactory solution could be found, it was decided to crowd in more generating plant upon the old site to enable the pressing demands for electricity to be met.

At that date the supply to the Torquay Tramways Co. accounted for the major portion of the total output, while the bulk of the remainder was used only for lighting purposes.

By the year 1920 effective generating plant of 3 000 kW capacity had been installed. Owing, however, to the cramped boiler house space, the maximum steaming capacity was only equivalent to 1 500 kW without reserve; and the maximum demand had already reached that limit.

Factors Determining Policy.

The determination of the future policy of the undertaking had consequently become a matter of pressing urgency, and the Electricity Committee gave earnest consideration to the question of establishing a new station upon another site.

It being evident that no suitable site existed within the borough, attention was directed beyond its boundaries, and a site upon the River Teign, adjacent to the Great Western Railway Co.'s main line at Newton Abbot, was eventually selected as offering the requisite facilities for a larger station, and at the same time being situated at a centre suitable for distribution to other townships as well as to Torquay.

The town of Newton Abbot was supplied with electricity from a direct-current station of 520 kW capacity, owned by the Urban Electric Supply Co., Ltd., and situated close to the site selected by the Torquay Committee.

The nature of the Newton Abbot load was largely industrial, while the Torquay load was of a domestic character. The advantages to be gained by the combination of these loads from the outset were, therefore, apparent.

As the most expeditious means of effecting this, it was decided to acquire the Newton Abbot undertaking and to utilise their site, with additional lands, for the new station.

An agreement was thereupon completed between the Torquay Corporation and the Newton Abbot U.D.C., by which the latter were to exercise their option to purchase the company's undertaking, and, after so purchasing, to transfer the undertaking to the Torquay Corporation. Power to effect this transfer and to raise the necessary capital was obtained by the Torquay Corporation (Electricity) Act, 1922.

The Extended Area.

By the same Act the Torquay area of supply was extended to include, as well as the Urban District of Newton Abbot, the intervening parishes of Abbotskerswell, Coffinswell and Kingskerswell. The parish of Cockington was added by the Torquay Corporation Electricity (Extension) Order, 1923.

The Act of 1922 provided that the amount of the purchase price of the Newton Abbot undertaking should be determined by arbitration. The arbitration proceedings were, through various unavoidable causes, delayed until March, 1923, and the purchase was not actually effected and the undertaking transferred to the Corporation until May 1st, 1923. Plans and specifications for the new plant and buildings had already been prepared and all contracts placed before that date, and as soon as the Corporation took possession of the site, work on the construction of the new station was commenced and rushed forward with all possible speed. Progress was seriously handicapped by prolonged spells of bad weather and by floods, which, often for days together, prevented any access to the riverside works. In consequence of these delays the erection of plant was not commenced until March, 1924. Simultaneously with the construction of the new station, the receiving sub-station and new general offices were built at Torquay.

The underground trunk mains between Newton Abbot and Torquay were laid during the summer of 1923, and the numerous new 2 000 V mains in Torquay, necessitated by the change of supply from Beacon Quay to the main new sub-station, and from single-phase to two-phase, were laid in the early part of 1923. Beacon Quay was shut down on July 12th, 1924.

The area over which the Torquay Corporation have distributing powers totals 193 sq. miles, including the area covered by the Extension Order now pending. In addition, supplies in bulk are given to the Paignton Electric Light and Power Co., Ltd., and to the Teignmouth Electric Lighting Co., which together cover an area of some 150 sq. miles.

The primary e.h.t. transmission is at 11 000 V, and in consequence of the h.t. pressure having been fixed originally at 2 200 V at Torquay, that pressure has been retained for secondary transmission in the towns, and adopted for local distribution in the rural areas. The borough of Torquay is supplied from the main sub-station in the Upton Valley.

The e.h.t. 11 000 V switchgear at the Torquay sub-station is of the B.T.H. Co.'s compound-filled draw-out truck type. The equipment comprises 14 panels which control the two incoming feeders from Newton Abbot, the two incoming-outgoing ringmain feeders to Paignton, three rotary convertors for supplying the Torquay Tramways Co. and the various three-phase—two-phase transformers which supply the Torquay 2 200 V single-phase system.

Distribution in the town of Newton Abbot was originally given on the 3-wire d.c. system. With the exception of the main shopping centre, in which d.c. has been retained for special reasons, the distribution has now been converted to a.c., which is supplied from two main sub-stations situated, one at the power station and the other at the opposite end of the town, which each deliver energy into the 2 200 V, three-phase network. The remaining d.c. network is supplied through mercury arc rectifying plant, and from the rotary convertors in the power station.

Extensive developments have already been made in respect of the supply of electricity in the rural areas, and the results already achieved are very encouraging. Supplies are being pushed into more remote districts, and it is confidently anticipated that within three years from the present date supplies will be available throughout the Corporation's extensive and thinly populated rural area.

The sales of energy have grown from 2 700 000 kWh in 1923 to 16 000 000 kWh in 1929, and in that period the average price obtained per unit has fallen from 4·12d. to 1·57d.

THE TORQUAY STATION IN PICTURES.

IN our issue of May 3rd we reproduced several illustrations and a lengthy description of the extensions at the Torquay Corporation's Electricity Works at Newton Abbot which were formally inaugurated on May 1st by the Mayoress of Torquay. Above is given a further selection of views which are of particular interest in view of the fact that the undertaking will be visited next week by members of the Incorporated Municipal Electrical Association attending the Torquay Convention. The exteriors reproduced show (1) *the side elevation of the Urban Electric Supply Co.'s station in* 1923; (2) *the station (front elevation) as it will look when the buildings are completed for* 37 500 *kW installed capacity; and* (6) *a view showing the latest extensions with the coal silo and coal conveying plant on the left. Fig.* 3 *is of historical interest, being the original installation at Beacon Quay in March* 1898, *the early working of which station is dealt with in reminiscent vein overleaf. Fig.* 4 *gives a glimpse of the e.h.t. control room at Newton Abbot, and Fig.* 5 *is a picture of the h.t. control gallery at the Upton Valley sub-station.*

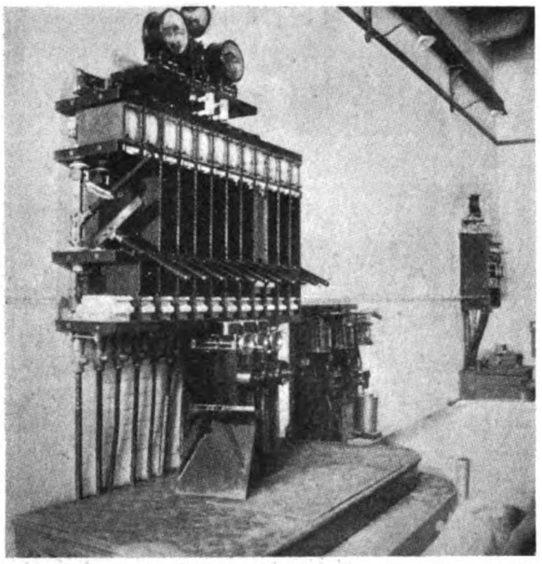
TORQUAY IN 1898.

Reminiscenses of Thirty Years Ago—Ingenuity of the Arc Lighting Engineer—The Famous Ferranti Rectifier—Hazardous Task of Switching-on—Cable-laying Adventures—Trimming the Street Arcs in a Gale.

By W. E. WARRILOW, A.M.I.E.E. (Then Arc Lamp Attendant and Improver, Torquay Corporation Electricity Department).

ON the occasion on which the Torquay Corporation is for the first time entertaining the I.M.E.A. at its annual Convention, it may be fitting to recall the opening of the first electricity works in the town in 1898, if only to remind the old hands who are still in the game of those pioneer days, and also to remind the youngsters in electricity supply of the good time they are now having as a result of those early efforts.



The switchboard at the Torquay station in 1898, with panel removed to show construction.

Reminiscences of thirty years ago are also worth while because they indicate the remarkable progress made during so short a period.

Torquay in 1898! Less than a hundred supply stations in operation in Great Britain and the "battle of the systems" in full swing! Ferranti, Mordey, Crompton, Siemens, Hopkinson, Elwell Parker, Lowrie Hall, and Fynn all competing at the electrical end, and Willans, Belliss, Musgrave, Yates and Thom, Maclaren and Fowler doing wonders with the reciprocating steam engine; not to forget Parsons and de Laval with their turbines and Crossley and Hornsby with gas and oil engines respectively. The steam raisers, Babcock and Wilcox and Galloway and mechanical stoker enthusiasts like Bennis and Vicars were each and all thrusting themselves to the front.

A wonderful galaxy of engineering talent, but what a patchwork to be presented to the bewildered minds of any municipal authority anxious to give its citizens an efficient electricity supply.

Baker as Chairman.

At Torquay in 1898 the chairman of the Electricity Committee was a working baker with a great local reputation for an excellent cottage loaf! He and his colleagues, all good men and true, on the advice of their consulting engineer, Mr. Trentham, decided that Torquay should have an alternating current, high tension, single-phase supply, and that the arc lighting of Tor Bay should be the wonder of the west; and it was so!

I came to the station from Cheltenham, which at that time had a particularly fine example of arc lighting along its famous promenade. My two years' experience in looking after those arc lamps was deemed sufficient to merit my appointment to Torquay at the magnificent salary (all electricity undertakings paid salaries, *not* wages, in those days) of 27s. per week!

The Torquay Electricity Committee encountered great local opposition to a station on the sea front, which was the only suitable spot for a site on account of circulating water. The amenities of the world-renowned bay must not be disturbed by a smoke stack, but the borough must be modernised by the introduction of electric light.

After much controversy a compromise was reached by converting two large coal cellars under the medical baths into the electricity works, these cellars being the property of the Corporation! The flues which carried off the gases from the boilers of the baths were connected through to the two Babcock boilers which supplied steam to the generating sets. There was no smoke stack, but plenty of smoke which, with the wind in a certain quarter, blew slap into the front windows of the Imperial Hotel on the cliff above the baths!

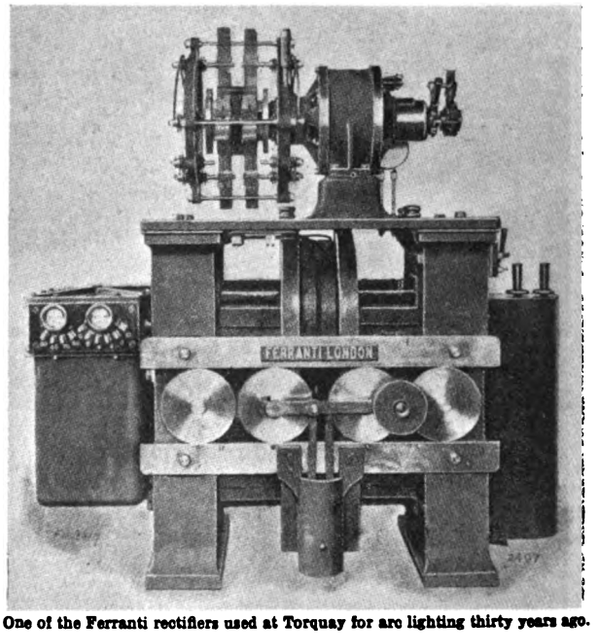
The amenities of the sea front were certainly preserved, but sadly at the expense of the station staff, who were cooped up in a narrow compass with a solid roof overhead and daylight from one end of the engine room only; the boiler room had no natural lighting, and was a positive inferno in the summer for the wretched stoker whose duty it was to fire up by hand!

The three 150 kW units which comprised the whole station were identical. Willans vertical central valve engines, direct coupled to Fynn inductor alternators, with outboard exciters, generating at 2 200 V, 50 periods. The latest Ferranti cellular switch gear controlled the supply to about half a dozen feeders connected to transformers in pavement tanks in various parts of the town. The station was a good example of compact equipment, and was a vast improvement on some of the rope and belt driven plants which were quite common at that date.

The Rectifiers.

But the rectifiers which supplied the arc lighting were the *real* part of the station. There must still be plenty of engineers to-day who remember the famous Ferranti rectifier. It was the answer of that wonderful pioneer to the protagonists of the direct current arc lamps which required to be supplied by dynamos driven by engines quite separate from the main generators. S. Z. de Ferranti would have no such complication, so he devised a rectifying unit which received its current from the h.t. a.c. supply and delivered a constant current to the arc lamps, which burned in series on a 2 200 V line. We had three such sets at Torquay.

The rectifier comprised a synchronous motor driving a high tension commutator of special construction about 10 in. diameter by some 8 in. wide, and fitted with an array of



One of the Ferranti rectifiers used at Torquay for arc lighting thirty years ago.

brushes which produced a glorious firework display when the machine was running at about 1 000 r.p.m.! Present-day stations which supply their street lighting by means of high c.p. gasfilled lamps, turned on from the main works or some sub-stations by remote controlled switches, have no idea of the excitement of series arc lighting from Ferranti rectifiers. The act of switching on was a dangerous business. A pair

Digitized by Google

of rubber gloves was necessary, and with the right hand a rapier like switch-rod was used for the water resistance to bring up the h.t. volts as gradually as possible; with the left hand the rocker of the h.t. rectifying brush gear had to be manipulated to bring the rectified current up on the positive side of the alternating current wave. To make sure of this current being correct, a pole indicator at least 10 ft. away had to be watched at the moment of making contact with the water resistance switch; if the needle swung over to negative the whole performance had to be repeated! The first engineer essayed this dangerous operation one evening without rubber gloves, and was badly burned and nearly killed by getting his fingers round the ebonite washer guarding the rod of the water switch. He remained in contact with this at 2 200 V, and the charge engineer shut down the one set then running, before releasing his unconscious chief from the rectifier. The engineer (the late Mr. P. Storey) afterwards stated that he attributed his life to this gradual reduction of the voltage, his belief being that the breaking of the h.t. switch supplying the rectifier would have produced a reaction which would have caused immediate heart failure. After this accident the makers altered the design of the water switch so that accidental contact was impossible.

Such were the risks that we ran with our arc lighting, but it was really wonderful illumination, especially all round Tor Bay. I doubt very much if the present gasfilled lamps can come up to it, though I have not seen Torquay at night time since I left it in 1899.

The ingenuity of the arc lighting engineer of those days was well demonstrated in a clever magnetic switch fixed at the base of each arc lamp-post. With this switch two carbon filament lamps on brackets about 10 ft. from the ground (on the same post as the arc lamp, of course) were turned on when the arc lamp itself was switched off at midnight. The object of this automatic switch was to supply these carbon-filament lamps from the low tension network, thereby obviating a separate special main for this purpose. The clever part of the switch was a pivoted permanent magnet, arranged in a horizontal position, and having a catch which held the l.t. switch open when at daybreak a negative or reverse current was supplied to the high tension arc lamp circuit for about 15 secs.

The supply of this reverse current to the arc lamps meant the running up of the rectifiers at the station specially for the purpose, but the net result was that the entire street lighting both by arc lamps and carbon-filament lamps could be controlled from the works without the necessity for walking lamp men.

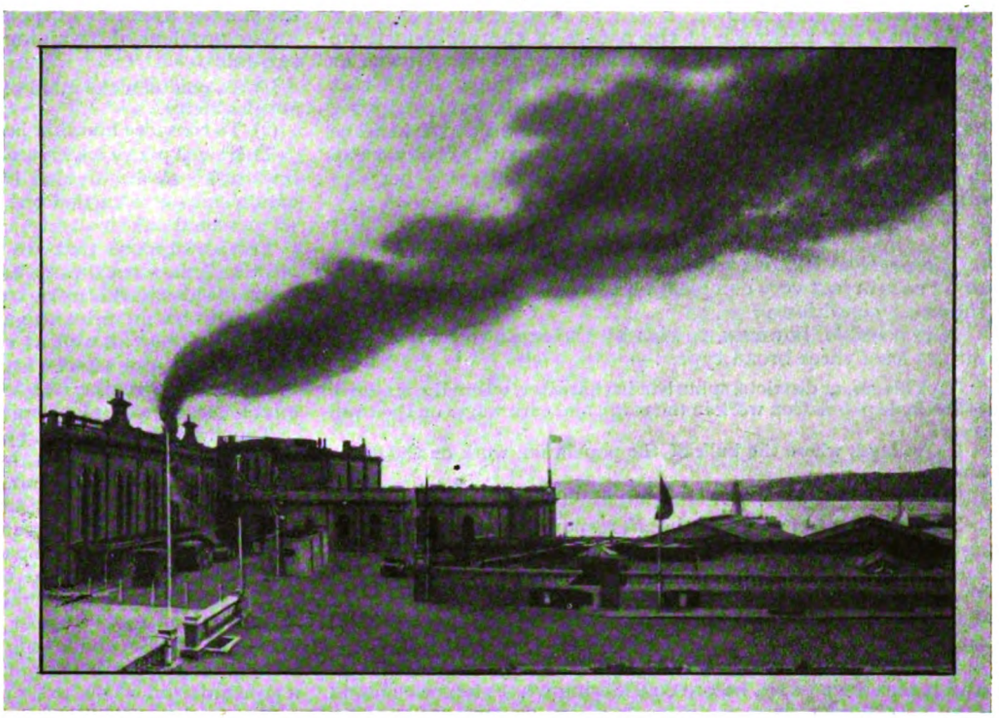
Puzzling the Police.

Incidentally, the local policemen could never understand why the arc lamps which had been turned off at midnight were again turned on in the early hours of the morning in order that the carbon-filament lamps which supplied the street lighting when burglars and "drunks" were abroad should be extinguished altogether. To-day such complication would be not only technically unthinkable but without doubt commercially impossible.

We had other excitements in the operation of the station in those days. We started very well on the night of the opening of the works. The Mayor had just proposed success to the enterprise at a dinner in the Queens Hotel when bang went a feeder fuse on the h.t. board, bang also went a transformer just outside the hotel, and nothing we could do would clear the fault; the dinner was, I believe, finished by candle light!

Service and cable laying was relieved of its usual monotony by the need for blasting the rock which was sometimes encountered in certain parts of the borough; now and again a little extra "pep" in the charge would result in a broken shop window!

The use of picks and wedges (there were no pneumatic horrors in the streets at that time) always meant two men walking back and forth to some near-by blacksmith for resharpening the blunted points; the jarring of the wrists of the most sturdy of the navvies also made progress in trenching very slow.



The old generating station at Beacon Quay, now superseded by the Newton Abbot station. This view shows the roof of the engine room buildings on the right. The boiler house was situated in cellars below the Medical Baths on the left.

Torquay was among the earliest of the hilly towns to use lead covered oil impregnated paper cables, and such was the art of manufacture at that time, the oil would descend by gravity along the h.t. feeders in the steep streets emptying the upper joint boxes and causing leakages in the lower ones; nett result a nice little flash over in the dry box, which in time would "breathe" in a supply of moisture sufficient to cause a short circuit.

The tower ladder with which I trimmed the street arcs was one of the local sights for a time, especially when a gale was blowing on the harbour front, but only once was this ladder toppled over when being wheeled across one of the wharves. I narrowly escaped being brained by a pair of heavy pliers which I had carelessly left on the top tray and which came crashing down as soon as I tilted the tower from off its stand and commenced to wheel it!

The Multi-job Staff.

The running of a small station then meant that every man had several jobs. The one jointer, after doing his service, would fix the meter and fuse boards on the consumers' premises, and in his spare time would also read the meters; on meter fixing jobs he was not allowed a mate because the chief thought one such a luxury!

And now it is all changed to the dull monotony of the efficient modern station. The delegates to the I.M.E.A. Convention can, however, give a thought or two to the Torquay pioneers who nearly thirty years ago kept the electricity supply going at great personal risk, from a couple of coal cellars at the land end of the northern pier of the outer harbour.

I wonder if the borough electrical engineer could put into the new station at Newton Abbot as a permanent exhibit one of the original rectifiers, and by some means have it running (behind protective triplex glass!), just as we used to run it on load in those dear old days. But probably the machines fetched much more than they cost when new, as scrap metal!

OBTAINING CONSUMERS IN RURAL AREAS.*

Districts Which Respond to Propaganda—The Price Question—Development Plan for a Hypothetical Area—Some Financial Aspects.

By Lt.-Col. W. A. VIGNOLES, D.S.O., M.I.E.E.

CONSIDERABLE interest is being evinced at present in the problem of rural electrification, and no excuse is necessary for discussing how we can obtain consumers in rural areas.

We may get a glimpse of the nature of the problem if we consider that 78% of the population live in cities, towns or urban districts, which only occupy 7.7% of the area of Great Britain, the remaining 22% of the population occupying 92.3%† of the area of the country. In other words the average density of population in the towns is nearly 5 000 per sq. mile, while in rural districts it averages only 115 per sq. mile.

A Complex Problem.

The problem is, however, not only one of density of population ; it is in fact very complex, no two areas presenting exactly the same conditions.

It is possible, however, to classify the areas to be met with into at least three broad types :—

(1) Villages, or districts, suburban in character, where the majority of the male population work in the town, and earn wages on the town scale.

(2) Villages where the bulk of the population work on the land ; and

(3) Rural areas with isolated farms and cottages.

The first class of districts should respond well to propaganda and sales efforts, as the inhabitants will appreciate the amenities of the town, and will be anxious to secure them in their home. The demand for electricity should be good, and the revenue sufficient to make the supply a paying proposition.

The second and third classes are definitely " rural areas," and it may be as well, before considering what steps we should take to obtain consumers in such areas, to review generally the conditions to be met with in the country.

The supply of electricity in rural areas has the advantage, as compared with supply in towns, that usually there is no competition from gas, while, owing to the cost of transport, coal is usually more expensive than in the town. Apart from coal our sole competitor is usually oil, used for lighting, and to a considerable extent nowadays for cooking.

But electricity for lighting at 9d. per unit is as cheap as oil, while electricity at 1½d. is as cheap for cooking as coal at 50s. per ton, and in most cases cheaper than oil, while the use of electricity reduces labour, promotes cleanliness, and is altogether more convenient.

In the town, it is possible to sell electricity at prices above the cost of competitive methods, as the greater convenience and the reduction in labour frequently represents a definite money value to the town dweller.

In rural areas, among those with the smaller incomes, this is by no means the case ; the rural dweller frequently does not spend money to meet his needs, but makes his needs match his pocket, while labour saving devices make no appeal whatever.

Even so, however, a cottager may easily spend 1s. per week on oil for lighting, and 2s. 6d. per week for coal, and this figure for lighting, while small, approaches the amount used in some small houses in town.

But such cottagers are on the bottom of the scale, and we find in the villages, in certain areas anyway, farms, shops, small villas, blacksmiths' and carpenters' shops and cottages of various grades before we come to the agricultural labourer whose characteristics are as I have described.

This is especially the case in country where there are small holdings ; where the country is in the hands of large owners we probably find fewer of the small villas and a big gap between the large house and the cottagers, but it is impossible to generalise.

In districts within fifty or more miles of London, the suburban character of the district will probably be very marked, while some of these districts contain numbers of large houses which should be good consumers.

In any kind of country the principal factor in obtaining success will be to secure the large houses or farms, as consumers ; if these can be obtained it will be possible as a rule to supply the smaller premises in the vicinity.

Our problem of obtaining consumers in rural areas is really two-fold :—

(1) To create in the mind of the probable consumer the desire to use electricity.

(2) To convince him that he can afford to buy it.

There are many ways in which we can tackle these problems, but these can be divided broadly into :—(*a*) National propaganda such as is carried out by E.D.A. ; (*b*) local propaganda ; (*c*) personal salesmanship.

Let us suppose that we are responsible for the supply of electricity in a rural area, and consider a plan for the development of sales in this area.

It will be an advantage if our hypothetical undertaking includes urban as well as rural districts, as, while the propaganda and sales efforts may have to be varied in the rural districts, the greater return obtained in the urban areas will enable a more complete organisation to be developed.

The first stage should be the circulation of propaganda in the area to be developed, before any decision to bring supply into the district is announced. This propaganda can be linked up with the work that E.D.A. is doing. This should be followed by a series of lectures to women's institutes, and other organisations. Such propaganda and lectures, it has been suggested, is best carried out by an organisation other than the undertaking which is actually going to sell the electricity (the cautious rural dweller looking with suspicion at anyone trying to sell him something) and the E.D.A. will very willingly carry out this work where this course is desired. It is merely a continuation of the work that E.D.A. is continually doing.

Where a reasonable sized audience can be obtained, E.D.A. would supply the lecturer, but in a small village it would probably be necessary to rely on one of the employees of the local undertaking concerned to give the lecture, although this could be arranged under the auspices of E.D.A.

Value of Public Meetings.

Finally there should be one or more public meetings in the area, where the question of the supply to the area should be considered, it being explained that unless sufficient support is forthcoming it would not be possible to give a supply to the area. At this meeting all questions of cost should be discussed, answers given to would-be consumers, and efforts made to obtain actual signatures to supply agreements.

At such meetings it is desirable to secure the attendance of some prominent local man, e.g., chairman or member of the Rural District Council, as chairman, while the attendance of the Chairman of the Electricity Committee concerned, or a director of the company, as the case may be, will be appreciated.

At such meetings it will be found helpful to state clearly in the first instance the number of consumers required to enable the scheme to proceed ; from time to time the number of signatures can be stated, and if properly worked it will be found that the inhabitants of the area who want a supply will themselves assist to obtain the necessary signatures.

As part of the propaganda in these early stages, small exhibitions of apparatus and cinema displays should be arranged in various suitable centres. Travelling exhibits arranged on lorries are useful, with a small petrol driven set to supply the electricity required for the cinema projector or small apparatus when exhibiting in districts where the public supply is not available.

When the necessary number of consumers have been obtained (possibly not as many as were first asked for) and the scheme is proceeded with, there still remains a great deal of " selling " to do.

It will be found, probably, that the majority of the consumers secured use electricity for lighting only, and that the revenue received is not what it should be, while a considerable number of potential consumers have not " signed on."

In fact there is still room for selling propaganda and a selling organisation, as there always will be in every undertaking ; no matter how well we have done in the way of sales we shall always be able to do better.

---

* Extracts from a paper read at the May meeting of the Overhead Lines Association.

† This figure is reduced to 57% if we exclude woods and forests, deer forests, mountains and heathlands.

Digitized by Google

What should the sales organisation be and how much should we spend on it? I consider that an undertaking that is well established should spend not iess than 1% of its revenue on publicity and propaganda. An undertaking developing a new area would have to spend more than this as the revenue might be very small. I would suggest that in such a case the amount to be expended should be based on the revenue anticipated at the end of say six years.

Perhaps I may say, in passing, that out of this amount of 1% my Association ask that one-tenth should be handed to them as the subscription of the undertaking to the Association, to be expended on behalf of the undertakings on national propaganda. In other words, undertakings are asked to contribute £1 per £1 000 of their revenue towards a national propaganda scheme on which about £35 000 per annum is being expended.

Whatever scheme may be adopted, each undertaking should have an adequately paid man in charge of the sales, with sufficient assistance, and the necessary transport facilities to cover the area.

I give the following detailed scheme of expenditure on propaganda for an electricity undertaking covering a rural and urban area, where the total expenditure proposed is £1 000 per annum.

This will perhaps form a useful basis for discussion, and I would only add that it would be necessary to consider the character of an area before settling the exact allocation of expenditure between the various items.

Scheme for propaganda and publicity for an undertaking comprising urban and rural areas, with a total revenue of, say, £100 000 per annum from electricity supply :—

	Expenditure per annum. £
Local newspaper and parish magazine advertising ..	200
Poster publicity on permanent poster boards (see E.D.A. Booklet " Say it with Posters ")	100
Booklets and literature for distribution	75
Direct mail	75
Travelling van with cinema and display of apparatus, hired, for a portion of the year	150
Exhibitions. Allowance per annum. A portion of this might be accumulated and spent every few years on a large exhibition	200
Lectures, entertainments and film displays.....	100
Subscriptions to E.D.A., say one-tenth of 1% of revenue	100
Total	1 000

Advertising in parish magazines is very effective, poster publicity, if space can be obtained free—e.g., on sub-stations, etc.—is very cheap and very effective, while booklets or leaflets have their appeal.

An item has been included for travelling vans ; such a van would cost a substantial amount fitted ready for use, and must be adequately staffed, but it is thought that undertakings might be glad to have one for a part of the year, and if there was sufficient demand for such a van the E.D.A. Council would be willing to provide one. It would provide very effective propaganda.

Local Salesmanship Essential.

With all the propaganda work that can be done by E.D.A. or by the undertaking, however, the time comes when salesmanship is necessary if the prospective client is to be converted into a consumer.

It is probable, as I have indicated, that such selling efforts will be even more necessary in rural areas than in urban, owing to the lack of knowledge of the rural dweller. A good salesman suited to this particular work will be invaluable, but how is he to be found ?

There are born salesmen who can sell anybody anything, but these are few and far between, and we shall probably have to train a man. Let us, however, select a man for training who has some knowledge of country life, or if he has no such knowledge let us set about remedying the omission. A man who can discuss the crops and the seasons with the farmer, who can stay to tea and can keep his end up in the general conversation, who can handle a gun and join the farmer in a little shoot, will, provided that he knows the remainder of his job, certainly go a long way.

On the domestic side women demonstrators will be helpful, especially if they also understand country folk and can give an acceptable talk at a Women's Institute. These institutes are likely to be extremely valuable in the future ; the members are all keen on getting to know what electricity can do for them, and they will spread the good news as soon as satisfied consumers are obtained in any district. It is undesirable, however, that lectures should be given to these institutes until there is some prospect of a supply being taken to the district, even if, as suggested above, this is not announced at the time of the first lecture.

The tariff and the provision of hire and hire-purchase facilities will have a great effect on the business done. I hope all undertakings will introduce a two-part tariff with a charge per unit not exceeding one penny, and that all undertakings will provide hire facilities.

Prospective Rural Business.

Now, what business is an electricity supplier likely to obtain in rural areas ?

Here let me quote from the Electricity Commissioners' Conference on Electricity Supply in Rural Areas :—

" The particulars point to the conclusion that when electrical equipment of an ordinary character is installed for farm purposes and a reasonably full use is made of electricity both for farming and farmhouse purposes, individual farms of the four most common types are likely to represent, on a conservative basis, potential loads of the order indicated in the following Table " :—

Type of farm.	Yearly Consumption : Units. Farm house.	Farm power.	Total.
A. Arable and stock farm of about 300 acres (with threshing)	7 000	1 800	8 800
B. Arable and stock farm of about 100-150 acres (without threshing)	3 000	1 000	4 000
C. Large dairy farm of about 300 acres (with milking plant)	7 000	7 000	14 000
D. Medium-sized dairy farm of about 100 acres (with milking plant)	3 000	2 600	5 600

The figures accord with the experience hitherto gained in this country, which has shown that the electrical power requirements, although constituting a load of potential value, are likely under present conditions of development to prove of secondary importance on the generality of farms as compared with the lighting, cooking, occasional heating and general domestic requirements of the farmhouses.

Appendix 6 to report of Sub-Committee No. 1 shows that 1 007 farms in rural districts in Great Britain in 1927 used on the average 1 400 units each.

Appendix 9 shows the consumption on a 300-acre dairy farm with 300 cows, as follows :—

	Units per annum.
Dairy use	7 700
Lighting.....	500
Farmhouse, cooking, heating, washing, machine, etc.	7 000
Lighting cottages.....	200
	15 400

I am inclined to think that we might estimate that where gas is not available we should at 1d. per unit, plus a fixed charge or on a prepayment meter, be able to secure a revenue of, say, £2 per annum from the smallest cottages, £5 to £10 per annum for a normal farm, while supply to large farms and houses may run into very large figures.

I have recently received information from the U.S.A. as to progress with rural electrification in that country. At a conference held there recently it was stated that in many cases it has been shown that electricity supply " costs nothing at all " ; in other words, that the farmer by using electricity had increased his net earnings by more than the cost of the electricity.

In what is called the Redwing line, the farms in the fourth year are averaging 2 900 units per annum at an average price of 2·9d. per unit.

At the same Conference a farmer showed how electricity had enabled him to make a success of his poultry farm. He calculated that hens left to themselves would on the average lay less than 100 eggs per annum, and that unless this level was reached the poultry farmer would lose money. He had by the use of electricity brought his hens up to an average of 130 eggs per annum.

Finally, let me say that here, as in the United States, there appears to be ample evidence that at anything like a reasonable price electricity can be shown to be a paying proposition for the farmer, at least to those engaged in dairy and poultry work.

MR. PURSE'S POST.

Appointment as Chief Engineer of London and Home Counties Joint Authority.

MR. Frederick W. Purse has been offered and has accepted the position of chief engineer of the London and Home Counties Joint Electricity Authority.

Mr. F. W. Purse, the new chief engineer of the London and Home Counties Joint Electricity Authority.

For the past ten years Mr. Purse has been chief engineer and manager of the West Ham Electricity Department, the largest municipal electricity undertaking within 100 miles of London. During his 30 years of continuous municipal service he has acquired an extensive experience of electricity supply in all its phases. His first electrical appointment was with the Bristol Electricity Department in 1897. In successive positions he was assistant at Bath for two years, deputy at Warrington for seven years, and chief at Watford, Carlisle and West Ham for five, six and ten years respectively. He has also advised and assisted many other municipalities on electrical matters.

Last year he was President of the I.M.E.A. and he is a member of Council of the I.E.E. and of the E.D.A., a member of the Registration Board and Executive Committee of the National Register of Electrical Installation Contractors, a member of many I.E.E., B.E.S.A. and other committees and sub-committees, and the author of numerous papers and articles on public electricity supply.

As Mr. Purse is a vigorous advocate of a cheap as well as an abundant electricity supply his appointment to the Joint Authority is full of promise for the densely concentrated population in the 1 796 sq. mile area stretching from Hertford and St. Albans in the north to Dorking and Reigate in the south, and from Windsor in the west to Gravesend in the east, with which he will be concerned.

It is understood that Mr. Purse will remain at West Ham until his successor is appointed.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

Wiring Regulations.

[To the Editor.]

SIR,—My company has incorporated the I.E.E. Wiring Regulations in its conditions of supply since 1911.

But, am I not right in saying that we cannot legally enforce them? I have always been given to understand that this is so.—I am etc.,

C. CULMER HODGES, A.M.I.E.E., A.M.I.Mech.E.
Engineer and Secretary
Dawlish Electric Light and Power Co.

Dawlish.
May 24th.

[We are unable to give a definite ruling on this question, though we share the view of our legal correspondent that in the case of a company legal enforcement of the Regulations would only follow an agreement to comply, signed by the consumer. We have no record of any such case having come up for decision. In the case of local authority undertakings which have, through private Bills, secured the inclusion of the Wiring Regulations in their bye-laws, the position is, of course, quite clear.—ED.]

Installation of Electric Ovens, etc.

[To the Editor.]

SIR,—At the last meeting of the E.D.A. Industrial Heating Sub-Committee I was instructed to notify you of the following modification of the London Building Act, 1894, the effect of which is to put the regulations as to the installation of electric ovens, coppers, boilers, etc., on the same basis as similar appliances heated by gas.

I may explain that the Act was passed before the use of electricity for heating was contemplated, and the only exception to the Section of the Act requiring special fire-resisting floors under ovens, etc., was made in favour of gas. As a result of representations that I have made this exception will now be given to electricity as well as to gas.

The relative Section of the Act reads as follows:—

The London Building Act, 1894, Section 66 (1):

"The floor under every oven, copper, steam boiler or stove which is not heated by gas and the floor around the same shall, for the space of 18 in., be formed of material of a non-combustible and non-conducting nature not less than 6 in. thick."

The amending resolution passed at the meeting of the London County Council held on March 26th, 1929, reads:—

"That the Council do not object to the fixing of ovens, coppers, steam boilers and stoves heated by electricity without complying with the provisions of Section 66 (1) of the London Building Act, 1894, and that the District Surveyors appointed under that Act be informed accordingly.—"I am, etc.,

W. A. VIGNOLES,
Director and Secretary
British Electrical Development Association.

15, Savoy Street,
Strand, W.C.2.
May 27th.

"The Wireman's Viewpoint."

[To the Editor.]

SIR,—The "Wireman's" human letter on the unfair competition of the "kerbstone contractor" and the exploiter of boy labour, for some reason does not touch on the commercial "vulture" who makes a hobby of paralysing any one's business but his own. In committee he worships gold and the lowest tender, and automatically sweeps aside reputations, lavishly scorns loyalty, and spurns experience and ability in favour of low prices and inefficiency. What is the advantage of a college education, we may ask, when it is numbered like a felon? Or why should skill and honesty be valued, when the lowest price is the only deciding factor?

Generally there is a clause relating to the standard of wages to be paid in these contracts, which if observed in these circumstances favours the workman at the expense of the employer, or alternatively encourages sweating and promotes doubtful methods.

Competition at the expense of the contractor does not seem fair, and yet the excuse advanced for low prices is generally attributed to gas competition.

Stripped of all colour, the contractor's work is regarded in some quarters as loot wrongly placed, suitable and capable of being diverted elsewhere in order to create more jobs for people possessing bureaucratic minds and inclinations.

Until recently the only choice before the contractor was to hit back, or, alternatively, the spectre of the pick, usually employed in roadmaking circles. Fortunately, however, two epoch-making engineers of some eminence have had courage to set an example of vital importance, which commends itself to all genuine supporters of the electrical industry.—I am, etc.,

"ANOTHER CONTRACTOR."

Manchester.
May 22nd.

POINTS OF VIEW.

The idea that electricity is only for the rich must go.—*Ald. H. B. Vorley.*

* * *

The truth may not be so complicated as some would have us think.—*Sir Oliver Lodge.*

* * *

As a conservative I dislike the slogan of "Safety First"; the Empire was not built up on that.—*Sir Hugo Hirst.*

* * *

We want to start now purifying London's atmosphere by stopping the construction of this plant at Battersea.—*Mr. Theodore Stevens.*

* * *

There is plenty of room for the application of rationalisation to our methods of production and distribution in order to eliminate competition and waste.—*Mr. H. J. May.*

* * *

One hesitates to enter into any question of rivalry as to priority in this age of scientific development, but upon the fact that television and its development is wholly British there can be no controversy.—*Mr. Clarence Tierney.*

* * *

If cheap electricity is going to benefit industry—and all parties are agreed that it will—then cheaper haulage services by electrically-operated railways will be an added stimulus to the recovery of trade by lowering the costs of production and delivery.—*Sir Arnold Gridley.*

NEWS IN BRIEF.

Coventry Assisted Wiring Scheme—Portsmouth Showrooms—Wireless Communication with Trains—Battersea's Successful Rental Wiring Department.

COVENTRY Electricity Committee recommends an assisted wiring scheme.

The Wessex Electricity Co. recently held demonstrations on the uses of electricity at Cold Ash and Lambourn.

Seaham Harbour Electricity Committee has obtained sanction to borrow £500 for domestic apparatus to be let on hire.

The Post Office authorities hope to have the telephone cable between the mainland and the Isle of Man installed and in working order by July.

Baird television tests have been resumed in Berlin.

A telephone service between London and all parts of Czechoslovakia is now available.

Westminster (London) City Council is to instal electricity at Canal Buildings, at an estimated cost of £200.

A report is to be prepared by the Architect and the Borough Electrical Engineer of Gravesend as to heating the town hall electrically.

Brighton Watch Committee is to erect six additional police telephone boxes, and the electricity department will supply the necessary electrical energy.

Portsmouth Electricity Committee has accepted tenders, amounting to £1 273 10s., for the erection of sub-stations at South Hayling and Lee-on-Solent.

A system of wireless telephony for communication with trains running between Montreal and Toronto has been adopted by the Canadian National Railways.

The Illinois Commerce Commission is to hold a hearing shortly upon whether or not a utility corporation is required to instal one large meter in office buildings to make it possible for the owners to retail electricity to their tenants.

Tynemouth Electricity Committee has decided that the number of assisted wiring installations is to be restricted to 600 per year.

An electrical engineer is required by His Highness the Nizam's Guaranteed State Railway Co. The company's offices are at 100, Old Broad Street, London, E.C.2.

Portsmouth Electricity Committee is recommending the acquisition of property at London Road, North End, at a cost of £5 300, for the provision of showrooms for the department.

A party consisting of 100 members of the Electrical Association for Women inspected the electrically operated machinery at the Great Western Railway Co.'s Cardiff docks on May 22nd. The visit was organised by Mrs. L. A. Snow, acting hon. secretary to the South Wales Branch of the Association.

The Baird Television Development Co., Ltd., seeks leave to amend patent specification (No. 295 210) for "improvements in or relating to television and like systems." Particulars of the proposed amendment appeared in the "Illustrated Official Journal (Patents)" of May 23rd, and any notices of opposition must be lodged at the Patent Office within one month from that date.

The Electricity Commissioners, on May 16th, approved of the construction and pattern of the "Ferranti" type F.C.c., single-phase, watt-hour meter, rated sizes 10, 12½, 20, 25, 40, 50 and 100 A, 100 to 125 V, 125 to 160 V, 200 to 250 V, 350 to 450 V and 450 to 550 V, 50 cycles. The approval by the Commissioners, on March 21st, 1929, of the "Ferranti" type F.C.c., single-phase, watt-hour meter, rated sizes 10, 12½, 20, 25, 40 and 50 A, 200 to 250 V, 50 cycles, is superseded.

The Electricity Commissioners require a principal engineering inspector.

Bracknell, Berks, Social Club has appointed a committee to go into the question of the adoption of electric lighting.

A distribution engineer is wanted by the Burma Electric Supply Co., Ltd. Applications to the company's offices, 1, Queen Victoria Street, London, E.C.

The London, Midland and Scottish Railway has recently put into service a special vehicle for carrying heavy electrical transformers and other loads up to 80 tons weight.

Bangor (co. Down) B.C. has referred to the Electricity Committee the forty-four applications received for the position of manager and engineer of the electricity undertaking, at a salary of £350 per annum.

"The Use of Electricity in School Domestic Centres" is the title given to a new E.D.A. publication. The subject-matter is taken from a report by Major E. A. Baker, borough electrical engineer, Barnsley.

Battersea (London) Electricity Committee reports that 2 200 consumers have been connected to the mains under the rental wiring scheme, and that the electrical apparatus now out on hire includes 1 809 irons; 374 kettles; 1 168 fires; 344 cookers; 15 washboilers; and 70 water heaters.

Arrangements have been made by the North Midland area of the E.D.A. for the third Area Sales Conference, to be held at Bradford Electricity Offices on June 4th, when Mr. C. E. Allsopp will deliver an address entitled "The Development of the Electric Cooker."

Manchester Health Committee, with a view to minimising the smoke nuisance from works in the city, has asked the Electricity Committee to consider favourably the policy of increasing the facilities for the supply of live steam to works.

The annual meeting of the Northern Section of the E.C.A. took place on Wednesday in the Small Conference Hall of the N.E. Coast Exhibition. Among those attending were Mr. W. H. Walton (president), Mr. H. Willoughby Ellis (president elect), the chairman of the section, Mr. H. C. Hazel, Mr. L. C. Penwill and Mr. R. W. Kennedy. After the meeting, lunch was given at Messrs. Deuchar's Restaurant in the exhibition.

The prospectus of short courses of lectures and laboratory work to be given at the Manchester Municipal College of Technology during the summer of 1929, contains a list of the professors and lecturers, the subjects, dates and times of lectures, and syllabuses of classes. In the electrical engineering department, lectures will be delivered by Dr. Miles Walker Mr. A. E. Moore, Dr. A. E. Clayton, Mr. E. A. Hanney, Messrs. G. F. Freeman and R. D. Jenner and Mr. A. K. Bentley.

About 80 members of the Yorkshire Branch of the Institution of Mechanical Engineers visited the works of Messrs. Hopkinsons, Ltd., Huddersfield, on May 16th. The inspection lasted two hours, and the departments visited included pattern shops and stores, foundries, laboratory, material stores, brass, iron and steel machine shops, tool room, finished part stores, fitting and testing departments, and mine signal and electric control departments, and the centrifuge department, where demonstrations were given of the new Hopkinson centrifugal separators.

LOOKING BACKWARD.

FIFTY years ago it was reported in THE ELECTRICIAN *dated May 31st, 1879, that :–*

It took 59 seconds to telegraph the result of the Derby to New York.

Mr. Edison's "Motograph" telephone was demonstrated in London.

The International Telegraph Conference was to be held in this country, for the first time.

Dr. Muirhead and Prof. Ayrton proposed receiving at their electrical laboratory, pupils who desired to receive a complete education as telegraph engineers.

* * *

TWENTY-FIVE years ago, according to THE ELECTRICIAN *of June 3rd, 1904 :—*

Dr. Friedrich Siemens died at Dresden.

The ninth annual I.M.E.A. convention was to be held at Derby, Nottingham, and Sheffield, under the presidency of Mr. T. P. Wilmshurst.

Arbitration was proceeding to determine the price Bournemouth Corporation should pay to the Poole and District Traction Co. for the tramways undertaking.

* * *

TEN years ago, according to THE ELECTRICIAN *dated May 30th, 1919 :—*

Mr. F. W. Purse, city electrical engineer of Carlisle, was appointed borough electrical engineer of West Ham.

Mr. C. H. Wordingham in an address to I.E.E. Centres advocated that the Institution, after obtaining the Charter, should be governed by a Grand Council representative of sectional trade interests.

LEGAL INTELLIGENCE.

Torquay Corporation and the Insulation of H.T. Cables.

THE Mayor, Corporation and Burgesses of the Borough of Torquay were the defendants in a case heard by the Torquay magistrates on Monday, being summoned for failing to cover a high tension cable with insulating material, in consequence of which N. G. Perring was killed on April 4th. A second summons charged them with failing to insulate the cable so as to prevent danger as was reasonably practicable. The Corporation entered a plea of not guilty.

Mr. B. G. Saywell, for the prosecution, said the proceedings were instituted by the Secretary of State under the Factory and Workshop Act. The offence in this case took place at an electrical sub-station in the Torbay Road which would come under the definition of a factory. On April 4th Charles Edmonds, an electrician employed by the Corporation, accompanied by Perring, entered the sub-station to wind the time switch. Edmonds had been at work a moment or two when he heard a groan, and turning round saw Perring grasping one of the h.t. cables. Edmonds pulled Perring away by the coat, applied artificial respiration and sent for medical assistance, but Perring failed to revive. The piece of cable was cut and had since been subjected to a test. It appeared that a join had been made, the ends having been fixed together with a brass ferrule, and the whole covered with Empire tape. It appeared that the join was made about eight years ago when the equipment was installed.

Evidence in support of the summonses was then called.

Mr. Kenneth Preston, divisional electrical inspector, stated that he had the piece of cable cut away and on examination found a join made by a brass ferrule, covered with layers of Empire tape. Such a cable should be out of reach or sheathed in lead. Tests were made with the cable, and the insulation broke down at the join at 900 V. In September, 1924, and again in April, 1928, he wrote to the Torquay Electricity Department calling attention to the need for sufficiently protecting high tension cables.

Opening the case for the defence Mr. P. H. W. Almy submitted that the regulations imposed by the Act were in excess of what was practicable. This particular cable was covered with insulating material, but the man who put in the brass ferrule in order to prevent an unsightly bulge did not make the insulating material as thick as he should have done. The sub-station was a small one, and no one was allowed there without special authority. As far as the inspector's letter of September, 1924, was concerned, the whole of the points in it were dealt with.

Mr. H. F. G. Woods, borough electrical engineer, produced for inspection the time sheets of the men who were employed in carrying out alterations at the sub-station in accordance with the suggestions of the divisional electrical inspector. What was then regarded as an up-to-date gear was installed, but to-day it would not be so regarded. A fortnight before this accident occurred they were asked to instal lead sheathed cables. Mr. Woods declared that modern practice was in advance of Home Office regulations.

The magistrates found the case proved and fined the Corporation £100 and ten guineas costs.

METALLURGISTS' CONGRESS.

Brief Details of the Forthcoming Meeting in Germany.

A LARGE attendance is promised at the forthcoming German meeting of the Institute of Metals. To be held in Düsseldorf from September 9th to 12th, this will be not only the first meeting of the Institute to take place in Germany, but will also constitute the first gathering of metallurgists and engineers to be held in Germany since 1914. The Conference is being held by invitation of the Verein Deutscher Ingenieure and of the Deutsche Gesellschaft für Metallkunde. In addition to the presentation and discussion of papers by members of many nationalities—nearly every country in Europe will be represented at the meeting—there will take place visits to works as well as gatherings of a social character. Though participation in the meeting will be limited to members of the Institute of Metals, non-members desirous of taking part can be elected—provided that their qualifications are satisfactory—in time to take part in all the proceedings at Düsseldorf, if their applications are received not later than July 4th by the Secretary, Mr. G. Shaw Scott, 36, Victoria Street, London, S.W.1.

PERSONAL.

MR. W. Jackson, lecturer in electrical engineering at Bradford Technical College, has resigned.

Mr. Victor Watlington is announced to speak at the Newcastle Advertising Convention, which opens on June 17th.

Mr. J. D. Peattie, of the Manchester Electricity Department, has obtained an appointment with the Central Electricity Board.

Mr. Henry Yates, the Socialist candidate for Rugby, whose death on Monday necessitates new nominations, was chairman of the Rugby Electricity Committee.

Miss Muriel Mellerup, only daughter of Mr. A. E. Mellerup, a director of R. A. Lister and Co., Ltd., has been selected to fill the part of Lady Godiva in a hospital carnival procession at Coventry.

Hammersmith (London) Establishment Committee has recommended that, subject to the approval of the Ministry of Health, a gratuity of £600 be made to the widow of Mr. Frank Hill, late borough electrical engineer.

At the meeting of the Western Centre of the I.E.E., at Cheltenham last week, Capt. S. B. Haslam was elected chairman and Mr. E. G. Okell vice-chairman for the ensuing year. Messrs. A. M. Willis, J. M. Bowman, R. Islington, T. E. Lewis and S. Thompson were appointed members of the Committee.

Mr. W. M. Selvey, of 64, Victoria Street, Westminster, is proceeding early in June to the United States and Canada for a tour of inspection of power stations, etc. One object of his visit is to obtain first hand information as to the available American experience in the problems of the emission of dust, grit and fumes, from power station chimneys. See page 657.

Mr. C. Elliott was on Monday appointed to the position of general manager of the Birmingham Section of the British Industries Fair, in succession to the late Mr. Charles Stanley. Mr. Elliott has taken a prominent part in the organisation of the heavy industries display for three years. He was the honorary organising secretary of the National Smoke Abatement Exhibition held in 1926. See page 657.

The Committee of the Meter and Instrument Section of the I.E.E. has made the following nominations to fill the vacancies which will occur on the Committee on September 30th :—Chairman : Mr. E. W. Hill (Aron Electricity Meter, Ltd.) ; Ordinary Members of Committee : Messrs. E. Fawssett (Newcastle-upon-Tyne E. S. Co., Ltd.), A. J. Gibbons (London Power Co., Ltd.). E. H. Miller (British Sangamo Co., Ltd.), and R. S. J. Spilsbury (National Physical Laboratory).

A presentation was made last week to Mr. Robert Blackmore, who, it will be remembered, has resigned the position of engineer-in-chief to the Stalybridge, Hyde, Mossley and Dukinfield Tramways and Electricity Committee, in the form of a canteen of cutlery from the Board and staff and an illuminated address from the members of the Board. Mr. Blackmore is, of course, leaving to take up the appointment of engineer to the Central Electricity Board for the North-West England and North Wales area.

Many of our readers will doubtless remember that in June, 1913, Mr. W. E. Warrilow, then a member of our staff, organised a demonstration run of an Edison battery-driven saloon car from Dumfries to London, a distance of 362 miles, the battery (150 Ah capacity) receiving boosting charges en route. The car was driven by Mr. Maurice E. Fox, himself an Edison man, and it is interesting to note that as a result of a meeting after the passage of 16 years, Mr. Warrilow will join Mr. Fox as his assistant manager. The company, Edison Storage Batteries, Ltd., will have offices at Victoria House, Vernon Place, Southampton Row, London, W.C.2. We wish our old colleague every success in his new enterprise.

Obituary.

MR. JOHN EUGENE BRADY, on May 4th, aged 70 years. He was formerly with the Electrical Power Storage Co. and Messrs. Pritchett and Gold.

CAPT. E. IRONSIDE BAX, on May 18th, aged 83 years. He played no inconsiderable part in the establishment of the electricity supply in London during the early years, and was one of the first directors of the Westminster Electric Supply Corporation.

MR. J. J. O'CONNOR, late contract manager for the Post Office Telephone service. He entered the National Telephone Co., at Brighton, when that company was in competition with the Brighton Municipal Telephone Service, and was transferred to the Post Office in 1912 ; he retired in 1923.

NOTTINGHAM EXCHANGE.

Details of the Lighting Arrangements and Controlling Switchgear.

THE lighting arrangements of the new Council House and Exchange at Nottingham, which was opened by the Prince of Wales on May 22nd, afford an example of the advantage of close co-operation between the architect, the decorative artist and the lighting expert. The building was designed by Mr. T. Cecil Howitt, while Messrs. W. J. Furse and Co., Ltd., of Nottingham, were the electrical contractors. The Illuminating Engineering Dept. of the General Electric Co., Ltd. is responsible for the lighting schemes. Passing through the entrance hall on the ground floor to the grand staircase, the beauty of the Italian marble is enhanced by an arrangement of reflectors, fitted with flame-sprayed lamps. The reflectors are sunk in an invisible cornice arranged round the periphery of the base of the dome. Running round the dome itself in circles are six graduated tiers of windows, each fitted with a specially prepared glass of amber tint. This tint is deeper in the lower tiers, and gradually fades to a clear transparency in the windows at the eye of the dome. The light from the reflectors in the cornice is reinforced by an additional set of 15 reflectors placed at various corners in the girders outside the dome. The combination of the cornice lighting within and the strong floodlights penetrating the irridescent coffered windows of the dome produce a brilliant yet glareless illumination. The dining room, ante-room, the library and sitting room have their particular schemes of interior decoration and lighting. In the members' room and library the illumination is obtained from lamps fixed in a series of G.E.C. trough reflectors set in the concealed cornice, sunk in the interval between the top of the panelling and the curve of the ceiling. The dining room, which accommodates 100 guests, may, perhaps, be singled out as the most attractive in the perfection of its lighting. Panelled in "Ancona" walnut, the room has a semi-elliptical or barrel ceiling decorated in pastel tinted enrichments picked out in gilt. By the use of reflectors disposed within the sunk cornice, a brilliant indirect illumination is obtained, and the panelling contrasted with the bright cream of the ceiling, is well brought out. The ante-room is panelled in light oak, the tones of which are brought out by lamps, fixed in trough reflectors of a special contour arranged in the cornice concealed behind the panelling. The fireplace is flanked on either side by two 6 ft. silver standards each containing six lamps, and in the centre of the room an octagonal table has four "Osram" pearl lamps concealed in an ornamental panel in the centre.

The new Council Chamber on the third floor is semi-circular in shape, and has seating accommodation for 64. The ceiling shows a series of graduated panels culminating in a semi-circular lay-light which acts as a reflector over the dais and its approaches. In order to intensify the light reflected from the cornice, the ceiling has also a cove finish next to the walls. Well diffused uniform illumination is obtained by means of reflectors disposed along the whole length of the cornice and concealed behind the top of the panelling.

The two division lobbies outside the Council Chamber with dome shaped ceilings are each lighted with striplite fittings concealed in a sunken cornice on a similar principle to that employed in the other rooms. All the corridors, the kitchens, service rooms, lavatories, and auxiliary staircases are lighted with specially designed adaptations of the standard "Unalux" three-light fittings, the metal work being of chased bronze.

The floodlighting of Exchange Row, the name given to the T-shaped shopping arcade which runs between the wings at the rear of the main front block, is carried out with "Gecoray" reflectors arranged behind the vases along the masonry. This arcade has already been let for high-class shops, the illumination of which will supplement the arrangement of floodlighting.

Some of the controlling switchgear supplied by A. Reyrolle and Co. for the new Council House.

The switchgear for controlling the electricity supply throughout the Exchange Buildings, has been supplied by A. Reyrolle and Co., Ltd., of Hebburn-on-Tyne. It is of the metal-clad, horizontal, draw out type, and is situated in the sub-station in the basement. There are two boards, one of seven panels for 6 600 V, 3-phase, working, and the other of fifteen panels for 400-V, 3-phase, 4-wire working. The h.t. board consists of two incoming feeder panels with a current carrying capacity of 300 A, four transformer panels of the same capacity, and one busbar section panel. The feeder panels and section panel are protected with inverse time limit overload and earth leakage protection, and the transformer panels with inverse time limit overload and Merz-Price protection. The l.t. board consists of ten 400-A feeder panels with inverse time limit overload protection, one 2 000-A section panel, and four 1 000-A transformer panels with time limit overload and Merz-Price protection.

An interesting method has been adopted for connecting the transformers to the l.t. switchgear. The transformer room is immediately behind the l.t. switch room, and special cable boxes have been fitted to the low-tension gear and shaped so that they project through the dividing wall into the transformer room. Cables have then been taken from the transformers straight to these boxes.

Some idea of the striking lighting effects which have been produced at the new Nottingham Council House and Exchange Building will be appreciated from these three representative photographs.

IMPORTED GLASSWARE.

Continued Hearing as to the Marking of Imported Illuminating Glassware.

THE inquiry into the application of British glass manufacturers for a Marking Order in respect of imported illuminating glassware was resumed at the offices of the Board of Trade in London on Monday and Tuesday, after the Whitsun adjournment, the case for the opposition being further proceeded with.

Mr. R. W. Buckingham said his supplies came chiefly from Germany and Czechoslovakia. He alleged that 95% of the volume of the decorative lighting glassware used here was foreign, for the reason that the British makers could not meet the demand. Answering the Chairman, witness said the glassware imported by him did not bear any mark except in special cases where the seller in this country required his own distinguishing mark. As regards the cost of marking imported glassware, Mr. Buckingham said he anticipated that the consumer would have to pay at least 12½% extra on account of the cost of marking. In reference to lighting fittings, he expressed the opinion that to mark the glass would give the impression that the whole fitting was foreign

Question of Cost.

In all cases the cost of the glass was much less than the cost of the metal work which, incidentally, foreign firms could not make anything like as good as the British makers. Special reference was made to glass for panel lighting, it being pointed out that whereas in many cases the cost of the glass panel would be anything from 2s. 6d. to 6s., the cost of the completed fitting might be from 30s. to £2 for a single panel. It would be impossible to mark these panels because when sold by him to manufacturers he did not know how they were to be mounted, and it might possibly be that a mark might be so placed as to deface the panel.

Answering Mr. Barnes (a member of the committee), witness alleged that in some cases the cost of the glass portion of a lighting fitting would be increased by 100% if marked.

In connection with the allegation that English makers did not make the glass panels now used for the new form of electric lighting, witness was shown some made by Hailwood and Ackroyd, Ltd., which bore a mark in such a position that it was suggested it did not disfigure the glass. Witness, however, would not agree, and repeated his opinion as to the difficulty of marking in an effective manner, owing to lack of knowledge as to the way in which the fittings manufacturer might mount the panels.

The Chairman remarked that the Board of Trade figures showed imports of glassware amounting to £300 000, and exports of English glassware to the value of over £40 000.

Mr. J. H. Cresswell (Revo Electric Co., Ltd.), opposed the application, on the ground that any increase in the cost of imported glass—which was the raw material of his firm's business—would handicap him in competition with continental street lighting fittings. If he were forced to buy British glassware his firm would be put out of the export market altogether. Moreover, in the home market, if prices increased owing to the use of English glass many of his customers would probably import the complete fitting direct from abroad. The glass formed only a small portion of the fittings, and to mark the glass would brand the whole fitting as foreign.

The Chairman said the witness seemed to make the assumption that the object of the Merchandise Marks Act was to keep out imports, but that was not an assumption the Committee had ever made. The object was to enable the purchaser to know what he was purchasing. Answering further questions, witness said that in some fittings made by his firm the cost of the glass was 2d. in an article having a total cost of 1s. 10d. Of the glass which his firm imported, 0·35% was used for the export trade. Mr. Cresswell agreed that in future orders he did not think the cost of marking would be appreciable, but it would be considerable in marking existing stocks.

Continuing, Mr. Cresswell spoke with regard to export trade, and said there would have to be separate handling of the glass intended for re-export in fittings.

Mr. Hailwood also cross-examined witness, and asked whether in the goods supplied to Government departments, the firm sold foreign glass.

Mr. Cresswell said that in most cases the specification stated that the goods must be of British origin, and then English glass was used.

Mr. Hailwood said his firm did not charge extra for marking as they found the cost so small.

Mr. N. L. Macaskie, addressing the Committee on behalf of the opponents, said that, although the applicants asked for an Importation Order, no evidence justifying the application had been given, and no attempt had been made to deal with the difficulties which would be encountered by the Customs Authorities with a view to ascertaining that the glassware coming into the country had been properly marked. Referring to imported illuminating glassware, Counsel impressed upon the Committee that there was an extensive industry in this country in mounting glass, and it was clear that this industry would be seriously handicapped if the glass which it used had to be marked as being of foreign origin. This glass formed but a small proportion of the total cost of the completed article, 90% of the total cost in many cases consisting of English labour and materials. The opposition made the suggestion that as regards illuminating glassware an Order should not be recommended. If, however, the Committee saw fit to recommend an Order, then the opposition asked that the marking should be by means of labels. As regards marking stocks already in the country, Mr. Macaskie asked that, if an Order were recommended, a considerable interval of time, say, six to nine months, should be allowed to elapse before the Order came into operation, so that stocks might be cleared.

Mr. Wethered, replying for the applicants, said the reason why those in this country who used foreign glass for lighting fittings and similar purposes did not wish to have it marked was because they did not wish to disclose to their customers the fact that they were using foreign glass. Referring to the evidence given before the Committee on behalf of the Chloride Electrical Storage Co., Mr. Wethered pointed out that the ground of objection was not, as in the case of illuminating glassware, that the mark would disfigure the accumulator and battery containers, but that the company desired to have an alternative supply to that obtained in this country, but at the same time the desire was expressed that this foreign glass should not be marked owing to the fear that it would prejudice the sales of the company's products. He suggested that this was not an adequate reason for asking the Committee not to recommend a marking Order.

BUSINESS ITEMS.

THE GREENWICH CABLE WORKS, LTD., has changed its name to the CROYDON CABLE WORKS, LTD., while the works are now at Mitcham Road, Croydon.

F. W. COOK AND CO. (SOUTHAMPTON), LTD., of 20 to 24, Bargate Street, have opened new showrooms, for electrical fittings at Russell House, Hanover Buildings, Southampton.

The HOVE ELECTRICITY DEPARTMENT, in conjunction with the local registered electrical contractors, held a second display and demonstration at the electricity showrooms on May 15th.

The latest addition to yachts fitted with wireless is Sir William Berry's motor yacht "Sona," which is equipped with a comprehensive Marconi wireless installation, including a broadcast receiver.

The merits of Hart accumulators for television circuits were the subject of a lecture by Mr. W. Schofield, of the HART ACCUMULATOR CO., LTD., to members of the Westcliff-on-Sea Television Society, on May 10th.

New showrooms and offices erected in Parliament Row, Hertford, by the NORTH METROPOLITAN ELECTRIC POWER SUPPLY CO., LTD., were opened on May 10th in the presence of about 75 guests by the Mayor, Sir Lionel Faudel-Phillips.

The A.-S. REFRIGERATING MACHINES, LTD., one of the associated companies of the General Electric Co., Ltd., have received an order from Messrs. Boots, cash chemists, of Nottingham, for fourteen sectional refrigeration cabinets, each fitted with the hermetically sealed, leakage and explosion proof A.-S. automatic refrigerating machine, for installation in various cafes.

In connection with the inauguration of supplies at Cold Ash, an electrical exhibition was held by the WESTERN ELECTRICITY SUPPLY CO., LTD., recently. At the official opening, Mr. A. J. Bridge, publicity and development manager, gave a short address outlining the uses of electricity in the home and explaining the tariffs for domestic purposes. Cookery demonstrations, given by Mrs. Peterson of the CREDENDA CONDUITS CO., LTD., were well attended and productive of good results.

ELECTRIC TOOLS.

ELECTRIC tools of various kinds have been on the market for some twenty years, but even at the present date their use might be greatly extended. Work by British firms in the making of electrically-operated tools, however, presents several difficulties. One drawback in designing portable tools —one which will practically disappear as frequencies and voltages become standardised—is that small motors, running at a very high speed, have to be designed for loads which may become unusually heavy for this class of motor. Added to this is the fact that only fine windings, which have to be carefully designed to stand up against heavy overloads, can be used. For instance, a ¼ in. drill may stick on the break-through, and, unless the design has been almost perfect, the risk of a burn-out is great, especially if the drill is operated from a 250 V circuit. We describe below some of the most modern equipment produced by leading British and foreign firms.

B.E.N. PATENTS, LTD., of 92, Tottenham Court Road, London, W.1, offer a large range of tools for light and heavy work. One of their newest productions is a portable electric saw, designed principally for the use of carpenters. There are two models, one with a maximum cut of 1½ in. in hardwood, the other with a maximum cut of 3⅜ in. The motor driving the larger saw is series wound, operating on a.c. or d.c. 100–250 V, as specified. A fan cooled ball-bearing armature with thrusts is used. A silent running worm drive transmits power to the saw blade. The cutting speed with 10 in. blade is 5 ft. per min. through 3 in. ash. All aluminium housing is used, and the saw is supplied in a fibre carrying case. The weight is 31 lb., the speed of saw blade 3 600 r.p.m., and the consumption approximately 1·3 W. A special feature of this saw is the combined depth gauge and saw guard. This telescoping guard completely encloses the blade and is automatically opened by release of the slipper plate only when the saw is pushed into the material. If desired, adjustments can be made to give any variation in depth of cut.

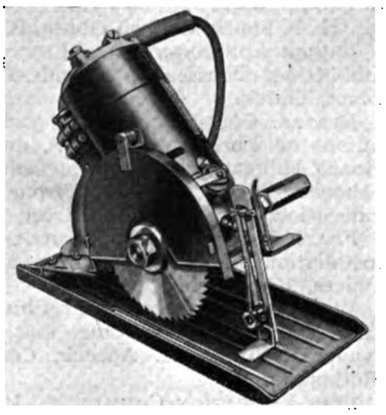
The B.E.N. sanding and polishing equipment for nitro-cellulose lacquers has recently been introduced. The following description applies to the combination machine type HC-5, which is the most popular model. The machine consists essentially of a rotatable disc—to which various devices may be fitted—driven through a 6 ft. by 7/16 in. flexible shaft from a ½ H.P. motor mounted on a movable tripod. The motor may be run at four speeds, giving 875, 1 300, 2 350 and 3 500 r.p.m. to the operating disc; the lower speeds are used for polishing and the higher for the preliminary sanding, etc. The speed changes are effected by transposition of belt and pulleys. The equipment of this model includes backing discs, facing belts, abrasive wheels, lambswool polishing buffs, rotary woollen mop, rotary wire brush, sanding drum and sanding sleeves.

Electric Drills.

This firm also acts as agent for The United States Electrical Tool Co., of Cincinnati, Ohio. "U.S." drills are offered in sizes from ¼ in. to 1½ in. Hand, suspended-type, and bench drills are provided. Buffeting, polishing and grinding attachments can be fitted. All motors fitted to drills are suitable for either a.c. or d.c. Nearly all kinds of electric tools are supplied by the American firm: among them may be mentioned valve grinders, valve refacers, hand blowers—for removing dust and free dirt—and grinders of all kinds, up to very heavy models.

The "N.U." electric drills manufactured by the SUN ELECTRICAL CO., LTD., 118–120, Charing Cross Road, London, W.C.2, are designed as light hand drilling machines, but they may also be used as bench drills by the addition of one of two bench stands which are sold separately. The machines are exceptionally light, and consequently can be operated by hand without undue strain. The switch is located conveniently in the revolver-type, or double-lateral handle, so that the operator does not have to alter his hold to switch off. Five sizes are available:—5/16 in., ⅜ in., ½ in., 5/8 in., and ¾ in., these capacities being for high speed steel drills, drilling in mild steel.

The "Sunco Universal" drilling machine has a stand designed to take a heavier type of drilling machine, with capacities ⅞ in., 1¼ in., and 1⅞ in. The stand consists of pillar with base, an adjustable end plate against which the top of the drilling machine rests, and a fitting which serves the double purpose of supporting the machine and transmitting its power to the drill. The power transmission is effected through an adjustable driving spindle provided with Morse cones and sockets. The drills are listed under three headings: d.c., up to 250 V; a.c., up to 250 V. and up to 380 V; Universal, 100 to 110 and 200–250 V. The "Sunco" electric screwdriver may be used with all types of wood screws; a reversing switch is incorporated. The winding is suitable for d.c. or a.c., 40–60 cycles, the consumption being 230 W. The company's rectifying and polishing machine for final finishing of press tools, dies, etc., is supplied complete in box and comprises drilling machine with grinding wheel, hard felt burnishing mops, and copper polishing bobs. Grinding and buffing machines are also manufactured by the Sun Electrical Co.



An electrically-operated saw, by B.E.N. Patents, Ltd.

THE GENERAL ELECTRIC CO., LTD., are the proprietors of the Witton Kramer Electric Tool and Hoist Works, of Witton, Birmingham. "Witton Kramer" portable drills are made in 6 sizes, ranging from ⅜ in. to 1¼ in., with consumptions from 200 to 1 100 W, and weights from 12½ to 65 lb. Three types are designed for d.c. only, while the remaining three also take a.c., 25/60 cycles. The motor shell is of cast steel in the d.c. machines, and of electric steel stampings housed in aluminium shell in the case of universal models. The shell is fitted with two aluminium end shields, the top shield containing the brush gear and carrying the feed screw, while the bottom shield forms the gear case and carries the bearing for the drill spindle. The switch, of the push button type, is contained in an aluminium cover fitted to the outside of the motor shell. Witton Kramer magnetic drill posts are supplied to obviate the necessity of using ordinary pillars with clamping down bolts. The post, with 8 in. or 12 in. base and either single or double post is placed on the steel or ironwork in which the hole has to be drilled, the current is switched on and the equipment is then held magnetically.

The A.E.G. ELECTRIC CO., LTD., of 131, Victoria Street, London, S.W.1, specialise on welding machines, of which they have a large range embracing butt welders, spot and seam welding machines and arc welders. Butt welders are available in sizes up to 450 kVA for welding sections up to 25 000 sq. mm. Machines are available for welding boiler tubes, bicycle and motor car frames, triangular brake shafts, drawhooks, railway buffers and many other purposes. Seam welding machines are designed for dealing with petrol cans, preserve tins, etc. Arc welding machines are divided into the two main classes of those with self-excited and separately excited generators, the type to be chosen depending on the conditions to be satisfied.

W. E. HIGHFIELD SHIELD.

Details of the Forthcoming Competition organised by the A.S.E.E.

WE are advised by the Association of Supervising Electrical Engineers that this year's competition for the W. E. Highfield Shield, will include, in addition to the shield itself, five prizes, three to members and two to associates. The value of the prizes will range from £1 1s. to £4 4s.

The rules of the competition are: (1) papers to be of about 1 000 words; (2) subjects of papers must refer to the electrical industry and/or the association; (3) all papers, addressed to the general secretary, must reach head office not later than noon on September 2nd; (4) all papers will be typed out by head office and each paper given a number. The typed copies will be judged by a Special Examining Board, to be set up by the Board of Control, which will select the winning papers. The names of the writers of the papers will be known only to the general secretary, who will not disclose the names until after the decision of the examiners has been received; (5) a signed declaration that the paper is the unaided work of the competitor must accompany each paper.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, when available.

BICESTER URBAN DISTRICT COUNCIL.—Electric light wiring of two houses in Banbury Road, Bicester. Specification from Mr. H. T. Smith, Council House, Bicester.

THIRSK CONGREGATIONAL CHURCH.—Electric light wiring and fitting. Particulars from Mr. Frank Taylor, 2, Melbourne Place, Thirsk.

BELFAST CORPORATION, May 31st.—Electric lighting installations at York Street School, and Belvoir Hall, Donegall Road, Hillman Street, Springfield, and St. Mark's P.E.S. Schools. Specification, etc., from the Education Architect, Education Offices, Victoria Street, Belfast; deposit £2 2s.

FEATHERSTONE COUNCIL SCHOOL, May 31st.—Electric light installation. Specification from Mr. C. Harris, Education Offices, Knottingley.

WEST RIDING ELECTRICITY COMMITTEE, May 31st.—Electric lighting of Maltby Crags and Aston Schools. Forms of tender from Mr. A. Adcock, Craigmoor, Godstone Road, Rotherham.

FIFE EDUCATION COMMITTEE, June 1st.—Electric lighting work in Markinch Public School new buildings. Schedules from Mr. G. Sandilands, Education Offices, Wemyssfield, Kirkcaldy.

BURNLEY-IN-WHARFEDALE URBAN DISTRICT COUNCIL, June 3rd.—Electric lighting and heating installation in the Council Offices. Specifications from the Surveyor.

COMMISSIONERS OF H.M. WORKS, ETC., June 3rd.—Fuse boards and switches. Forms of tender, etc., from the Controller of Supplies, King Charles Street, Westminster, London, S.W.1.

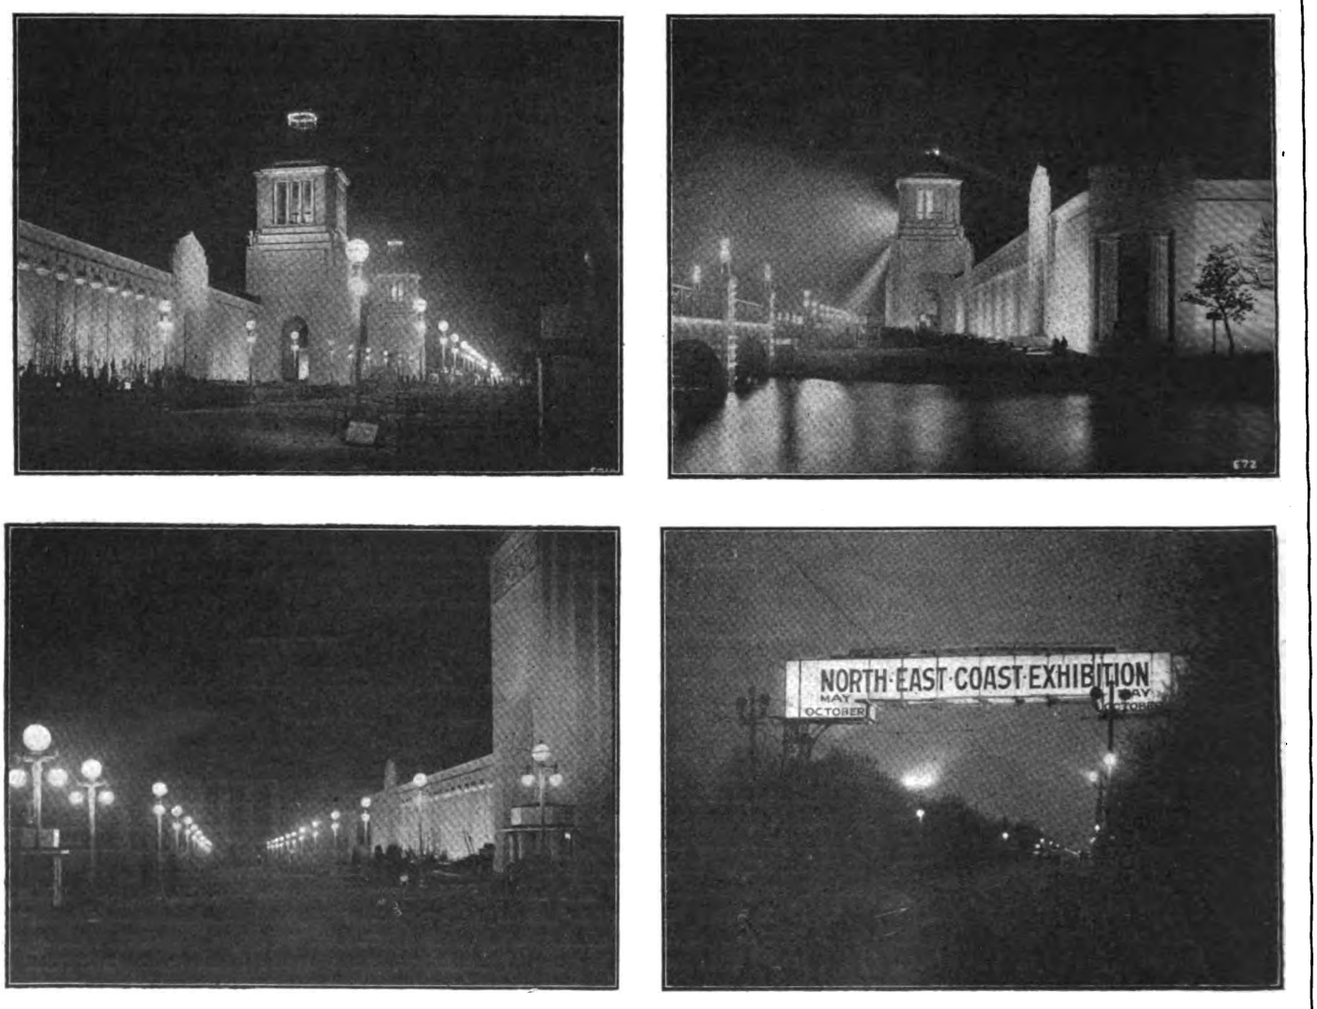
DUMBARTON COUNTY EDUCATION COMMITTEE, June 3rd.—Electrical work in new Primary and Secondary School at Kirkintilloch. Applications for schedules, etc., to the Clerk and Treasurer, 18, Park Circus, Glasgow, C.3.

THURROCK, GRAYS AND TILBURY SEWERAGE BOARD, June 4th.—Supply of a.c. motors, pumps, wiring, etc. Specifications can be obtained at the Sewerage Works, Marsh Farm, Tilbury.

MANCHESTER CORPORATION, June 6th.—Electrical installation at Mobberley Open Air School. Specification, etc., from Education Offices, Deansgate, Manchester; deposit £1 1s.

SHEFFIELD CORPORATION, June 7th.—Electric wiring and fitting at Carfield, Firshill, Hunter's Bar, Intake, Lowfield, Woodbourn, Woodseats, and Woodside Council Schools. Specifications, etc., from Mr. W. G. Davies, city architect, Town Hall, Sheffield; deposit £1.

SUTTON AND CHEAM URBAN DISTRICT COUNCIL, June 7th.—Installation of fire alarm system, connected with the fire



THESE pictures of the N.-E. Coast Exhibition show: (top left) a view of the main avenue with the Palace of Engineering and the two towers colour-floodlighted; (top right) the avenue at the opposite end showing the Palace of Industries with colour-floodlighting from projectors in spherical lanterns mounted above the lighting standards on the roadways; (bottom left) a view towards the pylons, showing the colour-floodlighted Palace of Engineering in the foreground and lighting standards with special spherical lanterns containing the floodlight projectors, mounted at the top; (bottom right) the large sign spanning the roadway. This sign is also floodlighted, as is every building and structure throughout the exhibition. The whole of the floodlighting scheme was arranged by the British Thomson-Houston Co. in conjunction with the consulting engineers, to the approval of the architect.

Digitized by Google

station. Plans showing positions of fire alarm boxes, etc., from the Engineer and Surveyor.

CENTRAL LONDON SCHOOL DISTRICT, June 8th.—Supply of four electric motors, switchgear, shafting, belting, etc. Specification from Mr. G. P. Morrell, clerk to the Managers, Greenford Avenue, Hanwell, London, W.7.

CLYDE NAVIGATION TRUST, June 8th.—Six or 12 months' supply of electrical stores, etc. Form of tender (No. 8) from the Superintendent of Stores, 1, Graving Dock, Govan.

CHEADLE AND GATLEY URBAN DISTRICT COUNCIL, June 11th.—Overhead distribution scheme (contract 47) and two e.h.t. truck cubicles (contract 50). Specifications from Mr. R. W. Willis, 37, High Street, Cheadle; deposit £1 1s. for each.

▶ STOCKTON-ON-TEES CORPORATION, June 11th.—Supply of two 1 250 kVA, 3-phase transformers and l.t., 3-phase switchgear, Specification, etc., from Mr. S. G. Marston, Electricity Works, Thompson Street, Stockton-on-Tees.

EAST HAM EDUCATION COMMITTEE, June 12th.—Electric lighting installation at the Salisbury School. Specification, etc., from the Secretary, Education Office, Town Hall, East Ham, London, E.6; deposit 10s. 6d.

STOKE-ON-TRENT CORPORATION, June 12th.—Supply of 33 000 V overhead transmission lines. Specification, etc., from the City Electrical Engineer, St. George's Chambers, Kingsway, Stoke-on-Trent; deposit £2.

WALTHAMSTOW URBAN DISTRICT COUNCIL, June 12th.—Two natural draught cooling towers and ferro-concrete tank, at the Electricity Works. Specification, etc., from Mr. G. R. Spurr, Electricity Works, Exeter Road, Walthamstow; deposit £1.

FARNWORTH URBAN DISTRICT COUNCIL, June 15th.—Supply of l.t. cables. Specifications, etc., from Mr. A. J. Hutchinson, engineer and manager, Electricity Department, Albert Road, Farnworth, Lancs.

BELFAST CORPORATION, June 17th.—Manufacture and supply of (a) h.t. combined cubicle and truck-type switchgear (Specification W. 85); and (b) transformer kiosks (W. 88); and manufacture, supply, and erection of (c) 1 000 kW rotary convertor (W. 86); (d) 500 kW rotary convertor (W. 87); (e) c.c.switchgear for sub-stations (W. 89); (f) h.t. armour-clad switchgear for sub-stations (W. 90); and (g) h.t. truck-type switchgear for sub-stations (W. 91). Specifications from Mr. F. H. Whysall, city electrical engineer and manager, East Bridge Street, Belfast; deposit £2 2s. for each.

WEST HAM EDUCATION COMMITTEE, June 17th.—Electric light installation at Fyfield Open Air School Extension, near Ongar, Essex.

STOKE-ON-TRENT CORPORATION AND STAFFORD COUNTY COUNCIL, June 22nd.—Electric light and power installation in new buildings at North Staffordshire Technical College, Stoke-on-Trent. Further particulars from the Clerk to the Governors, Town Hall, Hanley; deposit £5 5s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

VICTORIAN ELECTRICITY COMMISSION, July 15th.—Two 750 kVA transformers and spares (No. 29/42). (Reference B.X. 5 325.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, July 23rd.—Telegraph instruments (schedule C. 436). (Reference B.X. 5 323.)

NEW ZEALAND POSTS AND TELEGRAPHS, August 7th.—Enamelled and silk covered resistance wire (No. P. and T. 151/1 497.) (Reference B.X. 5 322.)

EGYPTIAN MINISTRY OF THE INTERIOR, August 13th.—Supply of electric power plant, with underground and overhead network, for the town of Maghagha, Minieh Province. (Reference B.X. 5 318.)

PIETERSBURG (TRANSVAAL) MUNICIPALITY, August 13th.—Supply of h.t. and l.t. cable, lamps and sundries, in connection with extensions of the electricity undertaking. (Reference B.X. 5 312.)

PIETERSBURG (TRANSVAAL) MUNICIPALITY, August 13th.—Supply and erection of steam raising plant, engine, alternators and switchgear (contract A). (Reference A.X. 7 983.)

AUCKLAND ELECTRIC POWER BOARD, August 19th.—Single phase transformers. (Reference B.X. 5 324.)

NEW ZEALAND GOVERNMENT RAILWAYS, September 4th.—Supply of motor generator (specification 287). (Reference B.X. 5 308.)

WINDOW FLOODLIGHTING.

Beauty of Stained-Glass Windows Revealed by Floodlight.

AN interesting scheme of floodlighting has been installed by the BATE ELECTRICAL CO., LTD., of 6, Creed Lane, London, E.C.4, in the Stationers' Hall, London. This hall is lighted by six stained glass windows, in addition to windows of other type, and in order that the beauties of the stained glass may be appreciated during dinners and similar nocturnal functions in the hall, a battery of five "Kandem" floodlight projectors, each fitted with a 1 000 W lamp, has been arranged in the garden adjoining the hall, so that the windows on the west side of the building can be illuminated. A large window of stained glass at the north end of the hall can also be illuminated, but in this case nine smaller flood units are employed; the lamps installed in this latter battery are each of 150 W. In addition, the centre of the window is lighted by a trough reflector, thus giving an even distribution of light over the whole area of the glass.

The scheme was developed by the Bate Electrical Co., under the supervision of Henry Dawson and Son, the architects, and the first practical use of the installation was made on Tuesday evening.

HAMMERSMITH WIRING CONTRACTS.

New List of Installation Contractors Placed on the Rota.

HAMMERSMITH (London) Borough Council recently terminated its contracts with local electric wiring contractors for the execution of electric wiring installations under the Council's scheme for the wiring of property, and an advertisement was issued inviting quotations for carrying out such work in accordance with a revised specification. In connection with the operation of the Council's wiring scheme and the execution of electric wiring installations by contractors thereunder, the Electricity Committee has had certain negotiations with the local branch of the Electrical Contractors' Association. A deputation composed of local contractors met a special Sub-Committee of the Electricity Committee in April, and several points were put forward by the deputation, the principal ones being: (*a*) That the Council should agree with local representatives of the Electrical Contractors' Association a fair and reasonable price per point for the execution of wiring work, and (*b*) that the Council should restrict its contracts for wiring work to Hammersmith members of the Electrical Contractors' Association. The Electricity Committee reports that it is unable to recommend the Council to adopt the proposals. As a result of an advertisement, 26 quotations were received from wiring contractors, and the average prices quoted were: For lighting installations, 4 points (*a*) 110 V, £4 9s. 4d, (*b*) 220 V, £4 7s. 6d.; 5 points, (*a*) £5 10s. 1d., (*b*) £5 7s. 10d.; 6 points, (*a*) £6 10s. 3d, (*b*) £6 8s. 8d.; 7 points, (*a*) £7 11s. 7d., (*b*) £7 8s. 6d.; 8 points, (*a*) £8 12s. 1d., (*b*) £8 8s. 10d.; 9 points, (*a*) £9 12s. 3d., (*b*) £9 8s. 9d.; 10 points, (*a*) £10 12s. 3d., (*b*) £10 8s. 4d.; 11 points, (*a*) £11 12s. 6d., (*b*) £11 8s. 4d.; 12 points, (*a*) £12 13s. 3d., (*b*) £12 8s. 11d.; 13 points, (*a*) £13 12s. 11d., (*b*) £13 8s. 4d.; 14 points, (*a*) £14 11s. 11d., (*b*) £14 7s. 6d.; 15 points, (*a*) £15 12s. 5d., (*b*) £15 7s.; 16 points, (*a*) £16 11s. 5d., (*b*) £16 5s. 9d. Power installations: 1 point, (*a*) £2 13s. 4d., (*b*) £2 3s. 6d.; 2 points, (*a*) £5 1s. 1d., (*b*) £4 0s. 1d.; 3 points, (*a*) £7 6s. 11d., (*b*) £5 13s. 1d.; 4 points, (*a*) £9 17s. 2d., (*b*) £7 16s. 11d.; 5 points, £12 8s. 8d., (*b*) £9 13s. 4d.

The Committee's Recommendation.

An intimation was given to all local contractors that the Council was prepared to consider offers to enter into contracts to execute electric wiring installations, orders being placed in a consecutive manner according to a rota, in accordance with the Council's specification, at the above-mentioned rate of charge. As a result of the replies received, the Committee has recommended the Council to place contracts with the undermentioned local contractors for six months from June 1st, 1929:—Brooks and White, Alan Bantock and Co., F. E. Beltram, W. T. Canning and Co., E. W. Chamberlen, Fenn and Co., A. H. Fisher, G. Goodchild, J. R. Goode, Sydney Hellyar, Ltd., L. T. Hall, O. E. Jones, W. T. Lofting, C. J. Mount, M.E.D.A.S., Ltd., A. E. Mayhew and Co., J. B. O'Brien, Smith, Owen and Co., H. E. Steer, Thornton and Co., A. H. Verney, Wilkins Electrical Works.

N.E. COAST EXHIBITION.

Further Exhibits of Electrical Interest at Newcastle.

WE gave in our last issue brief descriptions of a number of the electrical exhibits to be seen at the North-East Coast Exhibition, at Newcastle-on-Tyne, and this week we give further particulars of some of the plant exhibited.

The stand of CLARKE, CHAPMAN AND CO., LTD., of Gateshead, for instance, is devoted to power station and marine equipment. The pulveriser shown is capable of dealing with 10 tons of coal per hour at a shaft speed of 960 r.p.m., and is driven by a 180 H.P. motor, suitable for land or marine purposes. Another pulveriser exhibited is capable of handling 30–160 lb. of coal per hour, driven by a 3 H.P. motor at a speed of 2 800 r.p.m. An electrically driven ship's windlass, with a motor on the windlass bedplate controlled by a Clarke, Chapman patent booster system, suitable for a 2¼ in. dia. cable, is another feature of the show, and this is fitted with a 47 B.H.P. motor, which runs at a speed of 900 r.p.m. with an input of 220 V.d.c. Demonstrations of the equipment are available.

Electric Winches.

Electrically driven ship's cargo winches, controlled by the same system form another exhibit. These are self-contained and have infinite variable speed of haul, dealing with 5 tons at 60 f.p.m.; 2 tons at 150 f.p.m., and light hook speed 480 f.pm. The machines have creeping speeds at all loads and are capable of being stalled under any conditions. Demonstrations are being given. A motor generator set, consisting of a 70 H.P. 440 V 3-phase 40 cycle squirrel cage motor driving a standard marine type 45 kW 220 V. d.c. compound-wound generator is also shown. This set is used to supply the necessary direct current for the winch and windlass, while the switchboard consists of a standard marine type complete with a d.p. no-volt overload circuit breaker for the generator, and 4 d.p. circuit switches and fuses. The board is in accordance with Lloyds rules and requirements.

Messrs. BABCOCK AND WILCOX, LTD., of Babcock House, Farringdon Street, London, E.C., are giving a general display of their principal manufactures. The Babcock boiler is represented by two scale models, one representing a cross type marine boiler complete with inter-deck superheater, superposed counter-flow economiser, and tubular air heater, the furnace being fitted with the latest type of mechanical chain grate stoker; the other model represents a marine boiler as installed in the mercantile marine, and fitted for the burning of oil fuel. The company also shows a complete model illustrating the Babcock process of low temperature coal distillation with the recovery of tar oils, showing low temperature retorts supplying pulverised semi-coke to the furnace of a pulverised fuel boiler, or, alternatively, supplying semi-coke in lump form to the chain grate of a stoker-fired boiler. Another model shows the firm's balance lever luffing crane as used for coal unloading, general cargo discharge and similar purposes. The main exhibit consists of a complete totally-enclosed single gear 7 in. by 12 in. steam winch. This plant is shown in operation, the winch being arranged for a lifting load of 1 ton, and being operated for the purposes of exhibition by compressed air supplied from a Bellis and Morcom motor-driven two stage compressor. A representative selection of pipe work is shown, consisting of expansion bends, straight runs, and connections.

It is interesting to note that the whole of the electrical equipment for the Amusement Park was supplied by the Newcastle Branch of the GENERAL ELECTRIC CO., LTD., and here are seen "Osram" lamps and "Fairy-land" strip. The African Village and the Water Chute are two other examples, while the old Tyne Bridge is also illuminated by means of Osram lamps and Fairy-land strip. Among the interior installations may be mentioned the Festival Hall, the Grand Foyer and the Main Hall. Throughout the Palace of Industry and the Palace of Engineering, the two main buildings allocated to exhibition purposes, 300 W Osram gasfilled lamps are used. Many stands are equipped with G.E.C. fittings of various types, including "Wembley" lanterns, and in several instances auxiliary floodlighting is provided in addition—a notable example being the exhibit of a Diesel type engine. Two other examples of lighting are the Boulton Kiosk and the "Evening World" Pavilion, while the lighting of individual stands has called for "Gecoray" reflectors to the number of 1 200.

ELECTRICITY SUPPLY.

AN electricity supply scheme for Shoeburyness has been adopted.

Dover Electricity Committee has received sanction to borrow £3 000 for unspecified electricity services.

Bury (Lancs.) T.C. has received sanction to loans of £20 000 for mains, and £10 000 for sub-station equipment.

Cranbrook R.D.C. has given permission to the Weald Electricity Co. to erect a transformer at Goudhurst.

Dumfrie-shire C.C. has applied for a loan of £10 000 for cable extensions, distribution, generating, and boiler plant.

Guildford Electricity Committee has decided to extend mains at a cost of £2 220 to afford a supply to Clandon village.

Faringdon R.D.C. and Traders' Association has decided to invite the Wessex Electricity Co. to extend its scheme to the district.

Cookham R.D. Council has agreed to a proposal by the Western Electricity Supply Co. for the erection of overhead cables at Cookham Dean.

Dronfield U.D.C. is asking Sheffield Corporation for terms for a bulk supply. The Staveley Coal and Iron Co. offered a supply, but has withdrawn the offer.

Hungerford R.D.C. has consented to the application of the Wessex Electricity Co. to erect overhead and lay underground cables from Hungerford to Shalbourne.

In order to provide an l.t. supply to tenants' installations at the Royal Edward Dock, Bristol Electricity Committee reports that a new cable is necessary.

Haltwhistle R.D.C. has lodged an objection against the Newcastle-upon-Tyne Electric Supply Co.'s application for the South-West Northumberland Electricity Order.

Bradford Corporation has obtained land in Harrogate Road, Greengates, for the erection of a transformer chamber and voted £4 240 for a district transformer chamber in Ivanhoe Road.

Dewsbury T.C. has applied for a loan of £10 000, for mains and services. It has been decided to take no action in setting up a department in connection with the assisted wiring scheme.

Marylebone (London) Electricity Committee reports that the additional soot and grit catchers have now been erected, and all boiler plant at the generating station is now provided with this auxiliary equipment.

The Berkshire branch of the National Farmers' Union is advising members not to sign electricity company's wayleave consent forms, until the question of compensation for damage done to crops has been settled.

The Aylesbury Town Clerk has been instructed by the Council to take steps to enable an application to be made to the Electricity Commissioners for an Order to extend the area of supply so as to include Bradenham.

The High Street (Ealing) Traders' Association has asked Ealing Electricity Committee for a quotation for the supply and installation of electric lanterns fitted with 1 000 W lamps outside business premises in the High Street.

Macclesfield Guardians have accepted the offer of the Macclesfield Electricity Co. to supply the Macclesfield poor law institution at the reduced charge of £5 per kW and 1½d. per kWh up to 5 000 kWh per quarter.

Voltage Variation.

The Electricity Commissioners have refused consent to the Richmond (Surrey) Electric Light and Power Co. for permission to vary the voltage by 5% instead of 4% in connection with the proposed change-over from d.c. to a.c.

Wing R.D.C. has decided to ask Aylesbury T.C. whether a supply can be given to the parishes of Ivinghoe, Pitstone, Marsworth and Cheddington, and Luton Corporation is to be asked if it can supply electricity to the parishes of Soulbury and Wing.

Reigate R.D.C. has accepted the offer of the County of London Electricity Supply Co. for electricity for power at the Merstham Outfall, at 1¼d. per kWh, provided consumption exceeds 1 250 kWh per annum per H.P. installed. The Minister of Transport has consented to the retention of certain overhead lines erected by the Sussex Electricity Supply Co. in the Council's area and adjacent districts.

The underwriting of the new loan issued by the Central Electricity Board took place on May 23rd. The issue is for £3 000 000 4% stock, 1959-89, at 83% The interest on the stock is to be a first charge on the whole undertaking and revenues of the Board. The Board's two sources of revenue are from sales of electricity in bulk to authorised undertakers, and from a levy on the electricity supply industry in connection with the standardisation of frequency.

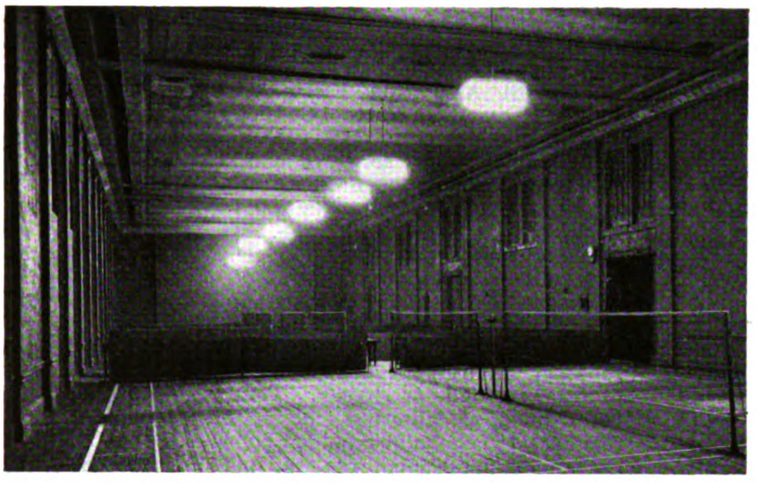
ELECTRICAL NEWS OF THE WEEK IN PICTURES.

Mr. W. M. Selvey, who, as announced on page 650, is shortly sailing to America on a tour of inspection of power stations.

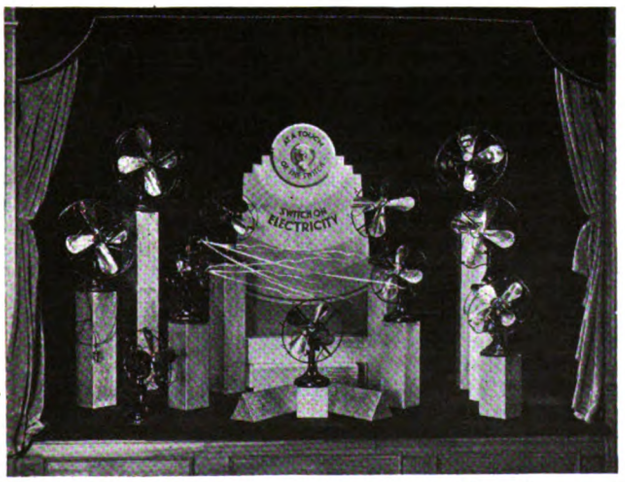
Mr. H. Willoughby Ellis, who has been nominated as president of the E.C.A. Allied Associations for the 1929–30 session.

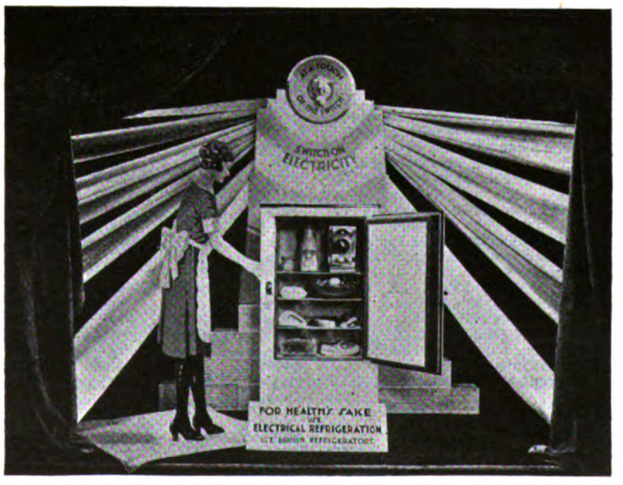
Mr. C. Elliott was appointed on Monday to succeed the late Mr. C. Stanley as general manager of the Birmingham Section of the B.I.F. See page 650.



An interesting lighting installation at the Alexandra Palace Badminton Club courts. The lighting units employed are made of a wire frame covered with Jap silk, the top being left open. Inside the unit there are 5 lamps of the frosted variety of 200 W each. As will be gathered from the picture, the units are arranged on the line of the net but in between the courts. Mounting height has been found best at 17 or 18 feet.

Firemen carrying scaling ladders to the roof of the Engineers' Club, Coventry Street, London, where a fire occurred on Monday. The premises were considerably damaged by water, but at the time of going to press no definite information was available.





In a recent issue we gave a number of suggestions from manufacturers with respect to the forthcoming fan trade. This week we reproduce the two June windows for the Monthly Selling Campaign organised by the E.D.A., one of which is devoted to fans. By making the most of the information contained in our special issue, and using the simple fittings of the E.D.A. design, a really attractive window containing all that is new in fans may be arranged. The second window is devoted to refrigeration, and again preserves the simplicity of previous windows. Both these designs may be arranged without professional assistance within a short space of time, and, with the warm weather now prevailing, good business is likely to follow such displays.

COMPANY NEWS.

Telegraph Securities Declining—Ferranti's and Callender's Bonus Share Issues—Meetings of Eastern, Eastern Extension and Western Telegraph Companies—Directors' Reports and Dividend Announcements.

GENERAL Electric shares continue to sag, and a further fall of 1s. 3d. has brought the price down to 53s. 9d. W. T. Henley's Telegraph Works ordinary shares have recovered half-a-crown to 55s., and Ever Readies have put on threepence. In the electricity supply section, Newcastle and District and Yorks Electric Power ordinary shares are respectively 1s. 3d. and 1s. higher. Underground Electric Railways ordinary shares are 6d. down. Eastern Telegraph stock is five points lower, Marconi's Wireless have dropped 3s.9d., British Electric Traction preferred ordinary stock has risen 1½ points, and International Marine are 2s. 6d. down.

FERRANTI, LTD.—It is proposed to capitalise £40 000 of gen. res. and distribute it among ord. shhldrs. in proportn. of two new shs. for every three held.

ISLE OF WIGHT ELECTRIC LIGHT AND POWER CO., LTD.—Rev. for 1928, £32 193, agst. £30 087, plus £1 035 brt. in. To gen. res., £1 500; staff benevolent fund, £500. Fin. div. 4%, makg. 8%, tax free. Fwd., £1 032.

INTERNATIONAL HYDRO-ELECTRIC SYSTEM.—Application has been made to the New York Stock Exchange for listg 1 045 000 shs. of class "A" stk., of which 475 000 shs. have been issued, and 570 000 shs. are held in reserve for convrsn. of debs.

LEWES AND DISTRICT ELECTRIC SUPPLY CO., LTD.—Net receipts for 1928, £11 218, agst. £11 598. After deductg. exes. and int. and providg. £3 500 for renewals, surplus is £3 658, agst. £4 522, plus £3 403 brt. fwd. To res., £2 000; ord. div. 10%; fwd. £2 735.

POTTERIES ELECTRIC TRACTION CO., LTD.—Rev. for 1928, £266 148. After deducting all exes. chargeable to rev. and addg. £3 400 brt. fwd., blce. is £28 618. Deb. and loan int. £18 636; to res. £5 000. Fwd. £4 982. Arrears of div. on 5% cum. pref. shs. at Dec. 31, 1928, amtd. to £59 719.

ELECTRIC FURNACE CO., LTD.—Pft. for year ended March 31, 1929, £16 047. Div. at rate of 7% p.a., less tax, on pfd. ord. and ord. shs. from date of incorporation to March 31, 1909. To writg. off prelim. exes., £2 416; to gen. res., £5 000. Fwd. £2 160. Satisfactory workg. agreements have been made with Associated Electrical Industries, Ltd., and important groups in France, Germany and Sweden.

EASTERN EXTENSION, AUSTRALASIA AND CHINA TELEGRAPH CO., LTD.—Gross rev. for three months ended March 31, 1928, £517 779; deducted for ord. exes. and maintenance ships res. fund £219 045; blce., £298 734. Income tax, payable in England, £47 694; mtge. deb. stk. int., £7 524; blce., £243 516, plus £653 622 brt. in. Div. of 2½%, less tax, has been paid. To gen. res., £797 138.

GREAT NORTHERN TELEGRAPH CO., LTD.—Traffic receipts and pft. from participatn. in other telegraph undertakgs. for 1928, £983 551, int. from res. fund acct. and other sources, £202 844, sundries £64 383, and blce. fwd. from previous year £219 308; total £1 470 087. Total expenditure £808 875. Intm. div. of 5% absorbed £100 000, proposed fin. div. of 7½% requires £150 000, and proposed bonus of 7½%, £150 000; to res. and renewal fund, £33 333, and directors' fees, £3 056. Blce. fwd. £224 823. An additnl. wire between Irkutsk and Vladivostock was taken into use in Feb. 1929. New and improved instruments were installed at the relay stations, resulting in considerable increase of transmission speed. With regard to two wireless stations to be erected near Shanghai by Radio Corporation of America, working agreements have been concluded wh. provide that, as regards exchange of traffic, each party shall give preference to the other. On April 15 this year, when the bilateral service was opened between Europe and the new wireless station at Nagoya (Japan) cable rates were considerably reduced.

CALLENDER'S CABLE AND CONSTRUCTION CO., LTD.—Accts. for 1928 show blce. to credit of pft. and loss acct., £360 581. Deductg. provisn. for depreciatn. (£50 000), income tax, deb. stk. int., divs. for year on 6½% and 7½% pref. shs., stamp duty on new cap. authorised and contributn. to pensn. fund (£10 000), leaves £216 081, plus £474 165 brt. in. Div. proposed on ord. shs. (Nos. 1–800 000) of 15% p.a., being 3s. per sh., less tax, of which 1s. p. sh. was paid on Nov. 2, 1928. Fwd. £570 246. Past year was marked by absence of large cable contracts, but gen. business remained steady and in many directions improved materially. Result of year's operatns., as shown by accts., was satisfactory, blce. at credit of pft. and loss being slightly in excess of that of preceding year, and carry-forwd. substantially increased. Since beginning of 1929 outlook has distinctly improved, and the volume of business is increasg., both in regard to Erith Works and to the rubber wires and cables mfd. at the Anchor Works. In additn. to usual div. directors propose that a bonus in ord. shs. be issued without paymt. to all ord. shhldrs. on the basis of one fully paid-up ord. sh. for each five ord. shs. held. Work on the contract received from the Electricity Board for the South-Eastern Section of the Southern Grid

Digitized by Google

has been commenced, and erectn. is being proceeded with. An imporgtant contract for underground mains in the London area has been received from the London Power Co., and the cables are being manufactured. Considerable progress has been made with Overseas work, especially in India. Anchor Cable Co. has had an excellent year. Results of year's operatns. are eminently satisfactory. Okonite-Callender Cable Co., New Jersey, in which company holds a large int., has also made steady progess. Directors accepted an offer made to them for the purchase of the old-established cable mfg. business of W. T. Glover and Co., Ltd., Manchester. Some other cable mfg. cos. have since become associated with them in this transaction. Board have set aside from pfts. of 1928 a sum of £10 000 as a contributn. towards a pensn. fund.

Company Meetings.

KALGOORLIE ELECTRIC POWER AND LIGHTING CORPORATION, LTD.—Mr. G. C. Howard, presiding at the meeting on May 23rd, said, after transferring £7 000 to a depreciation reserve account and bringing in the balance brought forward from the previous year, there was an available balance of £10 772, which it was recommended should be allocated as to £6 149 to payment of 6% on the income debenture stock and £3 000 to the payment of 6% on the ordinary shares, £1 000 being placed to general reserve and £623 carried forward. There was an unfortunate drop in revenue, attributable in part to a severe cyclone which caused damage to transmission lines and cooling towers. Notwithstanding this setback, they were able to recommend the same dividend as last year. The plant and machinery was in first-class order. If the Golden Horse Shoe Mine carried out its proposed programme, the installation of the necessary plant would be spread over five years, and a substantial amount of power would be required, which the company would be in a position to supply. The high tariffs on machinery imported into Australia had threatened to throttle industry, but they were advised that the new Minister controlling tariffs had adopted a sympathetic and more encouraging attitude.

SIEMENS BROTHERS AND CO., LTD.—Lord Queenborough, presiding at the meeting on Monday, said the profit for the past year was £335 758, a decrease of £20 977, and adding £250 041 brought forward from last year there was a balance of £585 799. After provision for debenture interest, preference dividend, etc., it was proposed to pay a final dividend on the Ordinary shares of 5%, making 7½% for the year, and to carry forward £313 360. During the year they had manufactured a submarine telegraph cable for the Philippine Islands, and further progress had been made with new designs to meet the ever-increasing demands for long distance submarine telephonic transmission. They were entrusted by the Government with the manufacture of the new submarine telephone link between this country and Northern Ireland, via the Isle of Man, and had also manufactured a telephone cable which was laid from this country to the Isle of Wight and another intended for service in the Gulf of St. Lawrence. A number of supertension cables which the Company supplied and laid across Sydney Harbour were the largest cables which had ever been made for any purpose. There had been a considerable demand for manual and automatic telephone exchanges and apparatus, both at home and abroad. The Company, in co-operation with the Post Office engineers, had developed a new type of telephone instrument known as the Neophone, which had been found to be a real advance in transmission efficiency and articulation. There had been a great increase in the demand for radio batteries, and their marine specialities were being increasingly adopted by the larger shipping companies and shipbuilders. The report and accounts were adopted and the dividend was approved.

EASTERN TELEGRAPH CO., LTD.

Accounts for First Three Months of 1929 Adopted—Particulars of the Cables and Wireless Merger—Alterations to Articles of Association Approved.

THE 98th ordinary general meeting of the Eastern Telegraph Co., Ltd., was held on Wednesday, May 29th, Mr. J. C. Denison-Pender presiding.

The Chairman said : I will proceed to deal with the accounts which cover a period of only three months, namely, for the quarter ended March 31st, 1928. The reason for this is that this is the date as from which the Report of The Imperial Wireless and Cable Conference recommends that Imperial and International Communications, Ltd., should acquire the "communications assets" of your company, and of the Eastern Extension, Australasia and China Telegraph Co., the Western Telegraph Co. and Marconi's Wireless Telegraph Co., and of their wholly owned subsidiaries, and should purchase the Pacific Cable Board's undertaking, including the West Indian undertaking now worked by them, also purchase the Imperial transatlantic cables, and the lease from the Government of the beam wireless stations, which were both operated by the State. After providing for all expenses, income tax and debenture interest, and for the dividend on the preference stock, there remains a balance of profit of nearly £150 000, so that we have been able to maintain the dividend at the rate of 10% per annum, free of tax, which we have paid for many years past, and still leave a balance of £24 672 13s. 2d. This amount, together with the balance of £525 764 12s. 10d. brought forward from the preceding year, has been transferred to the general reserve fund, thus closing the company's revenue account as at March 31st, 1928.

If the necessary percentage of stockholders and shareholders in the cable and wireless companies agree to exchange their stock or shares for shares in the newly formed company—Cables and Wireless, Ltd.—this will be the last meeting of the Eastern Company under existing conditions. Its name will be preserved and it will remain as a separate entity, although no longer operating a telegraph business, but remaining simply as a company holding reserve fund investments and investments in the new Imperial and International Communications Co.

It is now common knowledge that the Imperial Wireless and Cable Conference made a unanimous recommendation as to Empire communications, and also approved the tentative arrangement come to between the Eastern associated companies and the Marconi Co. for the merging of interests. As a result of this momentous decision two companies have been formed : Cables and Wireless, Ltd., and Imperial and International Communications, Ltd. The former was designed to hold the ordinary stock and shares of the cable companies and preference and ordinary shares of the Marconi Co. The latter, Imperial and International Communications, Ltd., to acquire the communications assets of these companies together with telegraphic services which were either owned or being operated by the Government. This latter company will therefore be world-wide in its ramifications and very comprehensive in its scope.

You have recently received from the Bank of England an offer on behalf of Cables and Wireless, Ltd., to exchange your existing holding of ordinary stock in this company for shares in the new Cables and Wireless, Ltd., an offer which your directors unanimously and unreservedly recommend you to accept.

I should remind you that the directors of the new undertakings have endeavoured to remove a disability from which rationalisation in many cases suffers, namely, the dismissal of staff, for they have made an offer to take over the staffs of all the interests coming within the merger, on terms not less advantageous than those which they are at present enjoying, a course which they believe to be both in your and the national interest.

The Chairman also said :—Upon the notice convening this meeting you will observe that, in order to conform with the recommendations of the Imperial Wireless and Cable Conference, it is essential that certain alterations should be made in the articles of association of this company, and to that end two resolutions will be submitted to you.

Resolution No. 1 simply ensures that the predominant shareholding interest in this company shall remain British.

Resolution No. 2 provides that the directors of Cables and Wireless, Ltd., and Imperial and International Communications, Ltd., and this Company shall be identical, and that no director or managing director shall as from April 1st last receive any remuneration from this company.

Resolution No. 3 empowers your board to apply by way of compensation to directors who have to relinquish their directorates in consequence of the amalgamation, a sum which in total shall not exceed £11 500.

The resolutions were carried unanimously, and the report and accounts were unanimously adopted.

EASTERN EXTENSION, AUSTRALASIA AND CHINA TELEGRAPH CO.

Report for First Quarter of 1929 Approved—The Cables and Wireless Merger—Alterations of Articles of Association Adopted.

THE 95th ordinary general meeting of the Eastern Extension, Australasia and China Telegraph Co., Ltd., took place on Wednesday, Mr. J. C. Denison-Pender presiding.

The Chairman said: The first item of business for your consideration is to pass the report and accounts for the three months ended March 31st, 1928, in which there is no item calling for any particular notice, and I assume you will take the report and accounts as read. The reason for the limitation of period to the date specified is that an arrangement was entered into on March 14th, 1928, between the Eastern and Associated Telegraph Companies and Marconi's Wireless Telegraph Co., Ltd., for the merging of cable and wireless interests. Of this fact, the Imperial Wireless and Cable Conference, which was then sitting, was duly informed. In its report, the Conference recommended to the Government the formation of an Imperial Communications Co., which would acquire as from April 1st, 1928, the communications assets of the Cable and Marconi Companies; also those of the Government's cable and wireless systems. In order to obviate any inconvenience to shareholders which might have resulted through the non-payment of interim dividends during the transition period, and which action, if followed, might also have caused adverse market fluctuations of your shares, it was decided to pay dividends quarterly as hitherto. You have, therefore, received the usual amounts, at the rate of 10% per annum, free of tax, on July 15th and October 15th, 1928, and on January 15th and April 15th, 1929, covering the full dividends in respect of the year 1928.

If the necessary percentage of stockholders and shareholders in the Cable and Wireless Companies agree to exchange their stock or shares for shares in the newly formed company —Cables and Wireless, Ltd.—this will be the last meeting of the Eastern Extension Co. under existing conditions. I am glad to think, however, that, having been in existence for fifty-six years, its name will be preserved and that it will remain as a separate entity, although no longer operating a telegraph business, but remaining simply as a company holding reserve fund investments and investments in the new Imperial and International Communications Co.

It is now common knowledge that the Imperial Wireless and Cable Conference made a unanimous recommendation as to Empire communications. and also approved the tentative arrangement come to between the Eastern Associated Companies and the Marconi Co. for the merging of interests. As a result of this momentous decision two companies have been formed: Cables and Wireless, Ltd., and Imperial and International Communications, Ltd. The former was designed to hold the ordinary stock and shares of the cable companies and preference and ordinary shares of the Marconi Co. The latter, Imperial and International Communications, Ltd., to acquire the communications assets of these companies, together with telegraphic services which were either owned or being operated by the Government.

You have recently received from the Bank of England an offer on behalf of Cables and Wireless, Ltd., to exchange your existing holding of ordinary shares in this company for shares in the new Cables and Wireless, Ltd., an offer which your directors unanimously and unreservedly recommend you to accept.

The directors of the new undertakings have endeavoured to remove a disability from which rationalisation in many cases suffers, namely, the dismissal of staff, for they have made an offer to take over the staffs of all the interests coming within the merger, on terms not less advantageous than those which they are at present enjoying, a course which they believe to be both in your and the national interest.

In connection with the negotiations with the Government and with the other interests concerned, I should like to pay a tribute to the spirit of accommodation shown on all sides.

Extraordinary resolutions were passed to the effect that provided the plan for the cables and wireless merger shall have become operative, the articles of association be modified by the insertion of provisions to ensure that the company remain under British control; and that the directors of Cables and Wireless, Ltd., shall *ipso facto* be the directors of the company.

Two ordinary resolutions (1) to apply the sum of £3 000 for the purpose of compensating such directors as will lose office in the company as a result of the merger, and (2) to convert the paid-up shares into stock were also carried.

The report and accounts were unanimously adopted.

WESTERN TELEGRAPH CO., LTD.

Resolutions for Alteration of Articles of Association—Directors Recommend Acceptance of Offer of Cables and Wireless, Ltd.—All Staff to be Taken Over.

MR. J. C. DENISON-PENDER, presiding at an extraordinary general meeting of the Western Telegraph Co., Ltd., on Wednesday, said: Although by our notice convening the meeting you are called together merely to pass certain resolutions, the occasion is in reality one which marks a very important stage in the life of our company.

If the necessary percentage of stockholders and shareholders in the Cable and Wireless Companies agree to exchange their stock or shares for shares in the newly formed company—Cables and Wireless, Ltd.—this will be the last meeting of the Western Co. under existing conditions. I am glad to think, however, that, having been in existence for fifty-six years, its name will be preserved, and that it will remain as a separate entity, although no longer operating a telegraph business, but remaining simply as a company holding reserve fund investments and investments in the new Imperial and International Communications Co.

It is now common knowledge that the Imperial Wireless and Cable Conference made a unanimous recommendation as to Empire communications, and also approved the tentative arrangement come to between the Eastern Associated Companies and the Marconi Co. for the merging of interests. As a result of this momentous decision two companies have been formed: Cables and Wireless, Ltd., and Imperial and International Communications, Ltd. The former was designed to hold the ordinary stock and shares of the Cable Companies and preference and ordinary shares of the Marconi Co. The latter, Imperial and International Communications, Ltd., to acquire the communications assets of these companies, together with telegraphic services which were either owned or being operated by the British Government.

You have recently received from the Bank of England an offer on behalf of Cables and Wireless, Ltd., to exchange your existing holding of ordinary shares in this company for shares in the new Cables and Wireless, Ltd., an offer which your directors unanimously and unreservedly recommend you to accept.

The directors of the new undertakings have made an offer to take over the staffs of all the interests coming within the merger, on terms not less advantageous than those which they are at present enjoying.

In connection with the negotiations with the Government and with the other interests concerned, I should like to pay a tribute to the spirit of accommodation shown on all sides.

The resolutions about to be put to you are for the purpose of making certain alterations in our statutes, in order to conform with the recommendations of the Imperial Wireless and Cables Conference.

The first resolution is to establish that the company shall always be under British control, and ensures that the predominating shareholding interests in the company shall remain British.

By the second, your directors cease to hold office under our present articles of association and these are altered so as to enable the directors of Cables and Wireless, Ltd., to be also the directors of the Western.

Resolution No. 3 is in a different class, and is of a more domestic character.

It was a condition made by the Imperial Wireless and Cable Conference and approved by the respective Governments in recommending the present scheme that the number of directors be limited to twenty-two, and it is consequently essential that some of your directors, have to relinquish their directorates. This resolution empowers your board to apply a sum in compensation which will not exceed £5 500.

Finally, you will be asked to authorise your directors to convert the paid-up shares into stock.

The resolutions were carried unanimously.

COMMERCIAL INFORMATION.

County Court Judgments.

[NOTE.—*The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debt. They may be for actions. But the Registry makes no distinction. Judgments are not returned to the Registry if satisfied in the Court books within 21 days.*]

BOWEN, Mr. G., 70, Theobald's Road, W.C., wireless dealer. £14 16s. April 16th.

CLARKE, John, and TIMMIS, Harold Edgar (trading as FORWARD ELECTRIC CO.), 46, Holloway Head, Birmingham, power plant and electrical engineers. £31 18s. 10d. February 13th.

DOE, Ernest E., 578, Oxford Road, Reading, wireless dealer. £29 17s. 5d. March 28th.

ELECTRICAL CONTRACTING CO., 7, Christmas Street, Bristol. £13 13s. 3d. March 18th.

FIDELITY AGENCY, 3/5, Burlington Gardens, Old Bond Street' W., electrical contractors. £11 12s. 6d. April 16th.

HUGHES BROS., 1,090, Manchester Road, Bradford, electricians. £10 10s. 11d. April 17th, and £21 18s. 1d. April 18th.

PENROSE, Mr., 1, Preston Street, Fleetwood, wireless dealer. £12 13s. 8d. March 18th.

W.M. WIRELESS CO., LTD., 531, Forest Road, Walthamstow. £123 3s. 1d. March 26th.

Deed of Arrangement.

GREEN, Herbert Thacker, KNOWLAND, Harry, trading at 221D, Great Cheetham Street, Higher Broughton, and 1123, Chester Road, Stretford, as GEEKAY RADIO SUPPLIES, wireless dealers. Dated May 17th, filed May 24th. Trustee, J. A. Seddon, 18, St. Ann Street, Manchester, accountant. Secured creditors, £54, liabilities unsecured, £568; assets, less secured claims, £102.

Receivership.

BRITISH AUTOMATIC REFRIGERATOR CO., LTD. W. Mills, of 31, Budge Row, E.C. was appointed receiver on May 9th, 1929, under powers contained in debentures dated March 30th, 1928.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

JONES, Clarence Lionel Frederick, electrical and wireless engineer, Colwyn Avenue, Rhos-on-Sea. The creditors were called together on May 24th at Colwyn Bay, when a statement of affairs was submitted which showed liabilities of £599, and assets comprising stock £210, estimated to realise £100; fittings and fixtures £25, expected to produce £10; book debts £87, valued at £65; and deposits, £2.

It was reported that after the debtor had completed his apprenticeship to a well-known firm he continued with the firm until he joined the army in 1915. He was discharged in 1918, but owing to his war service, his health was affected, and he had to relinquish his employment. In April of last year, he commenced trading on his own account, the premises being taken on a lease for three years at a commencing rental of £55 per annum. According to the books, the purchases during the period of the trading had been £909, with sales of £1 116, and there was a gross profit of £316. The expenses, however, exceeded £300. A resolution was passed confirming the deed of assignment already executed, conditional upon certain cash creditors withdrawing their claims. A committee was also appointed consisting of the representatives of Metro-Vick Supplies and B.N.B. Wireless, Ltd. The following are creditors: Beardsall (W. E.) and Co., Ltd., Manchester, £80; Marconiphone Co., Ltd., London, £30; Revo Electric Co., Ltd., Tipton, £26; General Electric Co., Ltd., Liverpool, £25; Hollindrake (H.) and Sons, Ltd., Stockport, £20; B.N.B. Wireless, Ltd., Liverpool, £25; Robinson and Hands Electric Co., Birmingham, £16.

JONES, Percy, and MERCER, James Henry, lately trading as the NORTHERN WHOLESALE ELECTRICAL SUPPLY, 266 and 268, Holloway Road, London, N.7. A circular has been issued to the creditors herein by Mr. C. G. Sunderland, of Sunderland, Mountstephen and Co., 15, Eastcheap, E.C., stating that in January last the above executed a deed of assignment in his favour. At that time the liabilities were estimated at £1 050, against assets expected to produce £1 248. The estate has been realised and has produced £1 197, and a first and final dividend of 20s. in the £ has been paid. Mr. Sunderland, in his report to the creditors, states that under the deed the creditors were entitled to interest at the rate of 4 per cent. A request, however, was received to the effect that the creditors should forego the interest and accept a dividend of 20s. in the £ in full and final settlement. A committee of the principal creditors recommended that that dividend should be accepted.

London Gazette, etc.

Company Winding-up Voluntarily.

ELECTRIC FACTORS (BLACKPOOL), LTD.—By reason of its liabilities, May 11th, J. Todd, 18, Birley Street, Blackpool, chartered accountant, appointed as liquidator.

Winding-up Petition.

RADIO ELECTRIC CO. (BOURNEMOUTH), LTD.—A creditors' petition for winding-up has been presented and is to be heard at the Law Courts, Stafford Road, Bournemouth, on Tuesday, June 18th, at 2 p.m.

Bankruptcy Information.

HUNT, Sydney Everest, 8A, Torwood Street, Torquay, electrical engineer and contractor. Receiving order, May 17th. Debtor's petition.

SKIPPER, Sydney Harold, 35, Broad Bridge Street, Peterborough, lately trading as S. H. SKIPPER AND CO., electrical engineer. Receiving order, May 25th. Debtor's petition.

Notices of Dividends.

HORSFALL, William Miles, electrical engineer, 7, Redcross Street, Liverpool. Fifth dividend, 4¾d. per £, payable May 31st, Official Receiver, Government Buildings, Victoria Street, Liverpool.

WESTNUTT, Josiah, described in the Receiving Order as John Victor Westnutt, High Street North, Dunstable, electrical engineer. First and final dividend, 9s. per £, payable May 31st, Official Receiver's Offices, The Parade, Northampton.

Notices of Intended Dividends.

EDWARDS, William Houston, the Docks, Milford Haven, electrical engineer. Last day for receiving proofs, May 31st. Trustee, H. W. Thomas.

JENKINS, Edward Charles, 124, Cheltenham Road, Bristol, wireless dealer. Last day for receiving proofs, June 4th. Trustee, H. Ashton, 26, Baldwin Street, Bristol, Official Receiver.

Bankruptcy Proceedings.

PEOVER, Harry, Market Lane, Newcastle-upon-Tyne, electrical apparatus and tool merchant. The first meeting of creditors was held on May 22nd when a statement of affairs was submitted showing liabilities of £1 869, against assets of £235. It would seem that the debtor's stock, which had been valued less than a month ago at £612, had realised only £140. It was reported, in support of the debtor's statement, that the stock had been sacrificed, that the Official Receiver had in his possession a letter from a business friend of the debtor who had been prepared to offer £300. The case, being a summary one, remained in the hands of the Official Receiver as trustee of the estate.

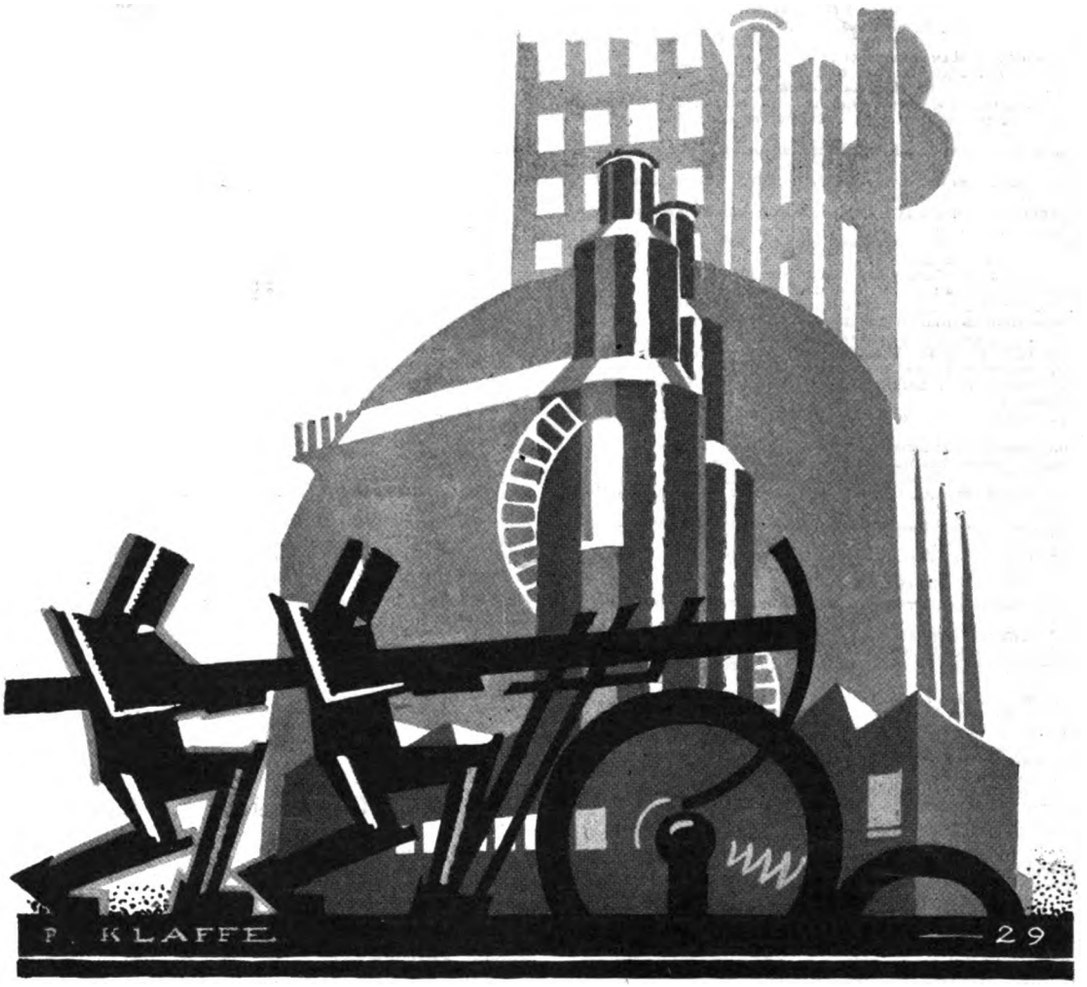
HACKBRIDGE TRANSFORMERS FOR THE MAIN LOAD OF THE METROPOLIS



The Hackbridge Electric Construction Co., Ltd., has received an order from the Central Electricity Board for over half a million of kVA of Transformers for the London Area Stations. The units are 45,000 kVA and 30,000 kVA capacity and are fitted with On Load Tap Changing Equipment.

Advertisement of the Hackbridge Electric Construction Co., Ltd., Walton-on-Thames, Surrey.

8 833 T. O. Harries. Apparatus for generating power from tides.
8 794 A. Henderson. Electrical connector, etc.
8 853 G. C. and P. A. Lundberg and A. P. Lundberg and Sons, Ltd., and G. Pegg. Contact tubes for electrical connectors, etc.

COMING EVENTS.

Monday, June 3rd.

Incorporated Municipal Electrical Association.—Torquay Annual Convention. President's Reception. 8.15 *p.m.*

Tuesday, June 4th.

Incorporated Municipal Electrical Association.—Torquay. Annual Convention. Presidential Address by Mr. A. Nichols Moore. Paper on "Whitleyism in the Electric Supply Industry," by Ald. W. Walker. 10 *a.m.* Official visit to Exhibition, 2.30 *p.m.* Reception by Mayor and Mayoress of Torquay, 8.30 *p.m.*

Electrical Contractors' Association (Derby Branch).—Ordinary meeting. 5 *p.m.*

Electrical Contractors' Association (Bournemouth Branch).—Ordinary meeting.

Electrical Development Association (North Midland Area). Third Area Sales Conference, 45-53, Sunbridge Road, Bradford. Paper by Mr. C. E. Allsopp on "The Development of the Electric Cooker."

Wednesday, June 5th.

Incorporated Municipal Electrical Association.—Torquay. Paper by Mr. J. H. Rothwell on "Some Notes on Recent High Court Cases in Connection with the Generation and Supply of Electricity." 10 *a.m.* Paper by Mr. G. Porter on "The Heavy Oil Engine and its Application in Electricity Supply Undertakings." 2.30 *p.m.*

Polytechnic School of Engineering.—307-311, Regent Street, London. Lecture IV. (course of six lectures) on "Thermionic Valves," by Mr. W. H. Date. 6.30 *p.m.*

Electrical Contractors' Association (Irish Branch).—Dublin. Ordinary Meeting.

Electrical Contractors' Association (London Branch).—Committee Meeting.

Electrical Contractors' Association (Cardiff Branch).—Ordinary Meeting. 2.30 *p.m.*

Electrical Contractors' Association (Bath Sub-branch).—Ordinary Meeting.

Thursday, June 6th.

Incorporated Municipal Electrical Association.—Torquay. Paper by Mr. E. J. Jennings on "Standardisation of Methods of Charge." 10 *a.m.* Women's Day.—Lecture by Miss M. Partridge on "Women's Work in Connection with Rural Electrification in Devonshire." 10.45 *a.m.*, followed by visits to Longpark Pottery Co. and Widecombe-in-the-Moor.

Electrical Contractors' Association (Newcastle Branch).—Ordinary Meeting. 11 *a.m.*

Electrical Contractors' Association (Bristol Branch).—Ordinary Meeting. 3.15 *p.m.*

Friday, June 7th.

Incorporated Municipal Electrical Association.—Torquay. Annual General Meeting. 10.30 *a.m.*

Importance of Distribution.

THE dominant feature in Mr. NICHOLS MOORE'S I.M.E.A. Presidential Address was the author's insistence on the need for a properly co-ordinated scheme of distribution on some national basis as broad in its conception and as practical in its application as the national scheme of generation and main transmission. This is not, of course, the first time the importance of the matter has been ventilated, but it evidently needs constant repetition if some of those who are engineers "first, last and all the time," are to realise the personal import of the changes that are almost imperceptibly, but inevitably, taking place in the electricity supply field. The day of the "juice merchant '—to use a "Purseism "—quickly draws nearer, and as it approaches the scope for the purely generating engineer will be correspondingly diminished. We do not think for a moment that this change will detract from the interest of work in the supply industry, for there are many technical considerations connected with present and future distribution practice which will provide ample opportunity for the exercise of ingenuity. But there must also be revolutionary development on the sales side to permit the fullest possible use of the facilities which co-ordinated generation, transmission and distribution will make universally available. The sooner supply engineers as a whole busy themselves in considering these questions the better equipped will they be when the not far distant time arrives for them to deal with them in a practical way. Few of our readers can have been surprised at Mr. NICHOLS MOORE'S outspoken expression of opinion on the work of the Electric Fittings Statutory Committee, as disappointment at its apparently negative policy has more than once been the subject of remark in these columns. While one reason is to be found in the difficulty which the Committee appears to have experienced in reaching agreement as to its main functions, there are two other factors outside the Committee itself which have acted as a brake on progress. One is the slowness of some of the local authorities in making use of the provisions of Sec. 48 of the 1926 Act, which conferred trading powers on those undertakings which did not already possess them. The other feature, the existence of which we should beg leave to doubt if the statement were not made with such authority—is what Mr. NICHOLS MOORE described as "the disinclination of the contracting interests to give full effect within the Committee and outside to the definite intentions which were clearly conditions precedent to the acceptance of the Section." We have no wish to take sides in this matter; there should be no sides on a matter which is the subject of an "agreed" clause. We will merely say to the obstructionists on the contractor's side that the old municipal trading hatchet was buried with their consent, and that even moral obligations are worthy of observance; and to some municipalities, that in accepting the "agreed" clause the contractors voluntarily sacrificed a principle for which they had fought long and strenuously, and that they are for this, if for no other reason, deserving of sportsmanlike treatment.

The I.M.E.A. Exhibition.

THOSE visitors to Torquay who have not yet visited the exhibition being held in the Old Torbay Hospital would be well advised to do so. The majority of the stands include a number of new items, descriptions of which are given elsewhere in this issue. The exhibition as a whole gives one the impression that manufacturers have considerable hopes of developing the water heating side of domestic sales, for the number of electric storage water heaters to be seen, is, if we remember rightly, larger than was the case last year. Electric washers and boilers are also well in evidence, and since many supply authorities include these appliances in their hiring schemes, this is as it should be. Many of these devices are shown for the first time, and those visitors to the convention who are members of electricity committees should, with their engineers, make a special point of acquainting themselves with the progress made in the manufacture of this class of labour-saving appliance. The industrial exhibits, which are probably of more concern to the technical visitor, are also of interest, for many of them have not been exhibited before, while the E.D.A. and E.L.M.A. also offer much of educational value to those connected with undertakings with window and showroom facilities. The lady visitors should make a special point of calling at the exhibit of the Electrical Association for Women, where they will learn how, by joining the Association, they can best serve the cause of electrical development, and at the same time enter into the social activities of the association. After attending at the meetings and entering into the discussions, a visit to the exhibition will prove to be, not only a contrast, but

Digitized by Google

a change in occupation likely to bring one closer in touch with the apparatus and equipment available for developing and improving individual opportunities.

The General Election.

THE one certain result of the General Election is the formation of a Labour Government. The uncertain factor is how long the Labour Party, now the largest single party in the House of Commons for the first time in its history, will govern the country. That will depend upon the nature of the measures which its members may introduce, for they are in a minority of the whole House and can be out-voted if any act of theirs outrages the feelings of the other two parties. For the present, however, the business world has got to face a change of Government and to adapt itself to different conditions from those under which it has laboured for nearly five years. There has been a very natural fear among business men that the absence of a clear majority for any one of the three parties may precipitate a second General Election within a few months. That would be a very disturbing factor to trade and industry, and there is a certain reassurance in the efforts attributed to more than one of the party leaders to ensure that there shall not be another appeal to the country for at least two years.

The View of the Business Man.

THE average man of business takes the view that a very definite responsibility rests upon the politicians to make the Constitution work, notwithstanding the obstacles which the three-party system of their own invention has put in the way of its effective operation. If trade and industry are to have a fair opportunity to develop and expand, moderation in speech and action is demanded from the representatives of the nation sitting at Westminster, and more particularly from the new Government and their supporters. It would be idle to deny that there are elements of anxiety in the position. A change of Government, with the substitution of one set of principles for another, can have a very decided influence on the course of business in Great Britain. If the business man faces the future with fortitude, it is not on account of the success or failure of any political party but because of his belief in himself and in the ability and courage of his associates.

The B.I.F.

THOUGH these are early days in which to speak of the next British Industries Fair, it is nevertheless interesting to note that arrangements for the forthcoming Heavy Section of the Fair are even more advanced than at the corresponding stage of the organisation for the last Fair. It was reported at a meeting of the Council last week that more than 60% of the space has already been let, and the reason for the present advanced state of the booking was said to be found in the fact that the period at which current exhibitors could exercise their option to retain the same sites was on this occasion limited to some ten weeks after the close of the last show. It is understood that approximately one-fifth of the firms have already taken advantage of the opportunity now offered to secure their stands for five consecutive years. This early reservation of the major portion of the space greatly facilitates a policy of grouping kindred industries which was put partly in operation last February, and which is to be considerably extended in 1930. Meanwhile, as we have already pointed out, there is still the question of the date of future fairs.

Floodlighting Stained Glass.

THE scheme, referred to in our last issue, of floodlighting the stained glass windows at Stationers' Hall, London, offers a number of suggestions which should not escape the lighting engineer. Throughout the country there must be many beautiful windows which, through lack of some special lighting scheme, cannot in every case be fully appreciated even during hours of daylight, and which, in consequence, do not receive the admiration they deserve. We have in mind as one practical application of a general scheme the floodlighting of church windows, for, though we are, almost every week, hearing of extensive lighting schemes being installed within such buildings, none of them, to the best of our knowledge, makes any special effort to reveal the beauty of the windows to those attending the services. We suggest that this form of lighting and the development of some scheme for its general adoption receive the careful consideration of the E.L.M.A., which, with its wide experience and ability to make the most of any lighting opportunity brought to its notice, could no doubt do much to promote further sales in floodlight equipment and high wattage lamps. Demonstrations of the effectiveness of floodlighting stained glass could possibly be arranged at many of the London churches, the attention of the congregations could be drawn to the displays, and since the cost of such installations is relatively small, their adoption may become widespread. Incidentally, electricity might thus get to its credit the much-needed revival of public interest in stained glass.

Electrical Patents.

SOME interesting details relating to the activity in inventions during 1928 are given in the annual report of the Comptroller-General of Patents, Mr. W. S. JARRATT. The main activity was in connection with the development and improvement of loud speakers, electrical reproducing equipment, and apparatus concerned with "talkie" films. The Central Electricity Board appears to have had a marked effect on the development of high tension distribution equipment, a large number of applications for protective systems and switchgear being recorded. Picture transmission, both by wire and wireless, was responsible for considerable activity, while automatic telephony, television, and electrically-driven gramophones have all made their mark. In spite of an increase in applications for patents of 3 087 when compared with the last report, the number of trade marks registered decreased by 715. It is interesting to note that the total number of applications received by the Patent Office during 1928 was the largest for any year in the history of the department. These figures show that though in present practice the various electrical designs installed for commercial purposes appear to give every satisfaction, they will in a few years' time become obsolete and uneconomical. Equipment in connection with television, the talking film, etc., is changing in design almost daily, but since a large percentage of the patents applied for concern high tension switchgear it may be assumed that activity in our research laboratories is not confined to any one particular interest.

An Electrical Achievement.

AN interesting example of the progress made with the transmission of pictures by wire and wireless, and perhaps one of the most remarkable feats of its kind, was accomplished recently when a photograph of the scene of the hospital disaster at Cleveland, Ohio, was sent to Berlin. The first stage of its journey, from Cleveland to New York, some four hundred odd miles, was accomplished over the land telephone line by means of an American system of picture transmission. The three thousand odd miles from New York to this country were covered by the "beam" wireless service, an entirely different method of reproduction, the Marconi, being used. From London to Berlin the picture was sent by the Fultograph process, the final six hundred miles of the journey being made over telephone lines and the submarine cable. The photograph was sent for a group of newspapers in Germany, and the fact that after having been handled by three quite different methods of transmission, the picture was still suitable for reproduction is a tribute to the efficiency to which the sending of pictures by electrical means has now been brought. The relaying of the picture over all three stages without undue distortion was a performance with which the electrical engineering world may be justly pleased.

THE I.M.E.A. CONVENTION.

Heavy Oil Engines—Legal Problems—Standardisation of Tariffs—Whitleyism in the Supply Industry.

A Full Report of the Association's Thirty-fourth Annual Conference at Torquay this Week.

ALL previous records were broken by the attendance at the thirty-fourth annual convention of the Incorporated Municipal Electrical Association which opened in the delightful surroundings of Torquay on Monday and continued until to-day.

As nearly 900 delegates had arrived over the week-end, the attendance at the President's reception on Monday evening was phenomenally large, and it was evident that this was to be a record I.M.E.A. Convention.

As usual, a number of special lighting effects were provided by electrical manufacturing firms, but such efforts, splendid as they were, were probably the less remarkable to the local residents by reason of the ambitious decorative lighting effects which have been developed by Mr. H. F. G. Woods as a permanent attraction.

Despite the comparative coldness of the weather at the beginning of the week, many of the visitors turned out for an early morning swim each day.

The Convention proper opened on Tuesday morning, when the Association was given a civic welcome by the Mayor of Torquay. Mentioning that the delegates to a recent conference at Torquay had derived from it sufficient energy to form the largest political party in the land and to cause the Government to resign, he thought it not improbable that municipal electrical engineers might cause similar action on the part of their electricity committees. Speaking as an engineer and a lawyer, he thought the Electricity Act of 1926 might provide a good deal of future work for lawyers. He was glad to say that Torquay was one of the few parts of England over which the tentacles of the grid had not spread their devastating influence.

Mr. A. Nichols Moore then read his Presidential Address, which furnished considerable food for thought, and drew special applause for his linguistic ability in reference to a German organisation.

Ald. W. Walker's paper on "Whitleyism in the Electrical Industry" was next read and discussed, the discussion being particularly noteworthy by reason of the fact that the whole of the speakers were committee members.

Tuesday afternoon was spent in an official visit to the Electrical Exhibition in the Old Torbay Hospital. The general opinion of the visitors was that it was, if possible, a better show than ever, but one heard many "asides" concerning the dim, religious lighting of the corridors, while some of the exhibitors were full of practical knowledge of the surprisingly high lighting voltages needed to make an effective show in an exhibition area from which daylight is not excluded.

In the evening there was a reception by the Mayor and Mayoress of Torquay at the Town Hall.

Two papers were read and discussed at Wednesday's morning session, when Mr. J. H. Rothwell gave "Some Notes on Recent High Court Cases and Current Legal Problems in Connection with the Supply of Electricity." Mr. G. Porter then gave a very interesting account of "The Heavy Oil Engine and Its Application in Electricity Supply Undertakings."

Thursday morning was devoted to the reading and discussion of Mr. E. J. Jennings's paper on "Standardisation of Methods of Charge." Special provision was made for the ladies, who had a morning meeting, at which Miss M. Partridge described "Women's Work in Connection with Rural Electrification in Devonshire." The annual dinner was held on Thursday, and the annual general meeting on Friday morning.

PRESIDENTIAL ADDRESS.

Supply Undertakings and the Cost of "Grid" Switchgear—Work of the Electric Fittings Statutory Committee—A National Co-ordinated Distribution Policy Advocated—Rationalisation not Nationalisation.

THE business of the Convention opened on Tuesday morning, when Mr. A. Nichols Moore (borough electrical and tramways engineer of Newport), read his presidential address.

The work of the Association during the past year had, he said, not been distinguished by any new matters of outstanding importance to the future of the electricity supply industry. The past year had, nevertheless, been an exceedingly busy one, and the work of the Association had steadily increased in both volume and variety.

The Mayor and Mayoress of Torquay who held a reception at the Town Hall on Tuesday.

Possibly none of these allied associations was of greater importance to the future of the electricity supply industry than the British Electrical Development Association, in the formation of which the I.M.E.A. took a leading part. It could only raise for publicity and propaganda, in an industry which on the supply side alone represented a subscribed capital of some £350 000 000, the paltry sum of £40 000 per annum, and until it was financially stronger it was unable to fulfil its essential purpose in the electricity supply industry. The President therefore urged those municipal electricity authorities who had so far declined to subscribe to reconsider their decision and give the Association their active support.

Referring to the British Electrical and Allied Industries Research Association, Mr. Nichols Moore submitted that electrical research was never of such importance as it was to-day, and the Research Association was deserving of greater support.

The Electrical Association for Women needed little commendation for support. It had rich possibilities for service and, under the directorship of Miss Haslett, was making progress much greater than some anticipated or believed possible.

Two other associations to which the President made a passing reference were the British Engineering Standards Association and the Conjoint Conference of Public Utility Associations. The work of the former was so well known that further reference was unnecessary. The work of the other association was not so well known. By tactful and co-ordinated effort the Conference rendered valuable assistance in composing the divergent views and requirements of the various public utility services, and, when the occasion arose, was able to exert a useful influence in legislative work affecting those services.

One matter of great importance to all local authority and private company undertakings whose stations were "selected," and to which during the year the Council had given careful consideration, was the Draft Regulations issued under Section 51 of the Electricity (Supply) Act, 1926, for the technically correct and equitable allocation of production costs between fixed and running costs and for the adjustment of the price in accordance with the power factor.

Another matter arising out of the operation of the Act, and to which the Council had given consideration, was the important issues involved in the provision of the necessary switchgear in all stations to be connected either directly or through secondary lines to the "grid" for controlling the bulk supplies, and for protecting the individual undertaking's existing plant and distribution system.

The technical requirements of this switchgear were such as must in most cases involve heavy capital expenditure, and, in the case of many of the smaller undertakings, quite possibly constituted what was relatively a considerable increase in their capital commitments. The Council had deemed it their duty to take all possible steps to protect the interests of municipal undertakings and to ensure an equitable adjustment in respect to the meeting of the cost.

In the case of those authorities whose stations were "selected" the issue was probably clarified by the provisions of the Act, i.e., the providing of the necessary monies would appear to be an obligation placed upon the Central Electricity Board. It was more in the interests of the vast majority of "non-selected" stations that the Council had deemed it necessary to endeavour to secure from the Central Electricity Board an assurance that, directly or indirectly, undertakings would be relieved of the burden which might otherwise fall upon them.

Referring to the work of the Electric Fittings Statutory Committee, as one who had taken an active part in its deliberations, Mr. Nichols Moore said that the underlying intention of Section 48 of the Act was to confer trading powers upon those undertakings who did not already possess them. It was believed that the inclusion in the Section of an agreed clause, which in a considerable measure was made possible by a friendly compromise between the electricity supply authorities and the Electrical Contractors' Association,

The "scene" at the opening of the Convention in the Pavilion on Tuesday morning, showing the members of the Council assembled.

Digitized by Google

would dispose of the long-outstanding differences that existed between them and retarded development.

One would have supposed that, with an agreed clause to work upon and with admirable intentions, the Committee would have been able to achieve in a year some definite progress, and to have found some common basis for giving effective assistance to the industry. In his own personal opinion, the results to date could only be regarded as almost negative in character, for it appeared to him that beyond confirmation of an agreed working constitution little had been done, and indeed it could scarcely be claimed that the Committee was yet in agreement as to its main functions and the duties presumably imposed upon it by the Section.

He held the view that at least one cause for this lack of progress was the disinclination of the contracting interests to give full effect within the Committee and outside to the definite intentions which were clearly conditions precedent to the acceptance of the Section. Whilst it was true that the operation of the Section placed upon local authorities definite statutory obligations to which they must conform, but which were not obligatory upon the contracting interests, it was unreasonable for the latter, as a party to the agreement, to be unwilling to recognise that there was at least a moral obligation upon them to observe, so far as possible, a similar basis in their commercial operations. He was glad that within the Committee now there was apparently a disposition to recognise the necessity for so doing.

At the same time there was evidence that some local authorities also were not yet prepared to give effect to the provisions of the Section, and so avail themselves of the opportunities provided for securing greater development by exercising their trading powers to the fullest extent. Admittedly it was a domestic matter that each undertaking must settle for itself, the adoption of the Section being permissive and not obligatory.

It might be argued that the functions of the Committee were in the main negative, but it must not be forgotten that it was clearly laid down that one duty of the Committee was to advise and assist all concerned as to the method of giving effect to the provisions of the Section. It was difficult to give helpful advice unless there was in the first place an agreed policy and a clear and definite understanding within the Committee.

The avowed objective of those responsible for the introduction of the Bill which became the Act of 1926 was to provide cheaper electricity. Whilst this was one of the intentions in view, it was, the President contended, not the main intention, which was rather to meet the ever-increasing demands of the community by providing adequate supplies of electricity more generally in all parts of the country.

Whether the political assurance of cheaper electricity supplies were likely to be realised within the next few years, if at all, was a matter of opinion. Such results were not possible of complete realisation until legislation had also been enacted upon a collateral basis for the whole system of distribution.

Shortcomings of the 1926 Act.

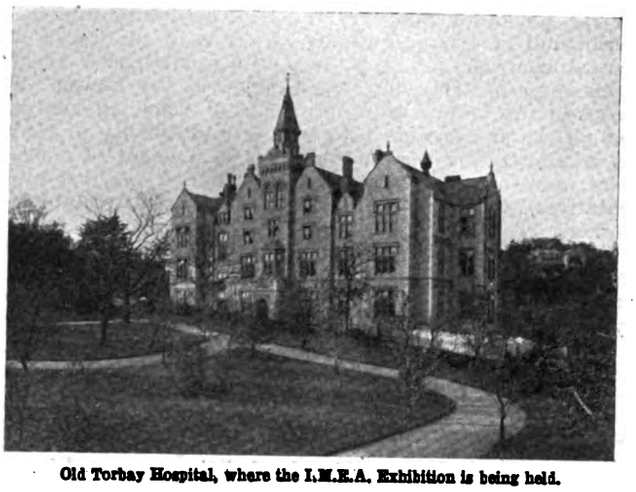
However much the 1926 Act might assist in securing economic generation, it would not alone solve the problem of the provision of an ample and economic supply throughout the country. In what other direction were we to look for an improvement? Now that we were rapidly establishing a system for the national generation of electricity, was it within the realm of practical politics to evolve a scheme as truly national in character and as co-ordinated in practice for distribution?

Municipal authorities were proud that more than half of the electricity supply industry was being municipally financed and developed successfully under municipal control and administration, and to-day it could be shown, generally, that the municipal system had resulted in the provision of adequate supplies at more economic rates than for the most part obtained under private enterprise. Whilst this was so at present, was it a condition that would necessarily continue to obtain?

Encouraged by Parliament, authorised undertakers were greatly extending their electricity areas and obtaining the control of electricity supplies in those areas. The obtaining of these extended areas carried with it great and increasing responsibilities.

In considering upon what terms and conditions a supply should be given in a particular part of an area, would not the local authority have more regard to the financial liabilities and to the beneficial results which might accrue than to the requirements and interests of the extended areas?

Moreover, the local authorities' financing schemes for areas would naturally have considerable regard to the views of those in their own area who provided the security for the loans. These factors made it difficult for local authorities to



Old Torbay Hospital, where the I.M.E.A. Exhibition is being held.

hold a detached view and always act impartially. There was, again, the disadvantage of an ever-changing representation on the local councils, making difficult a continuity of policy.

Another disadvantage under which municipal electricity undertakings laboured is in respect to the administrative policy of the corporate body. An electricity undertaking was essentially a trading concern, and should be regarded strictly as such. Unfortunately, there was a great tendency to-day to treat the undertaking merely as a branch of the corporate organisation, and as such one which must be regulated by the same detailed administrative policy and procedure that governed the non-trading undertakings.

A further consideration which under existing conditions must have a material bearing on the development of electricity supplies, perhaps more particularly in those areas administered by the smaller local authorities, was their disinclination to accept the ordinary commercial risks attendant upon schemes of development that in the early stages must clearly be non-productive.

Another aspect of the problem which must have a deterrent effect upon the speedy and complete development on any national basis of distribution was the very large number of authorised undertakers existing to-day. At the present time there were 667 authorised undertakers independently exercising their powers as distributors, and under two alternative methods of organisation and control.

Whilst all these authorised undertakers would, within a comparatively short period, only be able to obtain their supplies in bulk through the Central Electricity Board, each undertaker would still retain its autonomy as a distributor in matters of policy and administration, in methods of charging, and as to the rates to be charged, restricted only by the statutory maximum and the common law of supply and demand.

Mr. Nichols Moore then suggested that it might be profitable to consider in what direction an improvement in this respect was possible. In other words, was it possible for all existing interests to be merged into a scheme working upon a unified policy, administration and technical direction, and under a central governing control whose aim would be the rationalisation of the electrical supply industry? By "rationalisation" he meant, not the creation of a monopoly or the maintenance of prices, nor the extinction of public and private enterprise as such, but rather the setting up of a community of interests to regulate and develop the industry under efficient and economical conditions. Whilst realising the difficulties, he suggested that such a scheme was within the bounds of practical politics.

It appeared evident that with such a large proportion of the supply industry already under municipal control, the municipal position in any such scheme must be safeguarded. Their right to a general control over their affairs must be retained, but supplemented by a greater freedom and permanency of operation. It was obvious, also, that the whole question must be taken out of the realm of local politics, and that those responsible for the business of distribution must be freed from the necessity to weigh carefully the possible conflict of local

Digitized by Google

and personal interests which might be affected by a determined effort to deal with electricity supply on a sound technical and commercial basis.

A similar scheme was already being studied, and in a limited degree tried out, in Germany. The scheme now in operation for the generation and distribution of electricity supplies in Berlin and in a large outlying area was in the hands of a central controlling body, the Berliner Städtische Elektrizitätswerke Atkiengesellschaft, designated the Bewag. The status of this body was in effect that of a holding company, but all the shares were held by the municipality of Berlin. Its administration was in the hands of a board of management, assisted by a supervisory board of municipal representatives, technical experts and representatives of the workers.

One could perhaps visualise the possibilities of holding companies formed for the further development of electricity supplies and especially distribution, financed and controlled by municipalities and possibly private companies interested in distribution in a particular area, and administered by a permanent board of directors who were expert on the technical and commercial sides of the electricity supply industry, and who, together with their supervisory staffs, would in effect be the employees of the holding companies, and not of any individual local authority or private company. Such a plan would facilitate the development of a common continuous policy within a large area, and the control and administration, if not entirely separated from political influence, would at least be permanent and capable of definite and independent action. With such bodies it would obviously be more simple for the Central Electricity Board or other authority to deal, and the control which these bodies would have over distribution within the extended areas, and jointly over all areas, would only be limited by their capacity to deal with the requirements from a national as well as from a local point of view. Such an arrangement would wipe out existing and avoid future overlapping, it must obviously result in economies in both administration and operation.

WHITLEYISM IN THE SUPPLY INDUSTRY.

Conditions before the Adoption of the Scheme—The Strike of 1926—Absence of Critical Disputes—The Management Point of View.

By ALD. W. WALKER.

IN his paper presented on Tuesday after the Presidential Address, Ald. Walker recalled that during the war many consultations took place between the Government and representatives of the organisations of both employers and workmen of various industries. Good results followed, and it was felt that it would be well worth examining whether some method could be devised to put the practice on to a permanent footing. In 1916 the Government appointed a Committee under the chairmanship of the Rt. Hon. J. H. Whitley, M.P. (then Speaker of the House of Commons), and it was from his name that the term "Whitleyism" was derived.

Ald. W. Walker.

It was usual to speak of "the" Whitley Report, as though there was only one, whereas the Committee issued four, the particular one to which allusion was generally made being an interim report, dated March 18th, 1917.

The whole scheme was to be voluntary, and it was intended that the Joint Standing Industrial Councils should take into consideration matters beyond wages and hours.

In order to realise the effect on the electricity supply industry of the adoption of the Whitley scheme, it was necessary to recall what the conditions were before it came into operation. There was no uniformity of either conditions of service or rates of pay; the wages of some men were regulated by "the district rate," but these were a small number, and of skilled men only, the rest being paid in accordance with agreements made between the management of the particular undertaking and the representatives of the various trade unions to which the men belonged. This practice (it could not be called a system) occupied far too much of the time of the chief engineer and manager, and was a cause of friction. Wages and conditions differed greatly, even between undertakings which were near neighbours and which were alike in almost every respect, the natural result being that dissatisfaction existed at all times. It became the practice to play off one undertaking against another, and there was no machinery whereby a common standard could be obtained.

So great was the need felt for a better way that an attempt to secure some organisation was made during the war by forming an Employers' Joint Standing Committee, consisting of nominees of the I.M.E.A. and the various power companies.

After the publication of the Whitley Report an attempt was made to put its recommendations into force by making use of the Standing Joint Committee as the employers' side and twelve trade union representatives for that of the employees. Six of the employers' representatives were to be nominated by the I.M.E.A. and six by the Power Companies' Association. This constitution continued until 1921, when the I.M.E.A. resigned its connection on the ground that labour matters did not properly come within its functions. Following certain conferences it was decided to set up thirteen District Joint Industrial Councils, covering the whole of the United Kingdom, each Council to consist of twenty-four members, twelve representing the employers and twelve the trade unions.

The National Joint Industrial Council was to consist of a maximum of fifty-two members, twenty-six of these to be employers and twenty-six trades unionists. The National Joint Council delegated to each of the District Councils the duty of negotiating a schedule of conditions of work and rates of pay for its area. The National Joint Council tried to secure some amount of co-ordination and equality as between the schedules for different districts, but found this difficult because after the two parties (employers and trades unions) comprising a District Joint Council had, as a result of many meetings, agreed on a schedule of rates and conditions, there was naturally a desire to put it into operation at once.

The conditions and wages having been settled by agreement, copies were available in all electricity undertakings, so that every workman could know what the conditions were under which he was engaged. It was agreed on all sides that these conditions gave a general improvement throughout the industry, together with the asset of continuity of employment.

A test of the value of the agreement to the industry had been the absence of critical disputes and stoppages and a general improvement in the relationship between the management and the men. When the District Joint Councils were being set up it was realised that despite all the care taken in arranging the terms of the schedule, anomalies would be found when it was brought into operation, therefore a means of dealing quickly with these anomalies was provided by each District Joint Council appointing a small anomalies committee cosisting of eight members (four from each side).

Giving a short outline of the work of the Councils since their formation, the author pointed out that the early days were given to adjusting anomalies and to perfecting the organisation of the National and District Councils.

The first departure from the programme of leaving to each of the District Councils the negotiations for the alteration of wages was in 1920, when the N.J.C., after full discussion, recommended a general increase of wages for all grades of workmen within the schedule by two stages of 3s. each. In 1921 the N.J.C. arranged for two reductions to take place of 3s. each and for stabilising rates after the reduction until November, 1921.

On November 21st, 1921, a Negotiating Sub-Committee of the N.J.C. submitted to the full Council a draft agreement

Mr. J. Christie in his famous panama. To the right of him, Mr. R. W. L. Phillips, a past President of the Association, and on the right of him, Mr. A. W. Blake of Willesden.

Not coming out of church but leaving the electrical exhibition, at the old Torbay Hospital, on Tuesday.

regarding wages which was unanimously accepted. This established the principle of a sliding scale of wages based on a datum figure of 120% above an adjusted rate for 1914, and varying up or down in accordance with the Board of Trade index figure of the cost of living. It provided for an increase or decrease respectively of ½d. per hour for every complete six points calculated from the datum figure. This also was a national agreement. In 1922 the employers representatives on the National Council proposed "That in lieu of the existence of a sliding scale agreement a variation be made on the basis of taking the actual basic rates of each district (as shown by the schedule) and adding thereto the cost of living figure."

Another scheme put forward by the workmen's representatives both in the District and National Council was for grading undertakings according to the capacity of plant installed. The national application asked that power stations should be divided into four grades and that for each grade a section of the men should be paid 10s. per week and the remainder 7s. 6d. per week more than the next lower grade. The result of this would have been that in the highest grade stations 40s. per week to some workmen and 30s. per week to the remainder would have been paid in addition to the schedule rates. The same principle and amounts were asked for sub-station attendants. The claim was not agreed to because the impossibility was realised of justifying an all-round increase whenever additional plant was installed irrespective of whether or not additional duties or responsibilities were placed on the men. Instead of the plan put forward the National Council favoured additions to the rates of pay to certain specified workmen when appointed to take up duty on new large units.

When the report came before the N.J.C. for confirmation some of the trades union representatives asked for a short postponement, to enable them, as a matter of form, to refer the report to their members. It was ominous to find after this had been done that these representatives, including those who had served on the sub-committee and who had signed the report, were instructed not to vote for it, on the ground that it did not give an all-round advance to the whole of the men in the station. On other occasions the failure of some of the trades union representatives on the District Councils to accept responsibility had been equally marked, and it was a matter for serious regret that after prolonged negotiations recommendations were turned down by some other set of persons whom the employers had not met, and, who had not heard the arguments and facts which led up to the decision.

The Test of 1926.

The most critical event since the introduction of Whitleyism into the industry was the General Strike of 1926. It was regrettable to find that despite agreements, and without having regard to the good feeling and amicable relationship which had existed between the two sides, certain trades unions represented on the N.J.C. broke their agreements and tried to involve the industry in the stoppage. Owing to this happening employers refused to continue their association with the N.J.C. until some guarantees could be given by the trades unions, and finally a series of resolutions regarding the constitution of the N.J.C. were agreed to providing that nothing in the nature of a "lightning stoppage" can now take place, as any matter in dispute must be referred to the District and/or National Councils, thus giving time for consideration and adjustment if possible; and giving to undertakers the right to require that each employee shall sign an agreement that his service is in accordance with the terms and conditions agreed by the National and District Councils.

A Surprise for Employers.

In 1928 the trades union representatives on the N.J.C. gave notice to the employers that it was their intention to ask for a revision of the sliding scale, and this description of their intended claim was used in all subsequent discussions and correspondence when arrangements for dealing with the matter were being made. The employers were therefore surprised to receive, a day or two before the September meeting of the N.J.C., a letter from the secretary of the trades union side giving notice to terminate the agreement, together with claims for a 10% increase of all wages, double times for Sundays for shift workers, increased holiday and sick pay allowance and increased wages and improved working conditions for certain specified grades.

The employers called a National Conference in London of the employers' sides of every District Council, and after full discussion it was resolved unanimously that the employers' representatives on the N.J.C. should resist the application, and they were also empowered to give notice of an application for a decrease of one penny per hour, which, it was urged, was fully justified and overdue. The employers acted in accordance with this resolution and gave the necessary notice. Eventually the workmen's representatives reported that their National Conference had resolved that:—

"The notice to terminate the agreement should be withdrawn; the application for an advance of 10% should not be proceeded with, and that the portion of the notice relating to switchboard and sub-station attendants should be maintained."

After discussion it was agreed unanimously that the agreement of December 17th, 1927, was to be continued and extended for twelve months ending December 21st, 1929.

The chairman intimated on behalf of the employers that in view of the above resolution of the trades unions the employers would not proceed with their application for a penny per hour reduction.

The remaining claim was that the grades of switchboard and sub-station attendants and assistants should receive material increases in wages and be given conditions such as holidays, sick pay, etc., similar to those granted to the technical staff. To elucidate the real nature of the claim the chairman of the trades union side was asked by the employers at the first meeting of the negotiating committee whether they were to understand that it was a demand that all workmen, whatever their training or status, were to be classified as engineers and also as members of the technical staff, and Mr. Rowan's reply was that this was what was intended. The unreasonable nature of such a claim was argued by the employers, and the absurd conditions which would arise in practice if it were granted were cited. Eventually this part of the claim was modified.

The draft heads of agreement on demarcation were accepted on March 14th last, and were now awaiting incorporation in the general report. The clauses are:—

"Employees engaged as sub-station attendants and

Digitized by Google

switchboard attendants shall be subject to the conditions and schedules of the National Joint Industrial Council,

"Unless they have a supervisory status and are engaged on supervisory duties; or are responsible for the control of load distribution; or control sub-stations other than the one in which they are actually engaged; or who, for a temporary period of their training as technical engineers, are engaged on a switchboard or in a sub-station.

"The number of trainees working as switchboard attendants or as sub-station attendants shall not at any time exceed

Mr. A. Nichols Moore (President) leaving the Conference. Mr. F. W. Purse, the immediate past President is on the left. Between them is Mr. J. W. Simpson, the new secretary. To the right and behind the President is Ald. W. Walker, whose paper was extremely well received.

25% of the total number of switchboard and sub-station attendants employed at that time."

This out of the way, there was left only the question of increased remuneration. This was subjected to a separate and detailed examination by the employers, and a statement was prepared showing 1914 rates of pay, present rates and the rates claimed. The claims sought to establish a scale of pay very much in advance of anything previously paid, and substantially more than was being paid to qualified engineers.

A feature of the many claims made by the trades union representatives was that those making them had in nearly every case a small proportion only of their members employed in the electricity supply industry, the greater number being otherwise engaged. Agreements governing conditions in those other industries had been negotiated and signed by the same representatives who served on the Councils in the electricity supply industry. In the case of the former industries they had made agreements embodying lower rates of pay, no holidays and other conditions generally much less favourable than those for the electricity supply industry, yet their main efforts appeared to be concentrated on getting more still from the electricity supply industry instead of trying to bring the others nearer to that standard.

Although a number of electricity committees had sharply criticised the holidays given under the schedule as being excessive when compared with those in other industries, or other departments of the Corporation, employers, as a whole, had declined to support any reduction. A plea had been made that six consecutive days' holiday did not allow a complete week-end, therefore that only short journeys could be made, and that the Saturday was lost. To meet this a suggestion was made by the author that the public utility services might consider a uniform scheme for holidays for inclusion in the national agreement:—

"After 12 months' continuous service each man shall be allowed an annual holiday of ten consecutive days made up on the following basis:—'He shall commence his holiday as from stopping time on Friday night and shall return to work on the second Tuesday morning thereafter and shall be paid for all normal working hours (i.e., 60 hours) falling within that period.'"

The author also suggested for discussion the question of making the areas of the District Councils coincide with the electrical areas set up, or to be set up, by the schemes of the Central Electricity Board.

There were many questions of principle in connection with Industrial Councils which still require solving. One of these was whether or not the decisions of a J.I.C. should be compulsory on the industry. The employers had always said they were prepared to adopt this as part of the constitution, but they would make no move until the trades union side intimated that they wished the question to be discussed. If adopted it must obviously be by general agreement, and it was interesting to note how rapidly the question had advanced, the greatest step being the vote in favour at the Trades Union Congress at Scarborough. A Bill had been drafted and was known as the Industrial Councils Bill. It would be an adoptive measure, so that each industry would have to decide whether or not it wished to work under the conditions laid down in the Bill.

Whether or not support from the electricity supply industry should be given to the Bill was in the first place a matter for each side of the Industrial Councils to consider separately, and then, if agreed, joint action could be taken. It was important to note that even if the Bill became law it would not be compulsory for any industry unless adopted by a resolution of the two sides forming the Industrial Council.

In the author's opinion such a measure was the logical outcome of the Whitley scheme. It provided a means for healing the sore caused by a few concerns refusing to conform to the conditions under which the remainder had agreed to work, whilst at the same time safeguards against tyrannical use were ample. At present the means for getting an outside undertaking to honour the Industrial Council's scheme were two. The first is for the National Council to send a joint deputation to meet and persuade the recalcitrant body; the other for the trades unions to declare a strike.

In the electricity supply industry the number of undertakings outside the Industrial Council was small and is becoming less. The apparent reason for some of these being outside was to avoid having to pay their share of expenses.

In connection with zoning it had been noted that many times claims had been made, in different districts, to zone undertakings solely on the size of the station, whereas other considerations altogether should decide the question. If size only were to be the factor we should have the wages of a supply station which had been located because of water facilities in an agricultural area, where rents, food stuffs, taxes and rates were at the lowest, paying wages considerably higher than those paid in a smaller undertaking situated in a town or district where all the foregoing items were at the highest.

Since the Industrial Council was established for our industry there had been no serious dispute and no stoppage, the relationship between the two sides had certainly improved, the representatives had got to know and to understand each other, and the exchange of opinions and arguments had widened their views. There had been created a body expert in the knowledge of labour conditions and able to understand the correct bearings of various problems which arose.

The other application of Whitleyism to the electricity supply industry was that of the National and District Joint Boards for dealing with all matters relating to the technical staff. A salary scale had been arranged and conditions of service agreed, these being national in extent, and provision having been made in them for all grades and sizes of station.

As a result of changed and changing conditions brought about, or to be brought about, in connection with generation by the schemes of the Central Electricity Board, and the changes in the problems and methods of distribution, it had been realised for some time that an alternative way of fixing the basic salary would have to be found, as the present method did not meet the altered conditions. Both sides had been considering the problem separately, and the E.P.E.A. had prepared a draft schedule and handed it to the employers.

THE DISCUSSION.

COUN. WALTER GRIFFITHS (Newport) in opening the discussion, said he had had experience in the railway industry both under the old and Whitley conditions. In the old days much of the time of the managerial side was taken up in considering individual applications with regard to wages and conditions of service. The Whitley machinery had largely removed that burden. It had more or less standardised the wages system, and thus removed a great cause of dissatisfaction amongst the employees. Being a more satisfied body of workers they naturally gave more efficient service. Further, by relieving the managerial side from the worry and responsibility of dealing with individual claims, this side had more time to devote to improving its service to the public.

In spite of what had been accomplished, demands were still being received from the employees' side which were in some instances very extravagant and irresponsible. There must be some reason for this, and he thought that if the management made the employees feel that the aim was to get the maximum

Digitized by Google

amount of work out of them, their reaction would be to try to get the utmost farthing from the management. It was most desirable that the employees should be made to realise that they could not get out of an industry more than they put into it.

One of the best ways of achieving this was to invite the employees to take some share in the control and management of undertakings. To some this might appear revolutionary, and in the railway world it had required a national railway strike to bring it about. By 1928, however, the position had so changed that when the railway companies were in financial difficulties such mutual confidence existed that the companies invited the men's representatives to consider a voluntary wages reduction in order to help the railways out of their trouble. There could have been no greater evidence of the mutual goodwill than in the fact that a voluntary wages reduction of 2½% was agreed to without so much as a ripple on the industrial surface. If employers expected their employees to realise their difficulties they must take them into their confidence and make them take a share in the responsibility.

ALD. E. HUNTSMAN (Nottingham) thought that the essential objects of the Whitley Council movement had mainly been realised in the electricity supply industry. With regard to the author's suggestion for setting up an expert body to deal with matters from the employers' viewpoint a lot depended on the way it was done. Too often the expert was more concerned with making out a good case than with abstract justice. Mutual friendship was the keynote of the present relationship, but if the expert knowledge could be incorporated without prejudicing the good feeling that had grown up it would be an excellent thing. Financially the cost was so reasonable as to be hardly worth consideration.

District Councils.

Similar principles also applied to the proposal to make the districts compare to the areas delimited under the Central Electricity Board's schemes. The District Councils could not have sat continuously for ten years without engendering a considerable degree of local patriotism and confidence. They had met as friends, and in his own experience there had not been uttered a single unkind or discourteous word on either side. The question was, should this valuable feature be sacrificed, when it was obvious that time would be required for the growth of this tender plant in a new and wider body.

One serious omission from the paper was the author's neglect to refer to the time he had devoted for years past to the development of this great work. To his task Ald. Walker brought a cool temperament, a clear mind, and an unrivalled knowledge of conditions in the electricity supply industry. He was a firm, clean, and tactful negotiator, and the industry owed him a debt which it could never repay.

ALD. G. CROOT (West Ham), speaking as a representative on the board to District Council for the past ten years, and from the trade union point of view, thought that employers should be sympathetic towards trade union requests for assistance in persuading men to join the appropriate trade unions. It was often found that the non-unionists were the cause of far more dissension than the trade unionists, and though it was not for the employers to insist that their employees should become trade unionists there were many ways in which they could encourage them to move in this direction.

At West Ham and elsewhere it sometimes happened that the shop stewards tried to work independently of their unions. This was quite wrong. It was imperative that all matters should go through the trade union concerned.

A Bristol Grievance.

ALD. A. A. SENINGTON (Bristol) put forward a grievance applying to the Bristol area, claiming that certain elected representatives of the employees' side had not been acceptable to the other side. This procedure was quite wrong and was contrary to the maintenance of the democratic spirit which was so essential to the success of Whitleyism.

COUN. TOM SNOWDEN (Bingley) said that his own experience, both as an employer and as a member of the trade union movement, was against the system of compulsory agreements as advocated by the author. It was far more satisfactory to convince both parties of the rightness and equity of a proposal than to compel them to act one way or another. It was a commercial proposition to treat the workers as human beings, and it was the mutual jealousy and suspicion of the past that had so hampered progress.

There was no gainsaying the fact that both strikes and lock-outs had failed. He was convinced that in the past the employer was more to blame than the worker because he had not in prosperous times extended participation in that prosperity to his workpeople.

ALD. W. WALKER, in replying to the points raised, said that in the constitution of the councils in the electricity supply industry special provision had been made for the institution of works councils, and it was open to any undertaking in the industry to establish such a council should it so desire.

He agreed with Ald. Huntsman that the type of "expert" interested chiefly in fighting a case would be quite hopeless. All he had in mind was the creation of machinery to assist the employers by way of research into facts and statistics. Corresponding organisations were in existence on the trade union side. He would certainly not stand for anything which would detract in any way from the goodwill which had been built up

He was sorry that Ald. Senington had emphasised what was a local squabble concerned with the constitution of the local body. To equalise anomalies which might arise in appointing representatives, other districts had divided themselves into groups according to the size of the undertakings which they represented and he hoped that by altering their constitution in a similar way Bristol would end their troubles.

Mr. Snowden seemed to have misinterpreted the meaning of compulsion as used in the paper. It had already been explained that the Bill would only be adoptive and its provisions could, if desired, be put into operation for only a trial period. The whole matter was entirely in the hands of the industry, and agreement on both sides would be necessary before anything could be done.

A hearty vote of thanks to Ald. Walker was proposed by Mr. J. K. BRYDGES, and seconded by Mr. A. J. FULLER.

CURRENT LEGAL PROBLEMS.

Replacing Apparatus on Change of System—Hire-Purchase Agreements—Public Supplies—Prepayment Meters—Rate Aid.

By J. H. ROTHWELL.

THE first paper to be read on Wednesday was one by Mr. James H. Rothwell, the Association's honorary solicitor, and was entitled "Some Notes on Recent High Court Cases and Current Legal Problems in Connection with the Generation and Supply of Electricity."

Mr. J. H. Rothwell.

The author gave a short account of the more important of recent legal decisions of common interest, and also indicated some of the legal problems he had considered during his period of office.

Dealing with cases in the order of their importance, the first was Farnworth *v.* Manchester Corporation. This action was first tried at the Manchester Assizes, and, upon the plaintiff's appeal, was heard by the Court of Appeal last December. The author had reason to believe that the case would be taken to the House of Lords.

After commenting on several features of this case, Mr. Rothwell said the only conclusion one could arrive at at this stage was that in order to resist an injunction or damages for such a nuisance as was proved in this case, the undertakers must prove to the satisfaction of the Court that it is the inevitable result of operating a generating station that it should damage adjoining agricultural land by sulphur deposits, notwithstanding that they may have taken all reasonable precautions to explore the cause of and remedies for that damage, or adopted all reasonable precautions to prevent it.

It was interesting to note that the operation of the injunction was suspended for a year to enable the defendants to adopt measures to terminate or mitigate the nuisance.

Lord Justice Scrutton also made this significant remark: "The case showed the necessity for Parliament and other authorities concerned giving more careful attention to the provisions for compensation for damage caused by those enormous developments of electrical power stations. Promoters should not be allowed, by abstaining from asking in express words, for the exclusion of any duty to make compensation for damage done—a privilege which in his judgment they would not get if they had asked for it expressly—to argue afterwards that their duty to compensate had been indirectly excluded by obscure inferences.

Whatever might be the result of the final appeal, it was obvious that the liability under which undertakers might be in working statutory undertakings efficiently and without negligence should be more precisely defined, so that they might know what their obligations were before committing themselves to enormous capital outlay.

The second case referred to was that of the Attorney General *v.* London and Home Counties Joint Electricity Authority. Consideration of the facts clearly pointed to the necessity when establishing an *ad hoc* authority that the purposes for which it might be entitled to promote a Bill in Parliament should include all the purposes which it must seek to obtain in order to secure it functioning completely for the purposes for which it was set up. In the absence of such a power, immediately such an authority found that the obligations or activities which were legitimately within its province were not conferred by its then existing powers, either Parliamentary powers must be sought, or the instrument of its incorporation, be it a scheme or charter, must be amended by the authority which created it.

One could not help but sympathise with any authority placed in such a position as revealed in this case, because the power companies or other bodies or persons had ample opportunity of combating their proposals either on second reading of the Bill, or before the Select Committee to which the Bill was referred. The only remedy of the Authority now appeared to be to seek an amendment of its scheme under Section 7 of the Electricity (Supply) Act, 1919.

The next case, which was of general interest, although the facts of it were rather special and might never recur, was G. Scammell and Nephew, Ltd., *v.* Attlee and Others. The plaintiffs in this case were engineers in Stepney, who brought an action against seven individual members of the Electricity Committee of the Stepney Borough Council, claiming from the defendants damages for the effect of an alleged conspiracy whereby, in breach of a contract, the supply of electricity for power was unlawfully cut off from their premises during the general strike in May, 1926. The plaintiffs succeeded in the court of first instance, but the defendants appealed successfully, and judgment was entered for them with costs.

The important point of general interest emerging from this case was that where a defendant, whether he be an individual member of a committee or council of a local authority, or an official of the local authority, pleaded the six months' limitation imposed by the Public Authorities Protection Act, 1893, as the period within which an action must be brought in respect of his conduct, the plaintiff could defeat that plea by proving on sufficient evidence that the defendant was not really intending to act in pursuance of his statutory authority, but was using his pretended authority from some improper motive, such as spite, or for a purpose entirely outside statutory justification.

Where defendants were purporting to execute a statute, as in the case in question, the burden of proof was on the

plaintiffs if they alleged the existence of a dishonest motive and the absence of any honest desire to execute the statute, and such existence and absence would only be found to be proved on strong and cogent evidence.

On the facts of the case in question, the Court of Appeal held, after a careful review of the facts, that there was no evidence on which the jury could find that the members of the Committee were not intending to carry out their statutory duties when they determined to get a supply of light by sacrificing a supply of half the power.

The only other case of comparatively recent date was that of the Caerphilly Urban District Council *v.* Griffin, decided in December, 1927. The plaintiffs sought an injunction to restrain the defendant from supplying electricity to certain consumers in the area. The defendant had primarily two businesses, his draper's business and the business of developing his property. In the course of those businesses he provided plant to light his shop and residence, and he afforded a supply of electricity to one of his shops which he had leased to Messrs. Woolworth, and also to a covered market for the purpose of attracting tenants and developing his property.

The Court held that the supply of electrical energy in this case was only incidental to the defendant's two businesses and was not his primary business. The action therefore failed and was dismissed.

Dealing with some current problems, Mr. Rothwell first referred to the replacement of apparatus on a change of system.

The Association realised, of course, the importance of the principle that if undertakers chose to alter their system, frequency or pressure for their own purposes, the interests of consumers must be adequately safeguarded, but the Council, he believed, still thought that the form of consent to the alteration given by the Commissioners might be improved without injustice to consumers. Take, for example, the expense involved in replacing d.c. wireless apparatus with a.c. apparatus, expense which was altogether disproportionate to the amount received in revenue, and, secondly, the possibility that some persons might seek to gain personal financial advantage out of the impending change.

It appeared clear that the Commissioners had a somewhat free hand to modify their consent in such manner as they thought fit; and the measure of control which undertakers had by Statute over apparatus connected to their systems would appear to entitle them to insert in their agreements with consumers a clause requiring notice to be given before any new apparatus, other than lamps, was connected to the supply. The undertakers could not reject any intended apparatus which would not be likely (*a*) to cause damage, (*b*) to interrupt the supply to other consumers, or (*c*) to cause the consumer to exceed his declared maximum demand, and any condition in an agreement purporting to confer upon them this right would be unenforceable and void. Moreover, no consent of the Commissioners could impose as a condition precedent to compensation a condition that apparatus should have been approved.

It might be suggested that a further proviso should be added to the form of consent to the effect that if a consumer installed any apparatus after the date of the newspaper advertisement of the intention to apply for the Commissioners' consent to the change, such consumer should not be entitled to require the undertakers to alter such apparatus or to pay compensation in respect thereof, if the arbitrator should determine that the installation of such apparatus was not necessary, or was made with a view to obtaining compensation from the undertakers. It was hoped that the efforts of the Council in this direction would be successful.

A considerable amount of time had been devoted to settling a model hire-purchase agreement. The members of the Conference would recognise that the very nature of an electrical installation did not lend itself readily to hire-purchase terms, and considerable care had to be exercised to avoid the agreement being construed as one for sale and purchase. It would be an advantage if all undertakers embarking on the hire-purchase policy would adopt this model form with as little amendment as possible.

Touching on the bearing of Sect. 12 of the Electricity (Supply) Act, 1926, upon existing and future supplies of electricity in bulk to other authorised undertakers, the author said that with regard to contracts entered into before the

Digitized by Google

passing of the Act, Sect. 12 did not affect these at all, and therefore unless there was a clause in the agreement making some provision for variation of charges, the agreement must be left to expire or be determined before any modification could take place, except, of course, where the parties voluntarily agreed to modify the terms.

With regard to contracts entered into since the passing of the Act where there was a clause as to variation of prices : in these contracts Section 12 would apply when the bulk supplier took energy directly or indirectly from the Board, as must happen sooner or later. When this came to pass it would be open to authorised undertakers taking the bulk supply to demand Sect. 12 prices, and in default of agreement to refer the matter to the Electricity Commissioners for decision. Pending Sect. 12 coming into full force each undertaker must act according to the prices clause in the agreement.

Where there was no clause as to variation of prices, the authorised undertakers taking the bulk supply must wait until Sect. 12 came into force before they could demand any alteration, other than by agreement with the bulk suppliers.

As to contracts not yet entered into, it was competent for the contracting parties to arrange their own terms, but before doing so they should consider the model clauses which had been specially settled, having in view the early operation of Sect. 12.

Recently the point had been put, as to who was liable in case money was stolen from an electricity prepayment meter. In a reported case the money was stolen through no negligence on the part of the consumer, and the Court held that the consumer by putting the money into the box had paid, and was not liable to pay again. The law report did not indicate that there was any special agreement between the consumer and the undertakers, and in the absence of any such agreement one must accept the position as laid down in that case as being good law.

Mr. Rothwell thought the liability would be the same in regard to damage to the meter where it was caused without negligence of the consumer, and in the absence of a special agreement.

In Brighton, and possibly in many other towns, the application form which all consumers were required to sign contained the following among other conditions :

"Where the supply is through a prepayment meter, the consumer shall pay for all electricity registered by the meter at current rates, notwithstanding any insufficiency of prepayment, and, in addition, one halfpenny for every unit of electricity consumed, in lieu of meter rent. Should the meter be tampered with and money unlawfully extracted therefrom, the consumer shall make good the amount missing, and also pay for any damage which may be done to the meter, lock or fittings."

The reported case would not, of course, apply where a condition of this sort had been entered into by the consumer, and it appeared the obvious course to avoid this liability.

A point of financial interest had been considered arising out of a proposal to vote money out of the funds of the Electricity Undertaking of the years 1929-30 before the completion of the year where the reserve fund was not up to the required limits provided for in the 5th Schedule of the Electricity (Supply) Act, 1926.

In this case one had to point out that a grant out of electricity funds before the completion of the year was not "net surplus" within the meaning of these words as used in the 5th Schedule of the Electricity (Supply) Act, 1926. The power in this Schedule was now the only one existing which enabled an undertaking to apply money in aid of local rates ; and it applied only to the net surplus, which of course could not be ascertained until the end of the financial year, and if, after March 31st, 1930, the reserve fund did not amount to more than one-twentieth of the aggregate capital expenditure on the undertaking, the net surplus must go to the reserve fund until that condition was fulfilled.

In conclusion, the author referred to a somewhat technical problem which arose in the carrying out of the South-East England Electricity Scheme, 1927, and presumably other schemes throughout the country. Under Sect. 8 of the Electricity (Supply) Act, 1926, the Central Electricity Board were to construct the main transmission lines required for the inter-connection of selected stations one with another, and with the systems of authorised undertakers in accordance with the Scheme. Sect. 51 defined "transmission line," whilst "main transmission line" was defined by Sect. 36 of the Act of 1919.

In carrying out the Board's functions under Sect. 8 the following circumstances had arisen, which necessitated defining both technically and legally whether certain switchgear was part of a main transmission line, the cost of which was to be borne by the Board.

Existing switchgear was installed by a Corporation (whose station was a selected station) controlling their generating plant and outgoing feeders, and was designed to meet all requirements for years to come, but not in contemplation of a connection to a main transmission line of the Board's system.

Before the generating station was connected to the grid under

the Scheme, it would be necessary to instal switchgear of much higher disruptive capacity, or to supply other means of controlling the power in the main transmission line in order that it would not damage the station in the event of a fault, either on the Board's side of the busbars, or on the station's side of the busbars.

The estimated cost of installing the necessary gear was upwards of £20 000, and it had been assumed that this expense would be borne by the Board, the gear being necessary for the control of the Board's transmission line within the meaning of Sect. 36 of the Act of 1919.

The Board, however, contended that the gear was required, not for the control of their line, but solely for the protection of the Corporation's system, and in fact would form part of the Corporation's system, and were therefore not prepared to provide and pay for the gear.

In the case of a selected station the financial result of this decision of the Board would not be serious as the interest and sinking fund upon the extra capital expenditure would be borne by the Board under Sect. 7 of the Act of 1926, and the local undertaking would be able to protect itself from having this expenditure charged upon its price for energy for distribution purposes by the provisions of the Act of 1926.

It was for the technical experts of the Association to agree that gear of this nature, whether provided in a selected station or in connection with any system of an authorised undertaker (whether selected or not), was primarily " switchgear necessary to and used for the control of " the main transmission line within the meaning of Sect. 36 of the Act of 1919. The case seemed to be one eminently suitable for the joint considered opinion of the engineers to be placed before and discussed with the technical advisers of the Central Electricity Board, and this course was suggested.

THE DISCUSSION.

Councillor H. K. BEALE (Birmingham) said the Manchester nuisance case was of the greatest importance to all electricity supply undertakings, and though it was impossible to deal with that case, it being still under discussion before the House of Lords, the general question was deserving of careful consideration. The new power stations that were being put up constituted a serious potential nuisance to the public. Loud and bitter complaints had been raised against the emission of grit and dust from Birmingham's new power station. A sum of approximately £60 000 had already been spent in seeking to remedy matters, but, even so, the trouble was only partially cured. With stoker-fired furnaces the trouble had been practically overcome, but pulverised fuel firing still permitted a quantity of fine particles to escape into the surrounding atmosphere. These particles went farther and were generally more widely distributed than the usual grit, but they were bound to come down somewhere.

He rather feared that unless a remedy were found soon restrictions would inevitably be placed upon the permissible size of our generating stations, or operations of the stations would be subject to such conditions as would seriously advance the price at which undertakings would be able to furnish a supply of electricity to the public.

The problem was of immediate importance to the big power stations, and it was up to our engineers and chemists to provide a solution. The strength of public opinion which had made itself evident in regard to the proposed new power station at Battersea was by no means confined to that one case, and already similarly strong complaints were coming from the neighbourhood of other large stations.

Even though there might now be complete legal immunity against actions for nuisance, it was not, in his opinion, safe to rely upon a continuance of that immunity.

Under the Public Health Act of 1875 certain trades were exempted from prosecution for causing a nuisance, it being thought at that time that it was impossible for these operations to function without interference with amenities. In spite of that legal immunity, under which, as one instance, the railway companies had escaped liability for damage caused to growing crops, hedges, etc., by sparks emitted from locomotives, public opinion eventually became too strong to permit perpetual immunity, with the result that, in 1905 an Act was passed under which the railway companies were made liable for such damage, though the extent of that liability was limited to £100 in each case of damage; this limit was later raised to £200. The instance thus quoted was a direct case of a statutory undertaking being held responsible for damage done even though it had taken every reasonable precaution to prevent its commission.

Another point which was of more interest to committee members was the matter of contributions in aid of the rates. The provision that after March, 1930, no money should be appropriated for rate relief until a reserve fund of 5% had been reached was a very useful piece of legislation. In places where it was customary to take money in this way there was continual friction between the trading committee, anxious to improve its service and reduce the cost thereof, and the finance committee, generally backed by the whole corporation, determined at all costs to get money to enable it to reduce general rates. In this matter Parliament seemed for once to be wiser than the local legislators.

Relief of Rates.

In view of the provision referred to some local authorities would be trying to find a way to benefit next year's rates from this year's trading profits. He had heard the opinion expressed that these authorities could not do such a thing, but he believed there was a way round. It was laid down that no payment was to be made after March 31st, and also that such contribution must come from the next surplus. This had been construed by some people as meaning that as the net surplus could not be determined until after the date mentioned it would then be too late to appropriate the money. Even so there was no reason why municipal authorities should not follow the practice of commercial firms and pay an interim dividend. The approximate size of a surplus could be estimated before the close of the period and the amount handed over in good time. There would then, of course, be no final dividend.

It was, perhaps, hardly necessary to say that he had no intention to advise Birmingham to dodge the provisions of the Act in the way which he had described. On the contrary, he was most anxious to help to increase the reserve fund of the undertaking. The loophole, he added, had only been pointed out for the benefit of those local authorities who were sufficiently unscrupulous to take advantage of it.

Mr. O. T. MORGAN (town clerk of Newport) thought that though the Manchester case was *sub judice*, the general question of nuisance was appropriate for discussion. The liability for creating a nuisance of this kind could be brought home to the electricity supply undertakings in two ways, i.e., damages and injunctions. While it was unlikely that a utility would have an injunction granted against it, it might well be that the damages for which it had been made responsible would be of such magnitude and so continuously leviable as to have the ultimate effect of an injunction.

Replacement of Apparatus.

Regarding Mr. Rothwell's point about the replacement of consumers' apparatus on a change of system, he thought it would be preferable to fix the limiting date to that on which the Electricity Committee decided to ask the Council to authorise applications to the Electricity Commissioners. At present advance information regarding the Council's intentions would become available to the general public through the publication of the Council's minutes in the columns of the local Press, and this knowledge led to abuse.

Mr. F. W. PURSE remarked that as chairman for the past four years of the Association's Law Committee he had gained a considerable insight into the complexity of the legal side, and this enabled him to appreciate the great work which Mr. Rothwell had done for the Association. He desired to focus the attention of the meeting on the tremendous amount of legal work that was carried out by the Association, and of the great benefit of this work to its members. If this were properly understood members would soon realise that on the legal side alone their Association subscriptions would be repaid many times over.

It was important also that undertakings should appreciate that unless the law as to what they could or could not do were very clearly set out they would need to act cautiously.

Referring to the case of the London and Home Counties Joint Electricity Authority, Mr. Purse pointed out that the exact position was that in that area about 80 local authorities possessed purchase rights over company undertakings maturing at various times. The Bill asked that these rights should be transferred to and collectively held by the Joint Authority. It was of interest to note that the Joint Authority already possessed complete power to take over any of these undertakings by agreement if desired.

Mr. Rothwell's reference to disturbance of road surfaces was of interest, for it seemed that even if a highway authority

Digitized by Google

gave permission to an unauthorised undertaking to open a road the authority could be proceeded against.

With regard to the replacement of d.c. wireless equipment on changing over, it was worthy of note that in view of the recent considerable developments in rectifiers many undertakers would very seriously ponder the advisability of incurring the heavy expense of changing over.

The question of special protective clauses in Private Bills was of interest, and when the 1926 Act was promoted the I.M.E.A. had tried to get several useful general clauses included, though they were only successful in getting one through.

There were many apparently trivial details the omission of which might seriously prejudice the operation of an undertaking. It was important to have a clear definition of such a simple thing as the area of supply, though the matter was not tested until recently, when the question arose whether a supply could be taken from an undertaking in its own area and actually used in a contiguous authority's area. This and similar matters made apparent the necessity to go to the length of providing that the boundary might be the centre of a particular road.

Legal Position Uncertain.

It was necessary, too, to have clauses empowering an electricity supply authority to construct a sub-station.

Generally, the legal situation was so uncertain that it was vital that Corporations promoting Bills should include clauses which would definitely permit them to carry out what was desired. Unless they had such definition it was impossible to tell what the ultimate position might be, without taking the matter right through to the House of Lords.

It was important that local authorities should have power to safeguard the public in regard to installation work by getting sanction for special by-laws. Various undertakings had tried to make such provision, but so far West Ham was the only one that had had these by-laws approved by the Electricity Commissioners, and, therefore, was the only authority whose regulations were legally enforceable.

In drawing up such by-laws it was very desirable to indicate that they would apply not only to premises supplied, but also to those to which it was proposed to give a supply. Obviously, this authority should be applicable before a supply was given, but, without the precaution indicated, they would have the ludicrous position that they would first have to connect an installation to the supply before cutting it off for failure to comply with the by-laws. This was but one case which clearly emphasised the importance of giving scrupulous attention to details. It was very desirable that some of the special protective clauses should be standardised. Until the passing of the 1926 Act very few undertakings had any real authority to adopt even a two-part tariff.

The position in regard to prepayment slot meters was also curious, for unless the consumer signed an agreement taking responsibility for the custody of the money in the meter, a supply authority would have no means of recovering any cash that might be missing.

Re-codification of Electrical Law.

Mr. W. M. SELVEY suggested that one could draw a striking analogy between the present state of our law and the Jewish law as it obtained in Biblical times. In each case there was built up on a solid foundation of common justice a superstructure of fanciful decoration, which became so top-heavy that an entirely new codification of the law, comprising principles rather than details, was urgently required. It was only a matter of time before we arrived at this stage.

The matter had already been referred to in the President's address, but he wanted to put forward the definite suggestion that the legal brains in the electrical industry should now turn their attention to the codification of all the existing electrical legislation in one simple form.

Dealing with the Manchester case, Mr. Selvey thought that the quantity, rather than the composition of the material causing the nuisance, was regarded as the important matter by those who were adjudicating on the case. The problem was thus confined to the large stations, and, as increased size of generating plants was an integral feature of the Central Electricity Board's schemes, the matter needed the most careful attention.

He could assure Coun. Beale that the time and expense devoted to this problem was already colossal, though this was not to say that an economic solution was yet to hand. On the other hand, the great part of the problem would, he believed, be solved at a very early date.

Another suggestion was that all branches of the electrical industry should initiate means for evolving some body powerfully to represent the industry as one indivisible organisation. This suggestion, of course, presupposed close working contact between the I.M.E.A., the B.E.A.M.A., the C.M.A., and the E.C.A.

Mr. R. A. REAY-NADIN (Town Clerk, Sutton Coldfield) agreed with Mr. Rothwell's remarks regarding contributions to rate relief. His own opinion was that all local authorities owning electricity undertakings got an indirect but valuable contribution to their rates, and that its extent depended on the intelligent development of such undertakings. Where electrical development went forward they also developed the whole area and thus got a valuable indirect contribution to the rates. In any event the electricity supply industry was of such importance to the well-being of the community as to warrant development of the electricity undertaking on sound lines.

Councillor COUSTON (Edinburgh) thought that the clause making the consumer responsible for money in prepayment slot meters was based on a misconception. As a magistrate, he had to deal with such cases. If a consumer's premises had been burgled and money taken from the slot meter the charge against the defendant would refer to the stolen money as "the property of —— Corporation," and only the Corporation, and not the consumer, could sue.

As he saw the position, the consumer was not concerned with the money once he had paid it into the place in which the Corporation had instructed him to put it. He had no control over the construction or the position of the box. If the supply authority was not prepared to go to the expense of collecting the money daily it must take the risk involved in leaving its collection to a time convenient to itself. He did not think that any judge would hold that an agreement of the kind referred to was good in law.

Mr. Rothwell Replies.

Mr. ROTHWELL, in a brief reply to the discussion, thought that the Town Clerk of Newport had made a good point regarding the notice of a change of system. It was inevitable that reports of the authority's intentions should appear locally beforehand, and if there appeared at the same time a notification that the governing date would be that of the Council's decision to make the charge there would be no injustice to the honest citizen.

Mr. Purse's examples of points to look for in special clauses was particularly helpful. Many corporations were finding the bulk of local legislation so enormous that consolidation of the local Acts was inevitable in the near future. It was therefore valuable to have the opportunity of considering the inclusion of clauses which had already proved useful in practice elsewhere.

Councillor Couston had been most entertaining on the meter question, and one could imagine that the question of dealing with the abstraction of money from meters was of much greater concern in Scotland than its was here. He would suggest that a grave risk of that kind could be covered by insurance.

Sir J. R. BROOKE (Electricity Commissioner), in proposing a vote of thanks to Mr. Rothwell, thought it was pertinent to remark, in view of the legal nature of the paper, that when the London and Home Counties Joint Electricity Authority wanted help they did not consult a legal luminary, but appointed an extremely able electrical engineer. On the other hand, he must admit that legal ability such as had been displayed by Councillor Beale would see its way through any Act of Parliament.

Alderman H. B. VORLEY (Islington) seconding, referred to one difficulty experienced by chairmen of Electricity Committees. They all had two advisers, the electrical engineer and the town clerk. If they asked the former whether a certain thing was practicable he would invariably say that it could be done. The town clerk would hold the opposite view, and after discussion he would recommend them to take counsel's opinion. In his own council they had taken counsel's opinion twice in three months. He was recently informed that he was contravening the provisions of the Gas Works Act of 1847. On investigation he found that this was incorporated in the Electric Lighting Act of 1882, and had never been repealed yet. It was certain that we had not yet reached finality in electrical science. It was equally certain that we had not reached finality in electrical law.

THE HEAVY-OIL ENGINE.

Its Application in Electricity Supply Undertakings—Properties of Fuel Oils—Types of Plant—Working and Capital Costs—Possibilities for Extended Use in Power Stations.

By G. PORTER.

FOR the second paper on Wednesday morning Mr. Geoffrey Porter, borough electrical engineer of Worthing, chose the title "The Heavy-Oil Engine and its Application in Electricity Supply Undertakings." The Diesel engine, he said, had languished under the shadow of the achievements of the designers of the steam turbine and the high pressure water-tube boiler. Moreover, the performance of the few examples of the engine in England was not impressive.

Mr. G. Porter.

While the war of 1914–18 did nothing to ameliorate the conditions of life, it had an extraordinary effect upon the fortunes of the heavy-oil engine. The stress of the times called for an intensive study of materials, design and manufacturing method which, applied to the heavy-oil engine, bore rapid fruit. Curiously enough the chief development had occurred in ship propulsion, a branch of engineering where conservatism was of the most deep-rooted order. The success of the engine at sea had revived the earlier interest on land to some extent. The total power of the heavy-oil engine employed at sea exceeded four million horse power in ratings up to about 10 000 B.H.P. in individual units. On land it was difficult to ascertain a corresponding value of the total heavy-oil engine power employed. In the United States of America there was about two million B.H.P. and in the United Kingdom about one million B.H.P. Adding a reasonable power for the use in other countries throughout the world, an estimate of about six million total B.H.P. in use was probably not excessive.

The author dealt in some detail with the properties of fuel oils, and said that of a number of fuel oils of similar type those of the lowest viscosity would ensure the lowest specific fuel consumption and the highest thermal efficiency. The calorific value alone was not a safe guide to the value of an oil in use. The speed of engine, cycle time and cylinder temperature at the moment of injection exerted a marked influence.

Effective combustion varied approximately as the speed and as the temperature of the combustion chamber walls; or as the intensity of compression and the degree of oxygenation of the injected oil charge.

Other factors, such as the efficiency of cooling and the stroke/bore ratio, depending, more particularly, upon design, influenced combustion to a marked extent. Viscous oils burned more readily in a slow running large engine than in a fast running small engine. A high maximum temperature and pressure, though objectionable if in excess, aided in burning contained substances of a heat resisting nature.

At first sight the paraffin base oils would appear to be preferable to the asphaltic base oils. Refiners, however, blended the latter so effectively that there was little to choose between the two classes of fuel oil in practical use. Moreover, the great demand for lubricating oils which were generally distilled from the paraffin crudes, tended more and more to the production of lower grades of fuel oil for heavy-oil engine use. The heavy-oil engine of the future must look to a fuel oil of about 0·95 sp. gr. and a viscosity up to about 200 Redwood (No. 1) seconds as the standard.

The author was satisfied that the light grade furnace oil is a perfectly satisfactory engine fuel, subject to the question of "digestion." Knowledge of a recent fuel oil contract had also satisfied him that a "Diesel" oil can be obtained in large quantities at prices very much below those ordinarily quoted to the user of comparatively small amounts.

The principal types of heavy-oil engine designed for power station purposes were classified very roughly as low compression and high compression engines.

(1) The low compression, airless injection engine known as the "Semi-Diesel" or "Surface Combustion" engine. The latter description had been adopted by B.E.S.A. The former name had a wide commercial use and appeared to be founded upon the fact that the compression pressure adopted is about one half that of the genuine, high compression "Diesel" engine. In general such engines were less efficient than the high compression types of the Diesel class and its derivatives. The most recent development of this design, in which the hot bulb had almost disappeared and the cylinder head was entirely water-jacketed, approached very closely the so-called "cold-starting" type of heavy-oil engine. The retention of the crank case for scavenging purposes necessarily limited the permissible cylinder power rating.

(2) The high compression, air or airless injection, slow or high speed engine, commonly known as the "Diesel" engine.

This type of heavy-oil engine was capable of high power ratings in a multi-cylinder design. At the present time the largest engine of the kind, in which fuel was injected by air pressure and the rotational speed was 94 r.p.m., developed 15 000 B.H.P. in 9 double-acting cylinders. The engine was direct coupled to a 3-phase 6 600 V 50-cycle alternator. In interesting contrast to this engine was a pair of 11 700 B.H.P. 10-cylinder double-acting engines running at 215 r.p.m., each coupled direct to an 8 000 kW alternator. Some particulars of these engines were given in the original paper.

The tendency of the times to abandon the air compressor and the air blast system of fuel injection in favour of the high pressure fuel pump and airless (hydraulic) injection method was very decided. The object of the change was to simplify operation and construction and at the same time to cheapen first cost and improve thermo-dynamic and mechanical efficiency. The well known M.A.N. Aktien Gesellschaft in Germany was building at least as many airless injection engines as those of the older type.

In its modern forms the Diesel engine included double-acting and opposed piston designs in addition to the older single-acting 2- and 4-stroke cycle designs.

Coun. J. Wheeldon, Mr. W. H. Robins and Coun. A. Whitehouse in serious mood.

The power rating of single acting engines had probably reached its commercial maximum at about 400 B.H.P. per cylinder in 4-stroke cycle examples and about 600 B.H.P. per cylinder in the 2-stroke cycle. In either case the cylinder dimensions will be about 27 in. by 55 in. at a running speed of 100 r.p.m. and a piston speed about 900 f.p.m.

The double acting type of engine permitted much larger power ratings to be adopted. The problem of designing the lower combustion chamber had been solved in several ways. Most commonly the mean brake pressure below the piston was less than that used above it. Cylinder bores up to 33 in. are in commercial service.

A successful, but experimental, 35 in. double acting cylinder had been built, and developed 2 000 B.H.P. on the test bed.

The development of the heavy-oil engine had proceeded on lines more or less parallel to that of the reciprocating steam

Digitized by Google

engine. The essential requirement was to obtain the most economical power to weight ratio. The weight of engine per B.H.P. had been gradually reduced from 3 cwt. to 2 cwt. to about 1 cwt. in slow and medium speed engines. In high speed engines the lowest weight per B.H.P. was about 15 lb. for special railway service, and some 30-40 lb. in engines designed for driving electric generators.

In 4-stroke, double acting designs in service, slow speed cylinders were developing 650 B.H.P.; and in 2-stroke cycle engines as much as 1 600 B.H.P. (*vide* the 15 000 B.H.P. engine already mentioned). The 2-stroke cycle, double acting, airless injection engine constructed by the M.A.N. Co. developing 11 700 B.H.P. was rated at 1 170 B.H.P. per cylinder.

In general the mean pressure rating of cylinders remained at a conservative value, from 65 to 70 lb./sq. in. referred to brake horse power. Mechanical efficiencies ranged from 75 to about 80%. One recent double acting, 2-stroke cycle engine, slow speed and airless injection, had achieved the remarkable mechanical efficiency of 90%. In this instance, as is the case with the majority of the double acting engines, the average mean brake pressure in 27½ in. by 47½ in. cylinders was somewhat low at 54 lb./sq. in. In this engine the rate of fuel consumption per B.H.P. per hour was 0·38 lb.

Opposed Piston Engines.

The opposed piston type of engine, built usually as a 2-stroke cycle machine, had a successful record and was making good headway in land service. Developed from the designs of Prof. Junker and the Oechelhaüser and Fullagar variations, the method of securing the opposite piston motions in the cylinder was one of two kinds. In the well known "Doxford" design, each "line" had three cranks, one to operate the lower piston via the connecting rod, the other two to operate the upper piston. In the form manufactured by Messrs. Cammel Laird and Messrs. Palmer for marine service, and by the English Electric Co. for generator driving, the motion was obtained by rods connecting together the lower piston of one cylinder to the upper piston of the neighbouring cylinder.

The arrangement was good, the engine stresses being taken up very completely. The author's experience of a 6-cylinder engine of the kind running at 250 r.p.m. and developing 1 125 B.H.P. had been satisfactory over a period of nearly six years.

The opposed piston engine was, in effect, the equivalent of a double-acting engine. Up to the present time the cylinder bore of opposed piston engines for land service did not, within the author's knowledge, exceed 14 in.—in this country at any rate. A design employing cylinders of 19 or 20 in. was, however, under construction.

The demand for large engines in the United Kingdom had not approached that of the continent of Europe and other countries, with the result that British makers of land type engines had not seriously considered the extension of cylinder power ratings. An engine of 4 000 B.H.P. in the works of Messrs. Harland and Wolff in Belfast remained the largest heavy-oil engine in service in Great Britain and Ireland. This engine had been at work since about 1913.

It was noteworthy that the Doxford type of opposed piston engine was shortly to be built by a British licensee in England in power ratings up to the largest for land service.

A comparatively recent and very interesting advance in Diesel engine practice was the method of supercharging devised by Mr. A. Büchi.

The method adopted was to carry the exhaust gases discharged from the cylinders at about ⅞ lb. per sq. in. above atmosphere to a gas turbine coupled to a turbo blower. As the gases left the turbine at atmospheric pressure there was no loss of energy by this transfer, the inter-connecting pipes being very short. The blower supplied air to the engine cylinders during the "induction" stroke at a pressure about the same as that at which the gases left the cylinders at the end of the expansion period adopted. The quantity of combustion air and fuel oil mixed in the cylinder being larger than in the normal type of engine, a higher power rating was gained, while the pressure and temperature were not increased.

The "cold-starting" class of heavy-oil engine was singularly mis-named. The description arose from a commercial attempt to steal a march on the semi-Diesel engine which, as was well known, required the addition of heat to enable the first charge to be ignited in the cylinder. In point of fact, the first "cold-starting" oil engine was the Diesel engine itself, in which spontaneous ignition of the first charge occurred solely by reason of the heat generated by the compression of air in the working cylinder to a pressure of about 500 lb. per sq. in. immediately prior to injection.

The fundamental difference between this class of engine and the original Diesel engine lay in the nature of the heat cycle employed. The "cold-starting" engine was practically —if not entirely—a constant volume machine. The economy of the engine was good, if anything rather better than that of the Diesel engine of equivalent output owing to the nature of the design and the absence of an air compressor. In England this engine was extensively manufactured by Ruston, Hornsby and Co., Ltd., of Lincoln. At full load a fuel consumption of 0·396 lb. per B.H.P.-hr. was achieved, corresponding closely to a kWh consumption of 0·59 lb. The author did not know of any example of this type exceeding a total power 650 B.H.P. in 6 cylinders. In power ratings up to those of the equivalent Diesel engine this engine was a very close competitor of the older design.

Drawing a line at about 600 B.H.P. capacity per engine, it could be said that the "Diesel" engine in its modern form as an "air" or "airless" injection engine holds the whole heavy-oil engine field above that limit. The tendency of design was markedly towards higher piston and rotational speeds, higher brake mean pressures and lighter construction to reduce first cost. As a high speed engine could be sold at a price about three-fifths that of a slow speed engine of the same or similar power it was obvious that the problem of the efficient design of the high speed engine would be pursued with energy.

Mr. Porter thought it was unnecessary to say much about lay-out, as there was nothing simpler than the arrangement of the details of a heavy-oil engine lay-out in normal circumstances. Given a suitable site with an ample water service, a good sub-soil and easy access for the transport of fuel and all materials, the lay-out settled itself. The ease of oil storage required no elaboration and the complete absence of dust, noise and smell from the storage tanks eliminated at once nine-tenths of the possibility of "nuisance." Engine foundations must be very carefully carried out. A modern heavy-oil engine was so beautifully balanced that earth tremors seldom caused annoyance. The single-acting 6-cylinder engine represented perhaps the best example of balancing to be found in power plant practice.*

The cooling water question had nothing like the importance of the water supply in steam stations. A maximum of 7 lb. of water per kWh was an ample provision to make.

Fuel oil storage could be safely calculated on a basis of 3 500 kWh per ton of oil.

Floor Space Requirements.

The floor space required by the slow and medium speed heavy-oil engine was moderate. A maximum provision of 0·60 sq. ft. per kW of capacity was ample to ensure efficient working space round and about the engines. Expressed in the reverse manner the capacity density was about 1·7 kW per sq. ft. The height was least with engines of the trunk piston type and greatest with the double acting design. A single-acting cross-head type engine, 2- or 4-stroke cycle, was intermediate.

A recent paper read by Mr. Ricardo at a branch meeting of the Institution of Mechanical Engineers in Lincoln on December 19th last described a revolutionary lay-out of a 45 000 B.H.P. station in terms of 150 high speed engines of 300 B.H.P. each. His suggestions met with a not unfavourable reception in spite of their novelty, and the proposal was not so unwieldy or impracticable as at first sight it might appear.

When space was somewhat limited, as in a sub-station, and the dimensions of the generator might be inconvenient in width, there was no difficulty in arranging a geared drive between the engine and the generator. The levels of either engine or generator could be so chosen that they had a common centre line.

The author then gave details of heavy oil engine working costs.

The variations in engine cost were considerable and in this respect were comparable to the experience of steam users. Much, of course, depended upon the value of the "annual" and "running plant" load factors. There being no standby charges affecting the fuel consumption, the fuel cost was a function of "running plant" load factor. The other items depended mainly upon the "annual load" factor. Two

*The author dealt with this matter in considerable detail in a paper presented to the Diesel Engine Users' Association in 1920

Digitized by Google

stations in the table in the original paper showed an engine cost less than one half-penny per kWh and eight did not exceed 0·7d.

An analysis of average fuel consumption, thermal efficiency and fuel cost of 23 stations equipped with engines varying in age between 19 years and one year, operated over a wide variety of load factor, was also illustrated in graphical form, and various conclusions were drawn.

In analysing heavy-oil engine station costs the Diesel Engine Users' Association had noticed an interesting fact in the position taken by a set of engines about 20 years old. These engines achieved the lowest average rate of fuel consumption per kWh in a list of 138 engines. That so low a fuel consumption as 0·665-lb. per kWh should be attained in the 20th year of an engine was a remarkable commentary on the sustained efficiency of the heavy-oil engine. Except on account of obsolescence due to insufficient generating capacity the question of depreciation from the point of view of economy hardly arose.

In concluding the section of his paper dealing with the actual results obtained in the United Kingdom by the use of the heavy-oil engine, the author mentioned the great benefit derived from this type of prime mover by the undertakings concerned.

The future of the undertakings in this country, undertakings of the "non-selected" type, was very uncertain from the financial point of view. The heavy-oil engine had served them so well that their share in the good things to be offered by the Central Electricity Board might well be less than that of their colleagues in the industry who had clung to steam generation—perhaps not in its best form. Up to the present time the bulk supply prices that had been arranged were not especially attractive when contrasted with local heavy-oil engine generation, especially in the areas where a power company was supreme. With increasing output the standing charges of the "oil" stations tended steadily to fall, so that the position of many of them, good as it might be to-day, contained the prospect of even better results were local generation to continue.

Their future depended upon the level of the bulk supply charges, even if they remained active for peak load work. These charges were an unknown quantity. Those that had been provisionally agreed during the intermediate period of the construction of the primary and secondary transmission systems were not based upon any definite method of accountancy. The ultimate charge might be something very different from the temporary charge, especially when it was remembered that the Central Electricity Board had power to suspend any contribution to the Sinking Fund for five years. In general rates of charge of the order of £3 per kW and 0·25d. or 0·30d. per kWh were too high to benefit a well established heavy-oil engine generating station where extensions of similar plant could be effected. In units up to 1 000 kW capacity an extension could be carried out for an annual capital charge of about 30s. per kw (interest and repayment being calculated at 5% for the normal periods as a simple annuity).

Results Abroad.

Abroad, the favourable results gained in small and medium power stations equipped with the heavy-oil engine had encouraged the use of engine units of far larger capacity than was customary in this country. The variety of use was considerable. Units of 1 500 and 2 000 kW capacity were numerous. They were used as the sole generating medium; in combination with steam installations and with water power plants; for peak load duty; for secondary base load purposes; for emergency duty; for local sub-station requirements.

The individual problems had been most carefully investigated and solved to the best advantage by engineers abroad where the heavy-oil engine was now regarded not so much as a competitor of steam, but as an ally to be utilised in effective combination to secure the most favourable economic result. In the United Kingdom we had not reached this stage. It was also clear that the total capacity of heavy-oil engine plant in power stations at home was so minute a proportion of the whole capacity that it could not influence the general position, though, where it existed, it might continue to do useful and valuable service. The amount of steam capacity to be made available for the purposes of the Central Electricity Board was so vast that the purchase of further prime mover plant of any kind outside the great bulk supply base load stations would be entirely unnecessary.

It cannot be a matter for surprise if some of the larger industrial concerns returned to "self" generation and looked favourably upon the simple, compact and highly efficient and handy heavy-oil engine as an excellent means of satisfying

Coun. F. W. Pratt, Mr. I. V. Robinson and Mr. G. Robson enjoying the latest joke.

their requirements. Should this possibility materialise it was not unlikely that the accelerated increase of output and demand upon which the 1926 schemes depended would fail to occur and the Central Electricity Board might be unable, whatever its intention, to sell energy at a rate low enough to enable the local distributor to retain his best class of business.

As illustrations of the result of "self" generation by means of the heavy-oil engine the author quoted the case of a factory plant with an output of 586 000 kWh and a plant capacity of 420 kW. The maximum load was 235 kW and load factor 28·4%; fuel costs were £850; oil, water and stores, £122; wages, £130; repairs and maintenance, £150 and capital charges £950. The cost per kWh was 0·901d.

This expenditure represented a saving of £549 per annum on the amount formerly charged by the local supply undertaking for the same service. The local rate was undoubtedly high in the light of the good load factor conditions. That the plant would be written off in ten years' time was a deciding factor in the decision of the firm to put down their own generating plant.

A department store under "self" generator paid 2·16d. per kWh. The rate charged by the local authority was 3¾d. The annual saving was therefore £1 677.

A comparison was then made of the capital and operating costs of a 20 000 kW capacity generating station equipped with heavy-oil engines or steam power—the latter being of good design such as was found in municipal power stations of the capacity chosen, but not equipped with the refinements incorporated in the largest base load stations at home or abroad.

The annual demand load factors were taken in succession as 35, 25 and 20%, approximating to the conditions obtaining in an industrial or a residential town.

Capital costs worked out at £21 and £15 per kW for oil engine and steam plant respectively, and the average cost per kWh at 0·158d. and 0·111d.

On the basis of the estimates the steam station was the more economical to the extent of 4, 4·2 and 5%, the maximum difference being of the order of £3 600 per annum. An increase of 10% in the price of coal (say, 1s. 6d. per ton on 15s. per ton) would place the annual cost of the two equipments on level terms.

Thus, the conclusion of engineers abroad that "there is nothing in it" between the two methods of generation when the output to be dealt with is considerable was borne out. There might, however, be factors other than cost bearing an important influence upon the choice of plant.

The use of the heavy-oil engine in the power station side by side with steam generating units or in distant sub-stations for peak load duty had been much discussed during the past two years or so. In Germany combinations of the kind were frequent and were undoubtedly satisfactory. In making any such arrangement cost was not the only consideration to be taken into account. Indeed, on a pure cost basis it was not

Digitized by Google

always clear that a definite financial advantage could be obtained.

The heavy-oil engine possessed a remarkable advantage over the turbo-generator in its capacity for quick starting from cold, and without any kind of preparation charge other than the standing charge for attendance and capital. Formerly this disadvantage of steam power was felt not only in the turbine room, but in the boiler house as well. The advent of the pulverised fuel boiler had much improved the flexibility of the steam raising section. With a reserve of powdered fuel of far smaller quantity than the amount of larger coal required in stoker-fired boilers steam could be very quickly raised in emergency. On the other hand, the turbine lacked this degree of flexibility entirely. Careful adjustment of temperature was an essential before load could be applied. This consideration, among others, had weight in the decision of those responsible for the purchase of the 10 500 kW heavy-oil engine set in Hamburg. Other towns in Germany, Bremen, Kottbus and numerous others had found this favourable feature of the heavy-oil engine a great convenience. At first sight the cost of a Diesel engine, round about £16 per kW with its foundations and generator, would not appear to be justified for short hour use. The time factor might vary according to conditions from 200 hours to 1 000 and over. Normally 800 hours was not unusual.

Oil Engines and Peak Load.

In the author's opinion the heavy-oil engine either for peak or base load duty, at the main generating station, could not compete with the "high efficiency" base load type of generating plant with its large overload capacity and quick steam raising characteristics. Until the prevailing conditions of relative capital cost and relative fuel price were materially altered this conclusion appeared to be inevitable. Nevertheless, each case must be investigated separately.

With regard to sub-station duty the position was governed entirely by the capital cost of transmission from the generating station, by the annual value of losses in the cables or overhead line transmission, transformers and converting plant from a.c. to d.c. if employed, and the capital cost of the last two items. According to the capital cost of laying e.h.t. cables to a sub-station, it might or might not be desirable to provide additional cables, either in the form of radial feeders or as additions to a ring main system.

There were undoubtedly cases where the extension of a sub-station plant by oil engines would effect an economical result. The provision of a quick starting generating plant, entirely independent of the electrical system on the "incoming" side, in a heavily loaded district such as a shopping or theatre centre or a group of factories, would add to the safety, continuity and reliability of supply.

In a minor but not unimportant direction there was a strong case to be made out for the use of the heavy-oil engine as the primary source of energy for the internal auxiliary service of a steam generating station. The house-turbine system afforded a supply of energy independent of the main electrical source, but was still dependent on a common steam raising equipment. In the interests of safety and in a dire emergency a complete separate power station supply system was a necessity when the auxiliary service was as important as that of a large generating station now was. The provision of a separate battery of boilers for the auxiliary system or the sole use of one of the main steam raising units for the purpose was out of the question. The heavy-oil engine was admirably suited to this class of service and could be usefully and cheaply so employed.

THE DISCUSSION.

Mr. MELLOR (Fraser and Chalmers) said he could not quite agree that the oil engine in this country had languished under the shadow of progress in steam turbines. On the contrary, he submitted that the steam turbine designers had been spurred to valiant efforts to maintain relative progress on overall therms, efficiency and generating cost per unit with that which the modern oil engine could give. To-day we still had in service oil engines, which though 25 years old, were giving not only high thermal efficiency but also good mechanical behaviour.

Progress in metallurgy had reduced the cost of maintenance considerably, the correct blending of metals for fixed and moving parts, working on each other, having promoted longer life.

Pistons, cylinder heads, and cylinder liners had been the subject of years of research, and oil engine manufacturers were practically at the point where they could say that the trouble of cylinder liner wear on large cylinder sizes was now reduced to a minimum by correctly-designed piston rings.

To-day they could give a definite assurance that thermal and mechanical efficiency would remain at a higher level than in any other prime mover over a given number of years. Could this be said of a steam installation, the efficiency of which decreased as wear and tear on blades and nozzles took place. Continuity of service, which was so vital in any prime mover, could in the oil engine be said to have reached as high a standard as a steam installation.

The author had covered the question of fuel oils very thoroughly. Furnace oil with a low ash content of 0·05% could be used on a normal engine, and a trunk piston engine of 250 B.H.P. per cylinder had run satisfactorily for over 8 000 hours on this fuel. Only a few years ago the limiting power per cylinder was thought to be about 500, yet to-day 2 000 B.H.P. or more per cylinder with double-acting engines or opposed piston engines was not an altogether impossible achievement.

It was generally agreed that the large oil engine could now be used efficiently for peak load or standby plant, and the many arguments in favour of this had been substantiated by practical demonstrations in Germany and London. It would be a surprise to many to learn that in London there was over 10 000 B.H.P. in oil engine plant specially laid down to deal with peak load, and supplying special theatre mains. In an underground space in the West End of London was an oil engine station capable at present of dealing with 5 000 kW, and, eventually, 7 000 kW. The space was 120 ft. long, 36 ft. wide and 21 ft. high, and yet there was ample room for reconditioning and dismantling. All auxiliaries were in the same space, and switchboards and controls were on the floor above. Fuel storage, filtering and water softening plants, together with cooling tower and exhaust silencers found accommodation without the passers-by having any idea that such a plant was in operation. It was not difficult to visualise similar, but much larger underground stations of the kind advocated by Mr. Dykes, placed in similarly unobtrusive positions in crowded centres.

An Invitation to the Commissioners.

Statements of this kind would show many advantages over steam plants of similar size, if only the Electricity Commissioners would take the trouble thoroughly to investigate their virtues.

The author apparently favoured supercharging for obtaining additional power for a given swept cylinder volume. In his view the oil engine was already pre-eminent without burdening it with supercharging.

Dealing with lay-out, he thought Mr. Porter had put the cost of oil engines and generators too high. Whilst pulverised fuel was lessening the cost of coal for steam generation, parallel efforts were being developed for reducing the cost of fuel oil. It was high time that we obtained our fuel oil from coal. Surely the Commissioners could, not lessening their patriotism towards coal, delve more sympathetically into the economic status of the large oil engine power station, either as a bulk supply, peak load, or standby plant.

We in this country were the pioneers of the internal combustion engine, just as much as of the steam turbine. The Electricity Commissioners were the servants of the public, and it was their duty to perform their functions by thoroughly investigating whether large oil engine stations could be used efficiently for the public benefit.

Mr. I. V. ROBINSON (B.E.A.M.A.) said that though it had been stated that the heavy oil engine was very useful for peak loads, investigation of the economics of peak load supply showed that cheap plant was the principal requirement. It was, in fact, from ten to fifteen times more important than the cost of the fuel. All the capital charges had to be spread over a very small number of hours of operation, and it was absolutely essential to get the cheapest plant possible. This was where the Diesel engine failed, for it was not possible to put up an internal combustion engine of the same capacity as a steam station for the same cost. The author had indicated that the high speed type of engine could be sold at about 60% of the cost of the slow speed unit, and thus it appeared that the future of the internal combustion engine was based on the high speed engine.

Mr. GERCKE said that at Hamburg, by merely cutting the peaks of the load curve, a Diesel set saved some 5 000 tons of coal in the last winter season, and also several times saved the general situation when the electricity supply of Hamburg

THESE interesting photographs, taken at the I.M.E.A. Convention in 1914, show, on the left, Mr. A. Nichols Moore (striped shirt), and Mr. J. Horace Bowden. They were at that time great antagonists and squared up in the grounds at Kenilworth to settle matters. Mr. E. E. Sharp, of Venner Time Switches, acted as second to both and may be seen holding the coats. The other picture shows the combatants reconciled.

was threatened by ice trouble in the condensers of the steam installation.

He advocated consideration of the possibility of producing the fuel oil for peak load Diesel engines in this country by utilising coal tar products. The production of coal tar was considerable in this country, and there would be enough to operate large peak load installations with coal tar oil, without increasing the importation of foreign Diesel oil.

Mr. J. CHRISTIE (Brighton) said he had watched with interest the gradual development of Mr. Porter's old and somewhat inefficient steam station and its ultimate replacement and extension by modern Diesel plant, which, for its size, was one of the most completely equipped and efficient Diesel engine stations in the country, with results which were second to none.

The author had made out an excellent case for Diesel engines and their more extended use as emergency and peak load spares, even on a big scale, for use in connection with super-power stations supplying the national " grid " system.

When such stations as Mr. Porter's were eventually shut down this efficient plant might well be used by the Central Electricity Board for developing the demand in outlying areas, until the demands justified the heavy capital expenditure of extending the " grid " with the e.h.t. switching stations, transformers, etc., and their attendant losses.

Lt.-Col. H. W. WATTS said that in the Epsom station a Diesel engine was installed in 1912, and it was interesting to compare it with the new and up-to-date engine now being erected, which was of the double-acting two-stroke type, 150% higher in power, and yet occupying less space than the older plant.

There was no doubt that the dice was loaded against the Diesel user, who had a very short loan repayment period compared with the steam user, and it was probably only due to this fact that the powers that be had found an excuse to withhold their sanction for further extensions of this type of plant. Col. Watts maintained that with its higher thermal efficiency the Diesel engine was a serious competitor against the very best steam plant. The paper exemplified the suitability of Diesel plant carrying peak loads, and there was no doubt that the schemes of the Central Electricity Board centralised the peak and showed it in a manner not previously recognised. It was a debatable point whether it would prove economical to transmit energy over long distances to meet these peaks, and it became a question of what type of plant would efficiently generate the energy required at a point as close as possible to the place of consumption. Being much greater in thermal efficiency than up-to-date steam plant, the Diesel was definitely suitable for this service. It was a fact that new plant could be installed for £11 per kW and at 8% for interest and depreciation; this worked out roughly at one pound per annum capital charge on Diesel plant. The tendency of bulk supply authorities was to often charge well over £4 per kW of maximum demand, so that with new Diesels there would be a saving of at least £2 yearly over steam plant. He had actually received quotations from British makers for a 5 000 kW Diesel set for £11 per kW, and had been offered a consumption figure of 0·47 lb. of fuel per kW. Whether electricity was generated locally or supplied in bulk it would continue to bear two or three profits before reaching the consumer. Of the steam stations in the south-east of England electricity district the highest thermal efficiency obtained in 1928 was 19·45% and there were seven stations in the district with less than 10%. The highest of all steam stations in this country was the Barton station of the Manchester Corporation for which the figure was 21·07%, while the lowest station was 3·03%. The highest figure for oil stations in this country was 28·23%, at Bognor. Another point was that the small quantity of fumes escaping from the exhaust of oil stations contained less than one tenth of sulphur that escapes from burnt coal. The author's figures for operating costs were too optimistic on steam fuel costs, as no steam station in any district could get such costs. At Epsom, however, the speaker was getting the fuel costs the author quoted for heavy oil plant, and any similar plant should easily produce these figures. He appealed to engineers with purely steam plant, and, particularly those who would control selected stations, to consider carefully the possibility of installing oil engines, more particularly for looking after peak loads.

Mr. C. M. JOHNSTON, of Shrewsbury, said the paper dealt with two types of plant, one running at 250 and the other at 750 r.p.m. The author advocated high speeds above 250, but the speaker had experienced sets at 350 with excellent results. Owing to low production cost, the oil engine plant made it possible to sell cheaply in Shrewsbury. In well balanced six cylinder engines there was no vibration and no smoke, while all smell was absent and at his own station water cooling plant was installed on the roof of the building.

MR. BERTRAM KELLY, of Douglas, said he had at his own station four heavy oil engine generators with an output of 2 500 000 kW, at a cost for fuel oil and water of 0·39 of a penny per unit. All agreed with the suitability of Diesels for the smaller stations, but it was the Commissioner's policy to use larger stations. In the Isle of Man where the Electricity Commissioners had ceased from troubling, and the Central Electricity Board were at rest, development was unrestricted but generally followed British practice, and his station would soon become the capital station for supplying the whole island. Though he was putting down a new steam station he was, nevertheless, confident that using Diesels for peak load would get much better results.

MR. HOWARD, of Macclesfield, thought the question of fuel very important. If the engineer did not understand fuel they were not likely to make the best showing with Deisel plant. With regard to Mr. Gercke's reference to tar oil this was suitable only in Germany where there was surplus tar, but here there was not enough for the purpose. He deprecated the pleas of those people asking for a fair chance to be given Diesels. They needed no sympathy, having proved their ability. At his own station he would scrap Diesels if they were not the most efficient machines for his purpose. One set, now fifteen years old, is almost as good as new. The whole secret was careful and regular maintenance.

Mr. G. PORTER briefly replied and Mr. P. P. WHEELWRIGHT proposed a vote of thanks.

STANDARDISATION OF METHODS OF CHARGE.

Some Thoughts and Considerations—Allocation of Fixed and Running Charges—"Equity" a Fetish—The Doctrine of Expediency—Desirability of Two-Part Systems.

By E. J. JENNINGS.

MR. E. J. JENNINGS (Secretary of the Birmingham Electricity Undertaking) in presenting his paper read on Thursday, explained that it was mainly intended for the Committee members, and it raised afresh such ever-recurring questions to the newly-elected committeeman, as why, for instance, lighting supplies should be charged at four, six or eight times the price at which some power supplies were furnished, and how it was possible, when the average price of all supplies worked out at, say, 1½d. per unit, to supply under certain conditions at ¾d. per unit, and yet make a good profit on the deal.

Mr. E. J. Jennings.

Among the methods of charge at present in operation in various parts of the country were three flat rate systems, four two-rate systems, two-part tariffs, with ten different methods of calculating the fixed charge, and three other miscellaneous forms of charging.

Obviously such a diverse range could not be justified on any plea of diversity of local conditions, and it formed a striking contrast to the uniform system adopted hitherto by the gas undertakings.

The desirability of evolving some sort of order for the foregoing state of affairs was apparent, and the fact that within the next few years practically all electricity undertakers would cease to be generating authorities and would become purchasers of electricity in bulk from the Central Electricity Board, rendered it necessary to take stock of the position.

Mr. Jennings thought there had been rather too much tendency in some quarters to found tariffs on "scientific" principles.

A manufacturer aimed at making a profit on each of his products. The measure of that profit was determined by market conditions, competition and so forth, but prices were adjusted according to the character of the demand for his product and the whole of the circumstances in relation thereto.

In any survey of the tariff question, first principles as laid down by Dr. John Hopkinson must be restated, and it was a tribute to the vision of that great man that the "Hopkinson" theory, as enunciated 37 years ago, held good to-day to so large an extent, though its application called for certain limitations under present conditions.

The author then gave extracts from Dr. Hopkinson's Presidential Address to the Junior Engineering Society in 1892, on "The Cost of Electric Supply," from which it was clear that, shortly put, the Hopkinson theory is that the cost of electricity supply depends mainly on the rate at which it is taken, rather than on the quantity of energy supplied, or, put in another way, that the costs are of two distinct categories, viz.: (1) those that do not depend on the number of hours of supply, and (2) those that are directly proportional to the hours of supply.

Mr. Arthur Wright was the first to attempt to translate this theory into practice with his maximum demand system. In time, the limitations of the M.D. system became apparent as it was realised that an important element not catered for was "diversity factor," both as between the various descriptions of consuming appliances and as between different classes of consumer. Neither did it allow for the period of the day when supply was required.

The actual time of supply might be of more import than the number of hours of supply. For instance, a consumer with a load factor of 30%, if taking supply wholly during off peak hours, would be cheaper to supply, relatively, than one with a 100% load factor whose demand must of necessity cover the peak load.

Water heating during the night under these conditions came as a gift from heaven, and any margin in price that could be obtained over the actual cost (say 0·25d. per unit) of the extra fuel, etc., required to meet this type of demand would all be profit for the undertaking. In spite of this, how difficult it was sometimes to persuade the powers-that-be that a rate of 0·375d. or even 0·5d. for this type of "valley" supply was good business.

Simplicity and equity were both admittedly desirable considerations in framing any system of charge, but one of the first essentials was to get the consumer to realise why electricity could not be measured and charged at the same all-round price (with perhaps a commercial discount on quantity), no matter when or for what purpose required. The main reason for this, of course, lay in the fact that our commodity could not be stored and packed away or put down to stock like most other commodities. If it could, the task of the tariff maker would be simple indeed.

Hence it came about that the major portion of the total costs per unit of output was definitely of the order of "fixed" charges; that was to say, all this expenditure must be incurred in preparing to supply before a single unit was sent out from the works. Once this class of expenditure was provided for, any additional cost per unit of output was small.

On the balcony following the reception given by Mrs. Nichols Moore, showing, right to left, the wife of the President, Mrs. Ll. B. Atkinson, and Miss C. Haslett.

The precise apportionment of an undertaking's expenditure into two classes—"fixed" and "running" costs respectively—had been the subject of much discussion, and was obviously a matter on which there was room for more than one opinion.

The following, in the opinion of the author, represented a fair approximate apportionment for general purposes, though

it was not claimed as being " scientifically " accurate. Local conditions might quite conceivably vary some of the proportions named.

The cost components of the order of " fixed " or " standing " charges were :—

(i) Capital charges as a whole (interest and sinking fund, etc.).
(ii) 15% of the cost of fuel, oil, water, etc. (required in order to be "ready to supply ").
(iii) 90% of wages and salaries at stations.
(iv) 80% of repairs and maintenance costs (generation and distribution).
(v) Rates, taxes and rents as a whole.
(vi) Management and miscellaneous expenses as a whole.

leaving as " running " charges :—

(i) 85% of the cost of fuel, oil, water, etc.
(ii) 10% of wages and salaries at stations.
(iii) 20% of repairs and maintenance costs (generation and distribution).

As a concrete example, the figures relating to the Birmingham undertaking for the year 1927-28, analysed on the above basis, were set out diagrammatically. From this it was seen that the fixed costs represent 78·54% of the whole, leaving 21·46% of the expenditure as being dependent on the extent to which use was made of the plant and organisation.

Corresponding particulars tabulated for six of the largest municipal undertakings for the same year showed that the results could be accepted as indicating average general data so far as large undertakings in this country are concerned.

The segregation of " fixed " from " running " costs having been accomplished, the fixed costs could be related approximately to the different classes of supply—domestic, commercial and industrial—with due regard to their respective diversity factors.

It must be conceded that both legally and in equity charges *should be related* to costs to a large extent. In any case, the true import of costs as defined between those of a " *fixed* " and " *running* " order, respectively, must be understood clearly by all concerned with the framing of tariffs ; hence the extent of the consideration given to this aspect of the matter. But slavish adherence in the framing of tariffs to a " scientific " analysis of costs might well be fatal to any real progress in the development of undertakings.

The supply of electricity for lighting was in every way the most expensive section of an undertaking's business, and in equity should be made to carry as much of the standing costs as it would stand.

The practice obtaining in some towns of so arranging price and tariffs as to provide substantial surpluses for rate fund was much to be deprecated.

Whether under any circumstances a portion of realised profits from electricity supply should be paid over to the rate funds was a matter on which there was room for two opinions, but a deliberate policy of charging more than would otherwise be necessary in order that large amounts could be handed over, and the ratepayers' pockets, *qua* ratepayers, relieved, was wrong and contrary to the spirit of the Acts under which it was made possible for public authorities to become authorised undertakers.

It was well therefore that the Electricity (Supply) Act, 1926, definitely put a veto on any contributions to rate funds after March, 1930, unless and until there was a sufficient reserve fund accumulated to establish a reasonably secure position, and then only within clearly defined limits.

All the available evidence seemed to indicate that in any scheme of standardisation the ultimate general adoption of a two-part tariff was desirable.

A graduated scale of flat rates might admittedly be constructed with some regard to the incidence of fixed and running charges, but this at best could only be on the basis of averages for groups of consumers, and could not possess that degree of flexibility that adjusted the average price to individual consumers according to their load factor, which was inherent in a two-part tariff.

The arguments in favour of a two-part system of charge were reinforced by the undoubted popularity and effectiveness of such a tariff wherever it had been introduced. Another inherent advantage was that it enabled the consumer to know to a large extent what his annual bill would be.

This was far more important to the consumer than that he should know exactly how the actual fixed charge was arrived at.

After examination of the principal forms of multi-part tariffs in use, the author felt that a blend of rateable value and area as a basis, so far as domestic supplies are concerned, presented so many advantages over others as to provide the most likely solution of the problem.

The conclusions reached as the result of a general survey of the incidence of costs, experience of progressive undertakings,

Digitized by Google

and the evolution anticipated under the 1926 Act, were therefore :—

(1) Standardisation of methods of charge is desirable in the larger interests of the industry, (*a*) because in future, practically all electricity supply undertakers will themselves be purchasing bulk supplies on a " common " basis, even though rates themselves may differ owing to differing conditions ; (*b*) because it will avoid confusing consumers, who move from one area to another, if a system of charge is universal throughout the country, as in the case of the telephone service.

(2) Equity and experience alike call for the general adoption of a two-part tariff with possibly two-rate meters in certain cases. Any tariff adopted must be sufficiently elastic to permit and encourage freely a policy of filling in the " valleys " in the demand curve.

(3) With regard to the basis for assessing the primary charge to cover standing costs, no universal standard, capable of meeting all requirements, has yet been evolved; but, as nearly as may be, this should be related to the size of the building and the character of its use (e.g., domestic or commercial), and in the case of industrial supplies it should be on the actual maximum demand.

(4) In any tariff or method of charge adopted every unit or output should bear some contribution, but not necessarily the same percentage contribution, towards fixed or standing costs.

(5) The difficulty of dealing with large undertakings developed on the basis of graduated flat rates should be met by the offer of alternative attractive tariffs of a two-part character, and a process of gradual change-over. Consumers should be given the option, for a limited period, of either two-part tariff or flat rate system, and reductions of charges should in future be confined to the two-part tariff rates.

THE DISCUSSION.

Mr. C. G. MORLEY NEW (Cardiff), discussing Mr. Jennings' paper, stressed that the paper was specially intended for committee members, but he thought if ever we got down to standardisation a technical consideration would have great weight. Expediency could be a good servant but bad master. He traced how differences in tariffs arose through starting out merely for lighting and developing other loads later. He agreed that standardisation of tariffs was necessary. It was often found that alternative rates were offered even by the same undertakings. He thought that the author might have aimed at simplification as well as standardisation. He suggested that the author should assume that those who dwelt in the higher rated houses would not object to a higher standing charge. The author might equally take into account habits of inhabitants and the number in family. He contended that in domestic tariffs no factor should be introduced which was left to the discretion of an official. There was too much separate bargaining. The paper would have been more opportune seven years ago, as the psychological time for drastic changes was now past. He thought that no compulsory two part tariff would command support either from the Commissioners or consumers.

Mr. ARTHUR WRIGHT, of London, the first president of the Association, who was received with great applause, said they wanted younger men to say what had been done during the last thirty three years on this subject. The author's paper was very complete and there was little to add. It was important to get lay members to study Hopkinson and get Hopkinson into their system. Hopkinson's scheme was perfectly clear and commercially understandable. Most of our troubles were due to wrong nomenclature. Electricity was not a commodity but a service—much more akin to telephone, police or water services. If considered just from the service point of view the problems would be much simpler and would have a simple charge for service. There was a danger in trying to meet the popular cry for some average charge which was fatal to further development. If they wanted the community to take electric service they must simplify the charges. The field for electrification here was tremendous. Amsterdam was quoted as a remarkable instance of the use of the Hopkinson principle. Some places were afflicted with tariffs and a different system existed almost for each.

The clamour for lower prices benefited those who could afford to pay more and left out the poorer classes. The business was to give a general supply on equitable terms to all choosing to take it. Some supply companies in this country had a monopoly and should be content to give a universal service and take a reasonable return. The monopoly also existed in the case of municipalities, and their duty again was to give electricity to the masses. There was a great danger of applying the doctrine of losing on the swings and gaining on the roundabouts. He had been unable to discover what terms authorities would get for supplies from the Central Board. He had asked members to find out how little it cost to continue a supply after arrangements had been made to supply. It was so startlingly low that some would suggest the use of special meters. The new grid electricity supply would have to be given at a much lower figure than any yet reported.

Mr. J. CHRISTIE (Brighton) said he had always advocated simple flat rates for light and power, each being as cheap as possible. The only fair way of operating a two-part tariff was a straight maximum demand. This was the only equitable method determining an equitable charge for every consumer. The flat rate system required an extra meter. But this was not a serious matter, and in his opinion we should abolish meter rent. He wholeheartedly supported flat rates.

Ald. W. WALKER (Manchester) urged all committee members not to bother with floor area and other fancy affairs. The author, after pleading for simplicity, had evolved a very complex method which was open to considerable criticism. It was not always so simple as Mr. Wright suggested, and it was more often necessary to evolve a special tariff if new business was wanted.

Dr. S. Z. DE FERRANTI said that he was, this year, president of the E.D.A., which association stood for more electricity and all going with it. The general public did not understand the business of charging for electricity, and the industry must try to make it easier for a better understanding. At the present stage of development there was no option but to adopt the two part tariff. The method of arriving at the fixed charge was not important, but must be high enough not only to cover standing charges but to supply metered units as cheaply as possible. The use of small labour-saving devices in the home was not only handicapped by the fairly high purchasing price, but when fully employed their consumption was often large and tariffs must allow for this. The time had arrived for simplification as far as possible. The public were puzzled by the wide fluctuation in prices throughout the country, and he was afraid that this was often due to want of commercial efficiency.

Mr. F. M. LONG (Norwich) said that the cost of mains was much greater for lighting than for power consumers, and this explained why bulk power rates could be cheaper than where the demand was spread over a wide area. He favoured the rateable value system for domestic consumers, as it appealed to such as being fair. A running charge of about a penny a unit was, in his opinion, about correct, but night water heating should be about a farthing.

Objection to Rateable Valve.

Mr. S. E. BRITTON (Chester) thought the paper valuable to engineers as well as to committee members. There were too many methods of charging, and the sooner they were cut down the better. He did not think it possible to supply for all purposes at a ½d. The principle of the two part tariff was that the highest possible charge for the standing charge be made and the lowest possible for consumption. One objection to rateable value was the difficulty of getting the rate fixed. He had got assessments of about 20 000 properties at a cost of about £25. Undertakings must be prepared to supply electricity for all purposes.

Mr. H. C. LAMB (Manchester) noted that nobody had attacked the author's views on equity, with which he heartily agreed. If they did not obtain business where there were profits to be got, progress would be delayed. He also referred to the strong competition in the industrial field from gas, and unless this was met with attractive rates we should not get more industrial consumers. The weakest part of the paper was that on standardisation, as the author failed to make any definite recommendation. The time was not ripe for standardisation, as it would not help progressive undertakings, though, on the other hand, it might speed up the backward ones.

Mr. E. J. JENNINGS, replying to the discussion, was deeply appreciative of the remarks of the speakers, but believed there had been too little criticism. Mr. Christie's attitude was one to get away from. He hoped to deal with the various points raised during the discussion, in the Association's proceedings.

Mr. NICHOLS-MOORE then announced the Council's decision to reprint the paper together with a full discussion for circulation to all committee members.

Mr. FRANK HODGES (Central Electricity Board) proposed a vote of thanks. Ald. G. WHITFIELD seconded, and said the paper was eminently understandable by committee members, being full of matter of interest to engineers as well.

Mr. Jennings briefly acknowledged. The President announced that no official photograph would be taken.

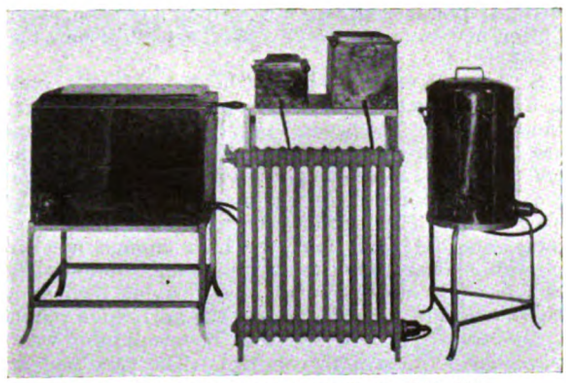
THE I.M.E.A. EXHIBITION.

First of our Brief Reviews of the Exhibits at Old Torbay Hospital—Comprehensive Display of Domestic Equipment—Wide Selection of Water Heaters.

THE I.M.E.A. Exhibition, being held in the Old Torbay Hospital, is again a popular feature of the Convention, including as it does many new power and domestic equipments, of interest to both engineers and others attending at Torquay. We commence below a brief description of the exhibits, and, since it is not possible to deal adequately with the exhibition in one issue, further space will be devoted to the subject next week.

The E.L.M.A. Lighting Service Bureau are responsible for three exhibits. The first consists of a series of display



A selection of apparatus shown by George Nobbs Ltd.

panels illustrating lighting effects for shop windows, showing the panels arranged to feature modern lamps; two panels demonstrating shop lighting; two panels illustrating home lighting; one panel demonstrating school lighting; and one panel illustrating industrial lighting. It is the intention of the Bureau to loan these panels free of charge in sets of four to supply authorities for periods of two or three weeks. The second display consists of a luminous sign situated on the front of the exhibition building reading "I.M.E.A. Exhibition." This sign has been specially built with a new form of letter which has great possibilities for shop fascia purposes and for all short-range sign lighting work. The third exhibit is devoted to special features in a room on the ground floor. The room is lighted by a large central fitting of modern construction conforming to the latest standards of architectural lighting, while supplementary lighting novelty is provided by two luminous columns installed at each side of the entrance doorway. Other interesting lighting features in this room are the lighted ornament display panel and the glareless lamp display cabinet.

The exhibit of the Electrical Development Association illustrates, by examples, the various services to members which the Association is able to render, while cinematograph film displays, special literature, examples of layouts and copy for electricity supply local advertising, window displays, including an entirely new design which the association hopes to produce in the coming autumn exhibition of posters, a collection of reports dealing with special subjects which have been prepared by E.D.A. Sub-Committees, on industrial electric heating, electric furnaces, rivet heating by electricity, electrical refrigeration, rural applications, hire and hire purchase and deferred payment schemes, etc., are also featured.

The Electrical Association for Women is also represented, the stand being devoted to the display of literature, explaining the objects and aims of the association.

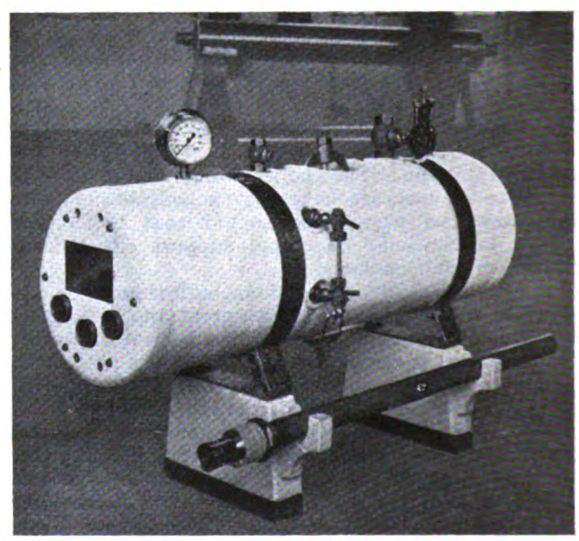
The REVO ELECTRIC CO., LTD., Britannia Works, Tividale, Tipton, is displaying a comprehensive range of electric cookers in standard and *de luxe* finishes, incorporating circular boiling plates, spring loaded drop doors to hot cupboard, improved door catches, improved and simplified switch boxes, larger ovens, etc. The "Superspeed" boiling plate, which was first introduced at Bath last year, is again exhibited. A further item of interest is a small patented device whereby the low loading of any boiling plate may be still further reduced to meet various culinary needs. This apparatus takes the form of a small subsidiary resistance mounted in conjunction with a tumbler switch, and can be adapted to existing cookers. Other exhibits are water heaters, automatic kettles, etc., together with a sample of the "Maisonette" cooker which is being supplied to Leicester Corporation.

In addition to a new design of Berry-McClary cooker, and new models of "Magicoal" fires, BERRY'S ELECTRIC (1928), LTD., 85-87, Newman Street, London, W.1, are exhibiting a domestic water heater of the storage tank type. The interior is built up from a unit system enabling the heating element and thermostat to be withdrawn without emptying the water from the container, and when necessary the whole of the internal gear can be removed for cleaning purposes, without interfering with the outer case. The heating element is of robust construction, with a single spiral wire, not coiled. The thermostat can be used on d.c. or a.c. In conjunction with the heating element there is a special circulating device which keeps the inner container more or less at equal temperature throughout, ensuring the full capacity of hot water.

BULPITT AND SONS, LTD., of Birmingham, are showing electric kettles fitted with a safety device which provides for the throwing off of the connector as the result of the softening of a low melting alloy. When the kettle has cooled it is only necessary to push on the connector again and this action resets the device. A range of immersion heaters for fixing into hot water tanks is shown for the first time, while a 15-gallon thermal storage tank having an external thermostat is another exhibit.

The INTERNATIONAL COMBUSTION CO., LTD., Africa House, Kingsway, London, W.C.2, includes amongst the many exhibits shown a model of the Barking power station of the County of London E.S. Co.

J. H. TUCKER AND CO., LTD., Kings Road, Tyseley, Birmingham, have a complete range of control units for electric cookers, water heaters, etc. These units are self-contained, and provide for a pilot light either enclosed in the case itself or showing through a bullseye lens, or for a lamp projecting through the lid which in the case of consumers on a flat rate



An electric steam raiser by A. Reyrolle and Co., Ltd.

can be used as a lighting medium, or for taking off any small apparatus such as toasters, etc. A sub-circuit is provided in the form of a socket point (either 2 or 3-pin in 5 or 15 A capacities), such sub-circuit being suitably protected by fuses inside the case. In one model this sub-circuit is controlled by an independent tumbler switch. Another model of the Cooker Control Unit is a competitive open type, specially designed for use with "baby" cookers. Included in the appliances for the control of heating circuits is the new 15 A. d.p. interlocked switchplugs. Other lines of interest include insulated lampholders in moulded bakelite, with automatic cord grips; types of sockets and plugs in 2, 5, and 15 A. capacities; tumbler switches in insulated telacite, in white, brown and black; sunk switches; metal clad lampholders and switch lampholders; ironclad switch and fuse gear generally. A new product is an ironclad fuseboard, consisting of totally enclosed units mounted on rustproof detachable battens. The case is fitted top and bottom with malleable detachable ends, which can be removed for drilling even after the board has been erected. Similar fuseboards are also available with teak boxes.

Digitized by Google

A feature of the stand of the GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, London, W.C.2, is a background to couple up central station operation with two supporting panels indicating the potential demand for current supply arising from the use of "Magnet" appliances. The breakfast cooker shown has a separate boiling plate, grill and oven elements, independently controlled by 3-heat reciprocating switches. The "Magnet" automatic cut-out safety kettle, a range of "Magnet" fires in special finishes, a new type of wash boiler, are among other items to be exhibited.

The latter operates on the thermo-syphon principle, and is mounted on three legs. The outer casing is of galvanised iron, and the container is of tinned copper. The boiler is fitted with a galvanised iron lid, which when reversed serves the purpose of a table. The elements are of the strip type each enclosed in a protecting copper sheath clamped to the bottom of the container. Control is effected by means of a 20 A 3 heat reciprocating type rotary switch mounted in a cast metal box with enamelled cover, which is connected to the wash boiler by a 4 ft. length of 4 core C.T.S. cable. This control box, as well as the boiler, is fitted with earthing terminals.

Another exhibit is a new type of electric storage heater, made in sizes from two gallons upwards and arranged for floor or shelf mounting. It is double-cased and has three inches of lagging between the outer and inner containers. The inner compartment is of steel or copper and is tested to withstand a pressure of 25 lb. per square inch. The heater, which is suitable for all voltages 200 upwards, is equipped with a thermostat of quick make and break bi-metal type, which can carry up to 5 A a.c. For d.c. and more than 5 A a.c. a relay switch must be added. The standard "Magnet" withdrawable type immersion heater is fitted. Still another new item shown is the "Minor" cooker fitted with oven, grill and hotplate, the respective loadings being 800, 1 500 and 1 200 W.

The JACKSON ELECTRIC STOVE CO., LTD., 143, Sloane Street, London, S.W.1, is showing a range of the No. 50 series cooking cabinets in "Marblon" all-enamelled finish, also series No. 50 J —the Jackson Junior Cooker, a small model being supplied to supply authorities for hire and hire-purchase purposes. The No. 51 cooker, which is similar to the No. 50 J. model, but has self-contained boiling plate in addition to a grill-boiler, is also exhibited. The No. 48 new table cabinet, built on the lines of the No. 46 model, but fitted with larger oven and additional boiling plate capacity, forms another item. A range of fires finished in the new Chinese finishes is to be seen on the stand and the makers believe themselves to be correct in claiming that it is the first time this particular finish has been applied to electric fires. A new wash boiler similar to the No. 154 model is also included.

SANTON, LTD., Dock Street, Newport, Mon., is exhibiting circulating immersion heaters, electric geysers, and electric tank belts. With regard to the circulator, this consists of a copper tube, of any required length, and two inches in diameter. This has a double shell, providing an air lagging between the cold water in the tank and the hot water passing through the circulator. The element tubes are fixed down the centre of this outer tube. The elements are nickel chrome wire, wound in porcelain tubes and encased in a metal sleeve. They are inserted into the circulator from the top, and can be withdrawn and replaced without interfering with the water in the tank, and are maintained at a dull red heat.

The latest addition to the range of products offered by METRO-VICK SUPPLIES, LTD., Trafford Park, Manchester, is a new electric iron-de-luxe. This is an improvement on all previous models, available in either nickel plate or blue vitreous enamel. A pressed steel table stand is supplied, the rating is 550 W and the weight 5½ lb. An improvement has been effected in the method of securing the flexible to the connector. A special cable clamp is fitted which takes all the pull off the actual connection and the risk of breakage of the flexible at this point is eliminated. The iron can also be supplied fitted with a new type earthing connector and 3-core asbestos braided flexible. The recently introduced self-regulating kettle and the well-known automatic kettle, both of which have already been described in detail, are also shown. Demonstrations are being given with the "Gyratory" washing machine, and the Model "A" wash boiler, while storage water heaters and various types of immersion heaters are also included in the exhibit.

The new Bakelite lampholders and ceiling roses recently placed on the market are worthy of inspection, and samples of these accessories are available for testing purposes. For the illumination of the stand several fittings of modern design have been installed, including panel type electroliers and brackets fitted with "Gilbert-Riley" glassware.

GEORGE NOBBS, LTD., 87/89, Cleveland Street, London, W.1, are making a special exhibit of automatic temperature controls for electric water-heaters, ovens, refrigerators, including the new type "M.B.R." room temperature control. The latter is suitable for low temperature convectors, heating panels, electric hot water radiators, tubular heaters, etc., though it is, of course, not recommended for luminous radiators, such as electric fires. The instrument is fitted with an adjustable temperature dial for normal conditions for 50/70 deg. types, types are also made for garages or private lock-ups. Electric heater tubes with current loadings for 25/70 W per ft. run are shown, while hot water calorifiers in 7 standard sizes from 5 to 50-gals. capacity are also exhibited.

The stand of MARCO REFRIGERATORS, LTD., Manor Works, Streatham Vale, London, S.W.16, are exhibiting a complete range of refrigerators for domestic and commercial purposes in various finishes.

The DOWSING RADIANT HEAT CO., LTD., Electrical Works, Bollo Lane, London, W.3, include on their stand at the exhibition a number of specialities. Amongst these may be mentioned the cordless electric ironing system together with irons, the "Solarium" luminous ray bath, and a new form of protective device for water vessels.

A wide selection of domestic equipment is to be seen on the stand of the MANOR ELECTRIC OVEN AND FIRE CO., of 303, High Road, Chiswick, including four types of cookers, water heaters, breakfast cookers, table heaters, three and six-bar fires, washer boilers (including one as supplied to Willesden Corporation), and three varieties of bowl fire.

(*To be continued.*)

MORE ELECTRICAL WOMEN AT TORQUAY.

Members of the Electrical Association for Women, showing Mrs. Nichols Moore, Mrs. J. Taylor, Mrs. Chattock, Mrs. Beale (Birmingham), Mrs Vignoles, Mrs. Purse, and Mrs. Morley New.

DESIGN AND CONSTRUCTION OF LARGE TURBO-GENERATORS.

Prospects of the 250 000 kW Set—Some Special Considerations—Aluminium for Rotor Windings—Replacing Air as Cooling Medium—Suggested Designs.

By W. SHARP, A.M.I.Mech.E., A.M.I.E.E.

IN accordance with the Electricity (Supply) Act, 1926, we are to have concentration of generation throughout the country in a few " selected " power stations. It is, of course, recognised that some time will elapse before this change can be made, particularly in districts where the frequency of supply is non-standard.

In Great Britain at the present time there are some 570 generating stations, the total plant installed being over 8 000 000 kW. It is probable that we shall ultimately depend only upon 100 power stations, and it follows that the areas concerned will be required to generate a much larger output.

These statements obviously create an atmosphere for thought, and provoke consideration of methods for the manufacture of much larger units in this country.

Larger Units Required.

If we consider the remarkable improvements in the electrical performance and the mechanical design of turbo-generators, coupled with the enormous demand for electricity supply, we shall not be surprised to find that larger units are urgently required. Machines with an output under 10 000 kW are practically obsolete. The order of to-day is between 20 000 and 50 000 kW, and it is comparatively safe to prophesy that the output of turbo-generators in the near future will be between 100 000 and 200 000 kW, and even 250 000 kW. These machines will be designed and manufactured as single unit generators.

To the average engineer no doubt a 250 000 kW turbo-generator sounds ridiculous, but let us consider some single unit machines of recent manufacture. For example, 40 000 kW at 1 500 r.p.m. for Barton power station, 75 000 kW at 1 800 r.p.m., and 85 000 kW at 1 200 r.p.m. for Hell Gate power station, and, of special interest, 160 000 kW at 1 500 r.p.m. for the East River power station, New York. It should, however, be stated that the generator of this last machine has two separate stator windings in alternate slots, each having a capacity of 80 000 kW.

While it may be admitted that in this country 100 000 kW in one unit will prove sufficient, yet there is no reason why we should confine our design and construction to manufacture for the home market. From the point of view of design these machines will require to receive special consideration, because much more progress will have to be made before such turbo-generators can be manufactured. The rotor winding for example, may be made of aluminium instead of copper, the insulation for the coils will have to receive more careful attention, and the cooling medium (air) may be replaced by either hydrogen* or some inert gas.

The sub-joined data may not cover such fostered ideas, but is simply given for example purposes, with the following conditions :—

Unity P.F. three-phase, 50 cycles, and 1 500 r.p.m.

K.W. ..	100 000	150 000	200 000	250 000
Volts ..	22 000	22 000	22 000	22 000
Amps. ..	2 625	3 940	5 250	6 560
D_a ..	180	180	180	180
A.S. ..	560	625	670	700
Z. ..	120	90	72	60
Φ_a ..	30×10^7	40×10^7	50×10^7	60×10^7
B_g ..	7 600	7 600	7 600	8 000
L_c ..	430	580	720	820
Rotor Weight (tons)	95	120	145	160
Bearings (dxl)	26 in. x 36 in.	30 in. x 42 in.	32 in. x 46 in.	32 in. x 46 in.
Shaft deflection	0.007 in.	0.009 in.	0.013 in.	0.028 in.

The voltage of 22 000 is proposed as an additional standard to those given in B.E.S.A. No. 77–1925. There are, however, h.p. transmission lines of 20 000 V at present in existence on the north-east coast.

The diameter of the stator bore D_a appears to be high but we have already built machines at 3 000 r.p.m. with a surface speed of 440 ft. per sec.

Some designers may prefer to limit A.S. to 630, and even make B_g 9 000. There may also be a difference of opinion as to sizes of the bearings, as can be observed in the following examples of two-30 000 kW sets at 3 000 r.p.m.

Bearings (dxl)	11 in. x 16 in.	13½ in. x 16 in.
Pressure (lb. per sq. in.) .	120	104
Velocity (ft. per min.) ..	8 560	10 600

It may be of interest, however, to note that, even in the case of ring oiled bearings, a pressure of 120 lb. per sq. in is not unknown, so that in the second example it is probable that trouble was expected with the deflection, and a stiffer shaft was found to be necessary.

The same remark can be applied to our designs where it is advisable to utilise large journals in order to get shafts with the strongest possible sections. It may be stated that there are limits, even in this direction, particularly when the critical speed upsets our determinations.

There are several types of stator windings which may be used in machines of this description :—

Chain or concentric winding (Fig. 1).
Diamond, i.e., two layer lap winding (Fig. 2).
Butterfly or single layer lap with involute ends (Fig. 3).

The chief advantage of the chain winding is that a single bar or conductor may be readily removed from the core in case of breakdown. The windings may be easily clamped and braced together to withstand short-circuit stresses.

A strong objection to this type of winding, however, is that it creates large eddy current losses in the stator clamp plates and end guards, due to the grouping of conductors belonging to the same phase. So serious are these losses that in order to reduce them it has been found necessary to fit bonding strips across each joint in the guard, and also between the guard and the stator frame.

In the case of the diamond winding quite a number of points can be put forward in its favour.

Open slots are invariably used, but the tooth ripple can be easily suppressed by judicious slotting of the rotor. It may be stated, further, that actual tests show the eddy current losses and short-circuit stray losses to be comparatively small, provided the correct end arrangement and chording factors are used.

Bonding strips are not necessary, owing to the fact that only the nose of each coil faces the guard, thus resulting in a much better distribution of flux, and consequently smaller losses.

Another factor in favour of this type of winding is that it lends itself to efficient cooling, as every coil is open to the ventilating air ; hence, in comparison with the chain winding, the coils are much cooler, and it becomes possible to increase the electrical loading of the machine.

The diamond winding with dropped-in coils has, in a measure, a disadvantage in the withdrawal of a coil—when this is necessary—because most of the winding must be disturbed to withdraw the damaged portion.

The butterfly or concentric type of winding embraces most of the advantages of the first arrangement, and some of the second, but is used more particularly for machines with very high current and low voltage.

Comparing this winding with the second arrangement, it will be seen that it is much easier to bend the copper, especially when very heavy strips are required. The design, however, is not capable of high loading, and for this reason is never used when a two layer lap winding can be adopted.

Rotor Shaft Design.

It now becomes necessary to consider the mechanical design of the rotor shaft, and also the rings which support the windings. It will be agreed that any slotting of the rotor shaft is detrimental to its strength and stiffness. Recent experience has shown that after machining a number of equally distributed ventilation slots in a particular rotor the core was out-of-truth with the horizontal centre line to the extent of 3 mm. Further experience emphasises the fact that all shafts bend after being subjected to the machining of deep radial slots. Later machines have been designed with only 4 or 5 radial slots at

These drawings illustrate the accompanying article by Mr. W. Sharp. They show various types of stator winding for use in large turbo-generators and rotor shafts and indicate methods of dealing with the problem of relative movement between support ring and rotor core. Detailed reference to the figures is made on pages 690 and 692.

Digitized by Google

each end of the core, with the result that previous trouble has been practically eliminated.

This procedure has also shown that the slotting of the central portion of the rotor for purposes of ventilation is not absolutely necessary, and consequently we are able to produce a much stronger shaft with an increased factor of safety. Slotting, other than that required for the rotor coils, is probably not essential, and subsequent experience might further modify present day design.

The rotor construction for machines of this type—100 000 kW to 250 000 kW—decides itself. Ingots above 170 tons have not yet been successfully cast in this country, and consequently (due in each case to the weight of the finished rotor) it is obvious that the shaft will have to be constructed in three parts. (Fig. 4).

In connection with the support rings various reasons have been given* why pieces have broken off as shown at (*a*) Fig. 5, and at (*b*) Fig. 6, i.e., where the support ring engages in the rotor core. The generally accepted reason is that owing to the deflection of the shaft (see Fig. 7) the support ring will be closed at (*c*) and open at (*d*) at any particular instant while the machine is running. This movement takes place at every point of the rim with each revolution of the shaft, and at a normal speed of 3 000 r.p.m. there are 180 000 movements per hour. As a result of this, it follows that fatigue of the metal can certainly be expected where the support ring is registered with the rotor core. Trouble of this nature demands immediate attention, and to prevent subsequent breakdown two distinct methods (Figs. 8 and 9) are in use. In each case the support ring is allowed to move in unison with the rotor core and probably each design solves the problem of relative movement between ring and core.

In the case of machines with a speed of 1 500 r.p.m. it is maintained that such a phenomenon operates only in a minor degree, and in our particular designs the relative movement will be negligible.

A suggested design is shown (Fig. 10) where provision is made for the fan plate—which is shrunk on—to sit upon a substantial surface. The support ring should be carefully machined with large radii, and clearance provided for each register, so that the ring will be free, if necessary, to adjust itself.

Other factors common to present-day practice will require to be reviewed to meet the more exacting conditions demanded with such large units. Further, from the manufacturing point of view, much larger workshops and plant will be required, and it is incumbent on British engineering works to provide the necessary accommodation.

THE BOILING PLATE OF TO-DAY.

The Present Position and the Probable Future Trend of Design—Reliability of the Modern Cement-filled Type—The Transformer-operated Plate.

By STANLEY F. BICKELL A.M.I.E.E.

THE rapidly growing popularity of electricity as a cooking medium prompts one to review the progress made to date in the development of electric boiling plates. So much criticism has been levied at this portion of electric cookers in the past, and so much of it has been justifiable, that it is interesting to note just where we stand in the matter of design to-day.

A striking feature of the display, staged for the I.M.E.A. Convention at Torquay, is the preponderance of enclosed type plates over the frailer open type. Having regard to all the advantages and disadvantages of each type, it is obvious that manufacturers, meeting the demands of supply engineers, have finally decided that reliability comes first, and to this end they have standardised on the enclosed pattern.

For fifteen years the two types have alternatively held the stage, each in turn being improved. Unfortunately for the trade itself, the only criterion by which a boiling plate can be judged is a protracted test over a period of time, and manufacturers, urged by the desperate need of supplying more reliable plates, have foisted on the consumer their latest idea. Instead, therefore, of the plates being thoroughly tested out in the laboratory, they have been rushed into the market and the consumer has been forced to bear the inconvenience of the experiment; the supply authority the expense. This method has had the only result to be expected, namely a general poor opinion of electric boiling plates as a whole, and this opinion is only now gradually being overcome by a universal retrenchment behind the reliability of the correctly designed enclosed boiling plate.

Temperature Limitations.

In considering the type of plate that has provided this relief from constant failures it is necessary to realise that the governing factor in boiling plate design is the maximum permissible working temperature of the resistor itself. Until some alternative medium to chrome-nickel alloy is found this temperature must remain in the neighbourhood of 1 000 to 1 050 deg. In order to ensure that this temperature is never exceeded, the design must be such that under no normal conditions can the energy input to the plate exceed the energy output. This rule limits the loading per sq. in. of dissipating surface to a definite amount, depending on the type of plate. For totally enclosed cement-filled plates this figure must not exceed 33 W per sq. in., if reliability is required, and any attempt to increase this figure can only result in the premature failure of the resistor.

Ordinary open-type plates, dissipating their energy by radiation, some convection, and slight conduction, may operate at a somewhat higher loading per sq. in., but in view of their fragile nature and high maintenance cost we can ignore them.

It has been proved empirically that at 33 W per sq. in., a cement-filled, enclosed-type boiling plate has an extremely long life, providing that the resistor and its cement covering form a homogeneous mass by virtue of a similarity of expansion coefficients, and their union made under suitable pressure, etc. These requirements ensure freedom from frictional movement between the two constituent parts, and limit the access of air to the metal resistor, thereby retarding oxidation.

While this surface density is not exceeded, and perfect and continuous contact is ensured between the wire and its cement dielectric, there is no reasonable limit to the life of the plate, though manufacturers state a guarantee period of two years. It is beyond question that on the score of reliability the present enclosed cement-filled plate meets the most exacting requirements, and cannot be further improved in this respect.

Freedom from Failure.

One large firm of cooker manufacturers who standardised on this type of plate three years ago, and who now have many thousands in commission, find that on a three years' basis the failures, from all causes, have amounted to less than 1% of the total number of plates in service. This is a tremendous and commendable step forward from the time when boiling plate failures alone sometimes accounted for as much as 25s. maintenance cost per plate per annum, and is surely sufficient answer to the critics of present day boiling plate reliability.

This desirable end having been attained, supply engineers and public alike are pressing for quicker boiling. The electric kettle, most efficient and rapid where water is concerned, cannot meet the needs where a half pint of milk or a boiled egg are required quickly, and the unfortunate designer is faced with the problem of satisfying the demand without increasing the loading per sq. in. on the plate beyond the safe limit.

Alternative solutions are to find a substitute for chrome-nickel alloy resistors (far easier suggested than done) that will operate safely at a temperature of about 1 400 deg. C.; or to reduce the mass that requires preheating. Danger of distortion under heat, and consequent failure lie ahead in the second case. The mass of the plate has been reduced already to a minimum consistent with safety, and any further thinning of the cast top plate must be accompanied by a strengthening of the metal's resistance to distortion, the selection of suitable metals being limited by their cost. In passing it is of interest to remember that circular plates, owing to their even expansion and contraction under heat, permit of the use of a thinner top plate than the square or rectangular pattern, and they therefore boil quicker with the same degree of reliability.

A plate that approaches this problem from an entirely new

* "Journal I.E.E." 1923, Vol 61, p. 453. "Journal I.E.E." 1929, "Recent Developments in Turbo-generators," by J. A. Kuyser.

Digitized by Google

angle is the Revo " Superspeed " boiling plate which is transformer operated, and it would appear likely that future development will follow in this direction. To overcome the chief failing of the open type plate, viz., its proneness to break down due to damage of the comparatively fragile resistor, a low voltage, high amperage plate is adopted employing a robust resistor of about 0·2 in. dia. A transformer, double wound, naturally forms an indispensable adjunct to the device, stepping down from the line voltage to something in the order of 10 V on the secondary. The result is a boiling plate having a small mass to be preheated, showing a desirable red-hot appearance, and a robust resistor that can be operated at a density of 125 W per sq. in. of plate surface, and in close proximity to the base of the utensil. The heavy section of the wire prevents local hot spots developing by readily conducting the excess of heat from the particular point and dissipating it in the adjacent wire. At the same time an operating temperature of 1 000 deg. C. is maintained when the plate is covered by a utensil, so that oxidation after the primary coat has formed takes place extremely slowly. These attributes, coupled with the low potential of the plate, rule out all possibility of open, short or earth circuits developing in normal usage.

Test Figures.

Test figures obtained from this plate are given in Table 1 reproduced in the next column.

It should be borne in mind when comparing electric boiling with gas, that a gas ring after one month's use loses 25 % of its pristine output unless regularly and carefully cleaned, whereas an electric boiling plate retains its original efficiency throughout its life.

The greatest drawback to the enclosed type of boiling plate is the need for suitable utensils. Where transference of heat depends on conduction, machined flat bases are required if the utensils are to function efficiently, and a dead flat base is not easily acquired, without unduly increasing the weight of the utensil. At the same time, when a dead flat plate and utensil are brought together, it requires only a small amount of foreign matter between the faces seriously to retard the speed of boiling, and in ordinary kitchen usage this frequently happens. One of the attributes of open type plates, and particularly the " Superspeed " pattern, is the fact that no special utensils are required ; in fact, the best results are obtained when employing a sixpenny tin saucepan or kettle, the base of which may even be in a distorted condition.

The one outstanding disadvantage of the " Superspeed " plate is its inseparable adjunct, the transformer, and it is this which necessitates the comparatively high prime cost. Since the copper and iron used in its construction cannot be reduced beyond a certain safe limit, and whilst the present market price of these commodities is maintained, no reduction in this initial cost can be expected.

Against this first cost, however, we must weigh the freedom from subsequent trouble and expense due to failure ; the extremely rapid and efficient boiling of small quantities ; the red glow so much approved by the housewife and an incentive to economical use ; and the absence of the need for special utensils. A further advantage is the provision of low simmering heat in the neighbourhood of 300 W, which is obtained by tapping the primary of the transformer, and which can therefore be arranged to give any predetermined loading to suit local requirements. This question of simmering heat is one which will most certainly come to the front in the near future. For rapid boiling an enclosed-type plate requires a loading of some 1 600 to 1 800 W, and as they are at present constituted low heat is fixed at ¼ of full load, which is 400 or 450 W respectively. This is found in practice to be too high for many culinary requirements, 200 W being far more advantageous.

TABLE I.

COMPARATIVE TESTS ON BOILING PLATES, USING 5 IN. DIA. PRESSED ALUMINIUM SAUCEPAN OF STANDARD TYPE.

			½-Pint.			1-Pint.			
Type of Plate.	Loading.	Temp. Rise.	Time. min.sec.	Consumption.	Efficiency.	Time. min. sec.	Consumption.	Efficiency.
Enclosed cement-filled	1 600W	158° F.	6 50	182 W	16·1%	8 45	233 W	24·9%
Gas ring	15cu.ft./h N.T.P.	158° F.	2 52	0·717c.u. ft.	26%	4 48	1·203 cu. ft.	34·5%
" Superspeed "	2 000 W	156° F.	2 48	84 W	34·4%	4 05	136 W	47·4%

It might be argued that the obvious solution is the provision of a 1 800 W plate for rapid boiling and a 1 000 W or less for simmering, etc. This, however, is an inefficient arrangement, if one plate can suffice, since it may necessitate the heating up of both plates to complete one cooking operation. Difficulties present themselves when we attempt to introduce elements of different loadings into one boiling plate, and the best attempt at a solution so far is a subsidiary resistance mounted with a switch to form a unit which may be easily adapted to existing plates.

A patented device of this nature is now obtainable, and we may therefore look forward to further developments on these lines.

In generally surveying the position it would appear that the enclosed-type plate has definitely established itself on the score of reliability, and that extra rapid boiling will be obtained by means of low voltage transformer-operated plates ; and it is probable that a combination of these two plates in a single cooker will prove popular in the future.

SWITCHGEAR DEVELOPMENTS.

Finding a Substitute for Oil—Methods of Investigation Criticised—Making Use of the Arc—Trouble Mainly Due to Gas—Importance of Mechanical Construction.

By CHARLES C. GARRARD, Ph.D., M.I.E.E., A.Am.I.E.E.

THE very considerable proportion that the cost of the switch and controlling gear bears to the total capital charge of present day power plant may justify a short discussion of recent progress in that branch of electrical engineering.

While it is unreasonable to classify expenditure under that heading as unremunerative, in that such apparatus does not directly take part in the generation of current like a turbo-alternator, nevertheless it is clear that the tendency for the ratio of cost of switchgear to total cost to increase with the extension of plant installed requires careful watching, especially to make sure that unnecessary expense is not incurred due, for example, to following precedent rather than thinking things out afresh.

Needless to say with matters as they are at present, it would be bad economy to instal inadequate plant of the character in question. But all such expenditure must be thoroughly scrutinised to make sure it is necessary, and that it has not been specified again because it has been called for in the past.

The Oil Circuit Breaker.

Some years ago the present writer had to explain to a jury the construction of an oil circuit breaker, and found it rather difficult to persuade that body of laymen that to produce the highest known artificial heat within a mass of highly inflammable material, such as oil, was a reasonable thing to do; and at the present moment we are still doing it and shall probably so continue for several years to come.

There can be no doubt that the efforts which inventors are now making to get away from oil as a constitutent of a circuit breaker will eventually lead to success, and thereby ensure a much greater safety than we have to-day. It is very open to doubt, however, whether the method of approach to the problem of the oil circuit breaker adopted by many investigators is correct. It is sought by these researchers to establish the arc energy as a criterion of operation of the circuit breaker.

Arc Energy Variation.

Unfortunately it is found that the arc energy varies tremendously, apparently without any very good reason, and we have it on high mathematical authority that, in accordance with the principle of probability, that the number of tests necessary, to make sure that one has hit the worst possible case, is so large, that practical rating tests become almost impossible.

Now, as has been pointed out recently by the mathematical physicists, the difficulty of finding the location of the electron within the atom is probably due to the fact that such a true location does not exist, so the difficulty of identifying arc energy with the rating of an oil circuit breaker is probably because the two have little or nothing to do with each other. The energy of the lighted match which explodes a room full of gas is small; yet the consequences are very serious. So it is with the oil circuit breaker. As made by reputable manufacturers, however, it is to-day a highly efficient apparatus. It very rarely gives trouble but when it does, generally it is due to a gas explosion. The oil becomes vaporised and is ignited and explodes, and this may be when the circuit is by no means overloaded. Bad contact is the origin of a large proportion of such cases. Therefore a good simple mechanical

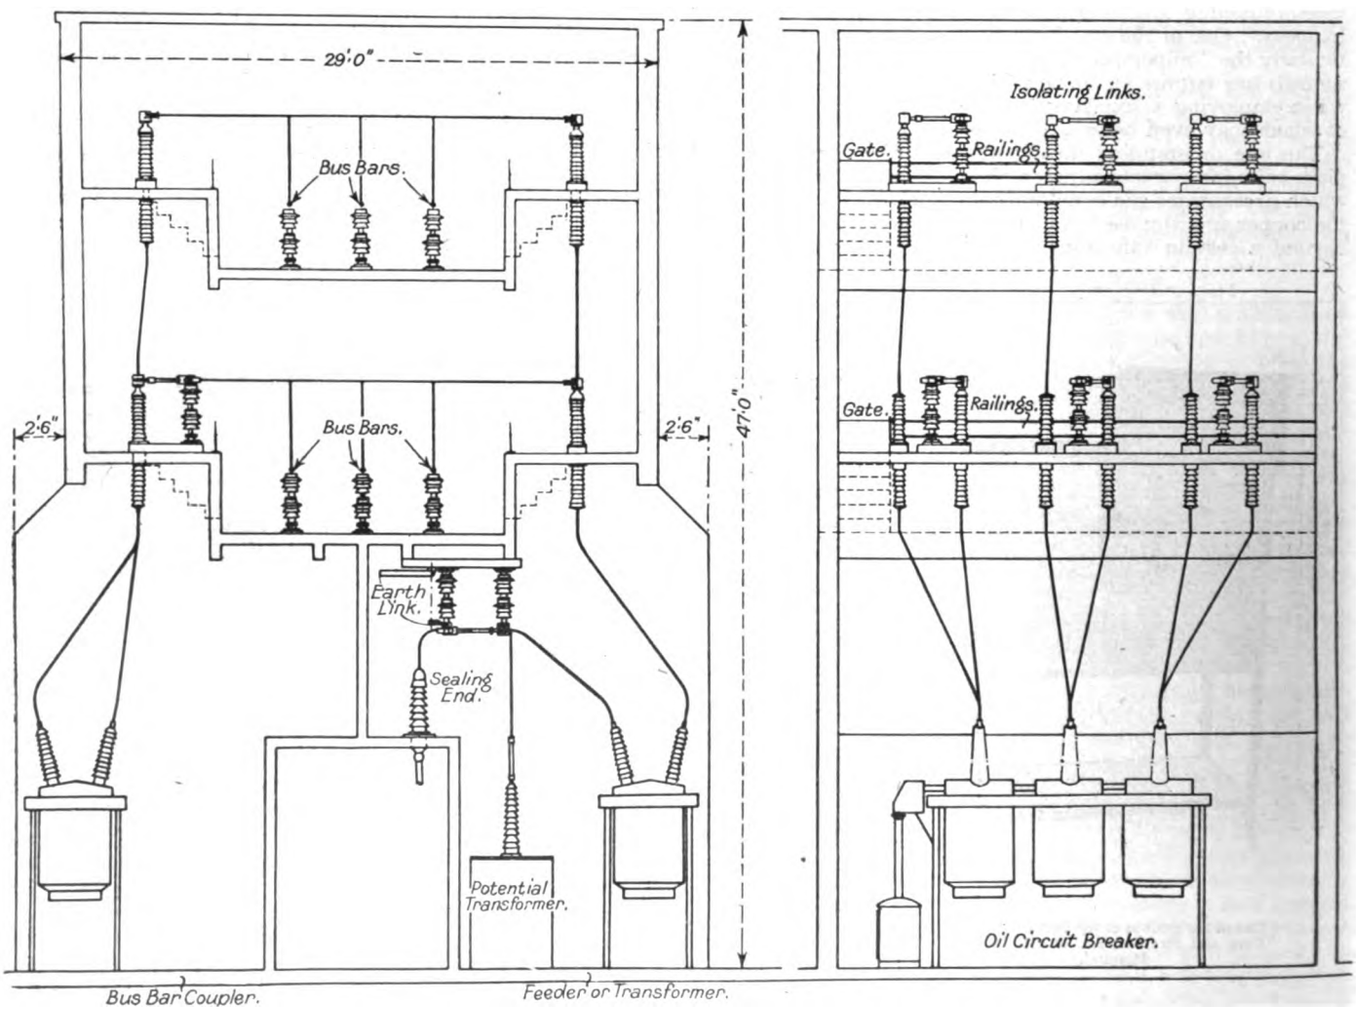

Fig. 1.—Indoor-outdoor switchgear for 66 000 volts.

Digitized by Google

construction is the chief consideration. It also follows from this that oil switches which have to carry large currents are likely to be more difficult to design and maintain than those for high voltages. This is actually the truth.

The difficulty of dealing with large currents is particularly emphasised with metal-clad compound-filled gear. The compound hinders the dissipation of heat, and consequently current densities have to be very much lower with compound-filled gear than with the cubicle type. It would appear that 4 000 A at 50 periods is about the largest current that can be used with compound-filled gear unless the cost be increased altogether out of proportion.

Fig. 2 illustrates a design of compound-filled gear for a current of 4 000 A. Naturally non-magnetic material must be used for the enclosures, and it is found that modern silicon-aluminium alloys are excellent for this purpose. These have great mechanical strength combined with ductility, and are unaffected, beyond of course being melted, when subjected to the action of an electric arc. While in practice, naturally, such an eventuality as arcing to the metallic enclosure would only occur in case of accident, nevertheless the use of a metal which would ignite under such circumstances is undesirable. Some aluminium alloys suffer from this disadvantage but the silicon alloys in question are quite satisfactory in this respect.

In order to keep down the heating due to the passage of the alternating current through the connections, it is necessary that the same should be properly shaped and correctly disposed relatively to each other. There are two phenomena which are present with alternating current which cause the heating to vary from that which takes place due to the passage of an equal direct current. These are the eddy current, or skin effect, and the proximity effect. Rectangular strip busbars are unsatisfactory in this respect. The best result is obtained by the use of tubular busbars, and with the three phases arranged at the corners of an equilateral triangle. It will be seen that the design in Fig. 2 is in accordance with these remarks.

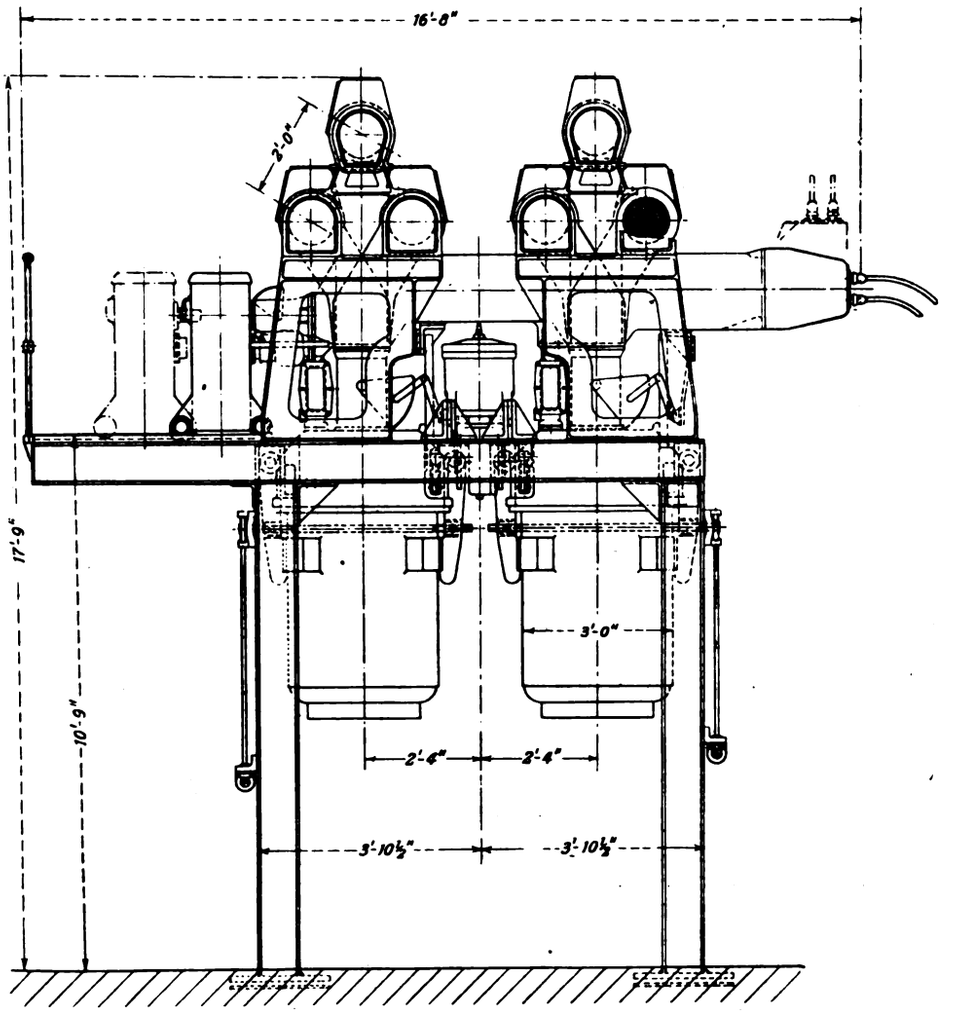

Fig. 2.—A design of compound-filled switchgear for 4 000 A at 33 000 V.

Fig. 3.—Illustrating the "sunk" type of switchgear house.

The Central Electricity Board has made the decision to use exclusively outdoor type-gear for its 132 000 V stations. The results in practice of this decision, under the atmospheric conditions of this country, are awaited with considerable interest.

Generally speaking, the locations of the Board's 132 000 V stations facilitate the use of open type apparatus. This is not the case however with situations within densely populated areas. It has been suggested to apply the metal clad principle for such cases for voltages of 66 000. The size of 66 000 V switches is, however, so large that the clearances to earth and the distance between phases are such that it is difficult to justify the metallic enclosure of the connections. Naturally such a design is quite possible, but the cost would be large.

Probably the best arrangement is the indoor-outdoor type illustrated diagrammatically in Fig. 1. The apparatus itself is similar to that used for outdoor stations but is to a great extent protected from the weather by a building. The oil circuit-breakers themselves are half exposed to the outside. Such a design is somewhat similar to that used largely on the continent for 110 000 V stations. (The Golpa Power House is an example.)

During the last few years an interesting development of this type, due to Brown Boveri, has made considerable headway. This is known as the "sunk" type. The particular point is the arrangement of the oil circuit breaker. The top of this is made very strong, much stronger relatively than the tank. The latter is sunk below the switch house floor into a fireproof chamber, which communicates with the outside atmosphere. The theory underlying this construction is that under certain circumstances it is impossible to prevent the tanks of the oil circuit breakers blowing off. Therefore the design, as described, has been adopted which allows such an accident to take place without damage to the rest of the switch house. It is claimed by the originators that practical experience has thoroughly justified the theory.

Fig. 3, in the previous column, illustrates the "sunk" type of construction.

Digitized by Google

Fortunately the idea formerly prevalent that the efficiency of an electric contact varied inversely as the current density of the surfaces in contact is nowadays quickly dying out. Considerable progress has been made recently in the application of line contacts to many kinds of switchgear. Such contacts have been used in oil switches, contactors and drum controllers for many years; but in the case of air break circuit breakers brush contacts have been, up to the present, practically universal.

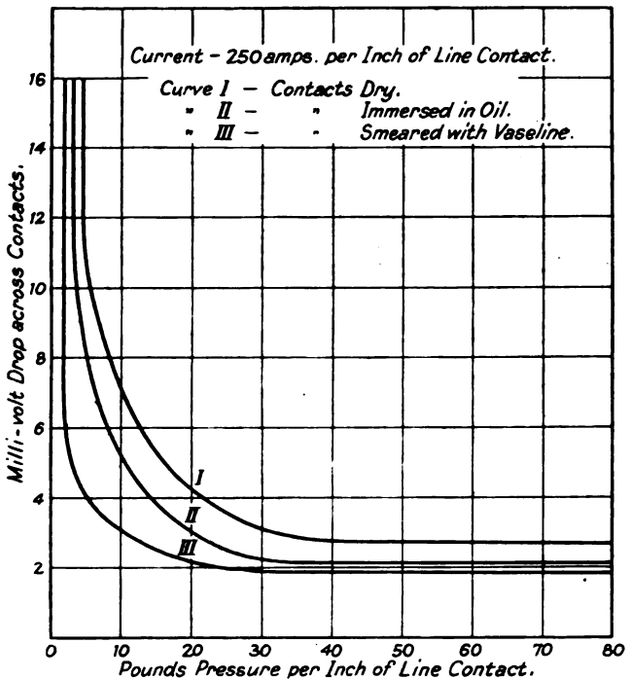

Fig. 4.—Milli-volt drop across line contacts.

Shape of Contact.

Fig. 4 gives the millivolt drop across a line contact formed by a D-shaped piece of copper pressing with its round face against a copper block, the radius of curvature of the D-shaped piece being 1 in. The curves show at once the value of lubrication of the contact. It will be seen that the contact resistance reaches a minimum with a pressure of about 27 lb. per in. length of line contact; greater pressures are not any advantage. It is found that the value of intensity of pressure which gives the best result varies somewhat with the shape of the contact, being lower with a small radius of the D-shaped piece. In other words, the sharper the shape of the contact line the better; but the difference is not great.

The values given in the curves were obtained by applying the pressure between the contacts and then subjecting them to slight vibration. If the vibration be omitted the contact resistance may be 6 to 20 times greater than the values indicated by the curves.

The same result is, however, obtained by subjecting the contacts to a mutual slight rubbing action. Of course, all properly designed switches are made so that their contacts close with a rubbing action. It is found that this principle of line contacts when applied to air break circuit breakers results in a very large reduction in the closing operating force. Needless to say, such contacts are very much more robust and less liable to damage than were the brush contacts previously used.

BOOK REVIEWS.

The Design, Construction, and Maintenance of Docks, Wharves and Piers. By F. M. du Plat Taylor, M.Inst.C.E., M.I.Mech.E., with an introduction by Sir Joseph Broadbank. (London: Ernest Benn, Ltd.) Pp. xxvii+495. 70s. net.

In this encyclopædic volume practically every detail on the engineering side of port operations is dealt with, and in spite of the very wide ground covered by dock engineering, a vast amount of practical information is brought within the range of a single volume. Among the various special lighting requirements the author points out that while for wharves and docks wide distribution of light with the absence of shadows is necessary, the lighting of jetties in navigable waters should be arranged to avoid confusion with navigation lights, the lamps being hooded to throw the light downwards only. In dock and wharf machinery, the author, while on the whole preferring electrical to hydraulic methods, considers that the practice of many ports in having both hydraulic and electric power systems is the ideal condition, each system having a field of usefulness in which it is superior to the other. A great economic advantage of electrical machinery is that the power consumed is proportional to the work done, whereas in the case of the hydraulic machine the water consumed in the operation of, say, lifting the empty crane hook is the same as that used in lifting the crane hook with the full load attached.

In the section dealing with the layout and equipment of a dock generating station the author mentions a system which he has adopted of storing all engine spare parts and all spanners and tools on boards fixed to the wall. The spare parts are clipped to the boards by sheet brass clips with wing nuts for removal, and the tools hung upon hooks. This is considered to be preferable to stowing in boxes and lockers, as deficiencies are readily detected, and as they are exposed the staff is obliged to keep them clean and polished or oiled.

There is an interesting section on electric cranes with which goods can be handled at fairly high speeds for lifts up to 50 ft., for as low a power cost as ½d. per ton, with energy at 1·75d. per kWh. A description is given of a light type of electric locomotive crane, of 11½ cwt. capacity, recently installed at Boulogne. The jib is triangular in cross-section, having three principal members connected by lattice bracing. The base of the jib is consequently also triangular in plan, with three main members, the front one of which forms the axis or hinge for luffing. At the apex of the triangle formed by the jib base is a bronze nut mounted on trunnions, and in this nut works a steel screw actuated by means of worm gear by a small electric motor mounted on the roof of the crane house. Level luffing gear, designed by Stothert and Pitt, and by Babcock and Wilcox, are described and details are given of large floating cranes electrically operated, but from the propelling machinery.

For stacking purposes in dock warehouses the electric runabout crane is finding increasing applications, and electric battery trucks are rapidly superseding hand trucks for trucking operations. The book is well produced and profusely illustrated. G. W. D.

Elementary Applications of Statistical Methods. By H. Bannister. (London: Blackie and Son.) Pp. 56. 3s. 6d. net.

This book will be found a useful laboratory manual, summarising several of the more important methods of statistical research in a very handy form. It is doubtful, however, if anyone not already possessing a working knowledge of the subject would make much of it. The author refers those wishing to understand statistical theory to Yule's "Introduction to the Theory of Statistics." Others may prefer Bowley's "Elements of Statistics."

A book of this length must omit a very great deal of important matter—for example, Poisson's distribution, the basis of many caculations in automatic telephony is not mentioned—nor are skew frequency distributions, which almost invariably occur in power supply problems.

A minor defect is that one would imagine from the treatment that a "normal" distribution usually meant a symmetrical binomial distribution. This is right in a sense, but the term is usually applied to the Gaussian Error Function (which, of course, can be obtained from the binomial).

Instead of the usual tables of probability the appendix gives a set of curves which is for many purposes preferable especially in a "practical laboratory handbook," and the graphs for $\chi 2$ (appendix 1) are particularly welcome.

To sum up—anyone using statistical methods from time to time, but not sufficiently frequently to keep all the definitions in mind, or requiring a handy guide for approximate computations, will find this book very useful. In any difficult problem, reference would, of course, be made to a standard treatise.

The ground covered is goodness of fit (of frequency distribution); meaning of mode, mean and standard deviation; measures of dispersion; precision of mean; elementary correlation.

MARINE ELECTRICITY.*

The "Viceroy of India" Revisited—The First Big Electric Passenger Liner Under the British Flag Considered as an Experiment, a Prototype, and a Fuel Conserver—Some Further Thoughts on Electricity for Propulsion.

By A. C. HARDY, B.Sc., A.M.I.Mar.E. (Author of "Merchant Ship Types," etc.).

IF any justification were needed as to the efficiency of electric propulsion from a maintenance point of view, one need go no further than the engine-room of the 19 700-ton P. and O. liner "Viceroy of India" to seek it. I was fortunate enough to be able to make an inspection of the ship at Tilbury shortly after her return from her maiden "shake-down" round trip to Bombay, and I can very definitely assert that the machinery after some 12 000 miles' running appeared to be in very good trim. That there is a future for large electric passenger liners on certain trades has been gradually recognised as a fact. The "Viceroy of India," having established a precedent in British shipbuilding and shipowning, is unquestionably doing what the "Virginia" and "California" as large electric ships did in America—pave the way for further similar ships.

The Shipowners' View.

The far-seeing and successful shipowner seldom adopts any system of propulsion other than that which has given him satisfaction previously unless the new system is going to result in some material benefit. A net lowering in the fuel bill is sufficient justification in the majority of cases, and has incidentally been responsible for the almost phenomenal increase in motor and in motor-electric ships. The electrically propelled ship at once offers a definite saving in fuel bills as compared with a corresponding steamer. Its advantages, however, neither begin nor stop there. Psychologically, perhaps, the electric liner represents a higher expression, a more up-to-date expression, of marine engineering technique than does the corresponding steamer. It offers, too, to the passenger an undeniable freedom from vibration; a comfort and a smoothness of operation which is inevitably associated with the operation of electric motors. It eliminates almost entirely that "ringing," rising and falling with the motion of the ship, necessarily associated with the most carefully balanced of geared turbine sets. It permits of an ease of manœuvrability which is almost astonishing. It allows of a flexibility of power output which is at once gratifying and economical. The electric ship is an easy "watch keeping" ship. As far as can be judged at present from the "Viceroy of India" she should have a remarkably low repair and maintenance bill. If the potential repair and maintenance bill for ships' machinery increases proportionately with improvements in machinery technique, then obviously the skill and care of operating staffs must increase in proportion too.

The motorship, on many routes to-day, is the most all-round economical ship in the world. Unless she is well serviced and looked after she may well prove the most expensive. The electric liner is perhaps a little less economical than the motorship, but she should not require quite the same amount of skilled care and maintenance.

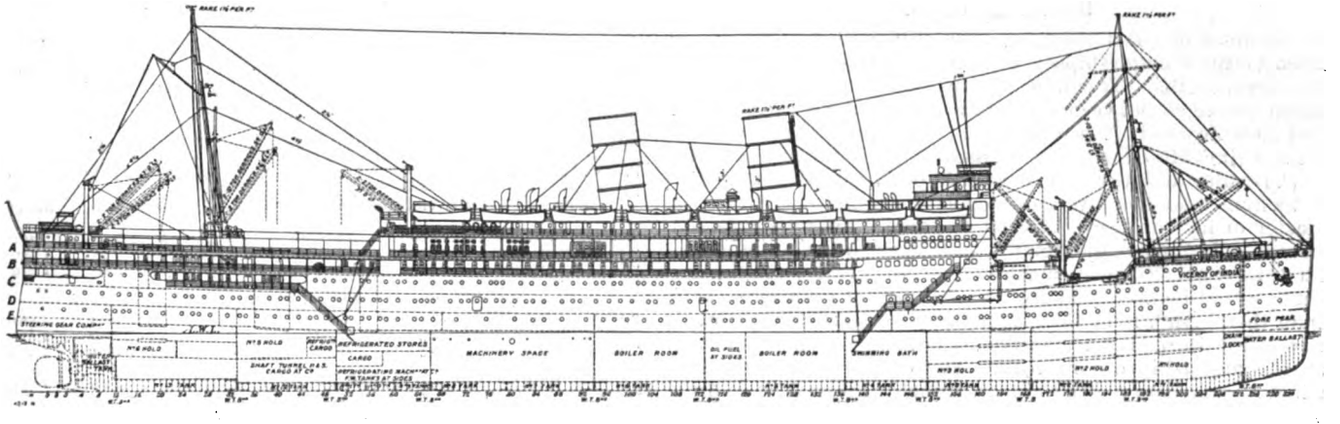
The turbine and the turbo generator, considering power output for space taken up, is probably one of the most compact forms of energy creator in the world. And this is even true if we take into consideration modern water tube boiler equipment and its auxiliaries. Probably, taking this into account, ideal economy and ideal compactness is more nearly approached in the Diesel engine-driven generator. In this case, however, there may be other disadvantages which have to be taken into consideration also. Probably a thorough relative assessment of the values of the respective systems will never be possible until a large Diesel-electric passenger liner has been built. For that reason the proposed new mammoth White Star liner as an electric ship is so significant. As a Diesel-electric ship she is even more significant, because she will be the largest ship in the world. The electric motor as a marine prime mover, however, is now definitely established, whatever the method employed to generate the current which feeds it. The electric motor, in its turn, is again most attractively compact.

We have suggested that the turbo-generator is extraordinarily compact in proportion to its power output. In no case is this more apparent than on the "Viceroy of India." One had remarked this on visiting the ship on the occasion of a demonstration run before she left her builder's hands. A second visit to the ship last week more than confirmed this. And in this compactness is seen yet one more inherent advantage of electric propulsion. The two main turbo-generators, each of some 11 600 H.P. output at 3 000 r.p.m., are on a raised flat in the main engine room on either side of and just abaft the main control station. This enables auxiliary machinery—condensers, feed pumps, circulating pumps, etc.—to be grouped conveniently below and around, at tank top level. As direct-coupled or geared turbine sets they would inevitably have to be on a level with the propeller shafts. The modern electric ship's main engine room in practice is really even more compact than was that of the theoretical electric ship of 10 or 12 years ago. But notice that whereas the original conception of marine electricity insisted for propulsion that the motors should be located right aft and thereby save, or rather give to the stevedores, much extra valuable cargo space, modern practice has determined that it is much more handy and practicable to sacrifice a problematic few hundred cubic feet of cargo space and to arrange everything under the eye of the man on watch in the engine room. The "Viceroy of India's" two main motors, each developing some 8 500 H.P., are very compact units conveniently located at the aft end of the engine room. They are also subject to great flexibility of operation as the following will make clear.

Ease of Operation.

For example, both motors can be run with only one turbo-alternator and four out of the six Yarrow water tube boilers in use. Thus with one alternator developing about 11 600 H.P. the ship can make about 16·5 knots with the two main shafts turning at about 92-93 r.p.m. Under these conditions the

* Mr. Hardy revisited the "Viceroy of India" on our behalf after that ship's maiden voyage. He here records his further impressions.



Inboard profile of the 17 000 H.P. electric passenger liner "Viceroy of India," now touring the Mediterranean.

Digitized by Google

boilers are using fuel at the rate of about 80 to 85 tons per day for all purposes, including heating, lighting, and cooking. On the other hand, at the somewhat higher speed of 18·5 knots, both turbo-alternators are taking their steam at 375 lb. pressure and 700 deg. Fahr. super-heat from all six Yarrow boilers. The two main motors are turning at 104-105 r.p.m., and the boilers are using fuel at the rate of 110 to 113 tons per day for all purposes. At a speed of 19 knots the main motors are turning at about 109 r.p.m. Such flexibility has, in service, resulted in considerable fuel saving, and the "Viceroy of India" on her maiden round voyage from London to Bombay, including harbour consumption at each end, used, as the table shows, but 3 521 tons of oil compared with an average of 4 807 tons for two similar oil burning ships with steam reciprocating engines and oil fired boilers. Unquestionably this is partly due to the possibility of being able to develop normal service speed with one turbo-alternator only and four boilers out of six, and partly due to the economies possible with modern high steam pressures and super-heat. Her boiler plant is not only compact but it may also be regarded as very efficient.

Advantages of Electricity for Cruising.

To-day the "Viceroy of India" arrives at 9 a.m. at Palma after having covered some 1 977 miles of her first 4 221 miles Mediterranean course. She is scheduled this summer to make in all five cruises to the Western Mediterranean, Northern Africa, and the Balearic Islands. These cruises will total some 21 889, miles and as most of the "runs" in the cruises will be performed at something under 16 knots, the ship should prove very economical running on one generator only. Cruising demands infinitely much more manœuvring than normal running, and here again the advantages of electric propulsion stand out. The "Viceroy of India" has been reported as a result of the experiences of her first voyage as being almost too quick on the "throttle," or on the controls, to be more exact. A motor ship is generally acknowledged to be quicker on the telegraph than an ordinary steamer. The electric ship, it would appear, is quicker than either. The possibilities of pilot house control are worth considering in connection with a ship of this type, but it seems really questionable whether this would be desirab e in view of the compact and efficient nature of the control cabinet on the upper platform on the "Viceroy of India." The largest electric ship with pilot house control is, I think, the British-built, American-owned tanker "Brunswick," completed last year on the Clyde and fitted with B.T.-H. equipment. This vessel has a deadweight tonnage of 12 500 tons, and, as far as the bridge end of the control gear is concerned, everything is centered in the Sperry automatic steering pedestal, on each side of which is a blank engine room telegraph face. Movement of the telegraph handles forward, in an arc away from the operator, increases the speed of rotation of the main propelling motor. Similar movement in an arc towards the operator decreases the speed of the motor. This ship thus is controlled absolutely like a tram-car and is really an automatic ship, because by setting the automatic gyro compass steering device and setting the main electric motor speed handle, the ship runs without human aid. Pilot house control, of course actually is not at any particular advantage on long ocean passages. In manœuvring in and out of port, however, there are considerable advantages once the pilot and navigating officers become really accustomed to the quickness of manœuvring.

Running Tests.

Commissioned last summer, this electric ship—one of the largest electric cargo ships—covered a total of some 48 000 miles in seven months. This mileage was all accounted for on long ocean passages between California, South Africa, Australia, and New Zealand. An inspection of the Diesel-electric plant a short time after the ship had made a voyage from California to Australia and then to a British port, revealed that the propelling machinery was in excellent condition. And as a matter of fact on the "Viceroy of India" after her maiden voyage only minor adjustments have been found to be necessary to the electrical machinery. No greater testimony surely could be needed as to the reliability of the electric ship than this. And, remember, too, that the electric ship is even now going through a formative stage in much the same way as the motorship did in 1912. The electric ship, however, will never and can never compare numerically with the motorship. She will always be a special case, but in her present state does not in any way represent the final and finished electric ship. Technique will alter and even improve considerably during the next few years. The electric ship of to-day is only an experimental foundation upon which the electric ship of to-morrow will be built.

Even already signs are not wanting that newer and more powerful electric liners are contemplated by European shipping companies, and on her maiden voyage the "Viceroy of India" had the representatives of important shipping companies on board—always a significant fact. The "Viceroy of India" has a S.H.P. of about 17 000 H.P. The new Dollar liners, to which reference was made in the last article in this series, are the largest and most powerful of new electric liners. They are also among the fastest because they will have a speed of between 20 and 21 knots in service. A maximum shaft horse power of 26 500 puts them on a par with big Italian liners like the motor liner "Augustus." They will easily be the biggest and fastest ships in round the world trade, their duties taking them out to the Far East from New York via Panama and home via the Philippines, ports in the Dutch East Indies, and the Suez Canal. Alternatively they may be employed in transpacific service from San Francisco to the Orient. As an example of the money which is now being spent by shipping companies in electrical shipping, it may be mentioned that the Dollar line contract alone will involve a total expenditure of £9 000 000, split up among various shipyards.

A comparison between the leading features of the new Dollar liners and the "Viceroy of India" is interesting in contrasting the various dimensions and service requirements. It will be noticed that the boiler equipment of the former is just double that of the latter.

ELECTRIC LINERS OF RECENT TYPE COMPARED.

Ship	L.o.a. × Build × D/mld.	Power	Displacement	Speed	Boilers	Passengers
"Viceroy of India"	.. 612 × 78 × 82[1]	17 000	25 000 tons	17–18	6 W.T.[2]	415/258/—
Dollar Liner	.. 653 × 81 × 42·5	26 500	31 000 tons	20–21	12 W.T.[3]	332/—/140

[1] To topmost of nine decks. [2] Yarrow type. [3] Babcock and Wilcox type.

Refrigeration Facilities.

The new Dollar liners will have exceptionally large cargo capacity, amounting to about 650 000 cu. ft. of general cargo and as much as 70 000 cu. ft. of refrigerated space. A tendency may be noted on all modern ships which have readily available electrical power, and whose trade requirements make it advisable, to fit large refrigerated space. Electric current represents a very convenient power source for the operation of refrigerating machinery, being both compact and clean. The deadweight capacity at a 32 ft. designed load draft is 17 400 tons. Large passenger accommodation of the latest type is provided for 332 first class and 140 tourist class passengers, while oriental steerage passengers to the number of 772 can also be accommodated in 'tween-deck spaces. For the work they have to do, these ships are among the most important now on order or under construction.

Some idea of the actual operating cost of big electric ships may be gained from the fact that on her maiden voyage from London to Bombay and back the "Viceroy of India" consumed some 6 800 000 electrical units for propulsion purposes and some 728 125 units for the "hotel" load, which includes heating, lighting cooking, punkah louvres, and laundry use. The cost per unit for the propulsion load, including 17½% capital charges, wages, and victualling of engine room compliment, works out at 0·346 pence. When this is taken into account in conjunction with the attached tables, it will be realised that the electric liner is likely to be an economic factor in shipping of no mean potentiality in the near future. The saving in gross oil fuel is interesting even when the ships are at different displacements. This becomes all the more pronounced with speeds and displacements reduced to a common figure.

P. & O. ELECTRIC SHIP "VICEROY OF INDIA"—VOYAGE RESULTS COMPARED WITH THOSE OF TWO STEAM SISTER SHIPS.

Ship	S.H.P. Available	Displ. Tons	Speed Kts.	Gross Oil Fuel	Lub. Oil
"Viceroy of India"	17 000	200 026	16·3	3 521 tons	361
"R" class steamer	13 500	19 235	16·14	4 655 tons	1 320
"R" class steamer	13 500	18 540	16·03	4 958 tons	1 279
SAME RESULTS AT CONSTANT DISPLACEMENTS AND SPEEDS.					
"Viceroy of India"	17 000	20 026	16·3	3 521 tons	361
"R" class steamer	13 500	20 026	16·3	4 801 tons	1 320
"R" class steamer	13 500	20 026	16·3	5 270 tons	1 279

The high lubricating oil consumption for the "R" class steamers is particularly noticeable. These ships have steam reciprocating engines and oil fuel Scotch boilers.

METERING BULK SUPPLY.

An Interesting Italian System with a Variety of Applications.

(By A CORRESPONDENT.)

IN the last few years generating stations have been increasing in size, and large amounts of power are sold and bought among various undertakings, with the result that methods which were considered as right years ago are not now satisfactory.

It is not to be wondered at that the use of a simple kWh meter of the induction type is only resorted to in a few unimportant cases. More elaborate systems of tariffs, dependent upon the measurement, not only of the kWh, but also of the power factor and of the maximum demand, have now been evolved.

In actual practice, however, these measurements are unfortunately all based on some sort of meter of the induction type, which is not the most accurate form of a measuring instrument. It is, therefore, interesting to hear of a new system which overcomes this handicap, in a new range of metering equipments which are just being put on the market by Messrs. Istrumenti di Misura "C.G.S.," of Monza (Italy).

This patented system is capable of a variety of arrangements and modifications so that practically any requirement can be met. For the sake of brevity I propose to deal with only one of these, the "C.G.S." Wattgraph-Integrator.

This instrument consists essentially of a standard "C.G.S." relay-operated, motor-driven, precision recording wattmeter (Fig. 1), in which the motor operates also a specially-designed planimeter. This recorder consists of two wattmeters of the electro-dynamic type mounted as a sort of Kelvin balance. By this clever disposition, and by operating it through a motor relay, the makers have reached a degree of accuracy hitherto unobtainable by other means.

The same motor is also used to operate the planimeter, as shown on Fig. 2.

Method of Working.

The displacement of the pointer is reduced and transferred through the flexible strips 4 and 5, and through the pulleys 6 and 7, to the chariot 8, upon which there is an integrating wheel 3 sliding along the surface of a clock propelled disc 2. This sliding motion is so arranged that, when the pointer is at zero, the integrating wheel lays on the centre of the disc (and therefore also at its zero), while when the pointer indicates the maximum, the integrating wheel lays near the edge of the disc (and therefore also at its maximum). A strip spring wound inside the drum 11 exerts a tension on the chariot by means of the flexible strip 10.

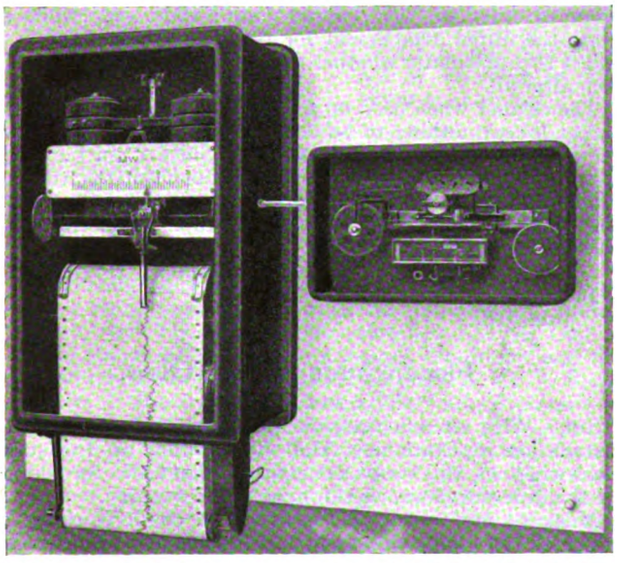

Fig. 1.—Showing a "C.G.S." meter with the specially-designed planimeter in position.

By this simple arrangement one obtains a chart with valuable information about occurrence, size and time of peaks, thus a very accurate registration in the standard Board of Trade units.

As groupings of instruments can, in a similar way, be easily arranged so as to record also the power factor, kVA, reactive component, etc., with further attachment for the automatic insertion of other instruments when the load comes under pre-determined conditions, it is obvious that this system is well suited for tariffs in cases of bulk supply and energy transfers.

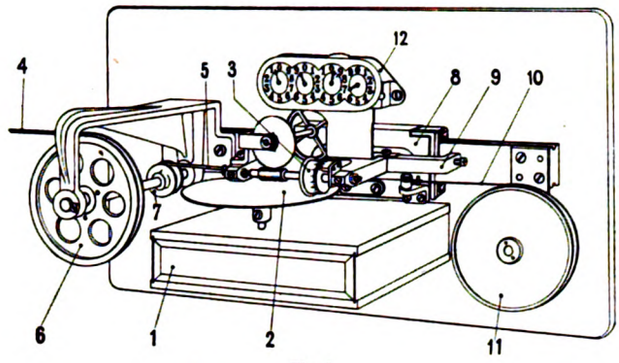

Fig. 2.

METER STANDARDS.

Reduction of Limits of Error—Performance of A.C. and D.C. Types for Measuring Electricity Supply.

AMONGST the specifications recently issued by the British Engineering Standards Association may be mentioned No. 37-1929, which is a revision of the 1919 edition and differs from its predecessor in several important respects. In the first place, the permissible limits of error have been appreciably reduced, the limits for all sizes, grades and types of meters now being within the Board of Trade limits. In the second place, differentiation has been made in several important respects between d.c. and a.c. meters, whereas in the 1919 edition there was no differentiation as regards the majority of the electrical performance requirements. Thirdly, two grades of both a.c. and d.c. types are provided for, namely, a sub-standard grade and a commercial grade. Fourthly, the registering mechanism is now restricted to the pointer type, and must consist of not less than 6 pointers. (This clause obviously does not apply to electrolytic meters, nor does it apply to sub-standard meters with special dials for testing or other purposes.)

A very useful feature of the Specification is a folding sheet containing a summary of the performance requirements. This sheet can be removed from the Specification and mounted in the test-room for ready reference.

Copies of the specification may be obtained, price 2s. 2d. each, post free, from the Publications Department, British Engineering Standards Association, 28, Victoria Street, London, S.W.1.

I.E.E. GOLF.

Result of Competition for the G.P. Dennis Trophy at Hesketh Club.

THE Golf Competition organised by the Mersey and North Wales (Liverpool) Centre of the I.E.E. in conjunction with the North Western Centre, in aid of the I.E.E. Benevolent Fund was played at the Hesketh Golf Club, Southport, on May 29th. Fine weather prevailed and some very good cards were returned. The G. P. Dennis Trophy was won by Mr. A. G. Barnard (Liverpool), with a net score of 1 down. Mr. J. O. Balshaw and Mr. F. G. Briant tied for second place with a score of 2 down. In the first division Mr. J. O. Balshaw and Mr. A. G. Barnard tied for first place with a net score of 75 and in the second division Mr. H. Gawthorne returned the best card with a score of 80. In the two-ball foursome the best card was returned by Mrs. Kessler and Mr. W. A. Phillips with a net score of 80½ and for the second best card Mr. F. E. Boot and Mr. F. G. Briant tied with Mr. R. Foster and Mr. R. Turnbull with a score of 81. The putting competition was won by Mr. G. S. King. The total entry was 75, of which 53 took out cards for the various competitions. Mr. S. E. Britton, chairman of the Liverpool Centre, presided at the dinner held at the Prince of Wales Hotel, Southport, and was supported by Mr. J. Harcourt Williams, chairman of the North Western Centre. The prizes were presented by Mrs. J. Harcourt Williams.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

North-East Coast Exhibition.

[To the Editor.]

Sir,—As one who has a sentimental interest in the north-east coast it has struck me as somewhat surprising that so little is heard of the North-East Coast Exhibition outside the northern area of England. Here in the south few people even know that there is such an exhibition!

We were told in the little advertising that reached the south coast that the Newcastle exhibition would be "a Wembley of the North," and here we are with the exhibition started to all intents as a purely local affair.

In the case of Wembley, the large national "dailies" published pictures almost every week, gave articles on the exhibition, and so on. With the exception of a picture or two of the opening, I have seen nothing concerning the North-East Coast Exhibition outside the provincial newspaper world and the electrical press. Surely something can be done to give better support to the enterprise of those exhibitors responsible for the show?—I am, etc.,

"Cullercoats."

Bournemouth.
June 1st.

132 000 V Cables.

[To the Editor.]

Sir,—The importance of this subject, coupled with the strictures in some quarters as to the reliability of 132 000 V cables, leads me to crave some further space in your columns for further developing the subject.

1. The amount spent on the New York installation (allowing for the duplicate cables necessary to put it on a par with our ideas over here as regards standby capacity) was £1·475 per kW per mile transmitted.

(*a*) This was a fancy price (owing to the novelty of the installation), and would now be only of the order of, say, £0·22 per kW per mile (in the case of Battersea), 15 miles by 300 000 kW by £0·22 = £990,000. (The difference between American and British initiative is illustrated by the readiness with which our American friends will find eight times the sum of money for an experiment.)

2. The *initial* transmission, it is well, however, to remember, would be only some 150 000 kW, and would cost perhaps only £660 000, with a very much higher proportion of spare cables than in New York.

(*a*) It might be some three years before developments in the growth of load made the next installation necessary. During these three years it may be taken as absolutely certain that any trifling improvements found desirable will have been introduced, and will appear in the second lot of cables.

(*b*) As regards causes of weakness in the cables, those of us who have for the last five years followed with unremitting and laborious attention the developments of paper insulated cables, know quite well that, having now entirely dropped non-radial electrostatic fields, there only remained the questions of voids in the cable, due to expansion and the change of power factor, and of capacitance, due to heating. The latter has now been experimented on, and tested, till we have reached a point where nobody would dare to hint *that we do not know* all we should learn by waiting.

(*c*) The question of voids is recognised, by those best qualified to judge, as completely met by the pressure-oil-filled type of cable. The only factor not yet tested by experience "in the field" is the effect of expansion and contraction below ground—whether due to tropical heat or to arctic cold, or to superincumbent loads; perhaps also the effect of external vibration. This can be met by greater depth of laying. These difficulties could all be met by slinging cables against the embankment walls on both sides of the river, high enough to be clear of the mud, and yet low enough to be always covered by the water, and with suitable provision for lifting joints for repairs.

(*d*) The expansion due to temperature caused by the current can be met by giving the cables a conservative rating, remembering that the heating goes down as the *square* of the load, and a conservative rating is not, therefore, expensive.

3. Another point that must be borne in mind is that it is inconceivable that all the cables—if laid in different routes—should go down suddenly; and in this sense we are taking very little greater risks than with generating plant units. What trifling extra risk there is can be met by the provision of a rather greater proportion of spare plant in cables than in generators, say, double the amount. As the £660 000 mentioned includes the equivalent of four spare generator units, it surely will not be contended that this is insufficient. A small extra sum would give a still greater protection; but is not considered necessary. In any case, a cable unit is replaceable in very much less time than a generator unit.

4. Have I not made it clear that, from the engineer's point of view, there is no risk of interruption of the supply.

5. From the financier's point of view, the £660 000 will always be worth £330 000 if the cables are used at 66 000 V, and the financial risk is, therefore, *in the limit* £330,000; and this is extremely remote. What is £300 000 to a scheme of the size of Battersea, compared with Britain losing the pre-eminent position in the world for cables and the world's markets for 132 000 V cables? It would pay the C.M.A. to take this risk and to offer to put in British 132 000 V cables *on a 10 year guarantee*, rather than lose the world's market, for tens of millions of pounds, for super-tension cables in the near future.—I am, etc.,

A. M. Taylor.

Erdington,
Birmingham.
May 27th.

Vacuum Cleaner Attachments.

[To the Editor.]

Sir,—A point which appears to be worthy of the attention of manufacturers of electric vacuum cleaners, is the unsuitability of the present design of cleaner attachments. The tool with which one is required to clean upholstery for instance, is usually of aluminium, and if used without the brush is very inclined to scratch furniture, paint work, etc. Further, the shape of the device renders the cleaning of stairs extremely difficult. It might, of course, be suggested that one should use the rubber attachment for the purpose, but here, again, one can spend so much time changing from one device to the other in order to "get behind" stair rods, etc., while still using the fluted attachment for the stair treads, that in the end it is problematic whether a hand broom is not the easiest way after all.

The cleaner when used on a "straight" job such as a floor carpet leaves nothing to be desired, but my experience with the attachments is not encouraging. Since I am but one of many users of vacuum cleaners it is possible that there are other equally critical "converts," in which case the sooner the cause of this mild grouse is remedied the better for all concerned.—I am, etc.,

Floodlighting Stained Glass.

[To the Editor.]

Sir,—With reference to your description of a floodlighting installation at Stationers' Hall for lighting up the stained glass windows, this seems to me an excellent idea for adoption by the different churches throughout the country.

Many of my week-ends are spent in country walks, and many of the churches which I visit have windows which, if treated with floodlight, would create an interest in stained glass which is, for the most part, confined to a few.

If it were possible to gain the interest of the congregations of these churches, I feel that many of them would be willing to bear the comparatively small cost of installation, particularly when they were made to realise that its erection would in no way spoil the beauties of the exterior of the buildings.—I am, etc.,

NEWS IN BRIEF.

Hull's Prosperous Telephone Department—Electrical Association for Women—Ex-Siemens Men's Association—World Engineering Congress.

MAIDSTONE T.C. has received sanction to a loan of £3 000 for domestic electrical apparatus for letting out on hire.

Hull municipal telephones department made a profit of £15 000 in the past financial year, after paying the Government £11 000 in royalties.

Guildford Electricity Committee has again considered the question of establishing an electricity showroom at 199-200, High Street, but the matter is deferred for the time being.

On May 25th members of the Electrical Association for Women visited the new power station at Longford, near Coventry. After inspecting the machinery, the visitors enjoyed the novelty of a journey up the inside of one of the four cooling towers.

An electro-technical assistant to the City Electrical Engineer of Salford is required.

The summer meeting of the North Midland Centre of the I.E.E. will be held at Buxton on June 29th and 30th.

The Crown Agents for the Colonies invite applications for the post of assistant telegraph engineer in the Public Works Department of the Government of Hong Kong.

The results, just published, of the working of the Paris-Berlin trunk telephone in 1928 show that, in the first three months after the laying down of a larger supply of through lines, the number of calls increased by more than 300%.

At a meeting of the Electrical Association for Women, on May 29th, Mr. H. L. Dover delivered a lecture demonstration with a thermal storage electric cooker sent from Sweden by arrangement with Dr. Ekström and Mr. R. Borlase Matthews.

Mr. John McCallum seeks leave to amend the specification of the application for letters patent No. 308 413 for "An improvement relating to lead-sheathed electric cables." Particulars of the proposed amendment appeared in the "Illustrated Official Journal" (Patents) of May 23rd, and notices of opposition must be lodged at the Patent Office within a month from that date.

At a meeting on April 26th an association of Ex-Siemens' Men was formed, and on May 29th the first re-union dinner took place, with Mr. Frank Willis (English Electric Co.) in the chair. Some fifty members attended the dinner and the concert which followed. The hon. secretary is Mr. J. Snow Huddleston, Dagenham Dock, Essex, who will be pleased to give full particulars of the Association.

The papers to be read at the World Engineering Congress and World Power Conference to be held in Tokio in September and October include "Synthetic Fuels and Lubricating Oil," by Prof. A. W. Lash; "Pulverised Fuel for the Small Unit," by Messrs. H. W. Holland and E. C. Lowndes; "The Volumetric Measurement of Coke and Coal" by J. E. Lea; "The Storage of Steam," by Dr. E. G. Ritchie; and "Coal Cleaning, with Special Reference to Japanese Coal," by Dr. R. Lessing.

At a meeting of Manchester Education Committee on May 27th, Ald. Woollam referred to a request which had been made by the managers of a non-provided school that the Committee should authorise and pay for an electric lighting installation in the school, so as to make its teaching as efficient as that of provided schools. Mr. Woollam said it had, unfortunately, been decided to ask for a report on the matter from the Sites and Buildings Sub-Committee, which did not, in his opinion, affect the matter of principle involved.

Representatives of more than 40 countries are attending the biennial International Congress of Telegraph Agencies which opened on May 25th at Therapia, Turkey.

The annual autumn meeting of the Institute of Metals will be held in Dusseldorf from September 9th to 12th. This will be the first meeting of the institute to be held in Germany.

The laying of the new submarine telephone cable from Norbreck, near Blackpool, to Port Grenaugh, Isle of Man, was begun by Siemens Bros. and Co.'s c.s. "Faraday" on June 1st.

In the Blackpool Municipal Cricket League, Electricity beat Police, scoring 170 for two wickets, to which the Police replied with a total score of 104.

A £6 000 000 project to harness the Osage River, in Missouri, as part of a new hydro-electric scheme, is announced. Transmission lines will convey power to Crystal City, where one consumer has contracted for 150 000 000 kWh per annum.

In order to conform to the proposed scheme of decorative lighting along the front during the forthcoming season, Portsmouth Electricity Committee proposes to arrange for additional decorative lighting on the pier deck and at the pier entrance, at a cost of about £300.

The British Empire Steel Corporation has completed plans for the erection at Glace Bay, Nova Scotia, of a power plant costing approximately $2 000 000 and equipped to supply the industrial district of Cape Breton, including the corporation's fifteen collieries and surface plants.

According to an Iowa report 13 817 farms are served electrically from central-station companies and about 14 000 from individual farm-lighting plants. Only 24 towns in Iowa out of the total of 922 do not have electric service. The average population of these towns is 133.

Smethwick Corporation has decided "to express grave concern at the proposed transfer, to a company controlled by a foreign undertaking and supported by foreign capital, of the whole of the ordinary shareholding in the Shropshire, Worcestershire and Staffordshire Electric Power Co.," and "to call upon the Government speedily to take steps to inhibit this and other transactions of the like nature."

Students from Brighton Technical College recently visited the all-electric farm of Mr. R. Borlase Matthews, near East Grinstead. Power from Wiremill Lake is being utilised for all the farm purposes to which electricity can be applied, including chaff cutting, grinding, milk separating and churning, cable heating of the soil, intensive illumination, etc., etc. The supports for the cable are of the X-pole type, about which Mr. R. Borlase Matthews is shortly reading a paper before the International Extra-High Tension Conference in Paris.

The Portuguese Minister of Commerce has nominated a commission of engineers to examine the whole question of the exploitation of the water power of the Douro, from the mouth of the River Huebra to Oporto. At the same time the General Administration of Water Services will examine the proposals already submitted for the exploitation of the hydro-electric power of the Douro, in order that the Government may take whatever steps it considers necessary to develop the zone reserved to Portugal under the terms of the convention concluded with Spain in 1927.

LOOKING BACKWARD.

FIFTY years ago it was recorded in THE ELECTRICIAN' *of June 7th, 1879, that :—*

Rock drilling was a new application of electricity.

The introduction of electric light had preceded that of gas in Persia, and several Jablochkoff candles were consumed every night by the Shah in his palace at Teheran.

* * *

TWENTY-FIVE years ago, according to THE ELECTRICIAN *dated June 10th, 1904 :—*

A "free" wiring scheme was contemplated at Dover.

The coming of the steam turbine was received with mixed feelings.

At a run of the Ladies' Automobile Club there were six electric cars out of a total of 50.

There was discussion at the I.E.E. annual meeting of a revision in the articles of association affecting the Associate class.

* * *

TEN years ago THE ELECTRICIAN *on June 6th, 1919, announced that :—*

The Birthday Honours included a Knighthood for Mr. Charles Bright.

The E.L.M.A. was to take over the work of the Tungsten Lamp Association.

A joint meeting of the I.E.E., the E.C.A., and the N.A.S.E. was held to find the best way to advance the use of electricity in the many small houses that were about to be erected.

ELECTRICAL M.P.'s.

Electrical Industry Well Represented, Although by Fewer Members.

OUT of the fourteen candidates associated with the electrical industry who took part in the Parliamentary elections last week, only six were elected. These were Mr. P. J. Pybus, Lt.-Col. Sir Frederick Hall, Mr. George Balfour, Sir Philip Dawson, Mr. P. J. H. Hannon and Major-General Sir Newton Moore, the last five being re-elected.

Mr. P. J. PYBUS (Lib.), elected for the Harwich Division of Essex, gained a seat for the Liberal Party, and had a majority of 2 700 votes in excess of the poll for the Unionist candidate. In 1924 the Unionist majority was 2 315. Mr. Pybus is chairman of the Power and Traction Finance Co., and a director of Willans and Robinson, the English Electric Co., and other electrical companies.

*Lt.-Col. Sir FREDERICK HALL (U.), re-elected for the Dulwich Division of Camberwell, had a majority of 5 700, compared with 15 611 in 1924. He also is a director of electrical companies, including the County of London Electric Supply Co. and the South London Electric Supply Corporation.

*Sir PHILIP DAWSON (U.), again re-elected for Lewisham (West), did not suffer as great a reduction of majority as most other Unionist Members as a result of Labour activities. He secured a preponderance of 9 872 over the poll for the Labour candidate, compared with a majority of 12 942 in 1924. As most of our readers are aware, Sir Philip is a notable figure in the electrical world. He is a partner in the firm of Kincaid, Waller, Manville and Dawson, consulting electrical engineers, and a director of Johnson and Phillips, the Reading Electric Supply Co., Wessex Power Producers, and other companies. He was a member of the Ministry of Transport Railway Advisory Committee and of the Board of Trade Water Power Resources Committee.

*Mr. GEORGE BALFOUR (U.) re-elected for Hampstead with a majority of 14 897, compared with 15 770 in 1924, is also a notable case of failure of the Labour attack. Mr. Balfour is chairman of Balfour, Beatty and Co., the Scottish Central Electric Power Co., and a director of other companies connected with electricity supply and traction work.

*Mr. P. J. H. Hannon (U.), re-elected for the Moseley Division of Birmingham, is a director of the Westminster Electric Supply Corporation, Ltd.

*Major-Gen. Sir Newton Moore (U), who retains his seat for Richmond, is a director of the General Electric Co., Ltd.

Those who have been defeated include Mr. J. W. McKAY, secretary of the Electrical Wholesalers' Federation (Lib). who stood for Coventry; Mr. R. S. CHATFIELD, chairman of Eastbourne Electricity Committee (Lab.), for Eastbourne Division of East Sussex; Mr. R. R. FAIRBAIRN, formerly manager of Worcester tramway undertaking (Lib.), for Worcester; *Mr. W. PRESTON, head of William Sanders and Co., electrical engineers, Wednesbury (U.), for Walsall; *Mr. R. G. ELLIS, a director of the Yorkshire Electric Power Co. (U.) for Wakefield; *Ald. J. P. BURMAN, a member and formerly chairman of Birmingham Electricity Committee (U.), for Duddleston Division of Birmingham; Mr. SIDNEY E. GARCKE, a director of the British Electrical Traction Co. and other companies (U.), for Kingswinford Div. of Staffordshire; Mr. E. KILBURN SCOTT, consulting engineer and author of books on electrical subjects (Lib.), for Leeds (South).

BIRTHDAY HONOURS.

Few Awards to Persons Connected with Electrical Industry.

AMONGST the Honours conferred by the King on the occasion of his 64th birthday are the following:—

KNIGHTS.—The Honour of Knighthood has been conferred upon Mr. William Smith Jarratt, Comptroller-General of the Patent Office; Mr. Roland Thos. Nugent, Director of the Federation of British Industries; Mr. Chandrasekhara Venkata Raman, Professor of Physics, Calcutta University.

OFFICER OF THE ORDER OF THE BRITISH EMPIRE. Captain Richard Alston Hale Lewin, Instructor, School of Electric Lighting, Gosport.

MEMBER OF THE ORDER OF THE BRITISH EMPIRE.—Mr. Augustus Charles Hayes Statham, Assistant Engineer, Wireless, Indian Imperial Posts and Telegraphs Service.

COMPANION OF IMPERIAL SERVICE ORDER.—Mr. A. L. De Lattre, Assistant Engineer-in-Chief, General Post Office.

* Members of the late Parliament.

PERSONAL.

MR. C. O. Brettelle has been appointed technical editor of the "Electrical Review" in succession to the late Mr. A. H. Allen.

Mr. H. A. Blackburn, of Huddersfield, has been appointed tramways manager to Keighley Corporation at a salary of £500 per annum.

Mr. R. Alan S. Thwaites, of the Yorkshire Electric Power Co., has been elected vice-chairman of the Yorkshire Association of the Institution of Civil Engineers.

Mr. J. G. Statter, of J. G. Statter and Co., is due to arrive at Liverpool on June 10th, by the "Walmer Castle," after a successful business trip to South Africa.

Mr. Allan Grant, previously assistant district engineer with the Clyde Valley Electric Power Co., has been appointed district engineer to the Grampian Electricity Scheme.

The directors of the British Electric Traction Co. announce with regret that Mr. E. Garcke, the founder of the company and its moving spirit since its inception, is retiring from the board.

Wigan Tramways Committee has recommended the appointment of Mr. J. Brierley, as general manager of the tramways, in succession to Mr. C. Hopkins, who has accepted a similar appointment at Sunderland.

Sheffield Electricity Committee recommends the appointment of Mr. Ernest Morgan, chief engineer and general manager of the electricity department, Wolverhampton, as general manager and engineer, at a commencing salary of £1 250 per annum.

Many of our readers will be interested in the announcement of the approaching marriage of Mr. R. B. Renwick, son of Sir Harry Renwick, to Miss Dorothy Mary Parkes, elder daughter of Mr. and Mrs. Harold Parkes, of Alveston, Stratford-on-Avon. The wedding will take place at St. Margaret's, Westminster, London, on June 11th.

Golfing readers will be interested to learn the latest feat of Mr. P. N. Rand, the general sales manager of the English Electric Co. Playing at Bramley, Surrey, last week, his shot from the fifteenth tee struck the pin squarely about 4 in. from the ground and the ball dropped into the hole. The fifteenth is a 120 yards blind hole with a bogey of 3.

Following the resignation of Mr. J. D. Peattie, distribution development engineer, in the Manchester Electricity Department, Mr. H. Hawkins, high-tension mains engineer, has been appointed distribution development engineer. Mr. A. W. Crompton, technical assistant, has been appointed assistant distribution development engineer, and Mr. P. T. Fowler, assistant high-tension mains engineer, has been promoted to the position of high-tension mains engineer.

Sir Ernest Benn recently complied with a request, by the organisers of the Electrical Convention, now being held in Atlantic City, that he should make an address for the "Movietone," on the subject of private ownership. On Wednesday morning the following cablegram was received at Bouverie House: "The National Electric Light Association extends to you grateful acknowledgement and thanks for movietone record shown the assembled thousands in attendance at the Convention to-day. The record is excellent, and so carried away was the assemblage with your concise and convincing argument on the superiority of private over government ownership that, then and there, it was unanimously moved that this message of appreciation be cabled to you at once. We wish it were possible to transmit as easily some comprehension of the enthusiasm with which the movie record was received.—Preston S. Arkwright. President."

Obituary.

MR. F. PERCY BALLARD, on May 24th, after an operation. He was for many years on the staff of Marconi's Wireless Telegraph Co.

MR. HERBERT GLEAVE, aged 30 years, chief electrician to the Chemical and Metallurgical Corporation, Ltd. He was previously with the St. Helens Cable and Rubber Co.

MR. JOSEPH JENKINSON, on May 22nd, aged 71 years. He was for about 20 years on the staff of the Urban Electric Light Co., at Grantham, and retired about six years ago. He was formerly a member of Grantham U.D.C.

MR. JOSEPH SHEPHERD, electrical engineer, Bexley, Kent, on May 28th, at the age of 61 years. He was formerly assistant electrical engineer to London County Council. Afterwards he went to Russia as an electrical expert for the British Government. He was at one time chairman of Bexley U.D.C.

Digitized by Google

BUSINESS ITEMS.

MR. H. MCCALLUM, electrician, of Prestwick, Ayr, has removed his business to 2, Boyd Street.

As from June 10th, the address of the Cardiff branch office of PHILIPS' LAMPS, LTD., will be 11, Womanby Street.

HOSKEN, TREVITHICK, POLKINHORN AND CO., LTD., of Truro, have opened new electrical showroom premises.

The GENERAL ELECTRIC CO., LTD., announce price reduction of automobile lamps. Of the thirteen types affected the majority are " BAS " lamps.

Mr. CECIL VEITCH, electrician, of Prestwick, Ayr, has removed his business from 113, Main Street, to Royal Bank Buildings, Gardiner Street.

B.E.N. PATENTS, LTD., 92, Tottenham Court Road, London, W.1, announce that they have received an order for " B.E.N.—Myers " high pressure washers from the L.M. and S. Railway.

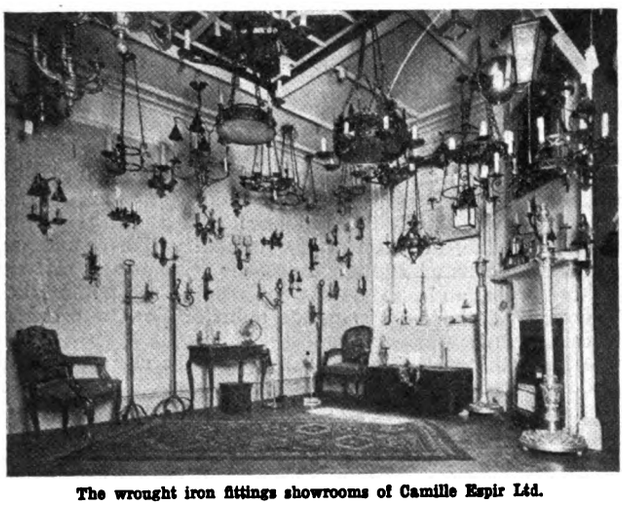
J. G. WHITE AND CO., of 9, Cloak Lane, London, E.C.4, have opened offices in the Equitable Trust Company Building, 39, Rue Cambon, Paris, under the management of Mr. R. L. McClure.

The new Gecophone adjustable reed-cone movement, made by the GENERAL ELECTRIC CO., LTD., is now fitted with a cone anchoring attachment. This small addition simplifies the attachment of the cone diaphragm to the armature reed, and will thus be greatly appreciated by constructors.

The Plaza Cinema, Liverpool, has installed floodlighting units similar to those at the Tivoli Theatre, London, and consist of twelve type I.E.2/86 G.E.C. projectors, equipped with gasfilled lamps. The BERKELEY ELECTRICAL ENGINEERING CO., LTD., of 29, Buckingham Gate, London, S.W.1, were the contractors responsible for the scheme.

The lighting installation at the Grosvenor Dancing Academy, Chester, in which approximately one thousand 60 W. type " Osram " colour sprayed lamps are installed, form the basis of a scheme, by Messrs. H. MORGAN, Broughton, Manchester. There are seven circuits operated by a small motor and many colour changes and rainbow effects are obtainable.

At the Tenth Brussels Commercial Fair, held from April 10th to 24th, there were 2 894 exhibitors representing 28 countries, including 1 885 Belgian, 141 Japanese, 144 German, 438 French and 60 British. The chief groups included machinery, etc. (550 firms), electricity, wireless, etc. (221). It is stated that good business was done in the electricity section. The next Fair will be held April 2nd to 16th, 1930.



The wrought iron fittings showrooms of Camille Espir Ltd.

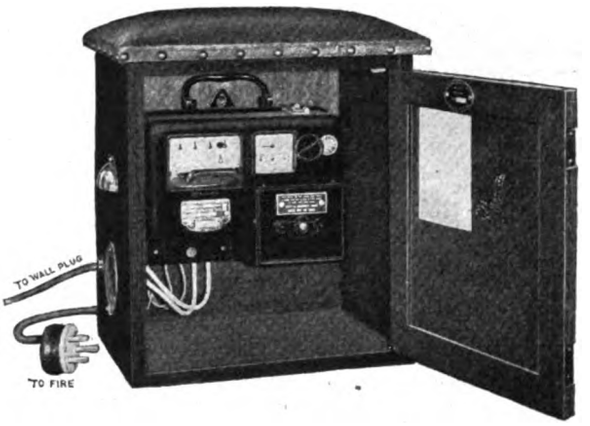
At John Barker's of Kensington, PHILIPS' LAMPS, LTD., were responsible for the whole of the arrangements for the announcing of results to the crowd which had congregated both in the Restaurant and Display Hall in order to hear the election results. A special control room was established on the fourth floor, from which were controlled the loud-speakers in the restaurant and display hall. Results were received ov r a special wire, and were transmitted to the control room, where they were announced, thence passing through a eries of amplifiers, finally emerging from the speakers. Between the results, the audiences were entertained by gramophone music relayed by the same means. The apparatus comprised two 50 W amplifiers which were driven from the a.c. mains together with a microphone, and " A " amplifier.

See page 706.

PORTABLE METER BOXES.

Interesting Device of the Brompton and Kensington Electricity Supply Co.

THE Brompton and Kensington Electricity Supply Co., Ltd., has sent us particulars of a portable meter box (Patent No. 25 866), which is designed to assist in increasing the general uses of electricity for heating, etc., in such places as hotels, boarding houses, and so on.



The portable meter box showing the construction.

The apparatus consists of a readily portable box or box-sea fitted with an electric meter, usually upholstered and placed by the fireplace. The ingeniousness of the device lies in the method adopted for connecting it with the circuit supplying the electric fire or other apparatus, the consumption of which it is desired to check or record. The box-seat is fitted with a plug base of a certain size and gauge, into which the plug attached to the flexible cord of the electric fire fits. A flexible cord is taken from the meter box with a plug top attached, which fits into the plug base on the skirting of the room in which the fire is used. This latter base is of a different pattern or gauge to that on the box-seat, so that it cannot be plugged direct into the wall plug base, but must be connected through the medium of the meter box. The box being fitted with a prepayment meter, energy can only be obtained by inserting the requisite coin. The meter box-seat is usually supplied in the form of an upholstered seat, but can be made up in any convenient size, shape or material, to match furnishings of room, and is thus as unobtrusive as possible. Another design is that of a curb fender with one end fitted as the meter box, and the other end can be used for the reception of kettle and utensils for heating water, milk, etc., used on boiling ring of the hotel pattern radiator. This curb can be arranged for the pins of plug to protrude and go straight into the flush plug base on wall, and flexible cord dispensed with. The insertion of coin is through a small aperture in the door, which is kept locked until the coin receptacle is emptied by the proprietor.

The advantage of the device is that, in hotels and boarding houses, when a guest desires to have an electric fire, it is sent to the room (with prepayment meter) all ready for use. In addition, when the fire is not required, it can be removed complete with the meter box. In this way the proprietor need only provide as many meters as the fires actually required, with a consequent saving in cost. The cabling for the fires can also be simplified and " looping " into adjoining rooms easily practicable.

Meters may be calibrated to give a predetermined benefit on the price charged, which not only covers the rental of the apparatus, but gives a satisfactory return to the proprietor. A resetting device is fixed to the meter, so that when the guest leaves, the meter is reset at zero.

York Electricity Committee has received the sanction of the Minister of Transport to the placing of overhead lines in the parishes of Nether Poppleton, Skelton, in the villages of Acaster Malbis, Towthorpe, and at Strensall, Hob Moor and Fulford.—The Committee recommends that rectifying plant be installed in the Groves sub-station at an estimated cost of £1 460.—Sanction has been received to loans of £3 422 for sub-station buildings; £16 390 for mains; £9 935 for plant; £5 000 for transformers; and £30 000 for mains and services.

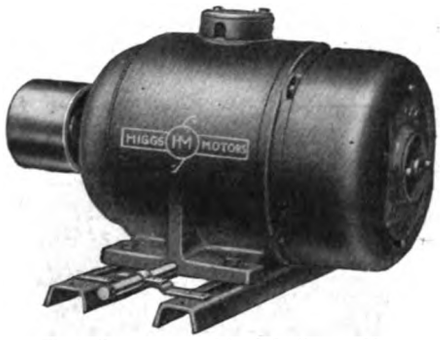
NEW INDUCTION MOTOR.

WE are advised by HIGGS MOTORS (Mr. Walter F. Higgs), of Witton, Birmingham, that they have recently commenced production of a new range of repulsion induction motors of the single-phase type. The machines are suitable for driving line shafting, or for incorporation in air compressors, pumps, washing machines and domestic appliances of all descriptions. They are commercially silent in operation, but the makers point out that they are not recommended for use in household refrigerators or organ blowing. The machines are constructed with a double wound rotor. On the periphery there is a winding somewhat similar to a d.c. armature, connected to a commutator in the usual manner, below this there is a squirrel cage winding. These working in conjunction with one another, develop a high starting torque with a reasonably low starting current. The brushes are permanently on the commutator. The specification of the company's standard a.c. and d.c. motors applies generally to these machines as they are a combination of the two.



Illustrating a new repulsion induction machine, by Higgs Motors.

There are eight different types available, giving powers of between 0·1 and 1 H.P. and speeds between 775 and 1 170 r.p.m., 40, 50 and 60 cycles being catered for. The type MK series is provided with drilled cast phosphor bronze bearings and lubricated by the wool yarn system. The remainder of the series is provided with ball bearings. The type 14k frames are arranged to run in the horizontal position, but should they be required to operate on a wall or ceiling the end cover can be correctly fitted. The types other than 14k can be run on the floor, wall, or ceiling, without alteration, as they are fitted with ball bearings. The standard rotation is clockwise when viewed from the pulley end, but the rotation can be reversed by a movement of the brush rocker. Instructions are sent with each machine. The limits of variation with respect to supply voltage are plus and minus 5%. The makers state that the machines can be thrown direct on to the line by means of a switch. When a starter is used the motors will develop 35/40% of full load torque with full load current. The starters are designed to pass full load current on the first stud, but this torque will increase as the starter handle is moved over, which, the manufacturers point out, is not the case with squirrel cage single-phase motors.

JOHN BENN HOSTEL.

Distinguished Company to Attend Banquet on June 25th.

LORD MELCHETT has consented to take the chair at the banquet which will be held on June 25th, at the Savoy Hotel, London, on behalf of the John Benn Hostel. This is the second public banquet which the East End Hostels Association has arranged, the first being held two years ago when the Lord Mayor of London presided and the headmaster of Harrow was the principal speaker. On the present occasion there is a brilliant toast list, for the headmaster of Eton, the Dean of St. Paul's, Mr. A. P. Herbert, the Mayor of Stepney, Sir J. Tudor Walters, Sir Ernest Benn and Captain Wedgwood Benn are all on the list of speakers.

Acceptances so far to hand make it certain that a very distinguished company will assemble on this interesting occasion, and the Hon. Sec., Miss F. Robinson, Bouverie House, Fleet Street, will be glad to hear from members of the trade who would like to have seats reserved for them.

The work of the Hostel is well-known to our readers, and it is therefore of interest to record the fact that the Queen has sent a miniature edition of Shakespeare and one or two other special gifts to be sold by auction at the Old English Fair, Chislehurst, on June 13th, on behalf of the John Benn Hostel.

BATTI-WALLAHS' LUNCH.

A Layman's Views on the Electrical Industry.

AT a luncheon of the Batti-Wallahs' Society, held at the Hotel Cecil, London, on May 30th, Mr. H. L. Howard in the chair, Mr. Henry S. Horne gave "A Layman's Views on the Electrical Industry."

One of the first things that struck him was that buildings were rarely given their electrical equipment until after the builder had finished his work. This necessitated a good deal of cutting away and delayed completing the job.

He was also surprised at the variety of voltages at which electricity was supplied. This was an age of standardisation, and the electrical industry needed standardisation as much as, if not more than, any other industry.

Speaking of the recent American investments in British electricity supply undertakings, he said he had asked one of the people concerned in a recent deal if he was not paying a very high price for something yielding only a modest return. "On paper we are," he replied, "but I am confident that the management we put in will in a short time double or treble what has been done in the past." That this was not empty boasting he knew from personal observation, which enabled him to say that many similar enterprises in various parts of the world had so been taken over during the last five years, and that this had generally given rise to a great increase in earning power.

In his view the electrical industry was run too much by technical men with little or no knowledge of commerce. The technical man was naturally important, but that importance seemed to have been exaggerated.

The trouble was that we were not sufficiently adventurous. We looked with complacence on estimates of probable future consumption which were ludicrously small compared with the real possibilities if we only went out for the business.

The consumption of electricity could be enormously increased, but it was desirable to let the consumer know what was being done, how, and why. As a farmer on a large scale he had tried numerous ways to obtain information as to how he could use electricity in farming. If his own difficulty in getting information was general it was not difficult to see why progress was slow.

After visiting several electrical trade exhibitions he thought they were exactly like a Woolworth demonstration.

Propaganda, Mr. Horne continued, was a subject on which he was qualified to speak. When he went out to educate the consumer and the builder about cement he was laughed at by the people in the cement industry; already the propaganda had justified itself.

Yet he had been told that the great electrical industry spent only £30 000 a year on industrial propaganda. A sum of that size was a piffling amount when there were 46 million possible users of the product wanting to know about it. He was not talking as a "layman" when he said that such a small expenditure was like putting money down a sink. If it was possible to take an interesting commodity like cement and spend on advertising it four times the cost of the electrical industry propaganda and reap good results, the potentialities of electricity from the propaganda point of view were tremendous.

He had noticed that practically the only users of electric signs were people who lived by advertising. The electrical advertising field was not even scratched as yet.

The electrical industry had a wonderful future, but like many others it ought to do a little gambling with personality. He believed that if the industry would only take a chance and make more use of the commercial mind it would cover not only Great Britain but the world, and would easily eclipse all existing estimates of consumption.

BRASS ARMOURING WIRE ELECTRIC CABLES.

The British Engineering Standards Association has recently issued a Specification relating to brass armouring wire for electric cables. The wire dealt with is intended primarily for use in the automobile and similar industries. The Specification provides for three sizes of wire and specifies the chemical composition of the material, the tolerances permitted on the dimensions, and the finish; mechanical tests are included, and the procedure of selecting samples for these tests is laid down. Copies of the new Specification, No. 356–1929, may be obtained from the Publications Department, British Engineering Standards Association, 28, Victoria Street, London, S.W.1, price 2s. 2d. post free.

GRAMOPHONE DEVICE.

An Electrically-Operated Self-Winding Mechanism.

WE have received from AUTO-ELECTRIC DEVICES, LTD., of Diamond Works, Brighton, particulars of a device for gramophones which, it is claimed, combines the advantages of both the spring motor and the electric motor. The device is known as the A.E.D. self-winding gramophone (Patent No. 299 645), and consists of an electric motor connected to a spring motor of standard type, by means of a gearbox containing a reduction gear. This gearbox is connected to the winding shaft of the spring motor by means of a coupling consisting of one member fixed to the winding shaft and one sliding member, which is held in engagement by an adjustable coil spring, the actual coupling being effected by two steel balls and sockets. When the spring motor is wound to such pre-determined point that the tension of the main spring exceeds the tension of the spring which keeps the coupling in engagement, the loose member of the coupling is forced back out of engagement with the fixed member, thus freeing the winding shaft of the spring motor from the electric motor. Attached to this winding shaft at its opposite end is a sprocket wheel, the teeth of which engage with a pivot trigger attached to a steel bar which carries the moving member of the electrical switch. Upon the disconnection between the electric motor and the spring motor taking place, the winding shaft of the latter is naturally forced back in a reverse direction by the action of the wound spring. When this occurs, one of the teeth of the sprocket wheel engages with the pivot trigger and moves the switch bar, thus opening the electrical circuit. The pivot trigger is so arranged that in moving, it forces a steel pawl into the path of the teeth of the sprocket wheel, thus checking any further backward movement.

Driven from the gear-wheel of the gramophone spring, via a worm and worm wheel, is a shaft carrying two slotted circular discs, in the slots of which is a yielding pin. According to the time desired between windings, the gear ratio of this member is arranged for the discs to make one complete revolution. In the standard machine this time is approximately three and a half minutes. On the completion of one revolution the floating pin strikes against a projection on the switch bar, is forced to the other end of the slot, and then drives the switch bar forward, thus closing the circuit and re-starting the winding operation. The lay-shaft of the gearbox which connects the two motors is drilled and tapped to take a standard winding handle.

REDUCTION OF CHARGES.

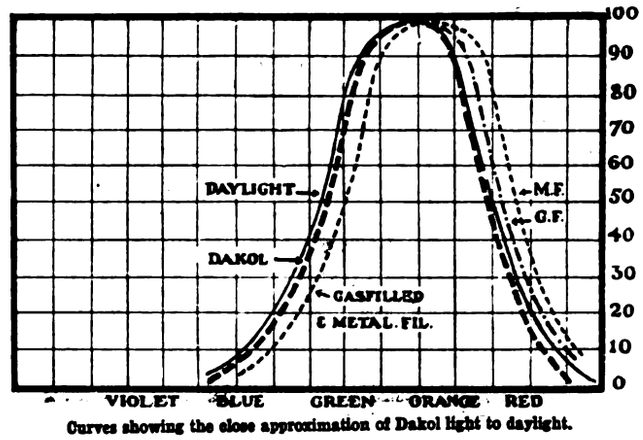
Alterations in Rates to Industrial and Domestic Consumers.

THE following reduced charges for electricity are announced. Figures in parentheses are the former rates:—

Wallingford (*Wallingford and District Electric Supply Co.*), lighting, 10d. (1s.) per kWh; *Rugby U.D.C.* commercial tariff, power, l.t. supply, 1½d. per kWh, with minimum charge of 72 kWh per quarter per H.P. installed; h.t. supply (by agreement), below 50 000 kWh per annum, 1·375d. per kWh; between 50 000 and 250 000 kWh, 1·25d. per kWh; beyond, 1·2d.; business premises lighting, 4½d.; cooking, 1d.; heating, controlled by time switch to keep off peak load, 1d. *Tonbridge U.D.C.*, lighting and power, fixed charge 20% p.a. of rateable value, with minimum charge of £2, to be collected quarterly in advance, plus 1d. per kWh. *Shropshire, Worcestershire and Staffordshire Electric Power Co.*, unit charge under residential tariff reduced by 33⅓% *Bromley* (*Kent*) *Corporation*, "all-in" tariff, private residences 10% of rateable value, plus 1d. per kWh (12½% and 1¼d.); business and non-domestic premises, £12 10s. per annum per kW of lighting installed, plus 1d. per kWh (£12 10s. and 1¼d.). *Llandrindod Wells U.D.C.*, lighting, 7½d. (8d.) per kWh; power, 4d. (5d.); heating and cooking, 1¾d. (2d.) *Blyth* (Northern Counties Electric Supply Co., Ltd.), shop lighting, 6d. per kW (6½d.) with secondary rate of 2½d. per kWh, number of kWh at primary rate to be consumed before secondary rate has effect depends upon floor area of shop; domestic supplies, 6d. (6½d.) per kWh, with sliding scale extending from 6d. to ¾d. per kWh, based on number of rooms. *Fulham* (*London*) *B.C.*, discount allowed on unit charge to large power consumers under kilowatt system, increased from 10% to 12½% on all consumption registered where total account is not less than £2 000 per quarter.

ARTIFICIAL DAYLIGHT.

ALL interested in "daylight lamps" whether for matching fabrics or lighting drawing offices, laboratories or workshops, will do well to examine the productions of DAKOL ELECTRIC, LTD., of 39, Victoria Street, London, S.W.1.



Curves showing the close approximation of Dakol light to daylight.

There is, for instance, a large hexagonal model recommended for art galleries and large showrooms. It is 14 in. wide, and is recommended for use with 300 or 500 W gasfilled lamps.

The accompanying diagram, which is derived from reproductions of spectra, expresses the relative values of the colours in the spectra of North Sky daylight, the Dakol lamp and an unshielded metal filament lamp. The vertical differences between these luminosity curves show the relative values. Thus, in the green, daylight is seen to be about 30% better than a metal filament lamp. It may be remarked that the sensitiveness of the eye to colours depends on the intensity of the source of light. When this is low, as in twilight, the eye becomes more sensitive to the blue end of the spectrum. The curves have the same shape, but are moved bodily to the left, so that the maximum sensitivity, which in strong light would be near the orange part, in weak light is in the blue green.

The method of filtering used in these lamps is quite simple. The light rays pass through two glasses, which are placed one over the other. One glass is blue; the other has been treated with an acid. When ordinary electric lamps are switched off, and Dakol lamps are substituted, at first the light seems to have a bluish tinge. This is, we understand, a momentary optical effect due to comparison with the yellow light.

ELECTRIC TRACTION.

Scottish Tramway Officials Discuss Omnibus and Railways Opposition.

AT the annual conference of Scottish Tramways and Transport Association at Pitlochry on May 24th and 25th, Mr. L. Mackinnon, manager of the Glasgow tramways, read a paper on "Additional Powers," in the course of which he supported the granting to any statutory body, whether municipal or private, the right of transport monopoly or protection within its own area. He also referred to the necessity for the relief of tramway undertakings from their present unfair obligations, and suggested that the tramway speed limit should be increased to 30 miles. Mr. J. Beckett, secretary of the Municipal Tramways and Transport Association, in the course of a paper on "Past and Present Road Passenger Carrying Business," said the conflict of interests seemed to be inevitable so long as we had independent ownership of transport facilities without either the will or the urge to co-ordination or the means of enforcing it. Such an important social service as transport must become a monopoly if it were to be effective and economical, operated out of its own resources without profit. Referring to the omnibus problem, he said local authorities were thrown into an unequal contest. They had antiquated weapons and harsh limitations. Regarding the position as between road and railway transport, he said all the portents pointed to an immense merger of all railway and road transport services. At the annual business meeting, Mr. J. H. Shepherd, of Dunfermline, was elected chairman, and Mr. L. Mackinnon vice-chairman. Mr. Robt. Watson, of Edinburgh, is secretary and treasurer.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, where available.

HALIFAX TOWN COUNCIL, June 7th.—Electrician's work in connection with extension of Shelf Sanatorium. Forms of tender, etc., from the Borough Engineer, Halifax; deposit £1 1s.

ANNOUNCING results with "Philips'" public address equipment at Barker's, London, on election night.

HULL CORPORATION, June 7th.—Electric light installation at Central Public Library. Specification from Mr. D. Harvey, city architect, Guildhall, Hull.

SHEFFIELD CORPORATION, June 7th.—Electric wiring and fitting at Carfield, Firshill, Hunter's Bar, Intake, Lowfield, Woodbourn, Woodseats, and Woodside Council Schools. Specifications, etc., from Mr. W. G. Davies, city architect, Town Hall, Sheffield; deposit £1.

SUTTON AND CHEAM URBAN DISTRICT COUNCIL, June 7th.—Installation of fire alarm system, connected with the fire station. Plans showing positions of fire alarm boxes, etc., from the Engineer and Surveyor.

BRADFORD CORPORATION, June 8th.—Upholstering of fifty sets of tramcar seats. Specification, etc., from Mr. R. H. Wilkinson, 7, Hall Ings, Bradford.

CENTRAL LONDON SCHOOL DISTRICT, June 8th.—Supply of four electric motors, switchgear, shafting, belting, etc. Specification from Mr. G. P. Morrell, clerk to the Managers, Greenford Avenue, Hanwell, London, W.7.

CLYDE NAVIGATION TRUST, June 8th.—Six or 12 months' supply of electrical stores, etc. Form of tender (No. 8) from the Superintendent of Stores, 1, Graving Dock, Govan.

COUNTY OF LANARK, MIDDLE WARD DISTRICT COMMITTEE, June 10th.—Electric lighting works in connection with erection of fifty-two additional houses at Overton Road, Cambuslang. Schedules from Mr. P. C. Smith, Housing and Town Planning Dept., District Offices, Hamilton, until June 10th.

Supply of Lamps.

GLASGOW EDUCATION AUTHORITY, June 10th.—Supply of electric lamps. Specifications, etc., from the Education Offices (Supplies Dept.), 129, Bath Street, Glasgow, C.2; deposit 10s.

CHEADLE AND GATLEY URBAN DISTRICT COUNCIL, June 11th.—Overhead distribution scheme (contract 47) and two e.h.t. truck cubicles (contract 50). Specifications from Mr. R. W. Willis, 37, High Street, Cheadle; deposit £1 1s. for each.

STOCKTON-ON-TEES CORPORATION, June 11th.—Supply of two 1 250 kVA, three-phase transformers and l.t. three-phase switch-gear. Specification, etc., from Mr. S. G. Marston, Electricity Works, Thompson Street, Stockton-on-Tees.

EAST HAM EDUCATION COMMITTEE, June 12th.—Electric lighting installation at the Salisbury School. Specification, etc., from the Secretary, Education Office, Town Hall, East Ham, London, E.6; deposit 10s. 6d.

METROPOLITAN ASYLUMS BOARD, June 12th.—Two electric passenger lifts at Colindale Hospital; fire alarm system at High Wood Hospital for Children, Brentwood; and electric bell system at Casual Ward, Swaffield Road, Wandsworth. Specifications from the Board's Office, Victoria Embankment, London, E.C.4; £1 deposit in respect of each work.

STOKE-ON-TRENT CORPORATION, June 12th.—Supply of 33 000 V overhead transmission lines. Specification, etc., from the City Electrical Engineer, St. George's Chambers, Kingsway, Stoke-on-Trent; deposit £2.

WALTHAMSTOW URBAN DISTRICT COUNCIL, June 12th.—Two natural draught cooling towers and ferro-concrete tank at the Electricity Works. Specification, etc., from Mr. G. R Spurr, Electricity Works, Exeter Road, Walthamstow deposit £1.

E.H.T. Cables.

COLWYN BAY URBAN DISTRICT COUNCIL, June 14th.—Supply, laying and jointing of e.h.t. and l.t. cables. Specification, etc., from the Engineer, Electricity Offices, Colwyn Bay.

LEICESTER CORPORATION, June 14th.—Steam engine, electric power wiring, etc., at Lero Public Wash-house. Specification, etc., from City Surveyor; deposit £2.

FARNWORTH URBAN DISTRICT COUNCIL, June 15th.—Supply of l.t. cables. Specifications, etc., from Mr. A. J. Hutchinson, engineer and manager, Electricity Department, Albert Road, Farnworth, Lancs.

BELFAST CORPORATION, June 17th.—Manufacture and supply of (a) h.t. combined cubicle and truck-type switchgear (Specification W. 85); and (b) transformer kiosks (W. 88); and manufacture, supply, and erection of (c) 1 000 kW rotary convertor (W. 86); (d) 500 kW rotary convertor (W. 87); (e) c.c. switchgear for sub-stations (W. 89); (f) h.t. armour-clad switchgear for sub-stations (W. 90); and (g) h.t. truck-type switchgear for sub-stations (W. 91). Specifications from Mr. F. H. Whysall, city electrical engineer and manager, East Bridge Street, Belfast; deposit £2 2s. for each.

EAST GRINSTEAD URBAN DISTRICT COUNCIL, June 17th.—Supply, laying and jointing of l.t. cables. Specification, etc., from the Clerk, Council Offices, London Road, East Grinstead; deposit £1 1s.

EDINBURGH EDUCATION AUTHORITY, June 17th.—Electrical installation at Colinton, Davidson's Mains, Gilmerton, Granton, Juniper Green, Willowbrae, and Milton House Schools. Specifications from Executive Officer, Education Offices, Castle Terrace, Edinburgh.

SWANSEA CORPORATION, June 17th.—Electrical requirements of Municipal Secondary Schools, Dyevor Place, and De la Beche Street, Swansea. Schedule, etc., from the Borough Architect, 3, Prospect Place, Swansea.

WEST HAM EDUCATION COMMITTEE, June 17th.—Electric light installation at Fyfield Open Air School Extension, near Ongar, Essex.

STOKE-ON-TRENT CORPORATION AND STAFFORD COUNTY COUNCIL, June 22nd.—Electric light and power installation in new buildings at North Staffordshire Technical College, Stoke-on-Trent. Further particulars from the Clerk to the Governors, Town Hall, Hanley; deposit £5 5s.

ACTON EDUCATION COMMITTEE, June 27th.—Electric lighting installations in schools. Specifications from the Borough Engineer, Municipal Offices, Acton, London, W.3; deposit £1 1s.

STAFFORDSHIRE EDUCATION COMMITTEE, July 2nd.—Electric light installation in Kingswinford Brockmoor Council School and in new buildings on the adjoining site. Specification, etc., from Messrs. Moffett, Rosher and Mann, consulting engineers, Union Chambers, Temple Row, Birmingham; deposit £5 5s. Only registered electrical contractors are invited to tender.

LONDON COUNTY COUNCIL, July 8th.—Manufacture, supply and maintenance of (*a*) 150 electric tramcar bodies; (*b*) 150 sets of swing bolster bogie trucks; (*c*) 150 sets of electrical equipment for tramcars, with assembly of bodies, trucks, electrical equipment, etc., into complete tramcars; and (*d*) 150 sets of magnetic track and wheel brake equipments.

Digitized by Google

Specifications, etc., from the Clerk, County Hall, Westminster Bridge, S.E.1 ; deposit £2 for each section or £7 for the four.

SUNDERLAND CORPORATION, July 8th.—Manufacture and supply of 12 months' requirements of (*a*) paper insulated, lead sheathed cable, (*b*) rubber insulated wire, (*c*) consumers, meters, and (*d*) gasfilled and vacuum lamps. Specifications from the General Manager, Electricity Offices, Dunning Street, Sunderland ; 10s. deposit for each section. Applications must state the classes of goods for which specifications are desired.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, July 10th. —Supply and erection at Ironbridge power station of three boilers, each having normal rating of 225 000 lb. of steam per hour, with economisers, air heaters, fans, ironwork, pipework, coal pulverising plant, ash handling plant, etc. Specification (No. 3), etc., from Mr. E. F. Hetherington, chief engineer and manager, Phœnix Buildings, Dudley Road, Wolverhampton ; deposit £2 2s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

VICTORIAN RAILWAY COMMISSIONERS, June 12th.—Supply and delivery of track reactors for power signalling. (Reference B.X. 5 302.)

ANTWERP MUNICIPALITY, June 17th.—Supply of 32 electric travelling cranes for new dock. (Reference A.X. 7 924.)

NEW ZEALAND POSTS AND TELEGRAPHS, June 18th.—Supply of telephone cords (No. P. and T. 151/1425.) (Reference B.X. 5 251.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, June 18th.—Supply of switchboard cable (contract C. 427). (Reference B.X. 5 228.)

JOHANNESBURG MUNICIPALITY, June 20th.—Supply of h.t. and l.t. cables (contract 188). (Reference B.X. 5 342.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, June 20th.—Two 5-ton electrically driven hoist blocks, with overhead conductors, runway girders and switches (tender No. 1 446). (Reference T/A.X. 7 867.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, June 20th.—Supply of one 10-ton and three 4-ton electric level luffing cranes (tender No. 1 437). (Reference A.X. 7 828.)

NEW SOUTH WALES PUBLIC WORKS DEPARTMENT, June 22nd.—Supply and erection of transformers, with certain spares, for Burrinjuck hydro-electric development (contract No. 29/29). (Reference B.X. 5 230.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, June 25th.—Supply of protected type telephone cable terminal boxes (schedule C. 430). (Reference B.X. 5 231.)

POSTMASTER-GENERAL'S DEPARTMENT MELBOURNE, June 25th.—Supply of underground and aerial telephone cable (Schedule C. 443). (Reference B.X. 5 346.)

NEW ZEALAND GOVERNMENT RAILWAYS DEPARTMENT, June 26th.—Supply and delivery of trailing cables for portable electric machines. (Reference B.X. 5 277.)

VICTORIAN RAILWAY COMMISSION, June 26th.—Alternating current power point mechanisms (contract 42 669). (Reference B.X. 5 334.)

VICTORIAN RAILWAY COMMISSION, June 26th (extended from May 15th).—Supply of geared three-phase, electric winding engine. (Reference A. 7 650.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, June 27th.—Supply of 2 200 and 660 V cables and accessories (tender No. 1 466). (Reference B.X. 5 343.)

SOUTH AFRICAN POSTS AND TELEGRAPHS, June 27th.—Automatic wall and table pattern telephones (tender No. 158). (Reference B.X. 5 273.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, June 30th.—Supply of two 5-ton electrically driven hoist blocks, complete with overhead conductors, and switches. (Reference A.X. 7 867.)

VICTORIA STATE ELECTRICITY COMMISSION, July 1st.—Supply and delivery of 44 000 V transformers. (Reference B.X. 5 293.)

LOURENCO MARQUES PORT AND RAILWAYS BOARD, July 8th. —Supply of two 5-ton electric portal cranes (Circular No. 60). (Reference A.X. 7 994.)

STATE ELECTRICITY WORKS, MONTEVIDEO, July 8th.—Construction and equipment of 50 000 kW power station.

POSTMASTER - GENERAL'S DEPARTMENT, MELBOURNE, July 9th.—Resistances and reactances. (Reference B.X. 5 281.)

NEW SOUTH WALES GOVERNMENT RAILWAYS, July 10th.—One 750 kW turbo-alternator ; 2 200 V ironclad switchgear ; two switch operating batteries ; and two motor generator sets. Specifications from the Chief Electrical Engineer, 61, Hunter Street, Sydney.

EGYPTIAN MINISTRY OF THE INTERIOR, July 15th.—Supply and erection at Minia power station of one Diesel engine driven a.c. generating set of 250 kVA. (Reference B.X. 5 331.)

VICTORIAN ELECTRICITY COMMISSION, July 15th.—Two 750 kVA transformers and spares (No. 29/42). (Reference B.X. 5 325.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, July 16th.—Supply of 250 galvanised steel transmission line towers to carry copper conductors, or 190 towers to carry steel-core aluminium conductors. (Reference A.X. 7 735.)

MONTEVIDEO PORT AUTHORITY, July 22nd.—Supply of 300 kilo. electro-pneumatic hammer. (Reference A.X. 7 974.)

Telegraph Instruments.

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, July 23rd.—Telegraph instruments (schedule C. 436). (Reference B.X. 5 323.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, August 6th.—Supply of 120-ton, four-motor, overhead travelling crane and runway (specification No. S.M. 358). (Reference A.X. 7 810.)

NEW ZEALAND POSTS AND TELEGRAPHS, August 7th.—Enamelled and silk covered resistance wire (No. P. and T. 151/1497). (Reference B.X. 5 322.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, August 13th. —Water turbine driven generating sets and switchgear, for Waitaki power development (section 2). (Reference B.X. 5 278.)

EGYPTIAN MINISTRY OF THE INTERIOR, August 13th.—Supply of electric power plant, with underground and overhead network, for the town of Maghagha, Minieh Province. (Reference B.X. 5 318.)

PIETERSBURG (TRANSVAAL) MUNICIPALITY, August 13th.—Supply of h.t. and l.t. cable, lamps and sundries, in connection

TWO views of the stand of A. Reyrolle and Co., Ltd., at the North-East Coast Exhibition, Newcastle-on-Tyne. A description of some of the exhibits was given last week.

Digitized by Google

with extensions of the electricity undertaking. (Reference B.X. 5 312.)

PIETERSBURG (TRANSVAAL) MUNICIPALITY, August 13th.—Supply and erection of steam raising plant, engine, alternators, and switchgear (contract A). (Reference A.X. 7 983.)

AUCKLAND ELECTRIC POWER BOARD, August 19th.—Single-phase transformers. (Reference B.X. 5 324.)

NEW ZEALAND GOVERNMENT RAILWAYS, September 4th.—Supply of motor generator (specification 287). (Reference B.X. 5 308.)

Tenders Accepted.

EMPRESS WORKS, ST. THOMAS ROAD, HUDDERSFIELD.—A. Parker, electrician's work, £89.

BROMLEY EDUCATION COMMITTEE.—G. E. Wallis and Sons, Ltd., electric lighting of school.

WOODSTOCK CORPORATION.—Woodstock Power Syndicate, electric lighting for 1929-30 period.

BARNSLEY GUARDIANS.—Brown and Roberts, electrician's work at the Institution for one year.

EAST HAM CORPORATION.—Bertram Thomas, supply of feeder panel, £416. (Recommended.)

ASHFORD (KENT) URBAN DISTRICT COUNCIL.—Dowling, electric light wiring of 60 houses, £372.

HOLBEACH GUARDIANS.—Bratley and Sons, electrical installation at the Institution, £137 15s.

PLYMOUTH CORPORATION.—Tudor Accumulator Co., Ltd., repairs to storage battery at the mental hospital, £107 5s.

BEDFORD CORPORATION.—Pirelli-General Cable Works, Ltd., main line to Wootton Pillinge, £1 329 (recommended).

BRIGHTON CORPORATION.—Vickers-Armstrong, Ltd., provision of de-aerating plant, for the electricity department, £976.

HASTINGS CORPORATION.—Mirrlees Watson Co., Ltd., electrically driven pumping plant for Kent Street water well, £2 000.

PORTSMOUTH CORPORATION.—Johnson and Phillips, Ltd., supply of h.t. cable, £3 168, and l.t. cable, £6 552. (Recommended.)

WEST RIDING EDUCATION COMMITTEE.—F. Porter, electric light installation in Ardsley (E. and W.) Westerton Council School, £52.

DUNFERMLINE CORPORATION.—A. Rolland and Co., electric light installation in 18 houses on a site east of Townhill Road, Dunfermline, £516.

ESSEX COUNTY COUNCIL.—Christy Bros., Ltd., Chelmsford, laying underground electric cables at Harold Court Sanatorium, £509 12s.

WEYMOUTH CORPORATION.—British Thomson-Houston Co., Ltd., motor generator, £112; Alfa-Laval Co., oil purifier. (Both recommended.)

ALDERSHOT CORPORATION.—Bruce Peebles and Co., Ltd., motor convertor, £3 036; Metropolitan-Vickers Electrical Co., Ltd., switchgear, £524.

YORK EDUCATION COMMITTEE.—H. Mandefield, electric lighting installations at Fulford Road special and open-air schools. (Recommended.)

MAYO COUNTY BOARD OF HEALTH.—G. Delahunty, electric lighting installation in connection with structural alterations at Creagh House, near Ballinrobe.

GENERAL POST OFFICE.—G. E. Wallis and Sons, Ltd., electric lighting at Farnborough, Herne Bay, Pembury, and Southborough Telephone Exchanges.

EAST HAM CORPORATION.—Enfield Cable Works, Ltd., supply of cable, £5 635; Bertram Thomas, supply of h.t. and l.t. switchgear and remote control gear, £3 938.

GILLINGHAM (KENT) CORPORATION.—Callender's Cable and Construction Co., Ltd., cable and transformers, in connection with extensions to Rainham, Wigmore and Hempstead.

CARLISLE CORPORATION.—Supply of cables for 12 months: Metropolitan Electric Cable and Construction Co.; British Insulated and Helsby Cables Ltd., and Macintosh Cable Co.

STEPNEY (LONDON) BOROUGH COUNCIL.—Universal Electrical Mfg. Co., supply of 12 sub-feeder boxes, and 35 two-way and 36 single-way disconnecting boxes, £285. (Recommended.)

WALTON-ON-THAMES URBAN DISTRICT COUNCIL.—Hopkinson, changing-over apparatus, £388 7s. 6d; Blandford, special apparatus for wireless installations affected by the change-over.

BOLSOVER URBAN DISTRICT COUNCIL.—J. Collier and Co., supply and erection of about 50 wooden poles, cables, etc., in connection with the lighting of Whaley Village. (Recommended.)

CHESTERFIELD CORPORATION.—Macintosh Cable Co., Ltd., overhead feeders for New Whittington trolley 'bus extension, £660 16s.; Greenwich Cable Works, Ltd., miscellaneous cables, £683.

BOMBAY CORPORATION.—Balmer, Lawrie and Co., Ltd., supply of electric lamps for 12 months, Rs. 5 392; Greaves, Cotton and Co., Ltd. (Rs. 4 729) and Sharma Trading Co. (Rs. 432) supply of electrical goods.

MANCHESTER CORPORATION.—Etchells, Congdon and Muir, supply of electric bed lift at Abergele Sanatorium; Ferguson, Pailin, Ltd., 33 000 V switchgear, for High Street, Oldham Road, Denton (West) and Droylsden (Ellen Street) sub-stations.

BIRMINGHAM CORPORATION.—Baxter and Impey, electric lighting installation at Edgbaston pumping station. General Electric Co., Ltd., supply of rotary convertor equipment at two sub-stations; Electric Construction Co., Ltd., rotary convertors for Summer Lane generating station and three sub-stations.

MARYLEBONE (LONDON) BOROUGH COUNCIL.—Tudor Accumulator Co., Ltd., renewal of positive plates of battery at Blandford Street sub-station, £2 000; General Electric Co., Ltd., enclosing convertor set at Blandford Street sub-station, £585. (Both recommended.)

WEYMOUTH CORPORATION.—Johnson and Phillips, Ltd., erection of e.h.t. and l.t. equipment for the supply to Weymouth Bay estate, £1 643 8s. 6d.; English Electric Co., Ltd., earthing equipment for two turbo alternators, £325; Ferranti, Ltd., supply of one 50 A rotating standard meter-testing set, £90.

BEXHILL CORPORATION.—Enfield Cable Works, Ltd., supply of cable, six months' renewal of contract; Bertram Thomas, feeder panel for Little Common sub-station, £76, and balancer panel for Ashdown Road works, £68; Crompton Parkinson, Ltd., balancer for Ashdown Road works, £275 4s., regulator £7 7s., and mechanical starter, £9 15s. (All recommended.)

STOKE-ON-TRENT CORPORATION.—Overhead wiring and services to new houses on various estates: Sutton estate, £183 18s. 2d., and Eaton Street, £43 11s. 9d., Barnett and Soans; Cornhill estate, £302 10s., H. Parker, and £359 17s. 6d., E. Holloway; Hanford estate, £176, H. Parker, and £229 12s. 6d., Tomlins, Ltd. Metropolitan-Vickers Electrical Co., Ltd., supply of 1 000 kVA transformers, £570 each.

LONDON COUNTY COUNCIL.—Cox-Walkers, electric light wiring and fitting at Bevington Road School, Kensington, £450. Also tendered: Stegman and Co., £487; Alpha Mfg. and Electrical Co., Ltd., £495; A. Dean and Co., Ltd., £509; J. Briggs, Ltd., £539; Grierson, Ltd., £557; A. Hawkins and Sons, £569; H. J. Cash and Co., Ltd., £569; Electrical Installations, Ltd., £595; L. G. Tate and Co., Ltd., £608; Barlow Brothers and Co., £755; Heath-Pritchard, Ltd., £758.

Supply of Cable.

SHOREDITCH (LONDON) BOROUGH COUNCIL.—Hackbridge Cable Co., Ltd., supply of cable, £4 525 10s. 4d. (recommended). Also tendered: W. T. Glover and Co., Ltd., £4 610 10s. 10d.; British Insulated Cables Ltd., £4 666 3s. 1d.; Pirelli General Cable Works, Ltd., £4 675 8s. 9d.; Siemens Bros. and Co., Ltd., £4 725 10s. 8d.; Union Cable Co., Ltd., £4 745 0s. 2d.; Macintosh Cable Co., Ltd., £4 752 9s.; Standard Telephones and Cables, Ltd., £4 759 17s. 1d.; W. T. Henley's Telegraph Works Co., Ltd., £4 796 15s. 5d.; Greenwich Cable Works, Ltd., £4 828 16s. 8d. Each tenderer stated current market prices for copper and lead on which tender is based, and variation in price per mile for each £1 per ton rise or fall.

GLASGOW CORPORATION.—Annual supplies: Cables, single, Enfield Cable Works, Ltd.; telephone, Callender's Cable and Construction Co., Ltd.; l.t., W. T. Glover and Co., Ltd., Enfield Cable Works, Ltd., and Callender's Cable and Construction Co., Ltd.; e.h.t., Callender's Cable and Construction Co., Ltd., and W. T. Glover and Co., Ltd.; rubber insulated, Craigpark Electric Cable Co., Ltd., and Edison-Swan Electric Co., Ltd. flexibles, Craigpark Electric Cable Co., Ltd.; meters; d.c., Chamberlain and Hookham, Ltd., and Ferranti, Ltd.; a.c. Metropolitan-Vickers Electrical Co., Ltd., Edison Swan Electric Co., Ltd., Ferranti, Ltd., Electrical Apparatus Co., Ltd., and Chamberlain and Hookham, Ltd.; arc lamp carbons, General Electric Co., Ltd.; electric cookers, Siemens Electric Lamps and Supplies, Ltd., and Falkirk Iron Co., Ltd.; electric kettles, Bulpitt and Sons, Ltd.; cast iron boxes, section pillars, etc., James Allan, Senr., and Son, Ltd., Carron Company, Falkirk Iron Co., Ltd., David King and Sons, Ltd., Lane and Girvan, John Needham and Sons, M'Dowall, Steven and Co., and Robert Taylor and Co. (All recommended.)

WORK IN PROSPECT.

ALTRINCHAM.—Extensions, Public Offices, for the Urban Council. Particulars, Mr. F. H. Brazier, 7, Market Street.

ASHBOURNE.—Houses (22). Particulars, E. Morley and Sons, Ltd., Derby.

BILLINGE AND WINSTANLEY.—Houses (20). Particulars, the Surveyor.

BOGNOR.—Masonic Hall, to cost £5 000. Particulars, the architect, Mr. J. Draper.

BOURTON-ON-THE-WATER.—Clinic. Particulars, Mr. R. S. Phillips, Shire Hall, Gloucester.

BROMSGROVE.—Houses (14). Particulars, the Surveyor.

BUCKHURST HILL (ESSEX).—Houses (54), Hurst Road Estate, for Mr. Stokes.

CARSHALTON.—Houses (32), Banstead Road, for Mr. W. Shire.—Houses (14), Waverley Way, for Hill and Seaby.

CHESTERFIELD.—School (240 places). Particulars, Mr. C. A. Edeson, Berryhill Lane, Mansfield.

CIPPENHAM.—School, for Bucks Education Committee. Particulars, the Director of Education, Aylesbury.

CRICKLADE AND WOOTTON BASSETT.—Housing scheme (32), for Rural Council. Particulars, the clerk, Mr. R. C. Hawkes, High Street, Wootton Bassett.

CUMNOCK.—Extensions, including hall, to the Baptist Church. Particulars, the Secretary.

DIDCOT.—School (250 places), for Berks Education Committee. Particulars, the Director of Education, Reading.

EDINBURGH.—School. Particulars, the Director of Education.—Extensions, George Heriot's School, to cost £34 750. Particulars, the Clerk.—Child welfare clinic and nursery school, Prestonfield. Particulars, the Clerk.—Hospital. Particulars, the hon. sec., Mr. R. W. Martin, 5, Hill Street.

HALIFAX.—High school, for the Borough Education Committee. Particulars, the Director of Education.

HEMSWORTH.—Infirmary block, for Board of Guardians. Particulars, the Clerk.

HODDESDON.—Houses (12). Particulars, Mr. William Plumpton.

LEEK.—Church schools, to cost £10 000. Particulars, the Rev. J. G. Halford.

LINCOLN.—Extensions, St. Giles' School (300 places), for the Borough Education Committee. Particulars, Mr. R. C. Minton.

LINCS.—Conversion of Nocton Hall into Mental Institution. Particulars, the Clerk.

MANSFIELD.—Cinema theatre. Particulars from the contractor, Mr. C. H. Hill.

MELTON MOWBRAY.—Extensions, War Memorial Hospital, to cost £18 000. Particulars, Messrs. Herbert, Leicester.

MERTHYR TYDFIL.—Extensions, General Hospital. Particulars, the architects, Johnson, Richards and Rees.

MOSSLEY (LANCS).—Housing scheme (30), for the Town Council. Particulars, the housing surveyor, Mr. G. G. Forster.

NORTHWICH.—Housing scheme (28). Particulars, Mr. J. Birtwistle, Winnington Street.

READING.—Post Office extensions, for H.M. Office of Works, King Charles Street, London, S.W.

STOURBRIDGE.—Church. Particulars, the contractors, T. W. Edwards and Sons, Audnam.

TRADE PUBLICATIONS.

KENRICK AND JEFFERSON, LTD., of West Bromwich, have sent us a folder dealing with business equipment and furniture.

Sheet No. 42F, describing and illustrating mining specialities has been published by GENT AND CO., LTD., Faraday Works, Leicester.

Folder No. 4150/5, describing the "Cadillac" blower is now available from METRO-VICK SUPPLIES, of Trafford Park, Manchester.

PHILIPS LAMPS, LTD., 145, Charing Cross Road, London, W.C.2, have published list No. 404 dealing with industrial lighting fittings.

BIRMINGHAM ELECTRIC FURNACES, LTD., 55, George Street Parade, Birmingham, have published a new folder relative to "Birlec" furnaces.

Gate-end circuit breakers are dealt with in list No. 49/1, issued by MAVOR AND COULSON, LTD., 47, Broad Street, Mile End, Glasgow.

List No. W.233 dealing with radio receivers has been issued by the WHOLESALE FITTINGS CO., LTD., of 23/37, Commercial Street, London, E.1.

The DRAYTON REGULATOR AND INSTRUMENT CO., LTD., West Drayton, Middlesex, has issued a provisional list relative to dial thermometers.

The JAMES KEITH AND BLACKMAN CO., LTD., 27, Farringdon Avenue, London, E.C.4, has issued a new folder relating to fans of the ventilating type.

The ELECTRIC HEATING CO., George Street, Croydon, has issued two pamphlets dealing with the "Elect" boiling ring and "Junior" iron, respectively.

We have received from the Z ELECTRIC LAMPS AND SUPPLIES CO., LTD., 73, Newman Street, London, W.1, a newly issued electrical accessories catalogue.

The electrical control of printing machinery is the subject of booklet No. 245, published by BROOKHIRST SWITCHGEAR, LTD., Northgate Works, Chester.

ELECTRIC ART SHADES (1928) LTD., Feering Factory, Kelvedon, Essex, have published a new wholesale price list of lampshades in imitation vellum.

Leaflet No. 287 descriptive of multi-speed squirrel cage motors has been received from BROOKHIRST SWITCHGEAR, LTD., of Northgate Works, Chester.

H. O. SWOBODA, INC., 3 400 Forbes Street, Pittsburgh, Pa., has sent us bulletin No. 160 describing the "Falcon" electrically-heated asphaltum coating tanks.

A.T.M. fire alarm equipment is dealt with in publication No. 84, issued by the AUTOMATIC TELEPHONE MANUFACTURING CO., LTD., of Strowger Works, Liverpool.

Details of a new "Celestion" loud speaker for incorporation in self-contained portable sets are given in a leaflet just issued by CELESTION, LTD., of Kingston-on-Thames.

List X/329, dealing with direction finding equipment type RA76, for marine use, has been published by the RADIO COMMUNICATION CO., LTD., 34/35, Norfolk Street, London, W.C.2.

The BRITISH THOMSON-HOUSTON CO., LTD., Crown House, Aldwych, London, W.C.2, has issued leaflet No. A.G. 281, describing the company's electric gramophone pick-up and tone arm.

ILLUSTRATING a special train prior to its departure from Willesden for Bonnybridge with the oil tanks and component parts for the last three B.T.-H. 132 000 V outdoor oil-immersed circuit breakers for the first sub-station of the eastern ring of the Central Scotland Electricity Scheme.

ELECTRICITY SUPPLY.

Village Lighting—Croydon and Kingston Extensions—Coventry Assisted Wiring Scheme—Expansion of Warrington Area—Congleton's Supply Scheme—Developments at Hastings—Carlisle's Rural Supply Project.

THE village of Friockheim, in the Arbroath district, is to be lighted electrically.

Bideford Electric Light Co. has decided to supply electricity to the parish of Instow.

Leyton T.C. has received sanction to a loan of £24 590 in connection with the change over from d.c. to a.c.

Eastbourne Electricity Committee seeks sanction to borrow £9 496 for main extensions to Willingdon and Wannock.

Lytham St. Annes extension to Warton and Freckleton is expected to be inaugurated by the Mayor on June 18th.

Barking Electricity Committee is to lay additional mains from Axe Street sub-station to the sewage works, at a cost of £3 200.

Accrington Corporation has agreed to supply electricity for the Royal Agricultural Show, at Blackburn boundary, at 2d. per kWh.

Wrexham T.C. has applied for a loan of £800 for constructing and equipping a sub-station at the Abbot leather works and a transformer kiosk at Old Acton smithy.

It has been reported to Malpas R.D.C. that the North Wales Power Co. will have a supply of electricity available for the district towards the end of the present year.

Croydon T.C. has decided to extend the generating station, including new cooling towers, coal handling plant, and switch-rooms, at an estimated cost, including plant, of £300 500.

Coventry Corporation has adopted a scheme for assisted wiring of residences, shops and business premises. Installations will be carried out by members of the Electrical Contractors' Association.

Kingston-on-Thames T.C. proposes to instal further plant at the electricity works, including a 3 000 kW generating set, at a cost of about £43 000, to meet the demand in the borough, and the estimated requirements of Walton-on-Thames and Weybridge.

Barnstaple R.D.C. has requested Bideford and District Electric Light Co. to proceed at once with provision of a supply of electricity for the parish of Instow. Underground cables are to be used along the front, and overhead lines in the back and side roads.

Warrington Corporation contemplates extending its area of supply to Agden, High Legh, and Warburton. Mr. F. V. L. Mathias, the borough electrical engineer, reports that it is likely that the requirements of these areas in three years will amount to 161 000 kWh.

Sanction has been obtained by East Ham Electricity Committee to borrow £3 500 for buildings, £5 526 for mains, and £15 000 for plant.—The Committee has accepted a tender amounting to £3 986 18s. for the erection of a sub-station at Manor Park.

In anticipation of the Commissioners granting an Order, Mr. A. Ellis has been authorised to prepare the specifications and estimates of the cost of an electricity scheme for Congleton. Energy will be taken from the main transmission line to be established by the Joint Authority.

Hastings T.C. has informed Battle R.D.C. of its intention to provide a supply of electricity to Crowhurst, and a committee has been appointed to meet Corporation representatives, for the purpose of making suggestions to preserve the amenities of the district in the erection of overhead lines.

Bournemouth Housing Committee has received from the Bournemouth Branch of the Electrical Contractors' Association an expression of regret that electric lighting is not provided in the Council houses, and a request that the advantages of electricity should be more fully considered on future occasions.

Mr. R. H. Hamilton, managing director of the Northern Light and Power Co., Warrenpoint, intends to apply to the Northern Ireland Electricity Commissioners for an Order authorising the use of land at Ringmacilroy for a generating station. It is proposed to erect overhead lines in Warrenpoint.

Southwark (London) B.C. has authorised capital expenditure of £7 500 on mains and £3 850 on reconditioning of cooling tower, economiser replacements, repair of flues, ducts and fans, retubing, etc., of boilers, steam pipes, repair of condenser electrical replacements, circuit breakers, etc. and battery replacements.

Guildford Corporation has decided to extend mains in the Worplesdon Road district at a cost of £1 658. The Borough Electrical Engineer has received an application from Mr. Hiscock for a supply of electricity to a new estate at Blackheath. In order to give the supply, the mains are to be extended at a cost of £507 10s.

Birkenhead Electricity Committee has received sanction to borrow £2 200 for an e.h.t. main from Upton to Greasby, and £1 360 for extensions of h.t. mains, and switchgear at the Singleton Avenue sub-station.—The Committee is seeking a loan of £1 754 for h.t. main extensions to the Leighton Hall Estate and the Pensby kiosks.

Driffield R.D.C. has decided to oppose the grant of the Buckrose and District Electricity Order to the Holderness Trust, Ltd., on the ground that, while the original proposal was to provide for the whole of the rural district, the compulsory works laid down in the Order only cover the parishes of Bainton, Hutton Cranswick, and Nafferton.

Hull Parks Committee has instructed the City Electrical Engineer to lay cable at a cost not exceeding £180 for the purpose of lighting East Park bandstand electrically.—The Tilworth Grange Institution is to be lighted by electricity and the new pavilion is also to be wired for electric light. The City Architect has been authorised to obtain tenders.

Glasgow Electricity Committee is to extend the 20 000 V switch-house at Port Dundas sub-station at a cost of £2 400. A sub-station is to be erected in Garngad Road, and additional switchgear is to be installed at Byres Road and Cadogan Street sub-stations, at a cost of £2 094. Extensions of distributing mains, at a cost of £16 000, have been authorised.

Hastings Corporation is to extend mains and provide street lamps at a cost of £1 500.—The Electricity Committee is to provide additional supply to Ore Brickfields, Ltd., at a cost of £750.—A supply to Crowhurst is to be provided at a cost of £7 500.—Terms for a bulk supply to the works and mines at Mountfield, Robertsbridge, have been arranged with Gypsum Mines, Ltd.

The Exe Valley Electricity Co. has informed the Dulverton R.D.C. of its application to the Ministry of Transport for consent to use 6 600 V overhead lines for carrying out the Bampton and Dulverton Special Orders. With a view to ultimate linking up with bigger centres of electricity supply, the central section of the line has been designed for a working pressure of 33 000 V.

Carlisle Corporation has applied for loans of £5 000 for meters, £15 000 for mains and services, and £3 500 for mains work and switchgear for an additional supply to the works of Ferguson Bros., Ltd., which necessitates the laying of a new feeder. Application is to be made for an Order to supply to the whole of Carlisle rural district and certain parishes in Brampton rural district.

Battersea (London) Electricity Committee seeks sanction for loans of £10 208 for additional plant for Lavender Hill and Chatham Road sub-station, etc., and £12 665 for changing over from d.c. to a.c. in Albert Bridge Road and Prince of Wales Road.—The Committee has voted £20 000 for laying additional mains and installing further sub-station plant to cope with the increasing demand.

Brighton Electricity Committee has obtained sanction to borrow £17 590 for works in connection with the extension of the North Road sub-station. The Engineer has been asked to report upon a suggestion that the Committee should put into operation a two-part tariff.—The Lighting Committee is seeking consent to the alteration of the system and pressure of the supply to properties in Patcham from 460-230 V d.c. to a.c. 400 V between phases, and 230 V between each phase and neutral; 50 periods.

The Shropshire, Worcestershire, and Staffordshire Electric Power Co. is about to make an interconnection at Oddington with the Wessex Co. At Moreton-in-Marsh and Stow-on-the-Wold underground systems are being laid. An overhead line will be carried from these villages to Banbury, a distance of 20 miles, and intervening villages will be connected, and wayleaves for a line from Redditch to Banbury are being sought. An overhead line is being erected from Stourport to Church Stretton, and work has been commenced on a high power pressure line between Cheltenham and Gloucester.

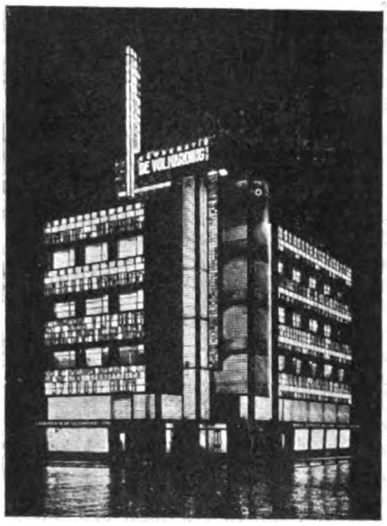
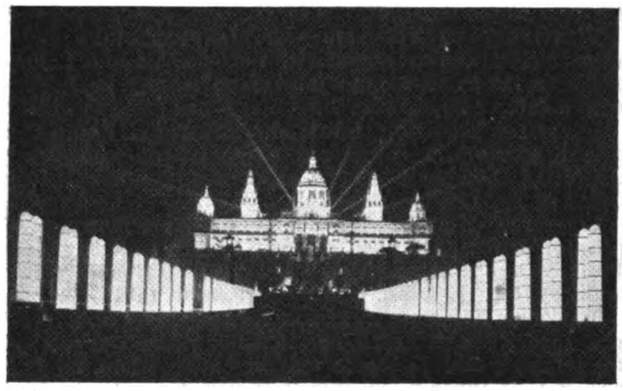
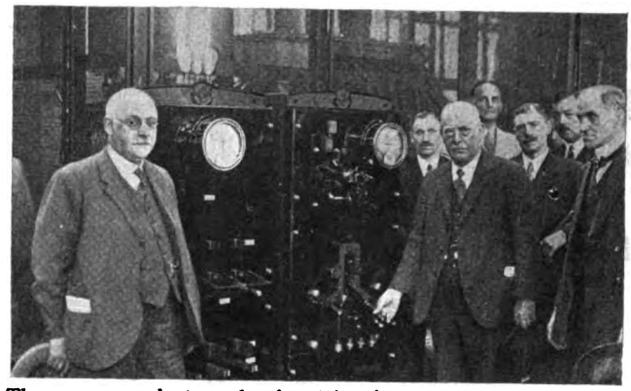
ELECTRICAL NEWS OF THE WEEK IN PICTURES.



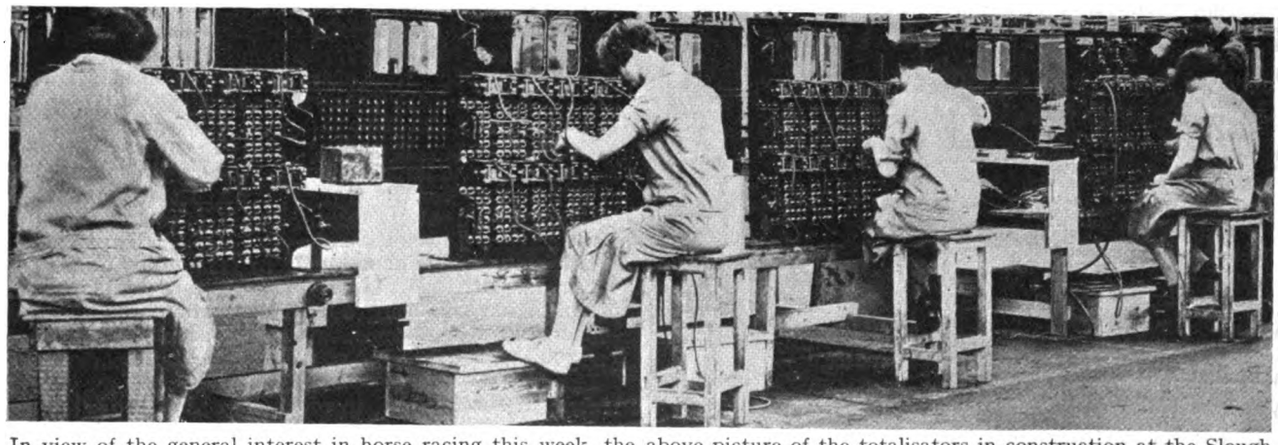
The Vol-Harding Building (left) recently erected in the Hague, is an interesting example of exterior lighting where advertising plays a primary part in the night design of the building. The horizontal bands, built up of glass separated by glazing bars, form the advertising space on the façade. The lettering is only visible when the bands are illuminated from the back. Colour has been introduced in the vertical pylons and also above the shop windows. The total electrical installation is 85 kW, of which 60 kW are used for lighting. The interior uses 700 lamps and the façade lighting 1 400. The day view (right) presents a pleasing and restful building, and there is due variation in the tones of the different materials.



This view, which shows lighting effects rivalling those to be seen at the North-East Coast Exhibition, is of the National Palace at the Barcelona Exhibition. A number of British firms occupy stands at the exhibition, and we understand that quite an appreciable amount of business is being done.



The ceremony last week of putting into service the overhead supply from Stoke-on-Trent to Leek. Amongst those to be seen in the picture are the chairman of Leek Lighting Committee and the chairman of Stoke-on-Trent Electricity Committee. The latter gentleman is at Torquay.



In view of the general interest in horse racing this week, the above picture of the totalisators in construction at the Slough works of the Graham Amplion Co. are of interest. The machines are being built to the specification of the Race Course Betting Control Board, and it is expected that the first one will be installed during the autumn. The wiring up of the lamps and the automatic switches for lighting them, is here seen in progress.

A supply of electricity is to be given by Maidstone T.C. to Teston and Wateringbury, at an estimated cost of £6 500, and, during the summer, mains in the town are to be relaid and other work carried out at an estimated cost of £8 173. The size of the main to the sewerage works is to be increased at an estimated cost of £2 125.

Croydon Electricity Committee has been in negotiation with the Central Electricity Board with regard to extensions for supplying the further needs of the Corporation and for giving additional supplies to neighbouring undertakings, and the committee recommends that it be authorised to obtain tenders for one 20/25 000 kW turbo-alternator, with auxiliaries, foundations, etc., £71 200; one 1 400 000 gall. p.h. circulating water pump, piping and valves, £5 700; boiler house extensions, with two 100 000 lb. p.h. boilers, coal conveyor, coal handling plant, piping, etc., £121 400; engine room extension, switch house, bridges, etc., £23 500; switches, reactors, cables, transformers, etc., £45 000; cooling tower and circulating water culvert, and piping, £26 000; pipe line to cooling towers, pumps, starters, foundations, etc., £5 300; land and fencing for cooling towers, £1 500, for switch house, £400; and for siding extension and coal handling plant, £500. The total estimated cost is £300 500, based on the ultimate development of the site to include a further two 25 000 kW sets.

COMPANY NEWS.

Franco-American Manufacturing Enterprise—International General Electric Co's Agreement with Russian Government—The Marconi £1 Shares — Steady Progress of Lancashire Power Co.—New Companies.

COMPARATIVELY few changes have to be recorded this week in price quotations of electrical shares. In the manufacturing section, English Electrics have risen from 8s. 1½d. to 8s. 9d, but other movements are downward; British Insulateds at 72s. 6d. losing half-a-crown, and Brush Electrical, General Electrics, and W. T. Henley's 1s. 2d. each. Ever Readies have also eased a trifle. Metropolitan Electric Supply ordinary shares have risen 1s. 3d., to 47s. 6d., and Yorkshire Electric Power shares have improved 6d. Eastern Telegraph Stock is a shade easier at 270, but Marconi's are unchanged.

MELBOURNE ELECTRIC SUPPLY CO., LTD.—Intm. div. of 5% on ord. shs. Same as last year.

NATIONAL ELECTRIC CONSTRUCTION CO., LTD.—Net pft. for past year, £17 949. Div. 10%, less tax.

CITY OF BUENOS AYRES TRAMWAYS CO. (1904), LTD.—Div. of 1s. 3d. p. sh. (at rate of 5% p.a.), less tax, for three months ended March 31, 1929, is announced.

INTERNATIONAL TELEPHONE AND TELEGRAPH CORPORATION.—Directors have authorised issue of common stk. priced at $50 a sh., permitting stkhldrs. to subscribe in the ratio of one sh. for each ten shs. held.

WESTINGHOUSE ELECTRIC AND MANUFACTURING CO.—An agreemt. has been concluded with the French firm of Schneider et Cie for the formation of a joint electrical mfg. co. in France, with a cap. of $4 000 000.

BRAZILIAN TRACTION, LIGHT AND POWER CO., LTD.—Qrtrly. div. of 50 cents. p. sh. on ord. shs. of no par value has been declared. London agents: Canadian and General Finance Co., Ltd., 3, London Wall Bdgs., E.C.2.

COMPANIA HISPANO-AMERICANA DE ELECTRICIDAD.—Net pft. for 1928, 50 884 559 pesetas, agst. 43 196 875 pesetas. Fin. div. of 9% proposed on "A," "B," "C," and "D" shs. and 4½% on "E" shs., making 15%, agst. 14%.

RANGOON ELECTRIC TRAMWAY AND SUPPLY CO., LTD.—Net pft. 1928, £58 058, agst. £60 326, after placg. £58 500 to res. for renewals and £4 000 to res. for cables. Div. on £1 ord. shs. R.1 12 annas p. sh. free of Indian tax. Fwd. £20 624, agst. £24 994.

ENGLISH ELECTRIC CO. OF CANADA.—Pfts. for 1928, $243 104, increase $24 527. To depreciatn., $40 000. After allowing for full year's divs. on class "A" stk., pfts. available for class "B" shs. were equal to $2.08 p. sh. Blce. to surplus acct. $143 104.

WESTERN UNION TELEGRAPH CO.—Gross revs., includg. divs. and int., for first three months of 1929, $35 228 385, agst. $32 210 169; total exes. $30 739 675, agst. $28 330 986; int. on bonded debt $902 516, agst. $899 151; net income $3 586 194, agst. $2 980 032.

BOMBAY ELECTRIC SUPPLY AND TRAMWAYS CO., LTD.—Net pft. for 1928, Rs. 4 927 794, plus Rs. 222 838 brt. in. Div. 14%. To reserves, Rs. 251 666; written off rights and concessions, Rs. 40 710; written off exes. of re-extensn. of debs., Rs. 2 000 000; fwd. Rs. 248 256.

INTERNATIONAL TELEPHONE AND TELEGRAPH CORPORATION.—Earngs. for 1928, $81 234 824, agst. $37 228 946, major portn. of increase being due to association with the Mackay properties. Net income, after provision for all charges, £14 596 337, equal to $10.26 p. sh., agst. $11.7 p. sh. last year.

ELECTRIC CONSTRUCTION CO., LTD.—Net pft. for year ended March 31, 1929, £8 738, to which are added £8 043 brt. in and £10 000 transferred from div. equalisatn. fund. Fin. div. at rate of 7% p.a. on pref. shs. and fin. div. at rate of 5% p.a. on ord. shs., both subject to tax. Intm. paymt. on ord. was 3% actual.

AKTIEBOLAGET ELEKTROLUX.—Gross pft. for 1928, 7 993 161 kronor, or 10 933 803 kronor includg. int. received and divs. from subsidiaries. Net pft., 9 123 751 kronor. Provided for taxes, 1 200 000 kronor; to res. 1 000 000 kronor; amortisatn. of patents, 848 577 kronor. Div., 9%. Fwd. 700 968 kronor, agst. 629 319 kronor brt. in.

KALGOORIE ELECTRIC LIGHT AND POWER CORPORATION.—Pft. for 1928 £16 544, agst. £26 841. After addg. £780 bt. fwd. and £446 net repaymt. of inc. tax claimed, and allocatg. £7 000 to deprctn. res., £10 771 available, directors recmd. paymt. of 6%, less tax, on income deb. stk., div. of 6%, less tax at 2s. in £, on ord. shs (same), placg. to res. £1 000, fwd. £622.

MANITOBA POWER CO.—Earngs. for 1928 were equal to $2.65 p. sh., agst. $2.56 p. sh. Gross earngs. $1 218 266, agst. $1 002 290. Deductg. operatg. exes. and adding miscellaneous

Digitized by Google

income makes gross income $1 120 125, agst. $876 784. Deductg. int., taxes, divs., etc., left surplus $23 971, agst. $31 109, makg. with amt. brt. fwd., total surplus of $72 960.

INTERNATIONAL GENERAL ELECTRIC CO.—An agreement betwn. co. and the Soviet Government for exchange of patents and designing, engineering and manufacturing information for ten years is announced. American engineers will be sent to Russia to assist the Soviet Electrotechnical Trust in carrying out plans for the expansn. of the electrical industry in that country.

BRAZILIAN TRACTION, LIGHT AND POWER CO., LTD.—Gross earngs. of co. and its subsidiaries for 1928, $42 774 813, agst. $38 319 989; net earngs. $24 869 330, agst. $22 054 624, plus miscellaneous income $145 933, agst. $50 876. Net blce. to accts. of parent co., $14 762 619, agst. $11 947 669; net pft. $14 121 605, agst. $11 947 669. After paying pref. divs. (four qrtrly. at 1½% ea.) and ord. divs. (two of 1¾% ea. on $100 shs. and two of 44 cts. ea. on shs. of no par value), surplus on year was $6 053 459, agst. $5 001 813; making total surplus $14 947 366, out of which $5 000 000 is placed to res. and $9 947 366 carried fwd.

BAHIA TRAMWAY, LIGHT AND POWER CO.—The trustee (Sir Wm. Plender and Mr. G. Kitchin) and the receiver (Mr. B. H. Binder) on behalf of deb. hldrs. of Bahia Tramway, Light and Power Co. announce that negotiatns. for a settlemt. of the claim of the co. agst. the municipality of Bahia have now been concluded. Arrangemt. provides for cash paymts. spread over three years, and, it is estimated, shd. result in total distributn. to deb. hldrs. of about 30% of nom. amt. of their debs. In 1914 co. agreed to accept paymt. for the business, which was sold to municipality, in the form of 6% bonds, which are held by the trustees for the deb. hldrs. The municipality has defaulted and attempted to repudiate the bonds.

BRITISH ELECTRIC TRACTION CO., LTD.—Gross pft. for yr. ended March 31, 1929, £330 822, agst. £311 908). Deductg. gen. exes. and loan int., £54 348, and deb. stk. int., £79 479, blce. is £196 995. Directors recommend fin. div. of 3% on pref. stk., making 6% for yr., and divs. of 8% on pfd. ord. stk., and 5% on defd. ord. stk., leaving surplus £40 735. Directors recommend that of this blce, £14 788 be capitalised and distributed to def. ord. stkhldrs. in fully paid def. ord. shs. of £1 each, to be converted subsequently into def. ord. stk. Subject to this being approved, pref. stkhldrs. are entitled to further div. of 1·67%, making 7·67% for year, leavg. £14 025 to be added to undivided pfts. acct., makg. that acct. £186 251. Res. remains at £520 000. Investmts. stand at £4 371 392.

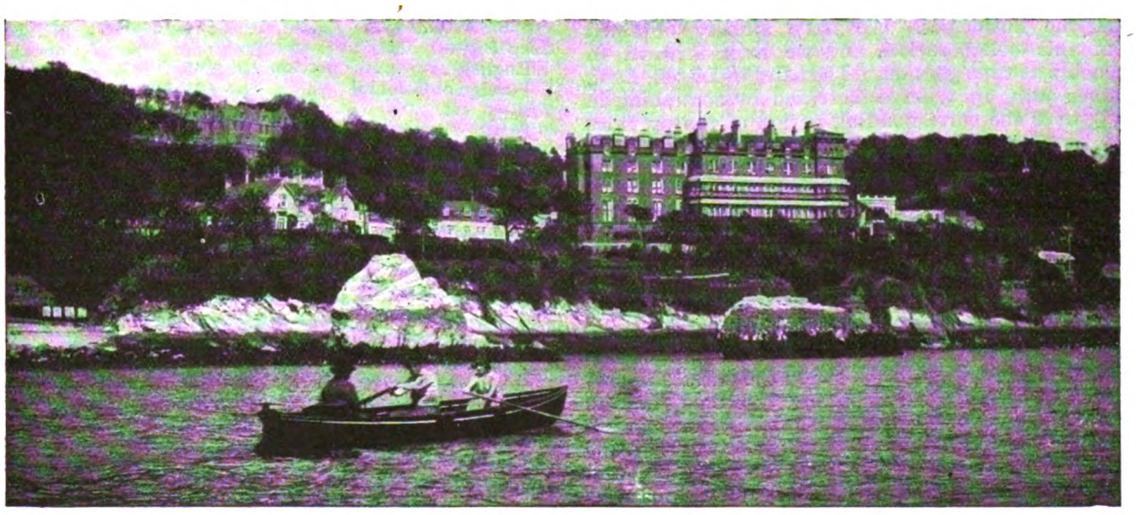
UTILITIES POWER AND LIGHT CORPORATION.—This American Corporation, in its report for 1928, announces its ownership of the Greater London and Counties Trust, which owns the entire capital stock, except directors' qualifying shs. of a number of electricity supply companies in Great Britain. The subsidiaries include the Bedfordshire, Cambridgeshire and Huntingdonshire, the Cookham and District, the East Anglian, the Oxford, Wessex and Western, electric supply companies and Edmundson's Electricity Corporation. The income report of the Utilities Power and Light Corporation shows gross earngs. $43 240 584, agst. $29 180 145; net income of the Corporation and its subsidiaries, $4 496 850, equal to $27·67 p. sh. on pfd. stk. After paying $7 p. sh. on pfd. stk., blce. amtd. to $4.95 p. sh. on class "A" stk., and after paying $2 p. sh. on "A" stk., blce. amtd. to $2·42 p. sh. on "B" stk.

MARCONI ONE POUND SHARES.—The two committees representg. the £1 shhldrs. of Marconi's Wireless Telegraph Co. announce abandonmt. of their plan to issue units against the deposit of £1 shs., in consequence of an intimatn. from the Inland Revenue authorities that the full *ad val.* duty wd. have bn. claimed—i.e., 1% on the market value of the shs. transferred. The committees suggest the substitutn. of a holdg. co. for the proposed deposit with a trustee. Under this scheme an investmt. co. wd. be formed with an authorised cap. sufficient to enable it to exchange its own shs. at par for the shs. of such holdrs. of £1 ord. or £1 pref. shs. of the Marconi co. as might signify their intentn. of supportg. the scheme. The shs. of the investmt. co. wd. be of 5s. ea., and four shs. would be issued in respect of every £1 ord. or £1 pref. sh. of the Marconi Co. Pendg. proceeds. in the High Court for an injunctn. wh. have bn. commenced by a hldr. of £1 shs., the committees will defer such actn. in connectn. with the scheme they now propose as would involve expense.

Company Meetings.

KOLSTER-BRANDES, LTD.—Lt.-Comm. Ellery W. Stone, presiding at the statutory meeting on May 24th, said: We shall be sorry if you go away without making a tour of our works while they are in operation and inspecting the additional facilities now nearing completion. You can confidently lay claim to what is, I believe, one of the best—if not the best—laid-out and equipped radio factories in Great Britain. Our associated company, Kolster Radio Corporation, of America, is enjoying an excellent market for its products and securing an increasing share of the American radio business. Present indications are that the American company's volume of sales will be from 60 per cent. to 70 per cent. greater than last year. In view of the close working arrangements between the two companies, the success of the American company must be reflected in expanded activities for Kolster-Brandes, Ltd. As to Kolster-Brandes, Ltd., the indications are that your directors' prospectus estimates as to turnover and net profits should safely be reached.

LANCASHIRE ELECTRIC LIGHT AND POWER CO., LTD.—Mr. Alfred Shepherd, presiding at the meeting on June 3rd, said the profit of the operating company was £238 514, against £203 734. The maximum load at the Radcliffe station had risen from 48 200 to 51 400 kW and that at Padiham from 13 000 to 16 500 kW. During the year the Parliamentary company had spent £385 069, of which £186 686 was expended on the new Kearsley station. Electricity sold was 206 608 807 kWh, an increase of 17%. The reduction of the average price per kWh on the l.t. system was due to a greater use of electricity for domestic heating and cooking, for which the charge was



A picturesque view of the Imperial Hotel, Torquay, the Headquarters of the I.M.E.A. Council during the period of the Convention.

Digitized by Google

1d. per kWh where the combined lighting and domestic power tariff was adopted. It was anticipated that the first two of the four 42 000 H.P. units at the Kearsley station would be in operation in the autumn of this year. The price at which the issue of shares was made last April, namely, 27s. per share, would show a substantial sum available for reserves. The report and accounts were adopted, and the fixed dividends on the preference shares and a dividend of 7½% on the ordinary shares, with a further dividend of ½% on the 7% participating preference shares were approved.

TELEFONAKTIEBOLAGET L. M. ERICSSON.—At the recent annual meeting the managing director, Herr. K. F. Wincrantz, announced that the total gross annual income exceeded 100 000 000 kronor and that deliveries made during the past year from Swedish telephone and cable works and from the radio co. amounted to about 75 000 000 kronor, an increase since the preceding year of about 25%, in spite of the fact that prices in general during the year decreased somewhat, owing to keen international competition. The foreign works belonging to the co. increased their turnover by 28%. The number of telephone subscribers of the affiliated concession co.s by Jan. 1, 1929, was 141 000, in comparison with 120 000 at the end of 1927, which was equivalent to a net increase of 16%, and the total revenues of the L.M. Ericsson Co., derived from telephone subscription fees now amounted to about 20 000 000 kronor.

Expansion of Business Abroad.

Of the affiliated concession companies, the Mexican one paid a dividend of 10%, and that of Entreriana in South America and the Polish Co., both 10%, while the company in Southern Italy paid 7%. The company had taken over the telephone works in Dorpat, and the Norwegian telephone works Elektrisk Bureau had also been acquired. The L.M. Ericsson concern now had offices,and affiliations in 18 different countries.

EVER READY CO. (GREAT BRITAIN), LTD.—The annual general meeting was held on Friday, May 31st. Mr. M. Goodfellow chairman and managing director, said: We come before you at the end of a year in which the sales and profits of the year constitute a record, and in which the general development of the business has made great progress. Were our industry protected by an import duty, it is true that our development would have been greater still, for our calculations show that portable lamps and dry batteries of all descriptions imported into this country from abroad would, if manufactured in our own factories in this country, employ some 5 000 additional workpeople. We believe that we observe signs among the manufacturers on the Continent of a more rational outlook regarding their exports to this country, which, during the past few years, have been made at unremunerative prices. The share capital issued has been increased from £570 000 to £742 800. The reserves are now £470 000, compared with £225 000 a year ago. We have increased the general reserve from £200 000 to £350 000. The balance on profit and loss account, after the payment of the final dividend, will be £30 696, or a few hundred pounds higher than the sum brought forward from last year. The Lissen acquisition, in the view of your directors, is one of great importance, not only to this company but to Lissen, Ltd. Steps have already been taken to bring about a close collaboration between the businesses. We have already obtained benefits from this collaboration, and we look forward to increasing benefits as time goes on. The sales of Lissen, Ltd., since September 30th, 1928, have increased by something in excess of 25% over the corresponding period of the previous year. The sales of our business for April and May of this year are 25% above the sales of April and May, 1928. The report was adopted and the dividends approved.

MARCONI'S WIRELESS TELEGRAPH CO., LTD.—At the meeting on May 29th, Lord Inverforth, chairman, said the profit for 1927 amounted to £412 971, the estimated comparable figure for 1928 being approximately £408 500. An interim dividend of 20 per cent. had been paid on the ordinary shares in respect of 1927, and a similar dividend for 1928, which dividends would be final. The decision to dispose of the company's interest in what might be called the entertainment side of wireless had been arrived at because the directors were of opinion that the company's principal interest consisted in its wireless traffic services, and in the manufacture and sale of transmitting and receiving stations both for telegraphy and telephony, of broadcasting stations and of wireless apparatus for ships. The report set out in some detail the history of the negotiations which had resulted in the formation of Cables and Wireless, Ltd., and since the issue of the report shareholders had received from the Bank of England, on behalf of Cables and Wireless, Ltd., an offer to exchange their shares for shares in that great new company. The directors might be asked on what ground they justified their action in agreeing to a merger of interest with the cable companies. They had followed the course they did because the Government of this country had decided that the exploitation of the Beam system of wireless telegraphy for Imperial communications was to be taken out of the hands of the company which had invented and developed the system, and was to be made a monopoly of the Post Office. The directors decided that, provided the Government was prepared to agree to the establishment of one comprehensive system of Imperial communication, and to hand over to the company responsible for operating that system the Imperial Beam stations which had been acquired from Marconi's Co. the directors were prepared to enter into negotiations for the merging of the company's interests with the Eastern and Associated Telegraph companies. The terms which had been offered to the shareholders on behalf of Cables and Wireless, Ltd., were such that he felt sure the overwhelming majority of shareholders of all classes would decide to accept. That the directors' action had met with the approval of shareholders was shown by the fact that the board held proxies for over 1 200 000 shares. The allocation of shares in Cables and Wireless, Ltd., amongst the different classes of shareholders of this company had been criticised by certain holders of £1 shares, as to which he would say that the board were satisfied that the allocation was fair having regard to the history of the company and to the equities of the situation. The Marconi Co. would continue to carry on its sales and manufacturing business, and the research incidental and essential to the success of that business. The shares of Imperial and International Communications, Ltd., would be held by the Marconi Co. and by the cable companies, whose shares in turn would be owned by Cables and Wireless, Ltd. The boards of all the companies were to be identical. The directors were confident that shareholders would best be serving their own interests by exchanging their shares for shares in Cables and Wireless, Ltd. The report and accounts were adopted, and resolutions, altering the articles of association with a view to carrying out the plan of the wireless and cable merger were approved.

PEAK SIGNS, LTD.—Cap., £100. Manufacturers of and dealers in daylight, illuminated (electric or other) signs, etc. Secretary: J. J. G. Sowerby, Weir Cottage, Chertsey, Surrey.

C. H. STAVE LTD.—Cap., £1 500. Electrical, wireless, scientific and general engineers, manufacturers of and dealers in electrical apparatus, etc. Reg. Office: 182, Church Street, London, W.8.

SUPRA ELECTRA MOTORS, LTD.—Cap., £10 000. Manufacturers and distributors of and dealers in electric motors, etc. A first director: J. Sinclair-Ross, 1, Morpeth Terrace, Westminster, S.W.1.

PANDONA, LTD.—Cap., £500. Manufacturers of and dealers in wireless receivers and instruments, electric or other advertising signs, etc. Reg. Office: Empire House, 159, Great Charles Street, Birmingham.

DISTRIBUTORS (BRITISH ELECTRICAL), LTD.—Cap., £1 000. To acquire business of a ventilating and general electrical engineer as formerly carried on by E. E. Lee as "Distributors," at 25, Victoria Street, London, S.W.1.

MAJOR, NEWMAN AND SONS, LTD.—Cap., £500. Electrical engineers, manufacturers of and dealers in wireless, telegraphic, telephonic, and electrical instruments, etc. Reg. Office: 34, College Road, Harrow, Middlesex.

BROWN'S HEAT STORAGE AND DRYERS (FOREIGN), LTD.—Cap., £5 000. Manufacturers of and dealers in machinery, plant and tools, electrical engineers, etc. Solicitors: Edwards and Childs, 17, Billiter Street, London, E.C.3.

C. HADDON POUPARD AND CO., LTD. Cap., £1 000. Electrical engineers, manufacturers of and dealers in accumulators and primary batteries, wireless receivers, loud speakers and components. etc. Reg. office: Thermion Works, 50a, Cranbrook Road, Ilford.

H. AND H. DAVIES AND CO., LTD.—Cap., £5 000. To acquire business of H. and H. Davies and Co., and carry on business of electricial and general engineers and contractors, etc. Solicitors: Walter Martin and Co., 8, New Court, Lincoln's Inn, London, W.C.

DISPLAY-MAKERS, LTD.—Cap., £1 000. To acquire business of H. T. Widgery, and to carry on business of designers and manufacturers of and dealers in pictorial window displays, electrical engineers, etc. Solicitor: F. P. Woodcock, 5, Holborn, London, E.C.1.

BUSHING CO., LTD.—Cap., £60 000. Manufacturers of and dealers in insulating materials and articles and products composed of or made from insulating materials of all kinds, electrical engineers, etc. Solicitors: Watson, Burton, Booth and Robinson, Pilgrim House, Newcastle-on-Tyne.

BELCO LONDON, LTD.—Cap., £2 000. To adopt agreement between Belco, Ltd. (by its liquidator), and E. May, and to carry on business of electrical merchants and wholesale dealers, dealers in electric lamps, electric fittings, etc. Reg. Office: 2, Castle Street, London, W.C.2.

PAINTER BROTHERS, LTD.—Cap., £30 000. To adopt agreement with L. E. Painter and R. A. Painter, and to carry on the business of electrical and general engineers, etc., formerly carried on by them as "Painter Brothers" at Hereford. Solicitors: Durrant, Cooper and Hambling, 70/71, Gracechurch Street, London, E.C.

MECHANICAL AND ELECTRICAL ENGINEERING CO. (BIRMINGHAM), LTD.—Cap., £1 000. Manufacturers, importers and exporters of and dealers in electrical and mechanical equipment, wireless, electrical, magnetic, telegraphic, telephonic and other appliances, etc. Reg. office: 18/20, Stafford Street, Birmingham.

YOUNG ACCUMULATOR CO. (1929), LTD.—Cap., £225 000. To acquire undertaking of Young Accumulator Co., Ltd., in a process used in connection with the manufacture of electrical accumulators, to carry on business of electricians, electrical engineers, etc. Reg. Office: 4, Drapers Gardens, London, E.C.2. (Public co.)

HYDRO THERMAL POWER, LTD.—Cap., £50 000. To acquire patents, licences, secret processes or inventions relating to a system of hydro-electric practice of generating power and a combined boiler and accumulator, to erect hydro-electric power stations and machinery, to carry on business of hydro-electric and general engineers, etc. Solicitors: Cohn, Seligman and Bax, 52, New Broad Street, London, E.C.2. (Public co.)

WYNSOR ELECTRIC RANGE CO., LTD.—Cap., £1 000. To acquire undertaking of Windsor Electric Range Co., to adopt agreement with L. Burn, carrying on business as Windsor Range Co., and W. D. Stevens, and to carry on business of manufacturers of and dealers in electrical cookers, radiators, stoves, lamps, service, advertising and flashing signs, electrical and mechanical engineers, etc. Reg. Office: 1, Broad Street Place, London, E.C.2.

HARDYSON RADIO, LTD.—Cap., £5 000. To acquire any patents relating to manufacture of wireless sets, combined wireless and gramophone sets, television apparatus, combined television and sound producing apparatus and instruments, aerials, transmitters, receivers, coils and transformers, and to carry on the business of designers and manufacturers of and dealers in wireless sets, combined wireless and gramophone sets, etc. Solicitors: Cartwright and Fieldhouse, Huddersfield.

ELECTRICAL TRADE MARKS.

LION.—493 863. Class 8: Telephonic loud speakers. Graham Amplion, Ltd., 37, Walbrook, London, E.C.4; manufacturers of wireless apparatus and electrical engineers. August 4th, 1928. (By consent.)

NATURAL TONE (SIGN).—499 816. Class 8. Sound reproducing apparatus. Orchorsol Gramophones, Ltd., 126, New Bond Street, London, W.1.; manufacturers. February 7th, 1929. To be associated with No. 499 986 (2 666) ix. Registration of this trade mark shall give no right to the exclusive use of the words "Natural Tone."

TRANSONIC.—500 040. Class 8. Instruments and apparatus and parts thereof for use in wireless telephony and telegraphy. Frederick George Woodall, trading as F. G. Woodhall, 20, Union Street, St. Helier, Jersey, Channel Islands; dealer in wireless goods. February 14th, 1929.

Opposition to the registration of the following trade marks can be lodged up to June 8th.

"SYMPHONISTA."—499 635. Class 8. Wireless telephonic apparatus and parts thereof, and sound reproducing apparatus and parts thereof. Dulcetto-Polyphon, Ltd., 2 and 3, Newman Street, Oxford Street, London, W.1; manufacturers. February 2nd, 1929. To be associated with No. 344 023 (1 800) and others.

ELODEN.—499 542. Class 8. Fitted electric switchboards, measuring telephonic and telegraphic apparatus and parts threeof. Elodén Muller and Co., Gesellschaft Mit Beschrankter Haftung, Urbanstrasse 67, Berlin, S.59; manufacturers. January 30th, 1929.

499 962. Class 8. Primary and secondary electric batteries and parts thereof. A.F.A. Accumulators, Ltd., 9A, Diana Place, Euston Road, London, N.W.1; manufacturers. February 12th, 1929. To be associated with No. 483 886 (2 587).

SYMPHONION.—499 636. Class 8. Wireless telephonic apparatus and parts thereof, and sound reproducing apparatus and parts thereof. Dulcetto-Polyphon, Ltd, 2 and 3, Newman Street, Oxford Street, London, W.1; manufacturers. February 2nd, 1929. To be associated with No. 344 023 (1 800) and others.

PROCELL.—500 896. Class 8. Electric cables. Mersey Cable Works, Ltd., Linacre Lane, Bootle, Liverpool; manufacturers. March 13th, 1929.

"SYMPHONETTA."—499 831. Class 8. Wireless telegraphic and telephonic apparatus and parts thereof, and sound reproducing apparatus and parts thereof. Dulcetto-Polyphon, Ltd., 2 and 3, Newman Street, Oxford Street, London, W.1; manufacturers. February 7th, 1929. To be associated with No. 344 023 (1 800) and others.

TUNGANITE.—501 329. Class 8. Electric accumulators (not for medical purposes). Walter Haddon, 132, Salisbury Square, Fleet Street, London, E.C.4; type founder. March 27th, 1929. To be associated with No. 501 330 (2 667), xi, and others.

TUNGANITE.—501 330. Class 11. Electric accumulators (for medical purposes). Walter Haddon, 132, Salisbury Square, Fleet Street, London, E.C.4; type founder. March 27th, 1929. To be associated with No. 501 329 (2 667), viii, and others.

Opposition to the registration of the following trade marks can be lodged up to June 15th.

SKARON.—498 975. Class 8. Philosophical and scientific instruments. Timber Goods, Ltd., 164 and 166, Kennington Road, London, S.E.11; manufacturers. January 14th, 1929.

AMPLION LION.—498 850. Class 8. Telephonic loud speakers. Graham Amplion, Ltd., St. Andrew's Works, Slough; manufacturers of wireless apparatus and electrical engineers. January 9th, 1929. To be associated with Nos. 408 176 (2 236), 493 863 (2 666), and others.

LION SPEAKER.—498 851. Class 8. Telephonic loud speakers. Graham Amplion, Ltd., St. Andrew's Works, Slough; manufacturers of wireless apparatus and electrical engineers. January 9th, 1929. To be associated with No. 493 863 (2 666) and others. (By consent.)

RABCO.—501 084. Class 8. Wireless telephonic apparatus and parts. William Vennard, 227, Pentonville Road, King's Cross, London, N.1; manufacturer. March 19th, 1929.

PASSPORT.—501 135. Class 8. Wireless telephonic and telegraphic apparatus and parts. Hart Collins, Ltd., 38A, Bessborough Street, Westminster, London, S.W.1; manufacturers. March 20th, 1929.

THE FORUM (sign).—501 291. Class 8. Wireless telephonic apparatus, and parts. The British Homophone Co., Ltd., 67 to 69, City Road, London, E.C.1; manufacturers. March 20th, 1929

Opposition to the registration of the following trade marks can be lodged up to June 22nd.

AQUAVISOR.—501 201. Class 8. Philosophical and scientific instruments. Radiovisor Parent, Ltd., 26, Coventry Street, London, W.1; manufacturers. March 23rd, 1929.

ELM.—501 223. Class 13. Electric light fittings, reflectors, shades and parts, all being metal goods. Elm Works, Ltd., Elm Works, Summerstown Road, Tooting, London, S.W.17; manufacturers. March 25th, 1929.

TELELECTOR.—501 382. Class 8. Apparatus for use in transmitting sounds and for transmitting and displaying views, scenes, images or messages to a distance by telegraphy or telephony. Baird Television Development Co., Ltd., 133, Long Acre, London, W.C.2; manufacturers. March 28th, 1929.

Opposition to the registration of the following trade marks can be lodged up to June 29th.

DAVCO.—500 684. Class 8. Instruments and apparatus for use in wireless telephony and telegraphy. Daventry and Co., Ltd., Mellings Yard, Friargate, Preston, Lancashire; wireless factors. March 6th, 1929.

THE WARRIOR (sign).—501 032. Class 8. Philosophical and scientific instruments. J. Bridge and Sons, 31, West Warrior Square, Southend-on-Sea; manufacturers. March 16th, 1929.

F. L. BEST.—501 032. Class 8. Philosophical and scientific instruments. Frederic Lafargue Best, 21, Muswell Hill, London, N.10; engineer. March 26th, 1929.

PANATONE.—501 584. Class 8. Philosophical and scientific instruments. British Brunswick, Ltd., 15, 17 and 19, Cavendish Place, London, W.1; manufacturers. April 8th, 1929. To be associated with No. 491 050 (2 623) and others.

PANACHORD.—501 585. Class 8. Philosophical and scientific instruments. British Brunswick, Ltd., 15, 17 and 19, Cavendish Place, London, W.1; manufacturers. April 8th, 1929. To be associated with No. 491 050 (2 623) and others.

MUSIVOX.—501 986. Class 8. Philosophical and scientific instruments. G. F. Billing and Co., Ltd., 41, Cheapside, London, E.C.2; general merchants. April 20th, 1929.

EMBOB.—497 468. Class 13. Electric irons, soldering irons, electric terminals, electric adapters and electric switches, all being goods of ordinary metal for domestic use. Maurice Bobin, 15, Farringdon Avenue, London, E.C.4; merchant. November 27th, 1928.

SONGSTER.—498 706.—6 726 S. Class 8. Sound reproducing and recording instruments. J. Stead and Co., Ltd., Manor Works, Cricket Inn Road, Sheffield; manufacturers. January 4th, 1929. To be associated with No. 392 332—5 730 S. (2 215) and others.

EVOHLION.—499 426—6 731 S. Class 8. Sound reproducing instruments and apparatus and parts thereof. The Standard Export Co., Ltd., 25, Fargate, Sheffield; exporters and importers. January 25th, 1929.

BOGOTA TELEPHONE CO., LTD.—Directors have recd. offer from Cable, Telephone and General Trust to purchase whole of issued ord. shs. at 35s. p. sh.; offer not to be binding unless accepted by May 21 by 75% of the issued ord. shs.

LIMA LIGHT, POWER AND TRACTION CO.—Gross pfts. for 1928, £P.164 910, plus £P.269 brt. in. After paying pref. divs., makg. contributns. to amortisatn. funds and res. fund and providing for directors' remuneratn., a div. of 75 centavos on ord. shs. is recommended. Fwd. £P.1 063.

COMMERCIAL INFORMATION.

County Court Judgments.

[NOTE.—*The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debt. They may be for actions. But the Registry makes no distinction. Judgments are not returned to the Registry if satisfied in the Court books within 21 days.*]

BEASLEY, LTD., 95, High Street, Whitstable, electricians. £21 18s. 2d. April 24th.

BERRY AND HAYWARD, LTD., Granby Street, Nottingham, electrical engineers. £13 12s. 8d. April 24th.

BRITANNIA COMPONENT CO., 296, Oxford Street, Stepney, wireless dealers. £29 4s. 4d. March 20th.

DOMINION SUPPLIES AGENCY, 33, Albert Terrace, Middlesbrough, wireless suppliers. £14 14s. April 23rd.

EAST END ACCUMULATORS DEPOT, 15A, Holborn Street, Plymouth, electrical engineers. £14 6s. 2d. April 26th.

HAMBLING, CLAPP AND CO., LTD., 21, Garrick Street, W.C., electrical engineers. £17 3s. 10d. April 29th.

JOHNSTONE, William H., Wireless Supplies Co., 2, Lichfield Street, Charing Cross Road, W.C., wireless dealer. £22 7s. 2d. April 16.

MASON AND BROWN, Melton Road, Leicester, electrical engineers. £14 2s. April 24th.

METCALFE, Mr. J. E., 55, Fishergate, York, wireless engineer. £16 9s. 4d. April 19th.

TOPPING AND SON, 51, Linden Avenue, Thornton Heath, electricians. £14 9s. April 26th.

Deeds of Arrangement.

TICKLE, Edgar Alex., trading as the WIRELESS DOCTOR, 1, Chatterton Road, Bromley, Kent, wireless dealer. Dated May 27th, filed May 28th. Trustee, W. G. Milton, 329, High Holborn, W.C., accountant. Secured creditors, £18; liabilities unsecured, £901; assets, less secured claims, £269.

GALPIN, Sidney Bernard, 147, High Street, and 9, Gervase Street, Scunthorpe, electrical engineer. Dated May 24th, filed May 31st. Trustee, B. Spooner, 118, High Street, Scunthorpe, C.A. Liabilities unsecured, £1 811; assets, less secured claims, £1 088.

Receiverships.

P. KAY, LTD.—G. C. Jarvis, C.A., of 115-117, Cannon Street, E.C.4, was appointed Receiver by Order of Court dated May 16th, 1929.

C. J. THURSFIELD AND CO., LTD.—W. E. Alldrith, of Sun Buildings, Bennetts Hill, Birmingham, was appointed Receiver and Manager on May 18th, 1929, under powers contained in debentures dated January 8th, May 13th, 1929, and October 10th, 1927.

Mortgages.

[NOTE.—*The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—allowed by the date of the Summary, but such total may have been reduced.*]

L. P. S. ELECTRICAL CO., LTD., London, W.C.—Registered May 15th, debenture, to Bank; general charge. *Nil. December 31st, 1928.

MAXWELL (WILLIAM) AND CO., London, W., electrical engineers.—Registered April 30th, £2 000 charge, to S. T. Hurley, Briar Lodge, Askew Road, Shepherds Bush; charged on Tudor Lodge, 204, Goldhawk Road, Shepherds Bush. *——. March 4th, 1929.

SYMPER AND EVERSHED, LTD., Harrow-on-the-Hill, electrical engineers.—Registered May 14th, £500 debentures; general charge.

VIOZONE, LTD., London, E.C., electrical engineers.—Registered May 13th, £148 4s. 5d., 2nd debenture, to Export Marketing Co., Ltd., 19, Cursitor Street, E.C.; general charge.

Satisfactions.

ELECTRICAL CONTRACTS AND MAINTENANCE CO. (1925), LTD., London, S.W.—Satisfaction registered May 17th. £250, registered March 4th, 1925.

J. J. R., LTD., Wallington, wireless manufacturers.—Satisfaction registered May 13th, £250, registered February 6th, 1928.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

ELECTRIC FACTORS (BLACKPOOL), LTD., wireless and electrical factors, 2, St. John's Walk, Blackpool. The statement of affairs presented at the statutory meeting of creditors in this voluntary liquidation showed ranking liabilities of £3 287, all due to unsecured creditors. The assets comprised fixtures and fittings £20; stock of electrical goods, £606, estimated to realise £522; stock of wireless goods, £833, expected to produce £625; book debts, £1 325, valued at £800; and cash in hand, £16; making a total of £1 983. After allowing £12 for preferential claims, the net assets were £1 971, or a deficiency of £1 316. At the date of the liquidation, there were fourteen suing creditors. The deficiency was accounted for by loss on trading, bad debts, and goods loaned out on hire purchase, in respect of which records were not available. The voluntary liquidation of the company, with Mr. James Todd as liquidator, was unanimously confirmed.

JONES (E. O.) AND SONS, LTD., timber merchants and electricity suppliers, Welshpool. At the statutory meeting of creditors in this voluntary liquidation, a statement of affairs was submitted which showed ranking liabilities of £9 218, and net assets expected to produce £4 412, or a deficiency of £4 806. The company was registered in August, 1925, to take over the business of E. O. Jones and Sons, which was established in 1865. In 1927, when the company moved into new premises, the directors thought it would be a sound business proposition to instal electrical plant for working its sawmill machinery, and the company also entered into a contract to provide a bulk supply of electrical energy to Welshpool. The installation of the necessary electrical plant and machinery was expensive; engines were obtained on the hire purchase system, and an overdraft obtained at the bank. The electrical receipts during the thirteen months to January 31st, 1929, were approximately £440. It was hoped that arrangements could be made for the sale of the electrical side of the business. A resolution was passed confirming the voluntary liquidation of the company.

London Gazette, etc.

Companies Winding-up Voluntarily.

PRESTEIGN ELECTRIC CO., LTD.—J. Stephenson, of Stephenson, Smart and Co., Victoria Hall, Llandrindod Wells, appointed as Liquidator.

RADIO ELECTRIC CO. (BOURNEMOUTH), LTD. By special resolution April 23rd, confirmed April 30th.

VERDON CUTTS AND CO., LTD. By reason of its liabilities, May 27th. C. L. Widlake, 9, Paradise Square, Sheffield, appointed as liquidator. Meeting of creditors at the Institute of Chartered Accountants, Moorgate Place, London, E.C.2, on Thursday, June 13th, at 2.30 p.m.

WORMIT ELECTRIC LIGHT CO., LTD.—W. Anderson and J. F. Fleming appointed as joint liquidators.

Bankruptcy Information.

BLOOD, Ralph, late 20, St. John's Road, Padiham, and now 44 and 46, Station Road, Padiham, Lancs, wireless dealer and electrician. Receiving order, May 27th. Debtor's petition. First meeting, June 10th, 3 p.m., Official Receiver's Office, District Bank Chambers, Blackburn. Public examination, June 18th, 11 a.m., County Court House, Bankhouse Street, Burnley.

HENDERSON, John Arthur (trading as HENDERSONS), of Walton-on-Naze, Essex, electrical contractor, carrying on business at 28A, Basinghall Street, London, E.C. Receiving Order, May 30th Debtor's petition. First meeting, June 12th, 11 a.m., and public examination July 5th, 11 a.m., Bankruptcy Buildings, Carey Street, London, W.C.2.

HUNT, Sydney Everest, Bryanston, St. George's Road, Babbacombe, Torquay, electrical engineer and contractor. First meeting, June 7th, 11.30 a.m., Official Receiver's Offices, Exeter Bank Chambers, Broadgate, Exeter. Public examination, June 27th, 11 a.m., The Castle, Exeter.

SKIPPER, Sydney Harold, trading as S. H. SKIPPER AND CO., 35, Broad Bridge Street, Peterborough, electrical engineer. First meeting, June 11th, 12 noon, Official Receiver's Office, 41, Sidney Street, Cambridge. Public examination, July 12th, 10.45 a.m., Law Courts, Peterborough.

Notices of Dividends.

HYDE, Hubert Algernon, 148, Weston Park, Crouch End, North London, lately at 2, East Street, Bromley, Kent, wireless dealer. First and final dividend, 4s. 1¾d. per £, payable June 14th, Official Receiver's Office, 29, Russell Square, W.C.1.

LAY, Oliver Cecil, accumulator specialist, carrying on business as THE HOME WIRELESS INSTALLATION CO., 2C and 2D, High Street, Wandsworth. First and final dividend 3s. 1d. per £, payable June 19th, Official Receiver's Office, 29, Russell Square, W.C.1.

WISHAW, Bernard Henry, Bakewell Road, Matlock, electrical wireless engineer. First and final dividend 1s. 3d. per £, payable June 18th, Official Receiver's Offices, 22, Regent Street, Park Row, Nottingham.

YEEND, Reginald, 19, Victoria Avenue, Lynn Road, Wisbech electrician, trading as the CENTRAL ELECTRICAL WORKS, lately carrying on business at 57, West Street, Wisbech, and at Red Lion Street, Spalding, Lincs. First and final dividend, 7d. per £, payable June 11th, Official Receiver's Office, 41, Sidney Street, Cambridge.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

309 635 W. S. Smith and N. W. McLachlan, Thermionic and the like amplifiers. (12/1/28.)
309 965 J. L. Baird and Television, Ltd. Television apparatus. (19/10/27.)
310 066 R. W. James (Manhattan Electrical Supply Co., Inc.). Luminous electrical discharge tube. (22/10/27.)
280 919 Siemens und Halske Akt.-Ges. Signalling installations. (16/11/26.)
310 070 W. Fennell. Methods of guarding for overhead electric lines. (19/12/27.)
310 096 Sykes and Dyson, Ltd., P. Sykes, and W. Cooper. Means for distributing electric current. (11/8/28.)
288 236 Electrical Research Products, Inc. Synchronous motors. (6/4/27.)
309 846 A. F. Pollock and D. A. Pollock. Thermionic valve circuits. (16/1/28.)
309 847 Automatic Telephone Manufacturing Co., Ltd., and W. J. Brown. Multi-contact switches for telegraph or like systems. (16/1/28.)
309 884 J. E. Pollak (Hermsdorf-Schomburg-Isolatoren Ges.). Lead-through insulators. (16/1/28.)
288 237 Electrical Research Products, Inc. Systems for converting light energy in electrical energy, and vice-versa. (6/4/27.)
309 890 F. D. Berners and L. Burns. Electrical connectors or adaptors. (17/1/28.)
283 957 Siemens-Schuckertwerke Akt.-Ges. Arrangements for exciting commutator machines cascaded with asynchronous machines. (22/1/27.)
309 897 T. W. Ross, C. Ryder and Associated Electrical Industries, Ltd. Electrical synchronising apparatus. (17/1/28.)
309 898 T. W. Ross, C. Ryder, and Associated Electrical Industries, Ltd. Electrical synchronizing apparatus. (17/1/28.)
310 078 R. Nettl. Electric lampholders. (18/1/28.)
309 936 J. E. Pollak (Hermsdorf-Schomburg-Isolatoren Ges.). Lead-through insulators. (18/1/28.)
309 939 A. J. Haswell and Waygood-Otis, Ltd. Controlling or preventing electrical interference with wireless installations due to the operation of electric motors. (18/1/28.)
283 961 Siemens-Schuckertwerke Akt.-Ges. Means for generating alternating electric current with reciprocating engines as the driving power. (22/1/27.)
288 238 Electrical Research Products, Inc. Television systems. (6/4/27.)
310 081 Soc. Anon. Hasler Ci-Devant L'Atelier des Telegraphes de G. Hasler, and M. Neu. Switching arrangement for zone time-metering in inter-urban telephonic connections chargeable at different rates. (19/1/28.)
283 935 Siemens und Halske Akt.-Ges. Indicating means for electric remote-control installations. (20/1/27.)
288 239 Electrical Research Products, Inc. Television and like systems. (6/4/27.)
283 966 G. Maurer. Electric selective distant-control systems. (21/1/27.)
310 083 R. B. North and A. Massey-Allen. Magneto-electric machines. (20/1/28.)
283 967 Radiotechnique. Thermionic valves and their method of application. (21/1/27.)
310 087 J. E. Pollak (Hermsdorf-Schomburg-Isolatoren Ges.). Electrical insulators. (20/1/28.)
286 638 Associated Telephone and Telegraph Co. Rotary stepping-switches. (7/3/27.)
286 262 Electrical Research Products, Inc. Television and like systems. (2/3/27.)
310 102 General Electric Co., Ltd., A. Kinnes, and J. L. Rycroft. Electric heating resistance elements. (30/1/28.)
310 107 G. Barnard and E. L. Cotterell. Protective covers for underground electric cables. (31/1/28.)
284 626 C. Gaiser. Galvanic cell. (31/1/28.)
310 111 N. Coe and A. Lithman. Electro-therapeutic appliances. (1/2/28.)
301 855 Etablissements Gaiffe-Gallot et Pilon. Electronic discharge bulbs. (7/12/27.)
301 120 Telefonaktiebolaget L. M. Ericsson and E. A. Ericsson. Systems for metering telephone calls. (14/2/28.)
310 127 R. O. Bridger. Sound-reproducers for use in wireless telephony. (20/2/28.)
285 884 Westinghouse Lamp Co. Manufacture of electron-emitting bodies. (24/2/27.)

Current Topics.

The E.H.T. Conference.

THE present month is so occupied with conferences of interest to electrical men that some current events within easy reach of our shores are liable to be overlooked. Such a fate seems to have fallen to the Fifth Biennial International Conference on Large Electric High Tension Systems in Paris, where many important topics have been discussed, and although the attendance of British electrical engineers is this year greater than it has been at any of the previous meetings, the comparative smallness of the British party is apt to give a mistaken impression abroad of the ability of our engineers. The Conference exists for the interchange of information and the free discussion of matters of technical interest between government, municipal, consulting and manufacturing engineers, and also professors and others interested in the many and varied problems associated with the operation of big power systems. The special reports of the Conference, printed in this and the preceding issue of THE ELECTRICIAN, clearly indicate the importance of the matters that have engaged the attention of the delegates, and the subject matter of some of the group papers—of which those dealing with researches on oils may be cited as a typical example—demonstrates the value of international conferences as leading to co-ordinated effort, with concentration by the various participants on certain special factors for the benefit of the other researchers. Another interesting point brought out by the congress is the use which can be made of cinema films for instructional purposes. At one of the sessions Messrs. Brown Boveri showed a series of what might be termed progressive films, by the aid of which, beginning with elementary features, such as the mutual attraction or repulsion of conductors, the tendency of a circuit to enlarge itself to open switch links and so on, can be demonstrated in such a way as to be understood by an average child of elementary school age. The A. E. G. at a later sitting showed instructive films on power transmission, and the design and testing of high tension insulators. It almost looks as if, in the future, when a contract of some magnitude is to be let, rival firms will show films "featuring" the operative and constructional virtues of their wares. Even the proprietors of cinemas at home have some social duties towards their clients, many of whom would be glad of something really interesting as a change from the trash served up by so many film renters. In France and in some other countries several of the more progressive power undertakings are giving cinema shows in towns and villages demonstrating the use of electricity, and in view of the enormous sums now being spent in this country on national education and the poor results so often obtained, films on elementary electricity and kindred scientific subjects would undoubtedly be of benefit to the community.

Our Overseas Trade.

THE favourable trade movement indicated in April showed still more certain signs of existence during May, and although the Board of Trade returns reveal that imports exceeded exports by no less than £25 583 679 during last month, comparison with May, 1928, indicates that the balance has been reduced by £3 452 540. Taking the figures for the first five months of this year, imports increased by £7 513 445 when compared with the corresponding period of 1928, and decreased by £4 413 251 when compared with 1927. Exports for the five months showed an increase of £13 089 489 on last year, and £22 489 627 on 1927. Increases were recorded in May under four of the five divisions compared with the corresponding month of 1928, manufactured goods alone accounting for £6 953 333 out of a total increase of £8 882 122, when compared with May, 1928. The returns for the heavy industries were also satisfactory, exports of coal having improved by £778 729 during May, while under the heading of vehicles, which includes locomotives and ships, an increase of £1 810 820 was recorded. Under the section classifying raw materials every item, with the exception of silk, showed an improvement.

The Electrical Position.

ON the electrical side, detailed figures of which are given elsewhere in this issue, exports for May improved by £250 994, while imports increased by £150 672. For the five months of this year the total electrical exports, by comparison with the same period of 1928, improved by £171 277, while imports increased by £350 057, and though these figures are not as satisfactory as we would like, it is consoling to record that during May last exports were £1 231 559 in excess of imports, while for the five months the favourable balance was £5 132 978. The improvement in May export trade was largely accounted for by shipments of wire and cables, other than submarine, which between them, improved by £176 174, when compared with May, 1928. Various electrical goods and apparatus also showed a considerable increase, the amount in this case being £114 395. Bearing in mind the fact

Digitized by Google

that Whit-Monday was lost as a working day during May these figures may be regarded as satisfactory in spite of the many orders which will have been withheld pending the arrival of visitors from overseas whose destination is the North-East Coast Exhibition.

Radio Trade and the Wavelength Problem.

CONSIDERABLE publicity has been given in the daily Press to the view that the forthcoming wavelength changes will result in many listeners being unable to separate the London and Daventry (5GB) programmes. Had the changes been proposed some four years ago we might have agreed that there was cause for alarm, but the present understanding of the selectivity problem renders any such anxiety unnecessary. The attitude adopted by many daily newspapers to the effect that all existing receivers will shortly become useless is likely to do considerable harm to a trade that is already feeling the annual competition of summer sports, and many sales may be withheld in consequence. No one will buy an expensive receiver believing that in a few months time it will have become obsolete, and though, in fact, there is no foundation for such belief, the sense of caution is already beginning to show itself. Electrical contractors should realise that radio manufacturers have so developed their tuning circuits that the separation of stations whose wavelengths give a difference of over 20 metres is not likely to give difficulty, and can furthermore be demonstrated to potential customers by tuning to stations already operating within that limit. In the case of 2LO and 5GB the difference in wavelengths will be over 20 metres, and, though we do not suggest that the average crystal set or direct coupled valve receiver will give separation, neither of these two instruments should be regarded as efficient in the light of present practice. The all-mains designs, the three and four valve cabinet sets are all, to the best of our knowledge, sharp in their tuning and free from pick-up, and though 2LO and 5GB will be using powers which will give results out of proportion to any comparison which can at present be made, manufacturers have not overlooked the coming of the regional schemes, nor have they neglected the question of selectivity as applied thereto.

An E.T.B.I. Competition.

THAT deserving organisation, the Electrical Trades Benevolent Institution, is to be associated with a competition which we feel sure will not only be popular amongst those directly engaged in the electrical industry but, once attention is drawn to it, also amongst those many crossword and other puzzle enthusiasts outside it. The Committee of the Institution has considered means whereby more funds can be raised, and amongst such schemes which have been decided upon is one which in competition form possesses a desirable electrical atmosphere without requiring of its entrants any specialised electrical training. The competition, in brief, calls for an average general knowledge, and that understanding of road maps which, in these present days, is possessed by almost everyone, in particular motor enthusiasts. The competition is a novel and ingenious idea which has every prospect of being a financial success, and is furthermore being well supported by electrical and other companies in the matter of prizes. The rules are simple and there is no entrance fee, a voluntary donation of half-a-crown to the funds of the Institution entitling one to a competition ticket. The good work done by the E.T.B.I. has already been the subject of comment in these columns, and it is expected that the electrical industry as a whole will not only take an active part in the competition referred to, but will also make a special point of drawing the attention of others to both the contest and the cause it is designed to benefit. That we wish the competition every success goes without saying, for in no instance has the E.T.B.I. failed to give relief to a deserving case, but has, on the other hand, done, with the comparatively little cash available, such good work as to make its members proud of their association with the organisation. The fact that competitions to raise money for the fund are necessary in such an industry as ours is not to our credit; let us make sure, then, that the contest will be such a success, that the publicity given to the Institute will be so wide, that at no future date will a similar scheme be necessary.

Illumination Design Courses.

THE large attendance at the Nineteenth Illumination Design Course of the E.L.M.A. Lighting Service Bureau, which was held last week, is testimony to the appreciation of the value of such courses. Of the total of 120 attending, the electricity supply interests contributed 24, electrical contractors 50, and manufacturers 46. When it is remembered that of these numbers many were compelled to stay at hotels during the period of the course, at their own, or their employers', expense, it will be realised that the question of illumination is one which is being very seriously considered by all branches of the industry, and rightly so. The course just concluded is voted the most successful yet held, and it is due in no small part to the enthusiasm of the Lighting Service Bureau that such attendances and interest are possible. The teachings of the Bureau have already made their mark in many directions and the forms of illumination now being installed, by contractors in the domestic, commercial and industrial worlds all show with striking clearness the shortcomings of the older methods. The illustrations which we produce from time to time of lighting effects designed by the E.L.M.A. Lighting Service Bureau, and others, indicate the trend of modern thought in the matter of illumination, and with a view to still further developing this side of the industry the Designs Courses are invaluable. The Lighting Service Bureau is deserving of congratulation and every encouragement, as also are those who were enterprising enough to sacrifice their time and money in order to attend last week's course in the cause of better lighting.

Electricity Supply Statistics.

THE engineering and financial statistics of the electricity supply industry, just published by the Commissioners and reviewed elsewhere in this issue, show that since the last return the numbers of undertakers holding powers of supply has increased from 593 in 1925-26 to 621 for 1926-27, the year under review. Of the latter number 367 were local authorities and 247 company undertakings. The stage of development attained by these undertakings in 1926-27 was represented by a connected load of approximately 185 W per head of estimated population, a maximum demand of about 74 W, and the sale to consumers of 133 units per annum. The total capital expended at the end of 1926-27 on such development represented an average of over £5 per head of total population, 42% being in respect of generation and 58% in respect of transmission, distribution, etc. The production of public supply involved the operation, by local authorities, of as many as 482 generating stations, containing an aggregate 4 682 069 kW of plant of which upwards of 98% was steam driven. With regard to the concentration of generating plant, 61% was contained in 57 stations, each having an installed capacity of 25 000 kW or over, and 39% was distributed between the remaining 425 stations, of which 198 had an installed capacity of less than 1 000 kW each. A net addition of about 260 000 kW was made to the plant capacity of authorised undertakings during the year 1926–27 as compared with an average annual increase of about 360 000 kW in the previous five years. Further progress was made in the equipment of generating stations with large modern units of plant and at the end of 1926-27 about 40% of all the plant installed consisted of steam turbo alternator sets having capacities of 10 000 kW or over. The industry was responsible for the direct employment of nearly 49 000 staff and workmen, this being an increase of about 3 900 in the number employed as compared with an average increase of 3 000 in each of the preceding years. The industry thus involved, on an average, ten persons for every 1 000 kW of generating plant installed.

THE HIGH TENSION CONFERENCE IN PARIS.

Insulation Problems in Connection with H.T. Synchronous Generators—Dielectric Losses in Relation to Temperature—The Use of Auxiliary Insulating Tubes.

By THEODORE RICH, A.M.I.E.E.

(*Continued from page 729.*)

THE INSULATION OF LARGE HIGH TENSION SYNCHRONOUS GENERATORS.—By G. J. T. Bakker (of the Electricity Supply Services at the Hague) and J. C. Van Staveren (Director of the Association of Power Enterprise Managers of Holland).—This paper is the outcome of discussions on generator insulation which took place at the 1927 conference, when objections were raised regarding the testing of generator windings to high tensions as tending permanently to injure the insulation. The authors took up the investigation regarding coil insulation improvement and the means by which improved coils could be incorporated in machines.

The authors are of opinion that the pressure tests accepted by the International Electrotechnical Commission of twice the working pressure plus 1 000 V for several minutes is not sufficient. Objections have been made to such increased insulation as may be necessary to stand higher tests, on the ground that heat dissipation is checked and the mechanical strength of end winding due to the increased extension of the conductors beyond the stator ends is decreased.

The authors are not in agreement with such objections, as an intermittent earth in a junction box or through saline deposits on insulators with overhead lines can give rise to over-tensions of comparatively long duration.

In Holland, where the generating pressure is 10 000 V and connection is made direct to large networks without the intervention of transformers, not less than 24% of the generators in operation have had breakdowns, half in stators and half in rotors. These have not all been due to punctures to earth or between turns, but some to mechanical strains resulting from short circuits. Therefore it was found to be absolutely necessary to make improvements in coil insulation. Recently, as the result of an accidental ground on an aerial line of small importance, a large modern generator at the Hague power station was seriously damaged by a short between end-coils.

For some years supply authorities have been gradually raising the dielectric resistance of their networks, but corresponding improvements have not been made regarding the insulation of generators, so that they remain weak points on systems.

The authors have conducted tests on separate insulated bars and coils. Owing to difficulties through infiltration at end turns water is undesirable as a medium for testing, and the difficulty was got over by a layer of soot and lac covered with tin foil, the latter worked into the insulation with brushes. The insulated bar thus prepared is introduced into an artificial generator slot and placed inside an iron tube with plugged ends; the temperature is raised by means of a series of gas jets.

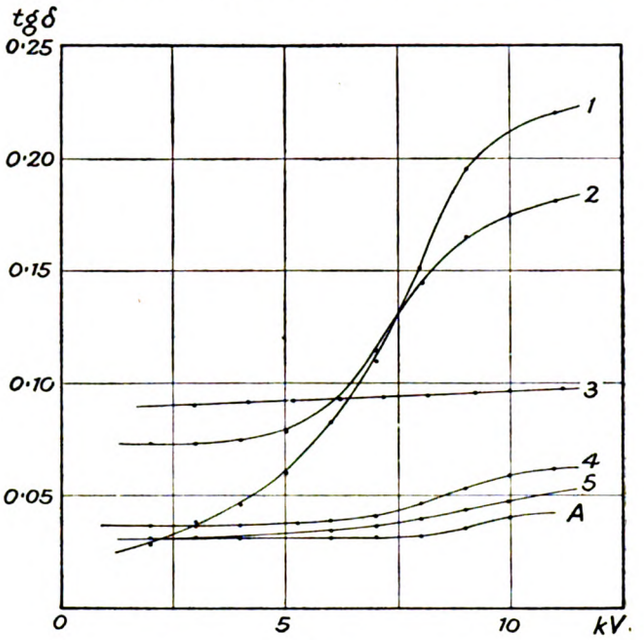

Fig. 1.

Several makers supplied test bars, and tests were made with a Schering bridge with the bars as received at room temperature, at 80 deg. C. (176 F.), and again when cold. The temperature of the bars was measured electrically.

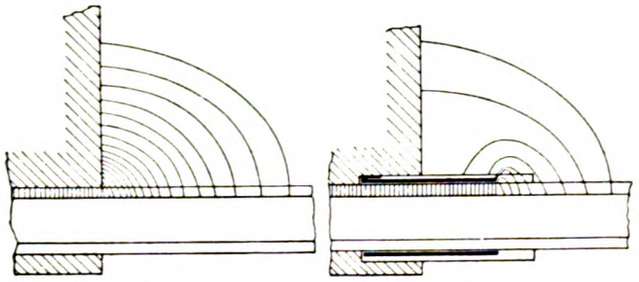
Tests showed that the dielectric losses increased greatly with the temperature returning to values very close to those first observed. This seems to be due to the fact that the slot

One of the sessions of the High Tension Congress at Paris. The modern decorations with the new type of wall lighting fittings of pressed glass should be noted.

Digitized by Google

rigidity prevents delitation as similarly tested bars not in a slot show largely increased losses after heating and cooling have taken place.

It is important to eliminate as far as possible spaces between the mica sheets in which ionization could take place. The improvement on slot insulation can be made with hot irons, but, if carried too far, the mica may be pulverised. Very careful methods, especially with binding machines, can give greatly improved results. Fig. 1 shows tests of slot resistance losses taken at 20 deg. C. (78 deg. F.) made in the works laboratory of a generator maker, the curves 1 to 5 showing successive improvements in slot insulation. The sample tested for curve A was repeatedly ironed. The dielectric losses were reduced but so was the puncture voltage (owing to damage to the mica) showing that a losses test must not be relied on solely. Although tests 3 to 6 are inferior to tests obtainable with h.t. cables they show that, with careful manufacture, bars free from ionisation under working conditions with insulation 5 mm. thick can be made suitable for working pressures of 10 000 V and over, although mica is not so liable to attack as the paper in cables. For the bars examined, the tension at which ionisation begins so greatly exceeds the working pressure, that one can now be satisfied that at working pressures and temperatures such difficulties can be avoided, and for the last four generators of 25 000 to 30 000 kVA at 3 000 revs. and 10 000 V, which are on order for stations in Holland, will be satisfactory in this respect. To avoid ionisation between slot insulation and slot surface the former is covered with a semi-conducting layer.



Figs. 2 and 3, showing lines of force with air auxiliary insulating tube with conducting layer, as compared with insulation of normal type.

Tests at 55 000 V.

Further, to judge the quality of insulation, time tests for puncture and flash-over were used. To reduce field stresses the bars and their protruding ends can be covered with a semi-conducting envelope such as silicium carbide. By such means a bar with insulation 5 mm. thick has withstood a test of 55 000 V for 4 hours, and a bar end a similar test of 40 000 V for 4 hours.

Fig. 3 shows lines of force with air auxiliary insulating tube with conducting layer, of a type made by the A.C.E.C. of Charleroi as compared with insulation of the normal type, Fig. 2. The use of auxiliary insulating tubes at the ends of bars tends to increase both their electrical and mechanical resistance.

In the discussion Mr. GOODLET said that a power factor test gives average results only and does not necessarily prove the absence of small bad places or voids which may give trouble in time. He also pointed out that end windings gave more trouble than slot insulation.

Mr. WILCZEK (of Buda Pesth) said that too much reliance on power factor tests might force manufacturers to adopt insulation of a type that might not stand up to temperatures such as 115 deg. C.

Mention was made by M. MAGRINI of h.t. machines which had been at work in Italy for 25 years, despite the fact that dielectric loss tests had never been made. He also mentioned the 33 000 V Parsons-Rosen alternators recently installed in England, at the Brimsdown station of the North Metropolitan Electric Power Supply Co.

M. DARREUS (of Paris) said that the design of alternators had been influenced by the lack of appreciation of factors relative to dielectrics, and that it was only recently that the systematic study and research regarding dielectrics had begun to be carried out in a way comparable to those regarding iron losses which had been taking place for a considerable number of years.

Mr. BAKKER said he believed in a combination of Cos φ and pressure tests. The tight clamping in the slots prevented the trouble of formation of voids through swelling and subsequent cooling.

FRENCH STATIONS USING HIGH PRESSURE AND HIGH TEMPERATURE STEAM. By M. Dubertret, of Paris.—The author pointed out that in accordance with the doctrine of Carnot the temperature range in steam stations is being increased by the use of higher temperatures and pressures and better vacuum at the exhaust end; the theoretical limit of efficiency with 35 deg. C. (0·85 lb. absolute) at the condenser and 300 deg. C. and 1 251 lb. per sq. in. absolute at the steam end, being 38·5% under Rankine's cycle as compared with 31·2% with 200 deg. C. and 16 kg. (227 lb. per sq. in.) absolute, the efficiency being materially influenced by bled steam for feed heating and inter-stage superheating.

During the year 1928 orders were placed with French makers for 34 turbines with an output of 360 000 kW for plant working between 400 and 420 deg. C. and 422 and 570 lb. per sq. in.

Some of these are two-cylinder turbines; others are arranged to supply a mid-pressure range. Material developments have been and are still taking place regarding the efficient combination of the functions of boilers, reheaters, evaporators and de-aerators.

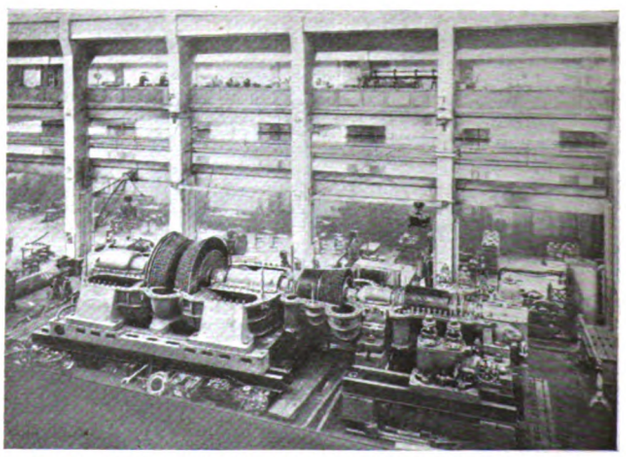
An interesting unit is being installed for the Compagnie Parisienne at Issy-les-Moulinaux. It is of the Brown-Boveri type 35 000 kW capacity at 1 500 r.p.m., and is to be fed with steam at 35 kg. (497 lb.) at 425 deg. C., the feed water being heated up to 170 deg. C.

The operating conditions usually met with in France, especially regarding power and load factors, have not yet justified the use of the much higher pressures to be found in some German and American stations.

The Discussion.

In the discussion, M. MEYER said that beyond 450 to 475 deg. C., there was a tendency for metals to creep, there being a modification of molecular structure tending to shorten life, necessitating the study of special alloys to counteract this effect. It was pointed out that the study of the properties of metals at very high temperatures brings nearer the advent of the gas turbine. M. NICOLINI said he had seen an installation which had been in operation for a year at 100 kg. per sq. cm. (1 400 lb. per sq. in.), and he was informed that the steel used for the pipework, etc., was of a hard commercial quality, 60 to 67 kg. per sq. cm. (38 to 42 tons per sq. in.) resistance.

Senor CARLO CHIODI, of Milan, presented a paper on a filter bridge for measuring alternating current waves, which form a residue beyond those which are perfectly sinusoidal, and on continuous curves of tensions which are not perfectly constant. This paper dealt with a modification of the measuring bridge originally proposed by M. Belfils, which he used for the measurement of the higher harmonics. The power required for the measurements has been made lower than would be otherwise necessary through the adoption of a thermo-couple milliamperemeter in lieu of an electrodynamometer voltmeter. The system is explained and analysed, and examples given. The bridge is so arranged that only currents which are outside those of regular frequency and form pass through the measuring branch.



Three cylinder turbines, 35 000 kW., under construction at the works of the Compagnie Electro-Mecanique (Brown Boveri) at Le Bourget, Paris, for the Issy-les-Moulinaux power station of the Cie Parisienne.

(To be continued.)

ELECTRICITY SUPPLY STATISTICS.*

Electricity Commissioners' Return of Engineering Statistics Covering Authorised Undertakings for Period 1926-27.

THE Return just published by the Electricity Commissioners, of engineering and financial statistics relating to electricity supply in Great Britain, covers all authorised undertakings holding statutory powers at the end of 1926 in the case of company undertakers, and 1926-27 in the case of local authority and other undertakers.

The Return points out that the number of separate undertakings authorised by existing Acts and Orders largely exceeds the number of undertakers holding the powers, but for the purposes of the statistics reviewed it has been necessary to adopt a reduced figure for the number of undertakings in operation. Allowing for cases where the same undertakers hold power of supply not only in England but also in Wales and Scotland, the Return deals with 621 separate authorised undertakers.

At the end of 1926-27 supplies were being given or had been commenced in 566 cases, representing an addition of 30 (19 local authorities and 11 companies) to the number at the end of 1925-26, the period of time covered by the last return. Apart from the Central Electricity Board there were 54 cases in which powers had not been exercised, while in 36 instances the statutory powers of supply were obtained subsequent to 1924. The company undertakings dealt with in the Return include one company possessing bulk supply powers only, and 28 power companies, of which 29 companies, 22 were supplying at the end of 1926-27. In certain of the remaining cases powers were in process of being exercised.

The figures quoted are based upon: (a) Where the component undertakings relate to contiguous areas of supply, they have been regarded as constituting one combined undertaking; and (b) where the component undertakings relate to geographically separated areas with independent sources of supply, they have been counted as separate undertakings.

On this basis, the undertakings of the 339 separate local authorities (including joint boards) who were supplying at the end of 1926-27 are regarded from the engineering standpoint as numbering 339; while those of the 227 separate companies who were then supplying are similarly regarded as numbering 257, making 596 undertakings in all.

Number of Generating Stations.

The generating stations belonging to authorised undertakers in Great Britain, of which particulars are given in the return, numbered 482 in all, local authorities owning 272, and companies 210 stations. The total capacity of the plant installed at the end of 1926-27 was 4 682 069 kW, the division of this total being local authority stations 3 157 031 kW and company stations 1 525 038 kW. The additions to the plant capacity during the year was mainly accounted for by extensions of existing stations, and amounted to 260 467 kW. Of this total 2 821 kW was accounted for by adjustments in the ratings of generator sets included in previous returns. An analysis of the types of prime movers and generating plant installed in all stations, subdivided between the stations of local authorities and of companies, is given and compared with the position at the end of 1925-26, there was an increase of 305 445 kW in the amount of steam turbine plant, a decrease of 55 109 kW in the amount of reciprocating steam plant, and an increase of 9 361 kW in the amount of oil engine plant. The total generating plant installed at the end of 1926-27 was subdivided as follows, namely: A.c. plant, 4 348 400 kW, or 92·88% of the total; and d.c. plant, 333 669 kW, or 7·12% of the total. During the year there was an increase of 298 461 kW in the amount of a.c. plant and a decrease of 37 994 kW in the amount of d.c. plant. The latter comprised units having rated capacities ranging from a minimum of 6 kW to a maximum of 6 000 kW. The a.c. plant comprised units having rated capacities ranging from a minimum of 10 kW to a maximum of 40 000 kW. The predominant sizes of the units installed are given, from which it may be observed that 133 a.c. units of 10 000 kW or over were installed by authorised undertakers, the aggregate capacity of the units in question amounting to 1 875 250 kW, and representing about 40% of the total capacity of the plant installed by all authorised undertakers.

A classification is given in summary form of the voltages of a.c. and d.c. generation at the 482 generating stations dealt with in the return, of which 156 stations generated a.c. only, 103 both a.c. and d.c., and 223 d.c. only. Of the 259 stations at which a.c. was generated, in 159 cases a voltage of 6 000 V or upwards was adopted either wholly or in part, a large majority of these cases representing three-phase 50-cycle generation at 6 600 V. In 15 cases a.c. generation was carried out at voltages below 650 V, and in 76 other cases at voltages below 650 V, and in 76 other cases at voltages ranging between 1 000 and 3 000 V. With regard to d.c. generation, the voltages in the majority of cases ranged from 400 to 550 V, but as many as 65 stations contained d.c. plant generating at pressures not exceeding 250 V. At two company stations d.c. generation was carried out at high tension at voltages over 1 000 V.

The Frequency Position.

The generation of a.c. was carried out by authorised undertakers at 14 different frequencies, the accepted standard frequency of 50 cycles per second being the predominating one and in vogue at 233 stations, the other principal frequencies being 25 cycles (18 stations) and 40 cycles (11 stations). As compared with the position at the end of 1925-26, there was an increase of 218 611 kW in the amount of 50-cycle a.c. plant installed, and an increase of 79 850 kW in the amount of non-standard a.c. plant. The aggregate capacity of the 50-cycle generating plant installed at the end of 1926-27 was 3 338 526 kW as compared with a total of 1 009 874 kW for all other frequencies, representing respectively 77% and 23% of all the a.c. plant installed. The predominating non-standard frequencies of 25 cycles and 40 cycles together accounted for 903 760 kW, or over 89% of the non-standard plant. It will be observed that over 71% of all the a.c. plant installed was three-phase 50-cycle plant.

An analysis of the systems of supply adopted at the 596 undertakings is given in the return, and excluding the Bournemouth undertaking, where supplies were given for public purposes only, the systems of the other 595 undertakings were a.c. only in 177 cases, a.c. and d.c. in 234 cases, and d.c. only in 184 cases. In the case of 20 undertakings (15 local authority and 5 company undertakings) where supplies to ordinary consumers were given on the d.c. system only, generation was carried out wholly or in part on the a.c. system, or an a.c. bulk supply was taken and converted to d.c. for distribution. While a.c. generation was carried out by authorised undertakers at 14 different frequencies, supplies of 16 different frequencies were distributed. In one of the additional cases, a bulk supply at 33⅓ cycles per second was obtained by the undertaker from a railway generating station, and in the second case, where the supply system was in process of being changed from 77-cycle a.c. to 50-cycle a.c., supplies at the former frequency were still being given through frequency changers. At the end of 1926-27, supplies at two or more different frequencies were being given by 21 undertakings, but in a number of these cases steps were in progress by the undertakers to eliminate the non-standard frequencies.

The principal declared voltages at which supplies were given to consumers, including cases of h.t. supplies and of bulk supplies, the predominating voltages for low and medium pressure supplies were: (i) A.c. supplies: 400 V (181 undertakings); 230 V (168 undertakings); 240 V (73 undertakings); and 200 V (69 undertakings). (ii) D.c. supplies: 240 V (133 undertakings); 460 V (113 undertakings); 220 V (91 undertakings); 240 V (80 undertakings); and 480 V (69 undertakings).

The preceding figures include 159 cases (129 local authority and 30 company undertakings) in which a.c. supplies were given at 400 and also 230 V; and 113 cases (86 local authority and 27 company undertakings) in which d.c. supplies were given at 460 and also 230 V. The diverse character of the declared voltages in force at the end of the period covered by this return is indicated by the fact that low and medium pressure supplies at voltages ranging from 100 to 480 V were being given at 35 different voltages in the case of a.c. supplies, and 24 different voltages in the case of d.c. supplies, the total number of declared voltages within the range in question for both classes of supply, taken collectively, being 40. These figures include associated pairs of voltages. It may be noted

Digitized by Google

there were 10 declared voltages exceeding 100 V but less than 200 V, and 17 declared voltages exceeding 200 V but less than 400 V. Taking account of declared voltages ranging from 100 to 480 V only, 206 undertakings (142 local authority and 64 company undertakings) were operating with three or more declared voltages within the range in question, 97 having four or more declared voltages, and 28 having five or more different declared voltages.

Particulars are given of the amount of energy generated and purchased by authorised undertakers during 1926–27, the amount sold in bulk to distributors for retail to consumers, the amount used on works by undertakers, the net sales to consumers, and the amount of energy lost in transmission, distribution, etc., and unaccounted for. The number of the units generated showed an increase of about 5½% on the figures for 1925–26. The total units generated by local authorities and companies respectively were approximately in the ratio of the capacities of the generating plant installed by the two classes of undertakers. The sales to consumers in 1926–27 were nearly 5% more than in 1925–26. The figures bear evidence of the effects of the prolonged coal strike and unsettled industrial conditions in 1926–27, the actual increase of 262 million units sold, as compared with the previous year, showing a marked falling off from the average increase of about 620 million units per annum during the four preceding years. As compared with the previous year the sales of electricity for lighting and domestic purposes increased by 199 million units, while the sales for power purposes showed an increase of 7 million units only.

For Great Britain as a whole, on the basis of the estimated population of 44 million in 1926, the sales of electricity by all authorised undertakers in 1926–27 represented an average consumption of approximately 133 units per head of population, as against 82 units per head in the year 1920–21.

As compared with the previous year, the sales of energy in bulk more than doubled in 1926–27, the actual increase amounting to 616 million units. Of this total, over 400 million units were sold by the London Power Co., Ltd., to its constituent companies.

The figures for 1926–27 represent, on an average, a maximum demand of the order of 74 W per head of the estimated population in 1926.

The statistics indicate that economies continued to be effected in the utilisation of fuel at steam-driven generating stations during the year under review, but that improvements in this direction were more than offset by the increased cost of coal. Public supply undertakings were consumers of coal and coke to the extent of over 7 000 000 tons in 1926-27, and the average cost of such fuel amounted to 31s. per ton, as compared with 18s. in 1925-26. The analyses of the average costs of generation given in the present and previous returns emphasise the importance both of fuel economy and also of fuel cost upon the working expenses of authorised undertakers, and hence upon the prices at which energy can be supplied to consumers.

The total expenditure charged to capital account by authorised undertakings amounted at the end of 1926-27 to £238 727 634, of which 42% was in respect of generation and 58% in respect of transmission, distribution, etc. The average expenditure for all purposes per kW of generating plant installed was £51, the corresponding figures for local authority and company undertakers being £48·4 and £56·2 respectively. The capital expenditure during the year 1926-27 amounted to over £21 000 000, an increase of about 10% on the expenditure at the end of 1925-26. The average revenue in 1926-27 from the working of all authorised undertakings per £100 of capital expenditure amounted to £21·2, this figure being reduced to £19·2 if revenue from the intersale of energy in bulk between authorised undertakers is excluded. The actual revenue in 1926-27 was about £50 000 000, as compared with a figure of about £43 000 000 in 1925-26. The total revenue from working in 1926-27 represented an average of 1·71d. per unit sold, the corresponding figure for the previous year being 1·66d.

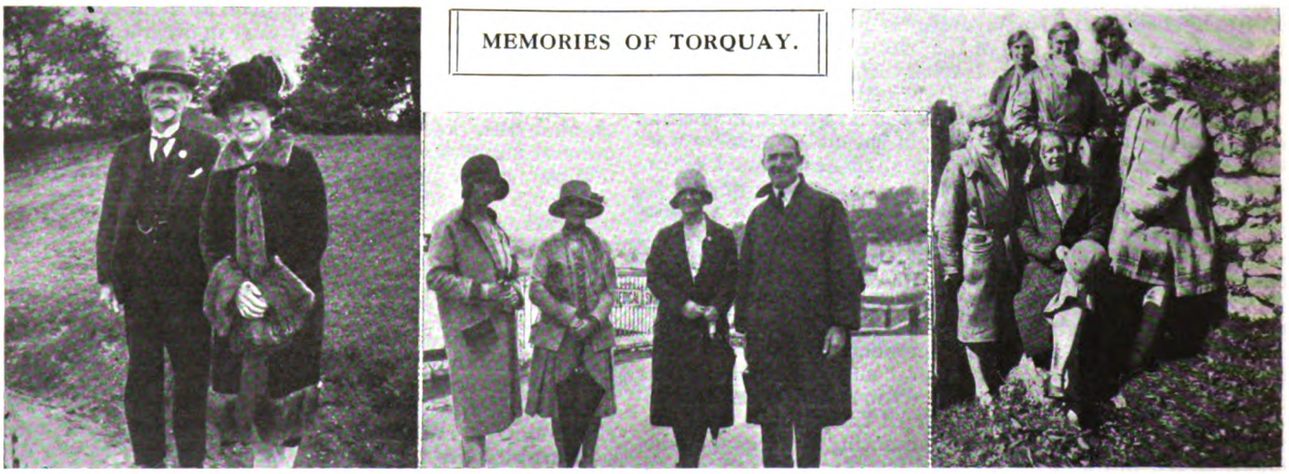
Mainly on account of the higher prices for coal during the year, the total working expenses (including the cost of all energy purchased in bulk by authorised undertakers but excluding capital charges) absorbed 66% of the corresponding revenue from working in 1926-27, as compared with 57% in 1925-26. The outstanding working expense was the cost of generation, this item accounting for over 47% of the total. Of the other principal items, distribution, management, and rents, rates and taxes respectively accounted for substantially equal percentages of the working expenses. The excess of revenue from working over working expenses represented 7·2 on the capital expenditure at the end of 1926-27, as compared with 8·5% in the preceding year.

In the case of local authority undertakers, the gross surplus which in 1926-27 represented 34·8% of the total revenue, was itself appropriated to the extent of 41·9% for interest charges on loans and deposits; 49·7% for repayment of loans and transfers to sinking funds and to reserve and renewals funds; 11·5 % for capital expenditure; and 5·1% in relief of local rates, the latter item representing a net contribution of £551 593. These appropriations involved a decrease of over £890 000 in the balances on net revenue account.

In the case of company undertakers, the gross surplus in 1926 represented 37·7% of the total revenue, and was appropriated to the extent of about 64% for interest charges and dividends, and to the extent of approximately 30% for transfers to depreciation and reserve funds. Some 3% of the gross surplus represented the increase in the balances on net revenue account. The average rates of the preference and ordinary dividends calculated on the corresponding capital raised at the end of 1926 were 5·58% and 7·4% respectively.

The position at the end of 1926-27 was that the capital (or loan) accounts of authorised undertakers were overdrawn to the extent of nearly £12 000 000; the balances in depreciation, reserve and renewals funds, including sinking funds in the case of local authority undertakers, amounted to upwards of £23 000 000; and the balances on revenue account amounted to over £1 800 000.

MEMORIES OF TORQUAY.



THESE snapshots, taken during the I.M.E.A. Convention at Torquay, show left, Mr. and Mrs. Taylor, who entertained members of the Electrical Association for Women on Thursday afternoon; Mr. Taylor is chairman of Torquay Electricity Committee and Mrs. Taylor is to be a member of the proposed new Torquay Branch of the Electrical Association for Women. The centre picture shows Lt.-Col. and Mrs. W. A. Vignoles and Mrs. Wheelwright (Blackburn), while on the right are Miss Partridge, Miss Rowbottam and a group of apprentices.

NATIONAL PHYSICAL LABORATORY.

Novel Exhibits shown on Annual Inspection Day—Many Demonstrations of Measuring Apparatus—New Short Wave Equipment—X-ray Protective Materials—Power Equipment for High Voltages—Standards for Telephonic Frequencies.

THERE was a considerable gathering at the National Physical Laboratory, at Teddington, on Tuesday, on the occasion of the annual inspection by the General Board, when the following experiments and apparatus were shown in the departments named.

ENGINEERING DEPARTMENT: Here were shown an electrical method of integrating the intensity of the pressure of the wind over a large area and an efficiency test of the reverse gear of a heavy lorry gear-box, using a 100 H.P. electric dynamometer and Froude brake. Estimation of efficiency by the torque difference method and apparatus for the determination of the elastic constants of single crystals of tungsten by oscillation methods were also shown, while experiments on the X-ray examination of stressed single crystals; the determination of the rates of creep of nickel-chromium, stainless chrome-vanadium steels and " staybrite " (to 600 deg. C.), duralumin and phosphor bronze (to 500 deg. C.), and Muntz metal (to 350 deg. C.); creep tests on Armco iron to determine the relations between strain hardening, temperature hardening, stress, rate of creep, etc.; creep tests at 800 deg. C. on nickel-chromium and nickel-copper alloys in an atmosphere of hydrogen, and creep tests on a superheater drum steel in superheated steam at 400 deg. C.—500 deg. C, formed other items of interest.

METALLURGY DEPARTMENT: The exhibits here included a study of alloys for use at high temperatures; specimens of cast and wrought alloys prepared at the laboratory; graphs of properties; microstructures of metals and alloys shown as transparencies; methods for the determination of surface tension of molten metals; thermal curves and X-ray crystal structure models; mechanism of age-hardening; a study of the changes in properties during age-hardening in aluminium alloys; potentiometer-type temperature recorders; and methods of making contacts for the study of electrical resistivity at high temperatures.

Measuring X-ray Energy.

PHYSICS DEPARTMENT: Among items to be seen in this department were methods of determining thermal conductivities of furnace materials; specific volumes of refrigerants; thermal and electrical conductivities of alloys up to 800 deg. C. Another exhibit demonstrated sound pulse photography in its application to the acoustics of buildings; and a three-dimensional model of an auditorium for the investigation of acoustical properties was exhibited. Cathode-ray tube apparatus was featured and the measurement of the speeds of vacuum pumps was demonstrated. Other demonstrations were the measurement of the energy of X-rays employing a valve-rectifier and condenser-smoothed generator. Thermal conductivity of insulating materials. Testing of radiation pyrometers; thermo-couple testing equipment was shown, as well as a valve-controlled high-frequency vacuum furnace for determining international standard freezing points at high temperatures. The testing of X-ray protective materials and the investigation of the scattering of X-rays, together with methods of testing X-ray protective materials at voltages above 100 kV on the X-ray tube, were inspected, while X-ray crystal analysis with special reference to industrial problems, the testing of X-ray pastilles and the measurement of X-ray intensities in terms of the International Unit, and alpha-ray tests of radio-active materials were also seen.

ELECTRICITY DEPARTMENT: In this department were shown standard alternating current apparatus in operation; precision current transformers with nickel-iron cores; a precision voltage transformer (ratio 0·5, 1 and 2 to 100 V) with nickel-iron core; 200 A non-inductive air-cooled resistances; a design of mounting of standard oil-sealed resistances for 1 Ω and upwards; precision resistances ranging up to 10 000 Ω constructed of two materials of opposing temperature coefficients, and standard water-cooled resistances for 10 000 A. In the High Voltage Building, power equipment for high voltages, single, two and three-phase was shown, together with apparatus for the measurement of peak voltage; a shielded air condenser for 150 kV; a water tube resistor for 150 kV of zero effective inductance; while three-phase phenomena at high voltages was another exhibit. Amongst the items relating to lighting were life testing of electric lamps; measurements of luminous flux; spectrophotometry; a vacuum furnace for spectral energy measurements and a ten-foot sphere for testing lighting fittings. In the Electrical Standards and Measurements Division of the department the main items of interest were a series of standards of self and mutual inductance for work at the higher telephonic frequencies; the measurement of the effective resistance and effective inductance of coils at the higher telephonic frequencies; the balancing of earth capacity effects in the comparison of unequal mutual inductances at the higher telephonic frequencies; the measurement of the increase in the inter-electrode capacities of thermionic valves due to the presence of the space charge; equipment for accurate calibration of wavemeters and other radio-frequency standards, including auxiliary generators for frequencies up to 50 by 10 cycles per second.

Further Measuring Equipment.

Other items were a Schering bridge suitable for frequencies from 50 to 1 000 000 cycles per second, for measurements of permittivity and power factor of dielectrics; effective resistance and capacity of condensers; effective resistance and reactance of high impedances such as radio-frequency chokes, and of other inductive coils; an interferometer for the examination and measurement of the deformation of piezo-electric resonators and oscillators of various forms; apparatus for the measurement of the piezo-electric constant by statical pressure on plates of quartz; a beat tone oscillator forming a source of alternating current of smoothly variable frequency from 25 to 10 000 cycles per second, of good wave form and constant voltage of about 100 V; equipment for the measurement of the amplification of valve amplifying systems for frequencies between 25 and 6 000 cycles per second. The phase displacement between input and output voltages was also measured; while equipment for the measurement of current and effective resistance at radio frequencies; a temperature regulated oven and enclosure for temperature control of apparatus and dielectric specimens under radio-frequency test were also exhibited.

Equipment for testing the permeability and hysteresis of materials by ballistic galvanometer methods, including magnetic testing yoke and magnetising coil with windings for producing very uniform magnetisation of test bars and strips was another exhibit, together with special switchgear for obtaining permeability curves and hysteresis loops on bars and strips of high permeability material under conditions of uniform magnetisation. Equipment for measurement of the total power losses at power and telephonic frequencies in magnetic sheet materials by wattmeter methods was also shown, this equipment including apparatus for the determination of form factor, whereby the losses may be separated into their hysteresis and eddy current components. A Campbell bridge for the measurement of a.c. permeability and total power losses at power and telephonic frequencies, and apparatus for the determination of the electrical properties of insulating materials were also exhibits of considerable interest.

Portable Wireless Transmitters.

In the Wireless Division the exhibits included a portable wireless direction finder, with a wavelength range of 40 to 2 000 metres; a portable transmitter having a wavelength range of 30 to 2 000 metres, for use in field experimental work. Amongst the experimental short wave transmitting and receiving apparatus were transmitters with a wavelength range of 1·8 to 100 metres; receivers with a wavelength range of 4 to 100 metres; a Lecher wire system for wavelength measurements; laboratory valve oscillators for the generation of undamped or modulated oscillations with a wavelength range of 4 to 20 000 metres; sensitive apparatus for the rapid measurement of the capacity and power factors of condensers; and cathode-ray oscillograph equipment for the delineation of alternating-current wave forms. There was also inspected a screened room for containing receivers under test and a screened cabin containing radio and audio-frequency oscillators for overall tests on wireless receivers.

THE I.E.E. SUMMER MEETING.

Visits to the Paris Power Stations—Experiments at 1 000 000 V—The Ivry Power Station—Interesting Transformer Designs.

THE summer meeting of the Institution of Electrical Engineers took place in France by the invitation of the Société Française des Electriciens, and began on Tuesday, June 11th, when a party of about 100 members and their friends left Victoria Station in the morning, arriving in Paris about 4 p.m. the same afternoon. The meeting of the Institution was divided into two parts, the first of which took place in Paris up to Saturday, June 15th, the remainder of the time in France being spent in a journey to points of interest in the Pyrenees, to be completed on June 23rd, when the party is due to arrive back in London.

On June 12th, one party visited the power stations at St. Ouen and Gennevilliers, the former being the principal station for the supply of lighting and industrial power for Paris proper, the latter giving a supply in the main to the suburbs outside the line of the old walls and for many miles radius round the city.

Saint Ouen.

The Saint Ouen station belongs to the Compagnie Parisienne de Distribution d'Electricité, generally known as the C.P.D.E.; this company is an amalgamation of a series of companies which operated at several frequencies. The original station contained eight turbines of 10 000 12 500 kW at 1 255 r.p.m., giving a frequency of 41⅔ per second, and was equipped with 40 boilers, 30 of which were of the Babcock type, the remainder being of the Delaunay Belleville type.

The auxiliaries of this section are electrically driven. After the war a new station was arranged alongside the old one to deal with the rapidly increasing load and units of 30 000 kW were chosen, with an overload capacity of 35 000 kW at Cos φ 0·08, arranged to operate at either 1 255 r.p.m. 41⅔, or at 1 500 r.p.m., 50 periods, so that the units could be changed over with sections of the area. The boilers are of the Sterling-Fives-Lille and Sadd-Belleville types, with a continuous duty of 132 000 lb. per hour, with Riley stokers. The circulating, air and condenser sections are driven through gears by means of independent steam turbines; the boiler ashes are cleared on the water flush system. When the site has been fully developed the whole station will have a capacity of about 400 000 kW, and considerable ingenuity has been used in order to keep pace with demands, especially while the process of unification of periodicity has been in progress.

The Gennevilliers station was started after the war to supply the outside area in bulk. A great deal of the power produced is passed through 60 000 V mains, partly underground and partly over aerial lines. The original six units were of 40 000 kW capacity each, the newer units are of 50 000 kW capacity. A feature of the station is the arrangement of the main transformers inside a large shed; in some ways it might be termed an outdoor transformer lay-out, but put indoors. The building of the Gennevilliers station enabled several smaller stations to be shut down. The owners, the Union d'Electricité, who might be termed the outer Paris bulk supply company, were pioneers in the use of underground single cables on a circuit with 60 000 V across phases (neutral earthed). The cables are laid in concrete troughs, the three phases in triangular formation. The company supplies a certain amount of power to the Orleans Railway, but the circuits are arranged so that, as the development of the water power stations on the southern central plateau of France enables a surplus of power to be available beyond the requirements of the railway itself, then such surplus will be fed into the Paris area for general power purposes to an extent beyond that which may be drawn by the railway from Paris during times of minimum water flow.

As an alternative to the above, a tour was made first to the million volt laboratory of the Compagnie Electro-Ceramique (formerly Messrs. Sailly-Caillet), at Ivry. This laboratory is of the combined indoor and outdoor type; a triple bank of step-up transformers is arranged inside a lofty darkened shed with testing bus-bars arranged so that various insulators of the pin, suspension and bushing types can be tested and photographed by themselves or in combination with supports or structures. By opening big doors at one end of the shed the same voltages can be applied to strings of insulators and so on attached to full-sized towers standing in the open under daily varying atmospheric conditions.

The generating station at Ivry Port was also visited. This station, which has only been running a comparatively short time, is placed on the river Seine above the Paris boundaries close to the junction with the now historic river Marne. It has been designed to share with the station of St. Denis the duty of supplying power to the Metropolitan Underground Railway, and eventually to certain other traction undertakings. It belongs to the Société Electricité de La Seine, the allied company, the Société Electricité de Paris, being the owners of the Saint Denis station. The station is designed for a first instalment of 60 000 kW, to be eventually increased to 150 000 kW.

The boilers are of the Babcock type, partly with chain grates and partly with pulverisers. The main coal conveying gear drawing from trucks or barges is of the telpher gravity-cum-automatic-creeper type, discharging into big bunkers. Ladder screens are used for the condenser water, and, except in the turbine house, armoured concrete is extensively used, special care being taken regarding the whole station so that it can continue to function with floods of the river Seine equal to the highest on record.

The turbines operate at 3 000 r.p.m., and are of the tandem type. They generate at 10 500 V with 50 periods. The substations on the Metropolitan Railway are being gradually converted to use this periodicity in lieu of the 25 periods for which the railway was originally arranged. A concrete cantilever cable bridge with three superposed cable passages has been built across the river Seine alongside the station by the City of Paris to carry power from the station, to take cables connected with the general bulk supply of Paris, and to eventually link up the future step-down station in the suburbs on the south side of the river, which will be built to handle hydraulic power from central France, with the power centres on the northern side.

In the afternoon of Wednesday the Ecole Supérieure d'Electricité was visited. This school was originally founded by the Société Française d'Electriciens alongside their laboratory to give young men trained in mathematics and natural philosophy a twelve months intensive course in practical electricity. Its lecturing professors are nearly all men in daily contact with practical electrical and engineering matters of the day, and many of its students come from the highest grade schools, the Ponts et Chaussées, the agricultural engineers, the Civil Services, the Army and the Navy sending students for a one year's course. The technical equipment is very well arranged, a difficulty being to allot places to the numerous candidates for the courses held.

The Banquet.

On the evening of the same day a banquet was given at the Continental Hotel by the Société Française des Electriciens the Compagnie Parisienne de Distribution d'Electricité and power companies in the Paris suburbs.

M. Bunet, the president of the Société Française, speaking in English, after patriotic toasts, welcomed the members of the Institution. He recalled the visit made to Paris by members shortly before the war, and the cordial feeling that existed during the years of struggle. He said his institution differed from ours in that it was smaller in numbers, but all the same it had achieved and was achieving results of which he was proud. Their school at Malakoff was equipped for 200 students, and their laboratory would shortly be removed to the same place.

Col. K. Edgcumbe (the president of the Institution of Electrical Engineers), speaking in French, said his first visit to Paris was in 1878, at a time when the first electrical exhibition was being held, and the Jablochkoff candle was on view; but, being only five years old, he did not appreciate much. He thanked the Société Française d'Electriciens for the splendid work it had done during the last forty years in the cause of electricity.

On Thursday, June 13th, the wireless station at Sainte Assise was visited, followed by a visit to Versailles.

On Friday an excursion was made to the Chateau at Chantilly, while on Saturday one party visited the new station of the Cie Parisienne at Issy-les-Moulinaux, for which turbines operating at high temperatures and pressures have been made, Another party visited the National Laboratory at Belleville and saw a magnet of 46 000 gauss designed for special work.

ADVERTISING FOR CONTRACTORS.

The Best Medium to Use—Planning the Campaign—Linking up with the E.D.A.—Continuity an Essential—Interesting Examples.

By "PUBLICITY CONSULTANT."

(*Continued from page* 473.)

POINTS for the electrical contractor advertiser mentioned in my last article included a passing reference to the possibility of conducting quite a useful newspaper advertising campaign in a surprisingly small unit space. I

WHEN Milly Volt got engaged to Harry Watt, the young engineer, they thought it would be years before they could marry.

His salary was not very large, and Milly said she could never do without a maid Cooking in hot kitchens, washing clothes, and sweeping rooms, would spoil her temper and her complexion. And then they found out about the Electric way They have an electric stove: cool and fool-proof and it costs only 2½d. a day to run.

And the electric washing-machine Milly's uncle gave them will do all the washing and save Milly's back and hands, all for 1½d. every four hours. And the vacuum cleaner, Milly says, will make doing rooms more like play than work. And all *it* costs is 1½d. for 8 hours!

Good luck to them. Here they are, home from their honeymoon.

A successful and amusing way of telling the electrical story.

emphasise this point because there are still many potential advertisers who only think of advertising in terms of front pages of national papers, and who, on finding the cost of such propaganda prohibitive, decide that newspaper advertising is not for them. Even supposing that a contractor could afford to buy large space in such a paper as The "Daily Flail" it would do him little, if any, good. His announcement would be read by people in many parts of the country, and the vast proportions of these readers would be too far away to think of popping into the advertiser's shop. Unless he is running a mail-order line, the electrical retailer does not need to bother about the national dailies, and, even with this exceptional case, he only needs to consider the use of spaces of not more than two column inches.

For all ordinary purposes, the best advertising medium for the electrical contractor is his local daily or weekly. In such papers the advertising rates are usually quite moderate, and in these circumstances small spaces, intelligently used, are a potential source of profit to all who employ them.

Much real inspiration can often be derived from a regular and critical perusal of all kinds of current advertising, and the small-space advertiser who takes the trouble to study the current announcements of Buoyant chairs, Schweppes soda water and similar well-known proprietary articles will readily appreciate that the attracting and selling power of an advertisement is not of necessity in direct ratio to the space it occupies.

Fill a whole page with any sort of rubbish—the firm's name and a few prices, set in ugly type and badly laid out—and you cannot help but get some results. Fill a three-inch single column space with one outstanding message or offer, dressed up nicely in easily readable type and accessories to match, and you will also get results; possibly better than you would from the badly filled full page. So it is not so much the size of the space you use, as what you put into that space, that really counts in advertising.

To say that advertising is cumulative is only to state a truism, but, as recognition of this fact is of fundamental importance in the planning of a publicity campaign, no apology need be offered for dwelling on it. Obviously the man who issues one advertisement and then leaves off is wasting his money. He might just as well have left advertising severely alone, for his solitary announcement might, perhaps, sell a few of his goods for him, but it would trick people into thinking that a trader they believed to be "dead" in the business sense, had come to life.

It is not the solitary effort that builds up the sales of a business, but the persistent, carefully-planned reiteration of a message and a name; not the size, but the frequency of advertising that matters. Week by week and month by month, the advertiser's public must be reminded of his continuing existence. As time goes on—assuming that the advertising and the goods are sound—the public response to that advertising will increase; valuable goodwill having been created over a period of time. If the advertiser, being satisfied with the increased trade that advertising has brought him, decides to cut out what may seem to him an unnecessary expense, he will soon find that he is forgotten in the hurry and scurry of this modern age.

It will be seen, therefore, that no matter what sum may be available for advertising in a given period, it should be spread out in such a way as to afford the maximum number of individual appeals.

Having decided on the allotment or appropriation for advertising, the size and frequency of the announcements can easily be determined. To get the best results from those spaces is a more difficult matter, though it should not present insuperable difficulties to anyone of average intelligence. One thing that should be decided at the outset is a rough plan of campaign for the period. It is of little use to sit down on Monday in search of some item or items to be advertised in Wednesday's paper. In the electrical business a good many items of domestic equipment are more readily saleable at certain times of the year than at others; suction cleaners in March and April, refrigerators and fans in the summer months, and so on. The task of deciding when to push particular lines, as indicated, is greatly multiplied by the seasonal selling programme which is being popularised this year by the Electrical Development Association. One has only to follow this to be sure not only of pushing certain lines at an appropriate time but also of valuable support in the way of general publicity on those very lines conducted simultaneously by the E.D.A. By linking up with those E.D.A. announcements the local advertiser encounters far less resistance than he would otherwise do if there had been no general preparation.

Housewives all over the country are to-day hearing of the advantages of electric fans and electrical refrigerators. All they need to be told, to complete the cycle, is, where to get these desirable appliances. They have, it is true, been told that the equipment is to be had from any electrical shop, but it must not be assumed that they will immediately set out in search of such a shop. Even if they did, the chances are that they would go to a competitor's shop in preference to yours. You have, then, to tell them in effect that yours is one of the places where the apparatus can be obtained, and if you can show them effective reasons why they should visit you before a competitor you will have solved the major problem of retail advertising.

It has already been mentioned that continuity is an essential in advertising, but mere continuity of insertions is not sufficient if the advertising is to be really successful. There must be continuity also in the general style and appearance of the advertisements so that the reader will in time almost automatically associate the advertiser's name with a particular announcement, and vice versa.

The use of some distinctive feature, such as a hand-lettered name block, or a special kind of border, is an effective way to

Digitized by Google

ensure such continuity without sacrificing the continual change of subject-matter which is essential in local advertising.

Special care should be given to the design of the name-block. A large proportion of those seen in advertisements fail to achieve their primary purpose of legibility. Lettering can be distinctive and expressive of character without being tortured into grotesque shapes or being freely hooked up to curlings and scrolls. Its first purpose is to tell the fleeting reader what your name is ; its second and subsidiary purpose is—perhaps—to associate that name with distinctions and certainly with continuity. It is well worth while to get a competent commercial artist to evolve a name-block. It should be designed to last, and it should therefore be so free from the passing whims of current advertising typography that it will not look out of place in the advertisements of which it will form a part in five or even ten years' time. It is worth paying several shillings a letter to get this detail right at the outset.

Borders, too, require sound consideration, and it is well to regard the border as the frame of a picture. A fine etching requires a quiet, unobtrusive frame, which, in conjunction with a considerable area of plain mount, shows up the beauty of etching at its best. A bolder subject naturally requires a bolder frame. Too heavy a frame or over-elaboration of design "kills" the picture. So it is with the frame in which you put your advertisement. If you always think of it as a picture frame and arrange your "copy" inside it accordingly you will, after a time, produce well-balanced advertisements.

The illustration reproduced on the previous page—the original measured 7½ in. by 4¼ in.—shows one successful and happy way of putting over the electrical story. Taken from a series which originally appeared in the Dublin evening newspapers, this announcement was issued by the Dublin Corporation Electricity Department. The series was specially planned to make more widely known the numerous advantages of electricity in the home, and particularly to emphasise the superiority and economy of electric cookery. The basic idea of the imaginary characters Milly Volt and Harry Watt is clever, and, being carried right through the series, this happy couple achieve that continuity which has previously been emphasised as being an important desideratum. It must also be observed that a similar layout and similar type was used throughout, thus further strengthening the cumulative effect. One can, in fact, imagine the reader of this series waiting eagerly for the next of the Newlywed Watt items, much as certain people wait for their favourite comic strip in the morning paper.

A notable publicity enterprise undertaken by Messrs. H. J. Galliers, the electrical contractors of Brighton, is worthy of notice here. It takes the form of an attractively produced monthly electrical bulletin, the June issue of which is the fourth of the series and runs to 12 pages of really interesting information.

The issue opens with a feature called "Between Ourselves," which is described as a monthly editorial chat. Then comes a simply-worded page, "Concerning the Kelvinator." There are notes on an electric washer for the small house, gramophone notes, and a well-written page on country house wiring, concluding with an invitation to those interested in country house lighting to see a complete plant at work at the Sussex Agricultural Show.

Of the remaining contents, an excellent piece of copy, "On keeping cool" simply asks to be quoted. Here it is :—

"Unfortunately, some of our summer days are such that the problem is not how to keep cool, but how *not* to keep cool. But all the same we can rely on our heat waves—several of them—times when we shall all gasp and perspire. So if it happens to be cold when you read these notes, remember the heat waves that are on their way. If you haven't got an electric fan, the day will come when you would give *anything* for one. Why not get it now ?

"Memorandum to business men : When the thermometer goes up to 80 the energies of your staff go down to zero. A fan or two will pay for themselves handsomely during the heat waves by preventing much of the falling-off in output owing to heat."

The production is streets removed from the ordinary catalogue, and, though it gives a maximum of interesting reading with a minimum of open advertising talk, it never lets the reader forget the service that electricity can render if only he will allow it to. A special word of praise must be allotted to the typography and lay-out, which are of a very high order of excellence.

(To be continued.)

TRANSMITTING AERIALS.

Considerations in the Design of Equipment for Frequencies of 500 and Upwards.

IN a recent paper read before the Institution of Electrical Engineers on "The Design of Transmitting Aerials for Broadcasting Stations," the authors, Messrs. P. P. and T. L. Eckersley and H. L. Kirke, deal first with the aerial as a radiator theoretically, and then go on to the theory of attenuation of waves of frequencies between 500 and 1 500 kilocycles per sec.

In the introduction attention is drawn to the higher standard of service now demanded by radio listeners. The technical difficulties have not been lessened by the somewhat haphazard methods adopted by some foreign stations. The proper method of dealing with the problem of mutual interference between stations and limitations of service area is to attempt the design of an aerial which only produces a direct ray or ground ray, i.e., a ray initially parallel to the earth's surface. It is the indirect ray which causes difficulties, by interfering with distant stations and producing fading and bad quality in the service area.

These considerations lead to a theoretical discussion of the aerial as a radiator. Curves are presented illustrating fading effects derived from theoretical reasoning, when using $\frac{1}{2}\lambda$ instead of $\frac{1}{4}\lambda$ aerials. "Effective height" usually taken as $2/\pi$ actual height for a $\frac{1}{4}\lambda$ aerial, is a somewhat misleading term. Some experimental tests with various lengths of aerials supported from a kite balloon are described and experimental results compared with theoretical data. Theoretical and practical effective heights do not always agree, the former being in general less than the latter. Effective height should, therefore, be measured rather than assumed. Relative power efficiencies tend to increase with increased height of aerial, but if it extends much beyond $\frac{1}{2}\lambda$ there is a rapid decrease in direct ray radiation, as the phase of the current in the upper part changes over. This has led to the Franklyn type, with as many as three aerials one above the other.

Some experimental tests of fading were conducted. The outstanding fact is that high aerials appear to be necessary, but this means high masts and increased costs. The wavelength allocated for broadcasting is between 550 and 200 m., roughly 1 800-650 ft. Thus masts for $\frac{1}{2}\lambda$ aerials would be about 1 000-400 ft. high, and with two $\frac{1}{2}\lambda$ aerials twice this height. Mechanical and economic conditions set a limit of about 800 ft., so that Franklyn aerials cannot be used for wavelengths greater than about 700 ft. (213 m.) in length. The T form of aerial is suggested as a possible compromise.

The next section of the paper deals with attenuation of waves. This question is discussed theoretically, and a summary of experimental tests is also given. The British Broadcasting Corporation undertook to find attenuation curves, in a given territory, for all frequencies between 500 and 1 500 kilocycles per sec. The results, obtained at Potters Bar, are presented in a series of diagrams in the original paper.

The chief conclusions which emerge from these investigations are :—

(1) The design of aerials for broadcasting should aim at using the energy to produce the strongest possible horizontal radiation, whilst diminishing upward radiation.

(2) To produce this desirable end, high aerials are a *sine qua non*.

(3) Nothing that is done with special aerials will prevent a serious limitation of the service area, relative to that obtained with the longer waves, when the shorter waves are used.

(4) Nevertheless, organisations must employ such waves which are more efficiently used by the employment of high aerials.

The use of shorter waves is quite economical in densely populated districts. The set of curves accompanying the original paper will serve to show the effectiveness of different wavelengths for the production of service area. Excellence of service can only be judged by the degree of freedom from interruption experienced by the majority of listeners. For this reason Capt. P. P. Eckersley defines service area in terms of signal strength alone, but points out that densely populated areas require a greater field strength than do rural areas.

THE INDUSTRIAL PRESS AND TRADE.*

Views on the Electrical Press—The Manufacturers' Shop Windows—The Overseas Markets and Overseas Editions—The Society of British Advertisers—An Illustration of the Practical Value of Co-operation.

By VICTOR WATLINGTON, M.B.E., M.I.E.E., A.C.G.I.

IT is obviously impossible for any one person to be familiar with the whole field of industry and my remarks are based on knowledge of the engineering world, and more particularly of the electrical branch. That industry needs the great services which the industrial press so ably renders is I think attested by the fact that many of our trade journals have been in existence for well over half a century, but, just as we have to scrap obsolete plant in factories if we are to remain competitive, so must we be prepared to scrap equally ruthlessly old ideas which do not meet the conditions of to-day.

Mr. V. Watlington.

The technical press offers manufacturers a shop window in which their goods may be displayed, but, just as it would be useless for a shop to fill its windows with goods in which it had no confidence and of which the owner of the shop had no knowledge, so it is useless to take advertising space unless manufacturers take the trouble to explain their products and their policy to the technical press, and unless the latter is willing to take the trouble to absorb this information and to identify itself with the result. My own experience leads me to think that neither the industrial press nor the industries which that press represents have realised sufficiently the value of co-operation, more particularly with respect to opening up and expanding our overseas markets.

I feel that the technical press should not be regarded as something separate which can exist by itself, but rather as an integral part of industry, and therefore vitally interested in the welfare of industry and willing to take its share in its development. I also feel that industry must not look on the technical press as a rapacious monster whose only function is to extract as much money as possible from manufacturers, but as a part of its own organisation which must of necessity be kept fully posted as to the views and aspirations of that particular industry.

The publishers of the trade press of this country can render assistance to manufacturers—(*a*) By propaganda for the industry they can help to create confidence in British manufactured goods, thereby bringing a greater demand from existing markets and aiding in the development of new ones; (*b*) by giving reliable news and information relating to the state of the markets and the possible consumer demand; (*c*) by keeping their advertising rates at a reasonable figure, consistent with quality and service, thereby enabling the manufacturer to spread his campaign over as wide a field as possible.

The industrial press of this country covers, I think, very satisfactorily the market at home. The only observation I should like to make in relation to this point is that one marvels sometimes at the multiplicity of these publications and wonders how it is that industry can find sufficient money to support so many. Whether industry could be better served by the merging together of some publishers and in consequence fewer and more comprehensive publications, is a matter for conjecture.

In the overseas markets I am firmly of the opinion that the trade press of this country, whilst doing very admirable work, has room for considerable expansion and improvement. I find in certain industries American and German publishers have more or less the monopoly of many markets overseas, and in some places it is practically impossible to purchase certain British trade journals. This, I think you will agree, is a matter which should receive your serious attention. British manufacturers would also appreciate all the support which the trade press can give them through the creative power of publicity in fostering goodwill and confidence in their products. Whether it would be possible for a number of trade papers representing a particular industry to combine in the production of joint overseas editions I cannot say, but this is a point which I think it would be useful to discuss between manufacturers and publishers.

I take it that the technical press in this country is primarily interested in helping the home manufacturer, and, if this is agreed, then combination would enable a particular industry to put its views and needs before the world in a manner which is impossible at present. I think much could be done by publishing technical papers in foreign languages, and, as this is purely a question of expense, it seems to me that joint effort might make this possible.

On the technical side of advertising there is already, I know, a strongly expressed desire on the part of British advertisers, as represented in the Incorporated Society of British Advertisers, to confer with other parties in advertising when any matter affecting the interests common to both advertiser and publisher is involved. I should like to recommend to manufacturers the services which the Society of British Advertisers provide; it is the corporate voice for the expression of the advertisers' views and interests, and should receive the support not only of national advertisers, but particularly those, who, like myself, are in the habit of using the trade and technical press.

As an instance of the usefulness to industry of joint conferences with publishers and advertisers, I may perhaps refer to the recent meeting arranged by the Engineering Section of the Incorporated Society of British Advertisers, with the Committee of the Trade and Technical Section of the Advertising Association, and a number of independent proprietors of trade papers, when the question of the standardisation of page size was discussed. As a result of this conference a Committee representative of all interests has been appointed and will now agree on standards and consider ways and means of giving effect to the principle. This, I think you will agree, illustrates the practical value of such co-operation, which brings mutual benefit to all parties, and in this case simplifies the work of the advertising expert and enables him to spend more efficiently his appropriation.

* Extracts from a Paper read before the Advertising Association Convention, 1929, Newcastle-upon-Tyne, on Monday..

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

The Menace of the Amateur.

[TO THE EDITOR.]

SIR,—Mr. Harry Moss's pertinacious efforts for "the elimination of the unfit in contracting" are all to the good. I feel, however, that not enough attention is given to what I would term "the menace of the amateur."

Whilst education has been receiving an increasing amount of critical attention, there has been a remarkable growth of technical knowledge and of the "handyman" faculty among the general public. This has been due to a number of causes. In the first place, the educational system (undoubtedly deficient in some respects) has, at any rate, aroused a certain amount of interest in scientific subjects. Again, the newspaper and semi-technical press have aided and abetted the creation of a vast number of handymen.

The irrepressible handyman was always with us, doing much useful and economical (and, occasionally, fearsome) work in the domestic sphere, but nowadays you will meet him much more often, and further afield! At the same time, the popularity of the motor vehicle (more especially as regards the owner-driver type of man) infers a certain amount of ultimate—though, perhaps, only semi-efficient—"tinkering about" with tools.

Then, too, the astounding development of radio, and particularly the overwhelming number of home-made sets, has probably awakened more technical and practical interest than any of the other causes: and this is not without its

Digitized by Google

peculiar implication when we consider the effect of blunder-headed amateurism upon electrical engineering.

The distinction between the amateur and the professional is bound to become a somewhat invidious one when the former attains, or even surpasses, the skill (though hardly the experience) of the latter, and in one or two fields of endeavour the result is quaint. In some directions the professional can regard the amateur's efforts with either scorn or equanimity, but it is inevitable that the amateur can seriously interfere with the professional's work, and, more especially, his livelihood. This, in most people's judgment, is the crux of the position.

Having presented this aspect, we can usefully examine more personal factors. We may grant and welcome the existence of the ubiquitous amateur; the work of the serious amateur (as in the peculiarly broad and virgin regions of the radio world) can even be encouraged and his co-operation invited; but we must be alive to the fact that there is a certain menace in amateur efforts which requires our open-mindedness to be qualified.

In the Case of House Wiring.

Need I say that in electrical work, such as house-wiring, the amateur can be the direct cause of grave complications? We have been accustomed to that stock phrase in journalese of "the fusing of an electric wire" so frequently "trotted out" in reference to conflagrations (to use another favourite term of the reporter). The phrase has generally excited our amusement whenever we have paid it any attention, though it can, naturally, be a perfectly legitimate technical reason.

There is, of course, no gainsaying the fact that indifferent wiring is a latent danger—a danger, moreover, which increases with the age of the installation. On the other hand, it has been suggested in various quarters, that in certain residences in which outbreaks have occurred, the original wiring was installed by contractors of repute, and the work carried out with probably more than ordinary care. Installations such as these having been completed, however, they are left to the tender mercies of non-electrical men (chauffeurs, handy-man-gardeners, and the like). These individuals, with the best intentions in the world, attempt to follow in the footsteps of the contractor's men, and not only "maintain" the installations, but have the hardihood to effect extensions.

It is not to be wondered at that eventually disaster results. Electricity, which is a long-suffering servant, at last revolts. Wiring which has been carried out on "motor car wiring lines" by a good-intentioned handyman breaks down at some point or other, and perhaps an old mansion is burnt to the ground. This type of handyman brings to the job a peculiar kind of enthusiasm, under the spur of which he may even complete the work in his own time! Thus is the skilled man robbed of a job, and an insidious danger introduced. The handyman, though doing his dubious work in the course of his paid duties, ought to be classed as an amateur—and a dangerous one at that.

The well-meaning ignoramus is not unknown to us. Treating an electrical installation as he would a gas one, a liberal application of soap on worn "flex," or even inside lamp-holders, is the very cure for a "leak"; while, without any malicious intent, a hairpin or the like in a fuse or current-limiter proves extremely effective! But, accepting the wide definition of an amateur as given above, I consider that we must include all those engineers and others in works, etc., who, with or without a rudimentary knowledge of electricity, attempt to maintain quite a large and complicated installation.

Slogans to Broadcast.

From the very nature of electricity we must therefore take careful measure of this menace in amateurism as it affects electrical work. "Call in an electrician," "Employ an electrical man," are injunctions which should be consistently broadcast. The subtle suggestion (for which the ordinary newspaper press must be blamed) as to electricity's liability for fire outbreaks must be countered by reasoned propaganda: electricity, though so adaptable and willing, must be treated with respect.

At the same time, that hardy tribe of semi-skilled hangers-on of the electrical industry should be rigorously dealt with—as firmly discouraged as the ubiquitous amateur. The registration of contractors and wiremen is vital, while the valuable features of the scheme relating to the training of engineers in the electric power industry have advantages regarding adequate training and so forth which might be applied over a wider field.

I suggest, too, that the insulation test carried out by a supply undertaking on the installation of a new consumer might be repeated periodically—say, every 3 years, or when a routine meter change is carried out. Such step would make evident those defects which do not at once show in faulty work, and also test unknown additions to the wiring; all domestic appliances could similarly be examined. I submit that such periodic insulation test would redound to the benefit of the industry, and particularly of the supply undertaking.

With the inevitable improvement which will result from these safeguarding steps there could follow a moderation of the tedious and costly precautions upon electrical work in some directions. The steady and encouraging progress of electricity would accordingly be quickened still further.—I am, etc.,

"EXPERTO CREDE."

Newcastle-upon-Tyne.

Mains Operated Wireless Sets.

[TO THE EDITOR.]

SIR,—Every wireless set whether mains operated or not, clicks when a light is switched off or on. It is impossible to obviate it altogether but, by increasing the size of the outdoor aerial and decreasing the amplification, the local disturbance can be limited.—I am, etc.,

W. I. JONES.

June 14th.

A Window with a Voice.

[TO THE EDITOR.]

SIR,—In your issue of June 14th, page 720, under the paragraph "The Window with a Voice," I notice that you state one of London's leading stores has been using a microphone and loud speaker, and also that this form of window selling has probably never been used before in this country.

May I correct this, and inform you that during an exhibition of household appliances held at my showrooms from April 8th-20th last, a microphone was placed in a window where cooking was being shown, and the demonstrator addressed a large crowd outside the window through a loud speaker. The microphone was in turn passed along to other windows demonstrating electric cleaners, ironing, etc. The whole was a complete success.

I feel sure that the demonstration at the London stores referred to by you, must have taken place subsequent to my demonstration,—I am, etc.

H. J. GALLIERS.

Brighton,
June 14th.

North-East Coast Exhibition.

[TO THE EDITOR.]

SIR,—With reference to the letter published under the above heading in your issue of June 7th, I note with interest that there is no criticism by other readers in your current issue of the views it expressed. This, in itself, seems to indicate that those associated with the North-East Coast Exhibition are more inclined towards a quiet life rather than start an argument, which in turn suggests that the beating of drums in the cause of the exhibition is too much to expect. It is true we have an exhibition in the North, but, so far, the whole enterprise appears to be confined to local interests. Since the purpose of the show, as far as I understand it, is to bring prosperity to the industrial North, it seems somewhat futile, does it not, to look for that prosperity amongst its own already hard hit neighbours?—I am, etc.,

NEWS IN BRIEF.

Electric Pumping Plant at Nottingham—Ilford's Loan for Apparatus Hiring—Irish Free State's Increased Electrical Imports—Appointments Vacant.

NOTTINGHAM Corporation's new electrical water pumping station has just been put into operation.

Forfar Sheriff Court House Committee has asked for a Government grant towards the cost of an electric light installation in the Sheriff Court House, Forfar.

Hull Electricity Committee has appointed a sub-committee to consider the question of purchasing a site for a central showroom and administration building in the city.

There is a vacancy for a civilian education officer, Grade III, at the Royal Air Force Electrical and Wireless School.

At a recent meeting of the E.C.A. it was decided to make a donation of £200 to the E.D.A. in addition to the annual subscription of £400 as in past years. A donation of £50 to the Electrical Association for Women was also approved.

The steamer, "La Marea," owned by the United Fruit Co., is to be lengthened, and is to have its present propulsion equipment replaced by turbo-electric plant made by Messrs. Workman, Clark (1928), Ltd. The present equipment comprises four oil engines driving electric generators.

Practically the whole of New Zealand was affected on Monday by a severe earthquake shock. The electric power houses at Nelson and Takata were wrecked, telegraph and telephone wires throughout the islands were broken, and electricity supply services in many districts were interrupted. A severe shock was felt at Wanganui, but up to the time of going to press no news is to hand of its effect upon the generating station of the Wanganui-Rangitikei Electric Power Board.

A Rugby football match is to be played at night at the McGill University Stadium, Montreal, between McGill and Balmy Beach, Ontario, the lighting being supplied by twenty 1 000 W lamps.

The provisional judicial decree in favour of the Klangfilm-Tonbild group forbidding the showing of the Western Electric film, "The Singing Fool" in Berlin, which it was alleged infringed the Telefunken patent, has been rescinded.

The Gatineau Power Co. has started the second 25 000 H.P. generator in its Bryson, Quebec, hydro-electric plant. The company's aggregate installed capacity is 562 600 H.P., all hydro-electric. In the first three months of this year the output was 482 859 000 kWh.

The Borough Electrical Engineer of Wimbledon has reported to the Baths Committee that the regulations of Surrey County Council regarding the licensing of the new hall for music and dancing, etc., require the installation of an emergency system of lighting. The chairman (Coun. Drake), the vice-chairman (Coun. Snell), the Borough Electrical Engineer and the Baths Superintendent have been directed to decide upon the most satisfactory system of providing such emergency lighting and domestic apparatus, and to have the work put in hand.

A gigantic electric sign over the tramway shelter at the Old Steine was one of the special attractions arranged at Brighton in connection with the opening by Prince George of the new Aquarium on June 12th. The sign, in the form of an arch, was 52 ft. in width, and was supported on two translucent, coloured towers, each 25 ft. high. The arch bore the greeting, "Welcome to Sunny Brighton, Queen of the South," and the lettering, the towers and the beams of the "sun" which formed part of the design, were lit by about 1 500 electric lamps.

Canteens and recreation rooms are features of Liverpool Corporation's new tramcar depot at Edge Lane.

Birkenhead Corporation is to carry out alterations to the lighting system at the art gallery, at an estimated cost of £266.

Bradford Electricity Committee has placed contracts for the erection of transformer chambers in connection with the supplies to J. Thornton and Sons, Thackley, and Thos. Obank and Sons, Ltd., Thackley.

LOOKING BACKWARD.

FIFTY years ago THE ELECTRICIAN, *dated June 21st, 1879, recorded that :—*

The British Electric Light Co. was arranging to light the camp of the 3rd Northampton Volunteers.

* * *

The Select Committee of the House of Commons on Electric Light reached the decision that the time had not yet arrived to give general powers to private electric companies for street lighting. Facilities for experiments were, however, recommended.

* * *

Twenty-five years ago it was recorded in THE ELECTRICIAN *of June 24th, 1904, that :—*

It was anticipated that the Board of Trade would sanction e.h.t. cables being taken into factories and works requiring large supplies of power.

* * *

The first annual dinner of the non-commissioned officers and men of the 1st and 2nd Divisions of the Telegraph Battalion Royal Engineers was held during camp at Lewes.

* * *

Ten years ago, according to THE ELECTRICIAN *dated June 20th, 1919 :—*

Mr. C. Turnbull, borough electrical engineer of Tynemouth, was selected by the I.M.E.A. to give evidence before the Royal Commission with regard to a proposal to establish a decimal system of coinage.

The lighting at the Great Western Railway's Swindon Station is to be converted from gas to electricity.

Croydon Electricity Committee has authorised the purchase of apparatus for hire up to the amount of £11 000.

Worcester City Council is to purchase a second thrust-boring machine, to be used in connection with laying cables across and along roads.

At the annual demonstration of the North-Western Fire Brigades' Association at Chorley, on June 15th, British Insulated Cables Ltd. took third place in the hose cart drill.

"N.E.L.A. Public Opinion" states that in the United States 73 publishing companies have installed 121 electrically heated stereotype pots ranging from ¾ ton to 9 tons in capacity, and with an aggregate loading of about 12 000 kW. It is stated that with electric heating and automatic control poor castings, due to improper or uneven temperature of the metal, are eliminated.

Electric Day was celebrated throughout Japan on March 25th. Under the auspices of the Electric Industrial Association 152 persons were rewarded for having been in the service of the same employer over 25 years.

Ilford Electricity Committee has applied for sanction to a further loan of £5 000 for apparatus to be let on hire to consumers.

Imports of electrical goods into the Irish Free State in April, 1929, were valued at £51 464, compared with £32 353 in April, 1928. Imports for the four months January to April, 1929, included electrical goods valued at £202 122, against £151 600 in the corresponding period of 1928.

The Saskatchewan Power Commission appointed by the Provincial Government has reported in favour of Government ownership and operation of the production and distribution of electrical energy, and has recommended the immediate purchase of the municipal plants at Regina, Moose Jaw, and Saskatoon as the initial step. The scheme envisages a capital investment of $6 700 000 to meet an anticipated demand of 150 000 000 kWh in 1935.

The Post Office has issued to telephone subscribers a folder calling attention to the facilities now available for cheap, evening, long distance telephone calls. On the cover are maps printed in six colours, indicating the zones to which the various fees are applicable. An alphabetical list of places with particulars of charges is also given, as is also information regarding the fees for prolonged use of lines and monthly subscription rates for regular nightly calls.

It is reported that the Manitoba Government has appointed a Royal Commission to investigate the corruption charges made by the Conservatives regarding the lease of the Seven Sisters 200 000 H.P. site on the Winnipeg River to the Winnipeg Electric Co. The lease was given by the Bracken Commission, composed of Chief Justice Macdonald, Judges Dysart and Kilgour. At the Island Falls Power site the Flin Flon Co. is building a 75 000 H.P. plant.

PERSONAL.

MISS Rosalind Haslett has been appointed as buyer for the electrical department of Shoolbreds, Ltd.

Mr. A. H. Darker, chief electrical engineer of J. Stone and Co., Ltd., who has been on a world tour, has now returned to London.

Senator Marconi was received by the Pope last week to discuss details of the construction of a wireless station within the Vatican city.

Dr. Lewis F. Richardson, who is in charge of the Physics Department, Westminster Training College, has been appointed principal of Paisley Technical College.

The marriage arranged between Mr. J. A. Benn and Miss Ursula Hankey will take place on Tuesday, July 23rd, at St. Margaret's, Westminster, at 2.15 p.m.

Lieut.-Col. K. Edgcumbe, president of the Institution of Electrical Engineers, and Mrs. Edgcumbe will give a reception at the Natural History Museum, London, on July 4th.

Mr. H. F. G. Woods, late borough electrical engineer of Torquay, took up his appointment as general manager of the East Devon and Exe Valley Electric Supply Co. last week.

With reference to the paragraph concerning Mr. T. H. Gait, which appeared in our last issue, this should have read to the effect that Mr. Gait is assistant to Mr. H. Faraday Proctor, chief electrical engineer of the Bristol undertaking, and not as printed.

Mr. W. H. Peak has resigned his appointments as managing director of the Marconiphone Co., Ltd., the Sterling Telephone and Electric Co., Ltd., and the Relay Automatic Telephone Co., Ltd. Private communications should be addressed to 17, Holland Park, London, W.11. See page 769.

The only paper to be read at the annual conference of the Institution of Mechanical Engineers, which is to be held at Manchester at the end of this month, is one by Mr. R. W. Bailey, director of research for the Metropolitan-Vickers Electrical Co., Ltd., on "Contribution of Manchester Researches to Mechanical Science."

Mr. Thos. J. Francis, who has been engaged at the Bolton electricity works for the past 4½ years and for 6 years has been part-time lecturer at the Bolton Technical College and the Manchester High School of Commerce, has been appointed lecturer in mechanical and electrical engineering at the Plymouth and Devonport Technical College.

It is announced that Sir Felix Pole, general manager of the Great Western Railway, has accepted the position of chairman of Associated Electrical Industries, Ltd. Sir Felix Pole is 52. He began his career with the G.W.R. at the age of 14, when he became a clerk in the telegraph department at Swindon. He was soon transferred to Port Talbot and to Truro, and at the beginning of 1893 to the electrical department at Paddington, where he remained three years. Thenceforward his promotions were frequent. For several years he was attached to the personal staff of the chief engineer, and he became assistant to the general manager in 1919, succeeding to that post itself two years later, at the unusually early age of 44. He was knighted in 1924. The resignation of M. Howard C. Levis, the former chairman, is also announced. See page 769.

Obituary.

MR. R. W. PENNINGTON, director of Gilbert Gilkes, Ltd., turbine makers, Kendal, aged 55 years. He had been associated with the firm during the whole of his business life.

Mr. CHARLES FRANCIS BRUSH, aged 80 years. Mr. Brush was the inventor of the Brush arc light, and in 1880 sold his arc lamp patents to the Anglo-American Brush Electric Light Corporation, which was succeeded by the present Brush Electrical Engineering Co., Although an American, Mr. Brush was of pure English descent. When only 15 years of age he invented a plant for turning gas street lamps on and off by electricity. At the University of Michigan, Ann Harbour, he graduated as a mining engineer, and later conducted the business of an analytical chemist. He resumed his electrical investigations later, and in 1876 completed his first dynamo. In 1877 he constructed his first commercial arc lamp, and soon after this he produced his series arc lamp having a regulating shunt circuit of high resistance. Amongst his other inventions were a multiple carbon arc lamp, for all-night burning, and his fundamental storage battery invention. He was a Fellow of the American Association for the Advancement of Science and a Life Member of the British Association. He was awarded the Rumford Medal by the American Academy of Arts and Sciences in 1899 and he received the Edison Medal in 1913.

OVERSEAS TRADE.

Electrical Exports for Five Months Exceed Imports by over £5 000 000.

EXPORTS of electrical machinery, apparatus and material shipped from the United Kingdom during May, 1929, amounted to £1 850 244, as against £1 599 250 for the same month last year, the increase being £250 994. Imports for the same month were valued at £618 685, as against £468 013 for May, 1928, an increase of £150 672. For the five months of this year the total electrical exports were £7 973 835, or £171 277 more than for the same period last year. Total imports for the five months were £2 840 857, as against £2 490 800, an increase of £350 057.

These figures show that May exports were in excess of imports by £1 231 559, while for the five months the balance was £5 132 978.

Export items which improved during May last as compared with the same month last year include rubber insulated wires and cables other than telephone and telegraph, increase £62 260; similar wires and cables other than rubber insulated, increase, £47 646; telegraph and telephone wires not being submarine cables, increase, £66 268; and various electrical goods and apparatus, increase, £114 395.

On the import side the same comparison shows in the case of electrical machinery, an increase of £37 000; telegraph and telephone instruments, excluding wireless valves, £52 439; and various electrical measuring and other instruments, £10 379. The following are detailed figures.

LEGAL INTELLIGENCE.

Settlement of Litigation between Ferranti, Ltd., and Measurement, Ltd.

A SETTLEMENT was announced, in the King's Bench Division on Thursday, of litigation between Messrs. Ferranti, Ltd., of Bush House, W.C.2, and Measurement, Ltd., of Townsend House, Greycoat Place, Westminster.

Mr. G. O. Slade appeared for Messrs. Ferranti, the plaintiffs, and Mr. W. T. Monckton for the defendants. The settlement was announced to Mr. Justice Avory.

Mr. Slade said the litigation, which was between two well-known companies manufacturing electrical meters, would not be continued. The action was an action for libel, and the plaintiffs complained of advertisements inserted by the defendants in issues of electrical trade papers in June and July, 1927. For the plaintiffs, he was instructed to say that they admitted that the words of which they complained were not defamatory, and they desired to withdraw the action. It had been agreed between the parties that each should pay their own costs. That being so, his friend, Mr. Monckton, for the defendants, agreed that there was no need for any order of the court to be drawn up.

Mr. Monckton said he agreed that no order was necessary, and he consented to the withdrawal of the action on these terms.

Cables and Wireless Merger.

In the Chancery Division, on Monday, Mr. Justice Clauson refused the motion of the Venture Trust, Ltd., who sought an injunction against the Marconi's Wireless Telegraph Co., Ltd., Senator Marconi and the other directors.

It was asked that the defendants should be restrained from carrying into effect a merger scheme with the three leading cable companies or selling or transferring any of the assets of the Marconi Co., or taking any other steps for the purpose of carrying the scheme into effect until judgment in the action or further orders.

The Venture Trust, Ltd., were the holders of a number of debenture shares, which they exchanged, under an option they possessed, into £1 shares. Subsequently, upon reduction, the ordinary shareholders consented to their £1 shares being reduced to 10s.

When the merger scheme with the cable companies was placed before the shareholders it was found that the holders of these ordinary shares were to be placed practically upon the same footing as the plaintiffs, who were the owners of £1 shares, which, in accordance with the terms of their acquisition under the option, were still £1 shares.

Plaintiffs alleged that the proposal of the company would put the holders of 10s. shares on the same footing as themselves, and would have an injurious effect upon the value of their holding.

The Counsel were Mr. C. E. E. Jenkins, K.C., Mr. Gavin Simonds, K.C., and Mr. E. Riviere for the plaintiffs; Mr. Wilfrid Greene, K.C., Mr. Lionel Cohen, K.C., and Mr. Cecil Turner for the defendants.

Mr. Jenkins, for the Venture Trust, recalled that the merger between the Marconi and cable companies was broadly approved by the Imperial Conference, which suggested, however, that it should be split into two parts. He argued that the scheme must stand or fall as a whole, and it was the defendants' view that if they could not carry out their plan for dividing the shares in the merger on what the plaintiffs said was an unfair basis, the whole plan would fall to the ground.

The Marconi Co. made two answers to the claim of the Venture Trust—that they had power to sell their assets, and that the directors had the power to exercise the powers of the company. He submitted that the directors of the Marconi Co. had arrogated to themselves the right to say "It is for us to say how the shares are to be allocated." The directors of the Marconi Co. said that they wanted to carry out the scheme for the sale of the company's assets to the new imperial Communications Company, but they could not do that unless the plan in regard to the merger company went through.

"I am asking your lordship," said Mr. Jenkins, "to make an order restraining the Marconi Co. from selling these assets as part of this plan and proceeding with this scheme. We say that the directors of the Marconi Co. were unfairly using their powers to induce the merger company, on the board of which they are, to carry out the second branch of the scheme. What they say is 'We must not give to our shareholders the chance to come into this merger on the footing of their getting such proportion of the shares in the merger company as is attributable to their rights in the Marconi Co.'"

Mr. Simonds submitted that the directors had taken a course which—he did not say it offensively—was designed by them to affect the rights of the shareholders.

Without calling upon Mr. Cohen, K.C., for the Marconi Co., Mr. Justice Clauson gave judgment. He said that he did not see his way to make the order asked for by the notice of motion.

After describing the arrangements for the formation of the merger company and dealing with the position of the £1 and 10s. shareholders in the Marconi Co., he said that the grievance of the £1 shareholder was that the merger company was not offering him twice the amount of interest in the merger company as the 10s. shareholder was going to get. He had nothing to do with the question whether the offer to the £1 shareholders was fair or not, however, and as the merger company was not a party to these proceedings he could not interfere with their offer to buy the shares of the Marconi shareholders.

With regard to the proposed sale of certain assets of the Marconi Co. to the imperial Communications Company, he said that he could not assume that when the directors did sign the contract for the sale they would sacrifice the interests of the company. He pointed out that throughout these proceedings there was no imputation whatever against the personal character of the directors.

"It is impossible for me," he went on, "to interfere with something, the details of which are not yet settled, which the directors propose to carry out in the future, and which I must assume will be a sale carried out fairly and honestly. At present I cannot see that the £1 shareholder is hurt at all. If he refuses the offer, he is in just the same position as if the scheme had never been invented. Therefore the motion is refused, and the respondents' costs will be costs in the action."

Mr. Jenkins asked for leave to appeal.

Mr. Justice Clauson said that was quite unnecessary. He had a right to appeal.

Marconi Royalty Appeals Succeed.

In the Chancery Division on Tuesday, Mr. Justice Luxmoore delivered his reserved judgment allowing the two appeals by the Marconi's Wireless Telegraph Co., Ltd., against the decisions of the Comptroller-General of the Patent Office in favour of the applications of the Brownie Wireless Co., Ltd., and the Loewe Radio Co., Ltd.

Mr. Justice Luxmoore allowed both appeals, and instructed that the orders of the Comptroller-General be discharged. He held that it was not in the public interest, as the Brownie Co. claimed, that a licence should be granted to them, that the terms of the licence offered by the Marconi Co. were not unreasonable, and there was no evidence to support their contention that the reduction of royalty they asked for would have the result, as they claimed, of bringing into existence a new class of valve-receiving set purchasers who were now prevented from purchasing such sets by the prevailing prices.

In the case of the Loewe Co., the judge held that there had been no refusal to grant a licence by the Marconi Co., as terms were never defined, and, therefore, the time had not arrived when the Loewe Co. were in a position to apply for a compulsory licence. He thought the establishment of a factory by the Loewe Co. in this country would be in the public interest, and he hoped the parties would come to terms.

Rating of Sky Signs.

The Manchester City Stipendiary Magistrate has given his decision in regard to the appeal of Electrical Signs, Ltd., against an assessment of rates levied by the Manchester Corporation in respect of illuminated sky-signs erected at the junction of Market Street and Cross Street. It was held by the stipendiary that the defendants were liable for the rate from the moment the signs were used. He said that overseers were entitled to claim payment of rates for a period prior to the date of the assessment, or amendment. He agreed to state a case.

A hydro-electric power plant has started operation at the Imatra Rapids, Eastern Finland. The plant is generating 81 000 H.P., and it is intended to extend it up to a capacity of 220 000 H.P.

Disqualifications were for having shots outside the scoring rings and ties were decided by the graduated gauges.

The annual dinner of the League has been fixed for November 30th.

The annual sports of Siemens Brothers and Co., Ltd., were held at the sports ground of the Siemens Sports Club, Park Lane, Charlton, on June 15th, when fifty-three events were staged, excluding a " toddlers' " race. The prizes were distributed by Sir William and Lady Bull and, in spite of the threatening and occasionally chilly weather, a large crowd followed with evident enjoyment the whole of the contests.

This was the seventh annual event, and, as usual, the items followed one another with clockwork regularity.

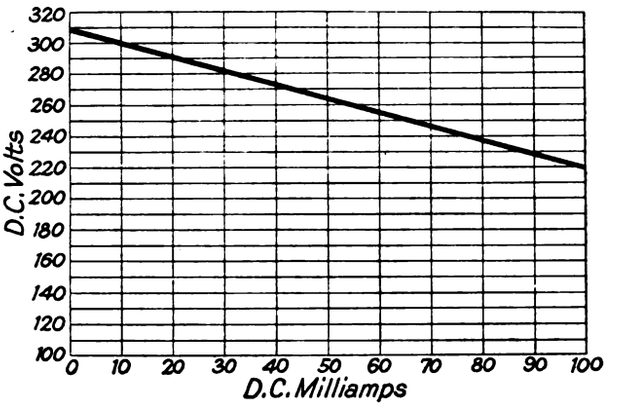
Interspersed with the more serious items were items of a more light-hearted nature, including the " band lucky spot march," pillow fight, tilting the bucket, climbing the greasy pole, and so on.

The musical entertainment was contributed by the Greenwich Royal Hospital School Band.

The hydro-electric plant installed in Switzerland at the beginning of 1929 amounted to about 2 142 000 H.P., distributed among 6 012 stations, of which 56 of more than 10 000 H.P. each accounted for 1 675 500 H.P. At the time mentioned eight hydro-electric works of a total rating of 539 000 H.P. were in course of construction.

NEW BATTERY ELIMINATOR.

WE have received for test from FERRANTI, LTD., of Hollinwood, Lancs, one of the new B.E.M.I. high tension supply units for use with wireless receivers. The unit is designed for connection to 200/250 V, 40/100 cycles supply mains and has an output of 100 mA at 200 V d.c. with corresponding outputs at other voltages. The unit consists of a filter



The voltage regulation curve of the mains transformer and metal rectifier used in the " B.E.M.I." h.t. supply unit.

comprising resistances and chokes in combination with a " Westinghouse " full-wave metal rectifier, fed by a mains transformer. The whole of the parts are contained in a fireproof sheet steel safety box fitted with two flexible cables for connection respectively to the mains and the receiver. The anode feed system developed by Ferranti, Ltd., is incorporated in the unit, and need not therefore be employed in any receiver operated from a supply unit of this type. The box in which the unit is assembled is fitted with an automatic switch so arranged that on the lid being raised all the accessible parts are " dead," being disconnected from the mains, and the unit complies with the I.E.E. Wiring Regulations.

The unit has been designed primarily for use in conjunction with receivers employing one or two stages of screened grid h.f. transformer coupling, an anode bend or grid leak rectifier, and one or two audio frequency stages up to a total audio frequency amplification of 5 000 times. It will also operate satisfactorily receivers employing one tuned anode h.f. screened grid stage or one neutralised h.f. stage provided that, in the latter case, neutralisation is properly carried out. It is also, of course, suitable for operating receivers without high frequency stages. Two flexible cables are fitted, one containing three wires for connection to the mains by means of a power plug, and the other containing six wires coloured and marked according to the receiver stage. When the eliminator is used with an ordinary neutralised h.f. stage, it is necessary to make a few simple alterations in the arrangement of the resistances contained within the unit, but since these are extremely easy and fully described in the instructions given there need be no difficulty in this conneciton.

The unit in question was, for purposes of test, first connected to a two-stage screened grid h.f., rectifier, single stage l.f. receiver, and then to a single screened grid h.f., rectifier, two l.f. equipment. In both cases results were in accordance with the manufacturer's claims. The unit was also tried with a neutralised high frequency circuit, and though it was necessary to readjust the neutralising condenser, the set finally remained stable over a 200-600 metre wavelength band. On longer wavelengths, therefore, stability may be assumed.

With a milli-ammeter in series with the common h.t. negative lead, various readings were recorded against measured voltages and the outputs obtained were such as to be ample for supplying even the largest set likely to be used by the broadcast listener. With the milli-ammeter connected in individual leads results were again satisfactory, the previously noticed margin in all output requirements being confirmed.

The unit is extremely flexible as to the types of valves it will accommodate, and the makers give in their instructions a complete list of resistance values for the various receiver stages and valve types.

The instrument is compact and for apparatus of its kind is not unusually heavy, weighing only 25 lb. It may furthermore be thoroughly recommended for use with domestic or similar wireless receivers, including those cases where neither technical knowledge nor operating ability are available.

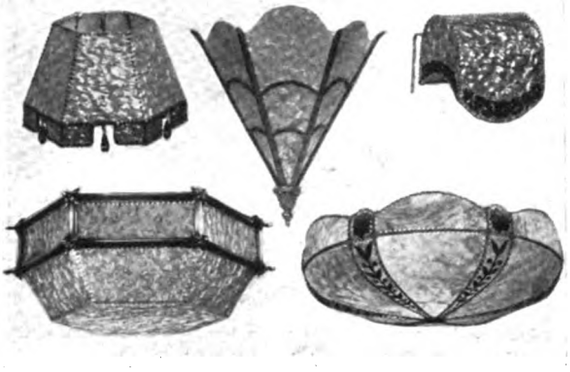
ELECTRICAL DOMESTIC APPLIANCES.

New Equipment of Interest to the Electrical Contractor—Special Lanterns for Porch Lighting—A Screen-Grid Valve for A.C. Mains.

AMONGST the latest appliances developed for domestic use may be mentioned health motors, and an entirely British model, known as the "Emesay," is manufactured and sold by the MEDICAL SUPPLY ASSOCIATION, LTD., of 167-185, Gray'sInn Road, London, W.C.1. This motor is intended both for curative massage, and for general vibratory manipulative massage. Our representative, who was given a demonstration in the showrooms of the makers, states that the motor is of very neat and durably-constructed appearance, and that the force applied can be varied quite easily and gradually between wide limits, by the simple expedient of causing the part of the body treated to put more or less tension on the belt. The small electric motor imparts motion to the belt through the medium of two cranks at opposite ends of the shaft; the oscillations are passed on to two hooks which project through the housing protecting the cranks. The flex supplied enables the motor to be run from any light or power socket. It is suggested that the medical practitioner will in many cases welcome the opportunity of adding this comparatively. inexpensive, revenue-producing novelty to his surgery equipment. The operation of the "Emesay," moreover, may be left in the hands of an assistant with entire safety, so that little of his time need be sacrificed to this additional source of income. The device is portable, and can be attached with the necessary firmness to the end of a table or any other suitable support. Once it is set in motion by the switch it needs no further attention.

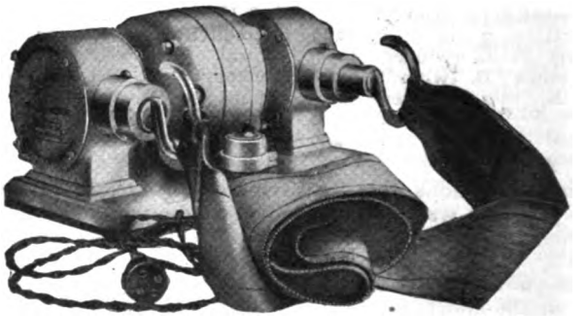


A range of "Opalac" fittings offered by Galsworthy, Ltd.

GALSWORTHY, LTD., of 16, Newman Street, Oxford Street, London, W.1, have, among the large variety of fittings offered, one or two innovations deserving special notice. A table illuminant which has just been designed comprises in effect a combined shade and table standard. The bounding lines used in the design are all straight, and the shading is arranged for by a square horizontal "Opalac" panel at the top together with four pentagonal panels, set vertically, between the four turned wooden legs. This lamp will certainly appeal to those searching for the unconventional, for, at first sight, the observer does not easily guess for what purpose the device is intended. A new bedroom light should perhaps be termed "the vanity lamp," but has at present been given only the rather prosaic title of "dressing table lamp." A cursory glance at this fitting reveals only an ordinary table lamp, but on closer inspection it is found that one of the panels of the shade is cut away. This is to allow of the shade being tilted back on the pair of hinges provided, through an angle of 45 deg. When the shade is in this position, a silvered concave reflector—normally placed vertically above the bulb—is horizontally behind the filament, so that a strong beam of light is directed straight on the person sitting before the dressing table mirror. One of the newest of Messrs. Galsworthy's "Opalac" standard lamps has an inverted shade which is very pleasingly coloured. The design, too, though unorthodox, is distinctly attractive. The shape chosen can best be described as the frustrum of a fluted cone, most of the light being thrown up to the ceiling through the large opening at the top. The material which this firm terms "Opalac" is certainly a useful one for many lighting purposes. It gives many opportunities for introducing variegated colouring, and is, we understand, durable, unaffected by heat or damp, and suitable for tropical climates. Being of a chemical composition, it is not damaged by insects. The accompanying illustrations give a good idea of the different ways in which Galsworthy, Ltd., adapt "Opalac." In addition to these and similar models there are some unusual nearly flat table lamps of French design with a cubist bias. These are intended only for locations where the rear of the lamps will be near the wall. "Opaloid" is also of a chemical composition, but appears more like alabaster than Mother of Pearl (which "Opalac" resembles). It can be tinted and decorated in a similar manner to "Opalac," but is less expensive. Both materials are mounted on wire frames and attached by leather thongs.

Many people will have dismal recollections of trying to identify houses in unlighted country roads on dark nights. Even when the houses are numbered the searcher may have no matches, or be prevented by wind from striking a light. To alleviate these unpleasant conditions Galsworthy, Ltd., offer an electric porch lantern, which displays the name of the house in illuminated letters and at the same time floods with light door, steps, and pathway. The lantern is hung under the porch, or from a wall bracket. This simple device is supplied in iron or copper, complete with chains and hooks, and requires only one lamp.

A useful addition to the Point 8 series of valves for a.c. mains working has been made by the GENERAL ELECTRIC CO., LTD., of Magnet House, Kingsway, London, W.C.2, in the production of the S. Point 8. This is a new screen-grid valve having working characteristics comparable with those of the S.215 valve, but with the additional advantage of an a.c. filament. The S. Point 8 is a specially-designed high-frequency amplifying valve, which, with the introduction of a screening grid, develops a magnification considerably in excess of that obtained with ordinary valves in stabilised circuits. In outward appearance, it is similar to the Osram two-volt screen-grid valves. The amplification factor of the new valve is nominally 160, and its impedance, measured at anode volts 120, screen-grid volts 80, is 200 000 Ω. The normal slope in milliamps per volt is 0·8, a figure which represents a very high efficiency in a valve of this type. In common with other valves of the same series, the filament characteristics are 0·8 A, at 0·8 V. These characteristics result in a short, thick filament which, when heated with a.c. through a suitable step-down transformer connected to the mains, operates without any audible trace of mains hum. When in use, the control grid (as distinct from the screen grid) must be negatively biassed by about one volt. The following table gives the relation between the values of anode volts, negative grid bias volts and screen-grid volts, for the correct operation of the valve.



The "Emesay" health motor of the Medical Supply Association, Ltd.

Anode volts.	Negative G.B. volts.	Screen-grid volts.
120–150	0–1·5	80–90
100–120	0–1·5	60–80

A new four electrode, screen grid amplifier valve, UY-224, embodying a 2·5 V heater element which permits operation from a.c., has been placed on the market by the RADIO CORPORATION OF AMERICA, New York. The valve is recommended for use primarily as a radio frequency amplifier in circuits especially designed for it, but it may also be used in special circuits as a detector or as an audio frequency amplifier.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, where available.

DUNDEE EDUCATION AUTHORITY.—Electric lighting work in connection with alterations at Blackness and Ancrum Road Public Schools. Specifications from the Master of Works, Education Offices, Dundee.

EDINBURGH CORPORATION, June 22nd.—Electric lighting and power installations in 16 houses and 10 shops at Gorgie housing shopping centre. Specification from the Electrical Engineer, Devon Place, Edinburgh; deposit £1 1s.

DR. GUTHRIE'S GIRLS' SCHOOL, GILMERTON, June 22nd.—Electric lighting installation. Specifications from the Secretary's office, 22, Hill Street, Edinburgh; deposit £1.

Electric Wiring.

HEPTONSTALL SLACK BAPTIST CHAPEL, June 22nd.—Electric wiring of chapel, school premises and manse. Specifications, etc., from Mr. D. S. Dearden, Rydal Dene, Keighley Road, Hebden Bridge, or Mr. D. Walton, Mytholm Works, Hebden Bridge.

NEWPORT CORPORATION, June 22nd.—One 1 250 kW motor convertor, and switchgear. Specification (M3), etc., from Mr. A. Nichols Moore, Town Hall, Newport, Mon; deposit £3 3s.

STOKE-ON-TRENT CORPORATION AND STAFFORD COUNTY COUNCIL, June 22nd.—Electric light and power installation in new buildings at North Staffordshire Technical College, Stoke-on-Trent. Further particulars from the Clerk to the Governors, Town Hall, Hanley; deposit £5 5s.

BICESTER URBAN DISTRICT COUNCIL, June 24th.—Electric light installation in premises in the Causeway, Bicester. Particulars from the surveyor, Mr. H. T. Smith.

GLASGOW EDUCATION AUTHORITY, June 24th.—Electric lighting and heating installation at King's Park Temporary School. Specification, etc., from Education Offices (Property Department), 129, Bath Street, Glasgow; deposit £1 1s.

HARROGATE CORPORATION, June 24th.—Wiring, etc., of 58 houses, included in Devonshire Place housing scheme, No. 7. Specifications from the Borough Engineer.

NOTTINGHAM CORPORATION, June 25th.—Supply of general stores to electricity department for 12 months. Forms of tender from the Engineer, Electricity Works, Talbot Street, Nottingham; deposit 5s.

REIGATE CORPORATION, June 25th.—Construction of refuse disposal works, including electricity generating plant. Forms of tender, etc., from Borough Engineer, Municipal Buildings, Reigate; deposit £5 5s.

ACTON EDUCATION COMMITTEE, June 27th.—Electric lighting installations in schools. Specifications from the Borough Engineer, Municipal Offices, Acton, London, W.3; deposit £1 1s.

BELFAST CORPORATION, June 27th.—Electrical installation in fire brigade station, Ardoyne. Specification, etc., from the City Electrical Engineer.

ST. THOMAS' CHURCH, HENBURY, June 28th.—Electrical installation. Specification from the Rev. H. A. Potbury, Henbury Vicarage.

SALISBURY CORPORATION, July 1st.—Electric light installation at new police station. Particulars from Mr. W. J. Goodwin, city engineer; deposit £2 2s.

BELFAST CORPORATION, July 2nd.—Twelve sets of upholstered spring seats for tramcars. Tenders to the Town Clerk.

HOLYWOOD URBAN DISTRICT COUNCIL, July 2nd.—(1) Three-phase transformers; (2) l.t. underground and overhead mains, laying and erection; (3) l.t. switchboard, erected; (4) h.t. armour-clad switchgear, erected; (5) h.t. truck type switchgear, erected; (6) h.t. cable, laid and erected. Specifications from the Town Clerk, Town Hall, Holywood, co. Down; deposit £1 1s. per specification, or £2 2s. per set.

STAFFORDSHIRE EDUCATION COMMITTEE, July 2nd.—Electric light installation in Kingswinford Brockmoor Council School and in new buildings on the adjoining site. Specification, etc., from Messrs. Moffett, Rosher and Mann, consulting engineers, Union Chambers, Temple Row, Birmingham; deposit £5 5s. Only registered electrical contractors are invited to tender.

STEPNEY (LONDON) GUARDIANS, July 4th.—Installation of two electric lifts at South Grove Lodge, and one electric lift at St. George-in-the-East Hospital, Raine Street, Old Gravel Lane. Specifications from the Clerk, Bancroft Road, Mile End, E.1; deposit £1 1s. for each.

LONDON COUNTY COUNCIL, July 8th.—Manufacture, supply and maintenance of (*a*) 150 electric tramcar bodies; (*b*) 150 sets of swing bolster bogie trucks; (*c*) 150 sets of electrical equipment for tramcars, with assembly of bodies, trucks, electrical equipment, etc., into complete tramcars; and (*d*) 150 sets of magnetic track and wheel brake equipments. Specifications, etc., from the Clerk, County Hall, Westminster Bridge, S.E.1; deposit £2 for each section or £7 for the four.

SUNDERLAND CORPORATION, July 8th.—Manufacture and supply of 12 months' requirements of (*a*) paper insulated, lead sheathed cable, (*b*) rubber insulated wire, (*c*) consumers' meters, and (*d*) gasfilled and vacuum lamps. Specifications from the General Manager, Electricity Offices, Dunning Street, Sunderland; 10s. deposit for each section. Applications must state the classes of goods for which specifications are desired.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, July 10th.—Supply and erection at Ironbridge power station of three boilers, each having normal rating of 225 000 lb. of steam per hour, with economisers, air heaters, fans, ironwork, pipework, coal pulverising plant, ash handling plant, etc. Specification (No. 3), etc., from Mr. E. F. Hetherington, chief engineer and manager, Phœnix Buildings, Dudley Road, Wolverhampton; deposit £2 2s.

ILKLEY URBAN DISTRICT COUNCIL, July 12th.—Supply and erection of 11 000 V combined cubicle and truck type switchgear, transformer kiosk, 300 kVA and l.t. feeder gear; and 11 000 V feeder and l.t. distributors. Specifications from Mr. S. H. Fowles, Electricity Offices, Chantry Drive, Ilkley; deposit £1 1s. for each.

CENTRAL ELECTRICITY BOARD, July 22nd.—Supply and erection of central indicators and telephones in connection with the Central Scotland Electricity Scheme. Specification (C.S.-S.S 15) and form of tender from Mr. R. H. Fox, secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, July 27th.—Supply and erection of 132 000 V overhead transmission lines, in connection with the Mid-East England Electricity Scheme. Specification (No. M.E.E.-P.L.1), etc., from Mr. R. H. Fox, secretary, Central Electricity Board, Trafalgar Buildings, Charing Cross, W.C.2; deposit £2 2s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, esssential.*

COPENHAGEN MUNICIPALITY, June 21st.—Supply of switchgear in connection with extensions to Faelledvej sub-station. (Reference B.X. 5 367.)

NEW SOUTH WALES PUBLIC WORKS DEPARTMENT, June 22nd.—Supply and erection of transformers, with certain spares, for Burrinjuck hydro-electric development (contract No. 29/29). Reference B.X. 5 230.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, June 25th.—Supply of protected type telephone cable terminal boxes (schedule C. 430). (Reference B.X. 5 231.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, June 25th.—Supply of underground and aerial telephone cable (Schedule C. 443). (Reference B.X. 5 346.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, June 25th.—Supply of hard drawn copper wire, tinned soft copper wire, and cadmium copper wire. (Reference A.X. 8 040.)

NEW ZEALAND GOVERNMENT RAILWAYS DEPARTMENT, June 26th.—Supply and delivery of trailing cables for portable electric machines. (Reference B.X. 5 277.)

VICTORIAN RAILWAY COMMISSION, June 26th.—Alternating current power point mechanisms (contract 42 669). (Reference B.X. 5 334.)

VICTORIAN RAILWAY COMMISSION, June 26th (extended from May 15th).—Supply of geared three-phase, electric winding engine. (Reference A. 7 650.)

Digitized by Google

SOUTH AFRICAN RAILWAYS AND HARBOURS, June 27th.—Supply of 2 200 and 660 V cables and accessories (tender No. 1466). (Reference B.X. 5 343.)

SOUTH AFRICAN POSTS AND TELEGRAPHS, June 27th.—Automatic wall and table pattern telephones (tender No. 158). (Reference B.X. 5 273.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, June 30th.—Supply of two 5-ton electrically driven hoist blocks, complete with overhead conductors, and switches. (Reference A.X. 7 867.)

CHILEAN PORTS ADMINISTRATION, July 1st. (extension of time).—Four electric travelling cranes for Valparaiso and 12 for Anzani. (Reference A. 8 122.)

VICTORIA STATE ELECTRICITY COMMISSION, July 1st.—Supply and delivery of 44 000 V transformers. (Reference B.X. 5 293.)

MELBOURNE AND METROPOLITAN TRAMWAYS BOARD, July 3rd.—Supply of two electrically-driven rail grinding machines (contract 704). (Reference A.X. 8 097.)

NEW ZEALAND POSTS AND TELEGRAPHS, July 3rd.—Supply of black adhesive insulating tape. (Reference B.X. 5 378.)

TURKISH ADMINISTRATION OF RAILWAYS AND PORTS, July 4th.—Supply of electric wire and cables and general lighting accessories. (Reference B.X. 5 368.)

INDIAN STORES DEPARTMENT, July 8th.—Supply of 30 kW oil-engine-driven generating set for Military Engineering Services, St. Thomas Mount, Madras. (Reference B.X. 5 364.)

LOURENCO MARQUES PORT AND RAILWAYS BOARD, July 8th.—Supply of two 5-ton electric portal cranes (Circular No. 60). (Reference A.X. 7 994.)

STATE ELECTRICITY WORKS, MONTEVIDEO, July 8th.—Construction and equipment of 50 000 kW power station.

POSTMASTER - GENERAL'S DEPARTMENT, MELBOURNE, July 9th.—Resistances and reactances. (Reference B.X. 5 281.)

NEW SOUTH WALES GOVERNMENT RAILWAYS, July 10th.—One 750 kW turbo-alternator; 2 200 V ironclad switchgear; two switch operating batteries; and two motor generator sets. Specifications from the Chief Electrical Engineer, 61, Hunter Street, Sydney.

PORT ELIZABETH MUNICIPALITY, July 11th.—Transformers, overhead line equipment, etc. (Reference B.X. 5 375.)

EGYPTIAN MINISTRY OF THE INTERIOR, July 15th.—Supply and erection at Mena power station of one Diesel engine driven a.c. generating set of 250 kVA. (Reference B.X. 5 331.)

VICTORIAN ELECTRICITY COMMISSION, July 15th.—Two 750 kVA transformers and spares (No. 29/42). (Reference B.X. 5 325.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, July 16th.—Supply of 250 galvanised steel transmission line towers to carry copper conductors, or 190 towers to carry steel-core aluminium conductors. (Reference A.X. 7 735.)

Telegraph Instruments.

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, July 23rd.—Telegraph instruments (schedule C. 436). (Reference B.X. 5 323.)

VICTORIAN RAILWAY COMMISSION, July 24th.—Electric overhead travelling cranes, spare motors, and down shop trolley wires (contract No. 42 672). (Reference A.X. 8 092.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, July 25th.—Supply of two 2-ton electrically-driven hoist blocks (tender No. 1 471). (Reference A.X. 8 072.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, August 1st.—One 10-ton electrically-driven overhead travelling crane, for Maritzburg workshops (tender No. 1 487). (Reference A.X. 8 105.)

SOUTH AFRICAN POSTS AND TELEGRAPHS, August 1st.—Supply of telephone cable (tender No. 160). (Reference B.X. 5 345.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, August 6th.—Supply of 120-ton, four-motor, overhead travelling crane and runway (specification No. S.M. 358). (Reference A.X. 7 810.)

NEW ZEALAND POSTS AND TELEGRAPHS, August 7th.—Enamelled and silk covered resistance wire (No. P. and T. 151/1497). (Reference B.X. 5 322.)

SOUTH AFRICAN POSTS AND TELEGRAPHS, August 8th.—Telegraph material, including g.i. tubular side-arms, insulators, paper sleeves, insulator spindles, etc. (tender No. 161). (Reference A.X. 8 112.)

NEW SOUTH WALES PUBLIC WORKS DEPARTMENT, August 12th.—Supply and erection at Burrinjuck of auxiliary hydro-electric generating plant. (Reference B.X. 5 365.)

EGYPTIAN MINISTRY OF THE INTERIOR, August 13th.—Supply of electric power plant, with underground and overhead network, for the town of Maghagha, Minieh Province, (Reference B.X. 5 318.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, August 13th.—Water turbine driven generating sets and switchgear, for Waitaki power development (section 2). (Reference B.X. 5 278.)

PIETERSBURG (TRANSVAAL) MUNICIPALITY, August 13th.—Supply of h.t. and l.t. cable, lamps and sundries, in connection with extensions of the electricity undertaking. (Reference B.X. 5 312.)

PIETERSBURG (TRANSVAAL) MUNICIPALITY, August 13th.—Supply and erection of steam raising plant, engine, alternators, and switchgear (contract A). (Reference A.X. 7 983.)

AUCKLAND ELECTRIC POWER BOARD, August 19th.—Single-phase transformers. (Reference B.X. 5 324.)

NEW ZEALAND GOVERNMENT RAILWAYS, September 4th.—Supply of motor generator (specification 287). (Reference B.X. 5 308.)

Tenders Accepted.

SMETHWICK CORPORATION.—Walker and Co., electric light installation at Mallin Street baths, £45.

SPENBOROUGH URBAN DISTRICT COUNCIL.—F. W. Birkett and Sons, electrical work at new library.

MANCHESTER CORPORATION.—Harland Engineering Co., Ltd., conversion of automatic rotary converter plant.

GREAT YARMOUTH EDUCATION COMMITTEE.—Lincoln and Egerton, electric wiring and fitting at Greenacre School, £729.

LEYTON CORPORATION.—Crompton Parkinson, Ltd., consumers' motors of new voltage in connection with change-over.

ROTHERHAM EDUCATION COMMITTEE.—Anderson and Thomson, Ltd., supply of electric dental engine, for school clinic, £42 (recommended).

SEAHAM HARBOUR URBAN DISTRICT COUNCIL.—Harrison Bros., electric wiring of 140 houses, £41 14s. 8d. per block of eight; £20 17s. 4d. per block of four, and £10 8s. 8d. per block of two.

MARYLEBONE (LONDON) BOROUGH COUNCIL.—Cables for 12 months; British Insulated Cables, Ltd., Enfield Cable Works, Ltd., Callender's Cable and Construction Co., Ltd., and Pirelli-General Cable Works, Ltd.

BRADFORD CORPORATION.—Supply of three-phase transformers: Hackbridge Electric Construction Co., Ltd., six 400 kVA and six 600 kVA; Bruce, Peebles and Co., Ltd., six 400 kVA; English Electric Co., Ltd., fourteen 600 kVA.

BIRKENHEAD CORPORATION.—W. T. Henley's Telegraph Works Co., Ltd., removal of portion of overhead line at Neston, £173 13s.; Liverpool Electric Cable Co., Ltd., supply of two miles l.t. 7·064 in. single core v.i.r. cable, £305; W. T. Glover and Co., Ltd., supply of 260 yards 0·1 sq. in. 11 000 V cable, £165 2s.

YORK CORPORATION.—A. Reyrolle and Co., Ltd., supply of switchgear for Foss Island Works, £1 361, and for Lendal Bridge sub-station, £1 220 3s.; George Ellison, supply of switchgear, for Kent Street sub-station, £768 9s.; for Scarborough Bridge sub-station, £633 11s.; for Groves sub-station, £422 10s.; for Burton Lane sub-station, £319 13s.; and for South Bank sub-station, £324 9s. (Both recommended).

PORTSMOUTH CORPORATION.—Mather and Platt, Ltd., supply and installation of four electrically driven vertical circulating pumps, each capable of pumping 10 000 galls. of water per min., £4 117. Also tendered: Vickers-Armstrong, Ltd., £3 150; Mirrlees, Watson Co., Ltd., £3 300; Gwynnes Pumps, Ltd., £3 597; Pulsometer Engineering Co., Ltd., £3 717; Drysdale and Co., Ltd., £3 970; Worthington, Simpson, Ltd., £4 070; W. H. Allen, Sons and Co., Ltd., £4 210; Lilleshall Co., Ltd., £4 355 and £4 485; General Electric Co., Ltd., £4 417 and £4 425; Rees Roturbo Mfg. Co., Ltd., £4 545.

RICHMOND (SURREY) GUARDIANS.—Richmond Electric Installation Co., re-wiring work at Grove Road Institution, £850 and (alternative) £795. Also tendered: Telephone and Electric Maintenance Co., £1 590 and £1 700; Troy and Co., £791 and £759; Stone and Co., £784 and £744; Tredegars, Ltd., £1 014 and £910; J. Passmoor, £881 and £838; Howson, Jones and Co., £750 and £680; Richmond Electric Light Co., £1 090 and £1 150; Clark, £1 341 and £1 248; General Electric and Maintenance Co., £1 985 and £1 817; Higginbothams, £1 150 and £1 150; Langston-Jones and Co., £929 and £849; Skase and Co., £3 250 and £2 850. Burdett and Co., £925 and £850; Vigor and Co., £998 and £1 030; Carr Bros., £553 and £454.

ELECTRICAL ENGINE TESTS.

Interesting Equipment for Testing Engines at Hillman Car Works.

THE Hillman Motor Works, Coventry, have recently been fitted with automatic electrical engine-testing sets, manufactured by the General Electric Co., Ltd., at their Witton works. Six of these sets have been installed up to now, and each unit consists primarily of a large steel plate cubicle which accommodates the electrical testing machine (which runs either as a motor or generator) in the lower part, and the various control apparatus in the upper part. The control apparatus comprises a main contactor panel, also various relays, grid resistances, meters, push buttons, speed regulating handles, etc. Mounted above the cubicle is a series of coloured lamps so that the stage of the test which is being carried out may be ascertained at a glance at any given time.

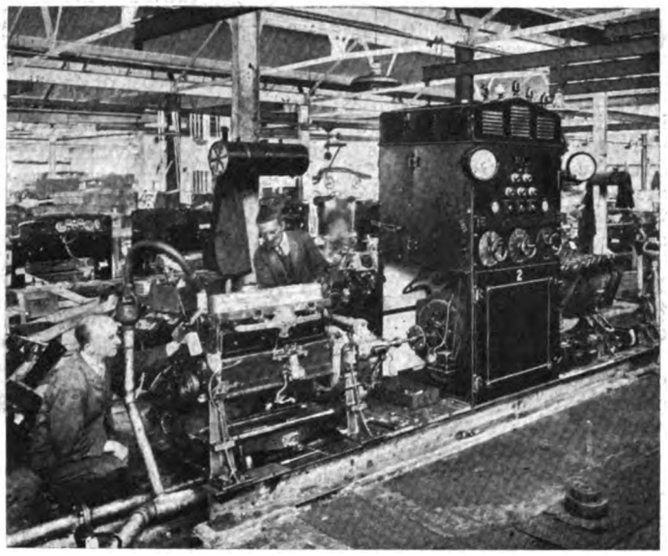
On each side of the testing unit is an engine seating to which an engine may be clamped. The provision of the two seatings makes it possible for an engine to be fixed for testing on one seating while another on the other seating is undergoing test. The whole of the control equipment is so designed that running in either direction of rotation can be obtained. The equipment first drives the engine in order that the wearing parts may become eased. Subsequently, the engine is fitted with carburettor, plugs, magneto, etc., and it is then started in the usual way. It drives the electrical machine which functions as a generator and feeds back to the line.

When the engine has been clamped in position, a push button on the front of the cubicle is pressed, and the motoring run begins. Any further action on the part of an operator is then unnecessary, the whole of the run being controlled by a special sequence drum, which governs the speed from its initial value of 300 r.p.m., accelerating gradually as required until 50 000 or any other fixed number of revs. has been completed, when one of the special signal lamps is lit. Automatic relays safeguard both engine and apparatus, one cutting off the current to the machine if the engine shows signs of seizing, and another preventing any acceleration if the initial friction does not decrease at a certain rate.

When the motoring run is finished, the pressing of a second push button enables the electrical machine to be connected to a section of the resistance grids in order that the engine may be run very slowly under its own power, while adjustments are being made to the valve tappets, etc., in readiness for the full speed generating run. The latter is accomplished by pressing the " re-start " push button, when the set automatically starts up to full speed again and the engine begins to fire. It is caused to feed back into the line by the simple adjustment of a hand wheel, and then the final run takes place, during which the engine under test supplies some proportion of the electric power required in the factory. Again the apparatus is safeguarded by relays, there not only being one to take care of any overload, but a second which would shut down the set if the field current of the generator were to fail, and a third which would come into action if the connection to the electricity main were to be broken, either of which faults would remove the load from the engine.

General view of G.E.C. automatic electrical testing sets for car engines, at the Hillman Motor Works.

Another interesting feature of the apparatus is that by means of an automatic paralleling device and field relay, should an engine seize, it is immediately disconnected from the line. Should, however, it overcome the trouble it picks up its running again. As rotation in both directions can be provided, separate accelerating contacts are fitted, which by an interlock are caused to function only for the correct direction of rotation in each case. Further, the set will test two types of engines, namely, the four and eight cylinder capacities, one change-over switch making all the necessary modification in the circuit. Another useful provision is that for swivelling the meters, so that they are conveniently in sight of the tester at either side.



View of one of the testing units coupled to a 4-cylinder engine.

BUSINESS ITEMS.

ENA ELECTRICAL APPLIANCES, LTD., have removed to 30, Church Road, London, N.1.

The SOUTH EAST KENT ELECTRIC POWER CO., LTD., has opened offices and showrooms at 4, The Exchange, Queen Street, Deal.

E. AND E. KAYE, copper wire manufacturers, of Ponder's End, Middlesex, have changed their telephone numbers to Enfield 2701-2.

The ELECTRIC HOMES CO., dealers in electric light fittings and domestic appliances, have opened premises at 73, Park Street, Bristol.

The lighting effects at Malvern Town Hall, Melbourne, were carried out by W. TOLSON AND CO., LTD., of that city, using G.E.C. equipment.

Mr. F. F. C. KING, wireless engineer, of 87, St. Aldate's, Oxford, is shortly opening a new branch business at 235, Banbury Road, at that city.

The whole of the cables for power and lighting at the North-East Coast Exhibition were supplied, laid and jointed by British Insulated Cables Ltd.

Messrs. ROUCH AND PENNY, electrical engineers and contractors, of 17, Prince Street, Bristol, have now removed to 8, Old King Street, Broadmead.

The offices of the Newcastle " Evening World," which were recently opened by Mr. Lloyd George, are fitted with electric conveyors throughout, manufactured by the IGRANIC ELECTRIC CO., LTD.

PHILIPS LAMPS, LTD., announce that, as from June 24th, the address of the Nottingham branch will be Trivetts Square, Short Hill, Nottingham. The telephone number will be as before.

It is announced that the business of EDWARDS AND ARMSTRONG, LTD., electrical engineers and contractors, has been merged with the WESTERN ELECTRICITY SUPPLY CO., LTD., whose head office is at Cainscross, Stroud.

L. C. MITCHELL AND CO., electrical engineers, of Northgate, Gloucester, had an attractive stand at the Three Counties Agricultural Show held at that city last week, and the judges of trade stands gave the firm a first class award of merit for their display of electrical and wireless goods.

ELECTRICITY SUPPLY.

New Machinery for Stalybridge, Hyde, Mossley and Dukinfield Electricity Board—Extensions in the Liverpool Area—Wimbledon to Confer with Amsterdam—Supply in Northern Ireland—Enterprising Farmers.

CARLISLE Electricity Committee is to extend mains at a cost of £1 101.

Croydon Corporation is to extend mains at a cost of £1 367.

Irlam District Council has nominated the Surveyor to investigate the Council's powers and also the powers of any other electricity undertakers to give a supply in the area.

London County Council Highways Committee has recommended that the standard price of 0·469d. per kWh fixed by the County of London Electric Supply Co. in respect of railway and traction supplies be approved.

Stalybridge, Hyde, Mossley and Dukinfield Electricity Board has decided to apply for borrowing powers for £25 000 to cover the cost of new machinery which will be required to answer the needs of the Electricity Board.

Bradford Electricity Committee seeks sanction to a loan of £5 000 for the erection and equipment of a transformer chamber at Harrogate Road. The Committee has approved a scheme for a transformer chamber at Keighley Road, Frizinghall, at a cost of £5 151.

Mr. W. Sheridan, addressing the Limerick Rotary Club recently, said farmers in Tasmania after a time saw the great advantage of electric current, with the result that the Government hydro-electric scheme (for which, as a member of the Legislature, he had pressed 14 years ago) was now successful.

A number of extensions are to be carried out in the various areas served by the Liverpool electricity department. These will involve an expenditure of about £19 000. An application is to be made for a Fringe Order to give a supply to premises in the Halewood district and also for authority to extend an overhead electric line.

Glasgow Corporation Statute Labour Committee has appointed a sub-committee to confer with representatives of the Electricity Committee and the Clyde Navigation Trustees as to the proposed expenditure on cables, etc., which would be incurred if the new cantilever crane at Stobcross quay were to be driven by electric power.

Bolton electricity department will shortly be in a position to supply electricity from overhead lines to premises in the Over Hulton district of the borough which are now being supplied by the Lancashire Electric Power Co., Ltd., and it has been decided that three months' notice be given to the company to terminate the agreement in respect of the supply.

Mr. A. E. McKenzie, borough electrical engineer, of Wimbledon, has reported upon certain phases of development of the electricity undertaking at Amsterdam, particularly in regard to night-loads, and the Wimbledon Electricity Committee has authorised Mr. McKenzie and the Chairman of the Committee (Ald. Hickmott) to visit Amsterdam for a conference with the electrical engineer of that city.

Thornaby Corporation demands that a portion of the Cleveland and Durham Electric Power Co.'s trunk line passing through the town should be underground, and the Great Ayton U.D.C. desires that steel instead of wood standards should be erected to carry the cables in its area. The company states that it is complying with Government regulations in taking the cables overhead over particular highways which are not much used.

Stamford Electricity Committee has reported that the Committee, using as a lever their power to purchase the local electricity undertaking, had succeeded in obtaining a reduction in the price of current. Electricity for lighting purposes will be 9d., for power 3d., and for household heating 2d., provided the Council accepts the suggestion of the company to grant a monopoly to them for 40 years. The Committee has been authorised to accept the terms.

Colchester Corporation has received sanction to loans of £4 776 for main transmission line to Wivenhoe, switchgear, etc., and £28 670 for further plant at the Hythe generating station. The following terms have been offered to the Walton-on-Naze Urban Council for a supply in bulk: First 100 kVA and 120 000 kWh per annum, £5 per kVA and 0·8d. per kWh; next 100 kVA and 120 000 kWh, £4 15s., and 0·75d., next 100 kVA and 120 000 kWh and beyond, £4 10s. and 0·7d.

Hull Housing Committee has decided that electric cookers and wash boilers be fitted in 12 houses on both the North Hull estate extension and the Willerby Road housing estate, and that the British Gas Light Co., Ltd., be requested to afford a supply of gas for gas coppers to the remainder of the houses on the same estates on the terms put forward by them, viz., The Corporation not to place any restrictions on the installation and use of gas apparatus by the tenants other than for lighting purposes and to pay to the company at the rate of 3% per annum for 15 years on the capital expended. The Health Committee has adopted a scheme for electric lighting for the roads at the infectious diseases hospital, at a cost of £1 000.

In a paper by Mr. James Boyd, which was read at the recent annual conference of the General Council of Municipal Authorities in Ireland, it was stated that the capital which would be involved in a Northern Ireland electricity supply scheme would be from £40 to £50 per kW, whereas the cost of extending the Belfast Harbour power station, which would be sufficient as a primary generating station for many years would be from £8 to £13 per kW.

Stoke-on-Trent Electricity Committee has obtained sanction to borrow £10 000 for general sub-station extensions; £1 535 for mains in the Cannon Street area, Hanley, and £20 000 for general mains extensions. The Committee has decided that supply be given to Messrs. G. R. Wood and Son's 20 kW baking oven at ¾d. per kWh, provided that such supply be not taken during winter peak load hours, or that it be so taken that the load factor shall not be less than 20%.

Cape Town Electricity Committee has approved a scheme put forward by the City Electrical Engineer for an electrical installation in the café of the new pavilion at Muizemberg. The initial cost and maintenance of the plant for 12 months will be borne by the Electricity Committee upon the understanding that the expenditure will be refunded by the Improvements and Parks Committee in instalments, plus interest at 5%, spread over 5 years. The cost is estimated at £2 500.

Norton R.D.C. has decided to make formal objection to the application of the Holderness Trust, Ltd., for an Order to supply electricity in the Council's area, on the grounds that there is only a small number of villages which could be supplied, and that the time allowed for consideration of the Order was not sufficient. The Council has decided to call a conference of local authorities concerned, with a view to concerted action. The Northern Electricity Supply Co., Ltd., which has powers for supply in the Norton urban and rural districts, also intends to object to the application.

At the recent inquiry by Mr. Gordon Tucker, on behalf of the Ministry of Health, into the application of the Central Electricity Board for powers to take overhead cables through Southwick for supplies of current to Worthing, Southwick U.D.C. opposed the application and urged that the cables should be placed underground. Mr. J. E. Dell, representing Southwick Council, said high tension cables would radiate from the supply station to all the surrounding districts and the amenities and beauties of the Downs would be seriously injured by the presence of high masts and cables running over them.

Mr. J. Milne Barbour, Minister of Commerce, in a recent speech in the Northern Ireland Parliament, said no less than one-third of the population of Northern Ireland now had a public supply of electricity available at its doors. A h.t. transmission line, from which cheap power could be obtained for factories, now ran between Belfast and Lisburn, and before the end of the year another link would run from Holywood to Bangor, and would be extended to Newtownards. They looked forward in the near future to extension down the Lagan Valley and to the linking up of the principal towns in co. Antrim.

The Ministry of Health has notified Eastbourne Health Committee that the Council's proposal for regulating the use of the electrically-heated baths at Devonshire Baths is not sufficient, as the supervision of a medical practitioner is required therefor.—The Town Planning Committee has decided to send a letter to the Central Electricity Board protesting against the proposed erection of the Eastbourne-Folkestone overhead h.t. cable through the area, which it is alleged, would spoil the rural scenery, and the Board is to be asked to consider again the possibility of laying the cable underground.

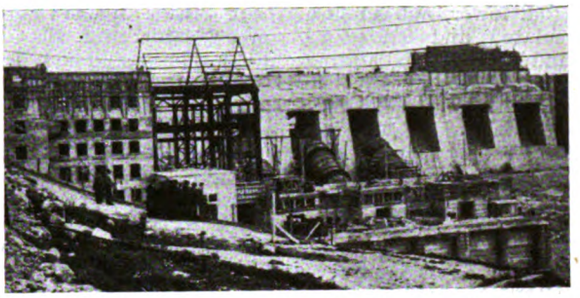
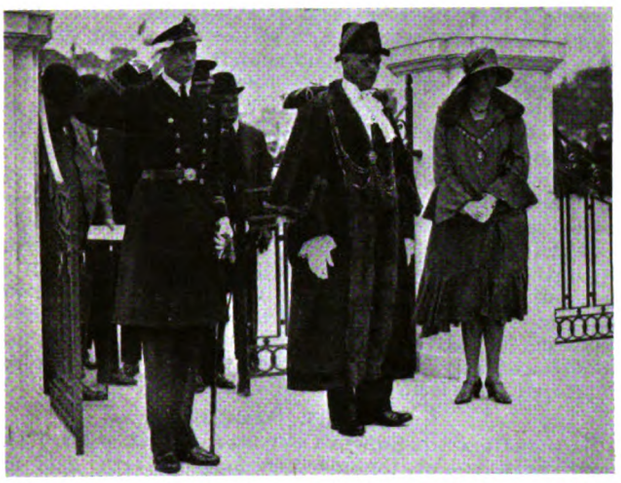
ELECTRICAL NEWS OF THE WEEK IN PICTURES.

Mr. W. H. Peak, who has resigned the managing directorships of the Marconiphone Co., Ltd., the Sterling Telephone and Electric Co., Ltd., and the Relay Automatic Telephone Co., Ltd. (P. 761.)

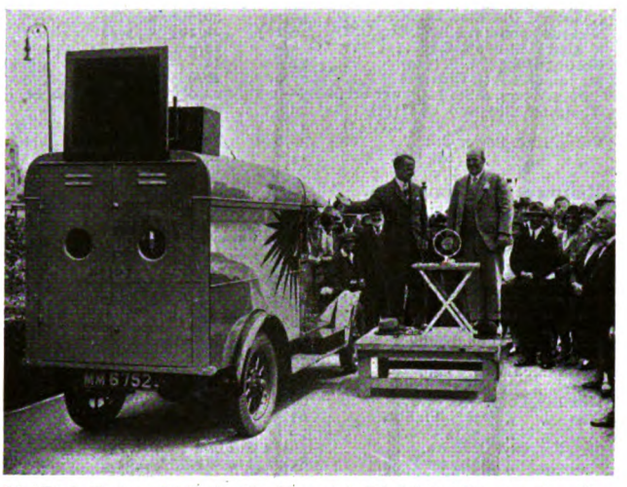


The work in connection with the Shannon Electricity Scheme at Ardnacrusha is now taking shape, and this recent photograph of the intake buildings shows two of the pipe lines being placed in position.

Sir Felix Pole, the general manager of the Great Western Railway, who, it is reported, has accepted the chairmanship of Associated Electrical Industries, Ltd. (See page 761.)



Prince George with the Mayor of Brighton, Ald. H. J. Galliers, on the occasion of the opening of the new Aquarium last week. It will be remembered that Ald. Galliers, besides being a well-known Brighton contractor, is also a member of the E.C.A. Council.



Mr. P. J. Pybus, M.P. for the Harwich Division of Essex, handing to Mr. J. E. Ball, chairman of Clacton Council, the broadcasting publicity van which he has presented to the Clacton Development Association. Mr. Pybus is, it will be remembered, a director of the English Electric Co. and other electrical companies.

Group taken outside the Institution of Electrical Engineers, showing those who attended the Nineteenth Illumination Design Course of the E.L.M.A. Lighting Service Bureau. The course was concluded last week and was voted the most successful yet held. Of those attending, the electricity supply interests were responsible for 24, electrical contractors 50, and manufacturers 46. A note on the subject appears on page 748.

COMPANY NEWS.

Henley's Shares Still Improving—India Rubber Co. Denies Amalgamation Rumours—Extension of Madras Electric Supply Corporation's Plant—Calcutta Trams' Increased Dividend—Appreciation of British Electric Traction Stock.

HENLEY'S ordinary shares have risen a further 3s. 9d. during the past week, from £6 6s. 3d. to £6 10s.; but Siemens shares, at 31s. 3d., are 1s. 3d. down. Callender's are quoted at 75s., with the share bonus deducted. General Electrics are 1s. 3d. up, but Ever Readies are 1s. 6d. lower, and smaller declines are shown by British Insulated and Thomson-Houston shares. Marconi's Wireless and International Marine have both improved half-a-crown. Underground Electric Railways ordinary shares have shed 6d., and London Electric, Metropolitan District, and Metropolitan United Tramways debenture issues are a couple of points down.

J. G. WHITE AND CO., LTD.—Pft. for past year £71 661, plus £5 157 brt. in. Deductg. div. already paid, amtg. to £72 000, leaves £4 818 to carry fwd.

YORKSHIRE (WEST RIDING) ELECTRIC TRAMWAYS CO., LTD.—Intm. div. in respect of half-year endg. June 30, 1929, on 6% cum. pref. shs. of 3% (6% p.a.) is announced. No div. has been paid on ord. since that of 1925.

REES ROTURBO MANUFACTURING CO., LTD.—Gross pft. for 1928, £11 068, agst. £4 378. Pft. and loss acct., after providg. for deb. int., shows deficit £1 532, compared with deficit of £8 599. Obsolete stk. amtg. to £658 has been written off. As values of plant and machinery were written down under cap. reconstructn. scheme, no provisn. has been made in this year's accts. for depreciatn.

INDIA RUBBER, GUTTA PERCHA AND TELEGRAPH WORKS CO., LTD.—Directors state, in their rpt. on co.'s progress during first half of current financial year, that on this occasn. they again regret that, although there is a small aggregate improvemt. on correspondg. period of last year, actual results are still far from satisfactory. Output has been fairly well maintained, but only at reduced selling prices in several important sectns. Resultant loss of pft. can only be met by considerably increased sales and reduced exes., and everything possible is being done in this directn. Positn. at co.'s French works is decidedly better. Serious losses of recent years have been stopped and directors are confidt. that this factory will soon contribute to co.'s pfts. Reorganisatn. of steam and power plant at Silvertown is in progress, and this, when completed, should yield further substantial economies. There has been some improvemt. in results of Burton factory, and small increase in pfts. from foreign branches; submarine cable dpt. and cable ship "Silvergray" have had little employmt. during recent months, but both the dept. and the ship are maintained in constant readiness. Directors cannot, in present circumstances, recommd. paymt. of a div. to hldrs. of ord. shs., but pref. div. due July 1 will be paid on that date. Attentn. of directors has again been called to various rumours appearing in the Press as to impendg. combines or amalgamatns. affectg. the co., and they take this opportunity of statg. that there is no foundatn. for these rpts.

Company Meetings.

MADRAS ELECTRIC SUPPLY CORPORATION, LTD.—Mr. J. G. B. Stone, presiding at the meeting on June 12th, said good progress had been made with the erection of their new plant. The second 6 000 kW set was now running, one of the 60 000 lb. Babcock boilers had been completed, and the erection of the second was proceeding. The balance at the credit of revenue account was £114 363, plus £4 930. Dividends from investments, etc., debenture interest and sinking fund required £18 081, depreciation and renewal fund £25 000, and provision for income tax £10 278. A balance of £65 935 remained as net revenue, to which had to be added £6 657 brought forward. The directors recommended provision for three months' preference dividend accrued to December, 1928, payment of a final dividend of 5½%, actual, on the ordinary shares, making 8% for the year, tax free, and that £9 855 be transferred to reserve and £6 906 carried forward. The report was adopted and the dividends were approved.

CALCUTTA TRAMWAYS CO., LTD.—Mr. J. G. B. Stone, presiding at the meeting on June 13th, said tramway traffic receipts showed the satisfactory increase of £37 105, and expenditure showed an increase of £5 257 only. The operation of the 'buses resulted in a loss of £12 903. Out of the available balance of £124 753, there had been allocated to the depreciation fund £80 000, and to the staff provident funds £4 566. It was proposed to pay a final dividend of 10d. per share, making 1s. 2½d. for the year, or a little over 6%, tax free, against 5% for the previous year, and to carry forward £11 020. If there were any doubts existing on the question of the tramways affording the best and most economical means of transport for the mass of the population of Calcutta, the results for the past year should have cleared them away. Nearly 90% of the total traffic receipts, amounting to £503 055, was again taken by the tramways, the actual tramways earnings for the year showing an increase of over £37 000, while those for the current year to date show an increase of

Digitized by Google

£6 500. As stated in the report, negotiations were still proceeding with the Calcutta Corporation in connection with the company's proposals for the improvement of the transport facilities. The report was adopted and the dividend approved.

ELECTRIC SUPPLY CORPORATION, LTD.—Mr. J. G. B. Stone, presiding at the meeting on Monday, said: Gross earnings in 1928 were practically stationary, because of reductions in charges to consumers. The effect of cheaper coal upon our large power contracts accounted for nearly £2 000, and reductions during the second half of the year to the general consumers amounted to £7 000. The effect of these reductions is that we sold 11 627 623 kWh for practically the same amount as we sold 11 017 008 for in the previous year. The undertakings at Jedburgh and Dollar were disposed of as at December 31st, 1928. In the case of Hitchin, we show the capital expended on assets which had to be written off when we shut down our generating station in that town and took a supply of electricity in bulk. Working expenses amounted to £68 783, against £64 995 in 1927. The revenue, at £109 099, is £50 more than in 1927. The net revenue account shows, on the credit side, the balance brought forward from 1927, interest and rent at £1 903, against £1 168 in 1927, and the balance from the revenue account reduced as already mentioned. The dividend on the preference shares, at £15 000, is for a full year on the increased preference capital, and the interim dividend on the ordinary shares, at £10 000, is similarly on the increased ordinary capital. There is a corresponding increase in the extra remuneration to which the directors are entitled under the articles, and the balance carried to the balance-sheet, £38 902, compares with £38 025 in 1927. We have purchased the whole of the share capital of the Steyning Electric Light Co. The Steyning Co.'s area is not far distant from the area of the Hassocks and Hurstpierpoint Order, which, in turn, is close to the area of the Haywards Heath Order. Both of these two Orders are now owned by Central Sussex Electricity, Ltd., and Steyning has made application for an extension of its area which will join it up to Hassocks on one side, and will extend its field of operations westward to Pulborough. The Central Sussex Co. has applied for an extension of the Haywards Heath area, which bridges the gap between the existing area and that of the Uckfield Co. on the east, and that of the Hassocks Order on the south, and on the north includes the districts surrounding Balcombe and Ardingly. The Alton Co. has applied for an extension to its area to cover the whole of Alton rural district, and the Petersfield Co. has applied for the whole of the Petersfield rural district, with a small portion of Midhurst rural district. At Petersfield we have not yet obtained a supply of electricity in bulk from Portsmouth. At Alton and Newhaven we have put down additional generating plant. We are promoting a special order to enable the transfer of the Exmouth undertaking to a local company in exchange for shares in that company. At Peterhead the power station is nearly completed and the machinery is in course of erection. The report and accounts were adopted, and the dividends, 6% for the year on the preference shares and the final dividend of 7% on the ordinary shares, making 11% for the year, less tax, were approved.

BRITISH ELECTRIC TRACTION CO., LTD.

Increased Profits—Sale of Certain Investments—The Improvement in the Value of the Deferred Stock—Mr. Garcke's Retirement from the Deputy-Chairmanship.

MR. J. S. Austen, presiding at the 33rd ordinary general meeting of the British Electric Traction Co., Ltd., at Winchester House, Old Broad Street, London, E.C., on Monday, said: Ladies and gentlemen, our profits for the past year show an advance of £17 000 on those of the previous year. To some of you that may not seem a particularly large sum, but I can assure you that when a company derives its sole income from dividends, that is a material amount even for a company of our size. We have sold our holding in the London and Suburban Traction Co. That was an amount of nominally over £850 000, and was the largest holding which we had in any single undertaking. I have no doubt whatever that the money which we got for those shares will be worth more to us than were the shares, which were paying us no dividend at all. I have also to mention the sale of the Shropshire, Worcestershire and Staffordshire Power Co. That was a company in which we held about a one-third interest, and the practical control of it was in our hands. It was a venture which was entered into after the war, and was entirely the creation of Mr. Garcke. It is rather difficult to give you the exact amount of profit which we made out of the deal, because the shares were mainly held by associated companies, of which we do not hold the entire share capital, but you may take it that the profit came to nearer £700 000 than to £600 000.

Now I want to say something about the value of our deferred stock. When that stock was created I told you that it was not our intention to pay large dividends upon it, but that it was a stock to which you must look for appreciation of capital value, and I think you will all agree with me that that appreciation has come with a vengeance. It is quoted to-day upon the Stock Exchange at round about £1 400 for £100 of stock. I have no recollection of any stock, as distinguished from shares, which has commanded such a price. Now that I have told you that this stock was given to you in order to obtain an appreciation of capital value, it is only reasonable that you should ask me what that stock is worth, and I feel that it is an obligation upon me to give you the best answer that I can to that question. It is a perfectly simple matter for a competent person to make a valuation of that stock, and I do not know that there is anyone who is more competent to make it than am I, but if I made such a valuation it would convey nothing to you, because it would depend entirely upon the basis upon which I valued it, but there are certain considerations which I now want to bring before you and which influenced my own mind in arriving at a decision as to the value of the stock. I must remind you that years ago about £1 000 000 was written off the capital of this company, and this deferred stock was given to you to represent that million. You may take it from me that in the ordinary course of the improvement in values which has taken place since that million was written off—and it was done when things were at about their worst—it has been recovered. If that million has been recovered it means that it gives a value of about 600 per cent. to your deferred stock. Then comes the question: What profits have been made in addition to that? I will take only one example, namely, the Shropshire company. Assuming that we made a profit there of £650 000, it means that that has added another 400 per cent. to the value of the deferred stock. That makes a total of 1 000 per cent., and there, I think I may perhaps leave it for to-day

I must now utter a word of warning. I say emphatically that nothing which I have said to-day must be taken to mean that the stock is worth more than its present market price, and also you must remember that whenever we give you a stock bonus, to a certain extent we water your stock. That means that when you receive your bonus the total value of your holding is more, but the average value of your stock is less. I must also say a word as to our policy with regard to dividends. It is repeating what I said last year, but I must emphasise it. It is our intention to continue the distributions at the same rate as we are making this year, but if our revenue grows and we see that we are in a position to give you an extra bonus, and then after that, for an indefinite number of years, to continue on the pfevious basis, we shall not hesitate to do so.

With regard to our earnings, I may say that just at the moment they are lagging behind our capital value. The reason for that is merely that we have received money which is not immediately remunerative. For example, taking the case of the London and Suburban Co., we had the use of the proceeds of that sale for only six months, and so for the current year we shall show an improvement on that. In the same way, with regard to our Shropshire deal, we shall for the current year get only a partial improvement from that money, but we shall have more to look for in the following year. It follows from that that if during the current year we have a material increase in our revenue you must not assume that that represents a corresponding increase in our capital value, because it will merely be that revenue is catching up capital.

The chairman then referred to the subject of Mr. Garcke's retirement, and said he expressed on behalf of the directors and himself—and he hoped he might do so on behalf of all present—the wish that he might live many years to enjoy his leisure. Mr. Howley would probably take Mr. Garcke's place as deputy-chairman.

The report and accounts were adopted, and other business was duly transacted.

Deeds of Arrangement.

JONES, Leslie Ernest, trading as JONES BROS., 193, Fawcett Road, Southsea, electrical engineer. Dated June 7th, filed June 14th. Trustee, E. H. Hawkins, 4, Charterhouse Square, E.C., accountant. Liabilities unsecured, £400; assets, less secured claims, £180.

YORK, William Henry, trading as WM. H. YORK, 11, Alcester Road, South, King's Heath, electrical engineer and contractor. Dated June 13th, filed June 17th. Trustee, H. V. L. Heaven, 20, Waterloo Street. Birmingham, C.A. Liabilities unsecured, £1 332; assets, less secured claims, £923.

Mortgage.

[NOTE.—*The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an * —allowed by the date of the Summary, but such total may have been reduced.*]

BARNETT, (C.), LTD., London, W.C., wireless accessory dealers. Registered May 30th, £1,000 debenture to C. Manning, 5, Great Chapel Street, W., wireless dealer; general charge (subject to 1st debentures).

Satisfaction.

RADIO SERVICE (LONDON), LTD.—Satisfaction registered June 4th, £125, balance of amount registered July 26th, 1927.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

VERDON CUTTS AND CO., LTD., 87, Fargate, Sheffield, manufacturers of electrical furnaces. At the statutory meeting of shareholders in the voluntary winding-up the liquidator, Mr. C. L. Widlake, C.A., of Sheffield, reported that the liabilities amounted to £7 738, all due to unsecured creditors. The assets consisted of sundry debtors, £1 335, valued at £509; work in progress, £100; and office furniture estimated at £70; making total assets of £679, from which had to be deducted preferential claims of £189, leaving net assets of £490, or a deficiency of £7 248.

The company was incorporated on June 12th, 1922, and took over a business, established in 1909, which had been carried on by Mr. Verdon Cutts, who had traded as Verdon Cutts and Co. The capital of the company was £10 000, which was later increased to £19 500. From the commencement of the trading of the company down to the date of the liquidation, continuous losses had been sustained, and the total loss to date was £19 427. When the company was established, it was considered that there was a good market for electrical furnaces, and it was hoped to get large orders from abroad, and one of the directors made periodical trips to different parts of the Empire with that object in view. Unfortunately, however, the orders were not sufficient to place the company on a sound financial basis, and throughout the period of trading the overhead charges and the expenses had generally been too heavy for the turnover. The matter remains in the hands of the present liquidator.

London Gazette, etc.

Bankruptcy Information.

DEAN, Joseph, electrician, lately 4, Gogerddan Place, Aberystwyth. Receiving Order, June 6th. Creditors' petition.

LAURENS, William Hamilton, 492, Prescot Road, Old Swan, Liverpool, radio engineer. Receiving Order, June 12th. Debtor's petition.

WARNES, Elizabeth Ann (Widow), 10, Crescent Gate, Wilmslow Road, Rusholme, Manchester, electrical and radio engineer. Receiving Order, June 10th. Debtor's petition.

WILMINGTON, Granville, 75, Railway Street, Nelson, electrical and radio engineer. First meeting, June 21st, 3.45 p.m., Official Receiver's Office, District Bank Chambers, Blackburn. Public examination, July 23rd, 11 a.m., County Court House, Bankhouse Street, Burnley.

Notice of Dividend.

JENKINS, Edward Charles, 124, Cheltenham Road, Bristol, wireless dealer. First and final dividend, 2½d. per £, payable June 21, Official Receiver's Office, 26, Baldwin Street, Bristol.

Notice of Intended Dividend.

JACOB, William Thomas, 14, Meyrick Street, Pembroke Dock, wireless engineer. Last day for receiving proofs, June 28th. Trustee, H. W. Thomas, 4, Queen Street, Carmarthen.

Bankruptcy Proceedings.

HENDERSON, John Arthur, trading as HENDERSONS, electrical contractor, 28A, Basinghall Street, E.C. The debtor filed his petition on May 30 and the statutory first meeting of his creditors was held on June 12th, at Bankruptcy Buildings, Carey Street, W.C. It appears from statements that the debtor has made that he has always been engaged in the electrical trade, and during the War was engaged in cable making. After the Armistice he acted as managing director of a limited company, and afterwards for a short time of another limited company which absorbed the former. In June, 1925, he began business on his own account as an electrical contractor under the registered name of HENDERSONS. Contract work was obtained both in London and the provinces, and he did very well for a time, but business during the past two years had fallen off, with the result that his profits have been insufficient to meet his overhead expenses. Eventually, in consequence of pressure by creditors, he filed his petition. The industrial unrest of 1926 had a severely adverse effect on his business, and he considers that he never really recovered from the losses he then sustained. The debtor, who attributes his failure to industrial unrest and general slackness in the electrical trade, roughly estimates his liabilities at £2 500, and values his assets at £351. The meeting passed a resolution for the appointment of Mr. D. C. Evans, I.A., 18, Ironmonger Lane, City, as trustee of the debtor's estate.

METAL AND CHEMICAL PRICES.

TUESDAY, June 18th.

		Price.	Inc.	Dec.
Copper—

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

310 592 British Thomson-Houston Co., Ltd., L. Griffiths and C. J. Morton. Make-and-break devices for use in electric ignition systems of the combined induction-coil and magneto-ignition type for internal-combustion engines. (15/2/28.)
310 593 T. W. Ross and Associated Electrical Industries, Ltd. Electrical relays. (15/2/28.)
310 595 J. McCallum. Metal clips and like fastening means for electric cables. (16/2/28.)
310 597 W. J. Charles and A. Watson. Electric switches. (18/2/28.)
310 605 H. S. Cooke. Electric lamps. (25/2/28.)
310 615 E. N. Bray, Ltd., and E. N. Bray. Control systems for electric motors. (15/3/28.)
310 620 J. B. Taunton and Ranton, Ltd. Electric connectors. (16/3/28.)
287 463 Marconi's Wireless Telegraph Co., Ltd. Thermionic valve arrangements. (17/3/27.)
310 625 J. Y. Johnson (I. G. Farbenindustrie Akt.-Ges.). Production and application of plates for electric condensers and the like. (22/3/28.)
287 578 Westinghouse Electric and Manufacturing Co. Electrical relay devices. (25/3/27.)
289 375 Landis and Gyr Soc. Anon. Adjusting-device for the driving systems of electric measuring-instruments of the induction type. (25/4/27.)
310 650 D. Guéron and S. Danon. Electric switches. (20/4/28.)
310 658 Siemens Bros. and Co., Ltd., S. H. Long and M. Hodge. Wireless direction-finding apparatus. (27/4/28.)
289 813 R. Frey. Lighting arrangements for power vehicles. (2/5/27.)
291 441 L. Canard. Electric radiators. (4/6/27.)
310 677 L. C. Easton. Telegraph printers. (21/5/28.)
310 682 J. R. Longworth and H. Hirst. Automatic fire-alarms. (25/5/28.)
292 120 Compagnie Pour La Fabrication Des Compteurs et Material D'Usines a Gaz, and Soc. L'Action a Distance. Electromechanical resonance device for distant control. (14/6/27.)
291 450 Dr. W. Hammer. Electrical heating of furnaces. (2/6/27.)
310 709 Savory and Moore (1928), Ltd., and J. W. Mason. Apparatus for administering radiant heat for medical purposes. (5/7/28.)
310 714 W. Fairweather (Singer Manufacturing Co.). Knee-control mechanisms for portable electric sewing-machines. (10/7/28.)
294 489 R. L. J. Laurent De La Ville Le Roulx. Telephone apparatus. (22/7/27.)
303 490 L. Renault. Arc-welding electrode holders. (5/1/28.)
308 674 British Thomson-Houston Co., Ltd. Speed-control systems for electric motors. (26/5/28.)
310 731 J. Beckmann. Electric lamp for illuminating rooms or containers filled with explosive gases or liquids. (16/8/28.)
296 355 Soc. of Chemical Industry in Basle, and H. Andriessens. Process for the economical treatment of mixtures containing hydrocarbon and nitrogen in the electric arc. (29/8/27.)
299 866 F. M. Van Gelderen. Method of and apparatus for removing insulation from insulated wire. (4/11/27.)
297 087 International General Electric Co., Inc. Electric transformers. (14/9/27.)
300 899 Siemens-Schuckertwerke A.-G. Long-distance cable for four-wire working. (19/11/27.)
304 148 W. Otto. High-frequency apparatus. (14/1/28.)
280 194 Traylor Vibrator Co. Vibrating electric motor. (2/11/26.)

Applications for Patents.

April 2nd.

10 272 M. L. E. Martenot. Electrical musical instruments. (2/4/28, France.)
10 259 M. Papalia. Device for automatic telegraphic transmission.
10 271 L. Tagliaferri. Electromagnetically controlled hydraulic governors for electric furnaces.
10 229 Telefonaktiebolaget L. M. Ericsson. Intercommunication telephone apparatus. (5/4/28, Sweden.)
10 123 A. Watson. Manufacture of insulated wire, etc.

April 3rd.

10 365 A. C. Spark Plug Co. Flexible cables. (6/2/29, U.S.)
10 349 Associated Electrical Industries, Ltd., and N. Dennes. Electrically-heated utensils.
10 337 British Thomson-Houston Co., Ltd., and H. T. Warner. Magneto-electric machines.
10 338 British Thomson-Houston Co., Ltd., and H. T. Warner. Make and break devices for magneto-electric machines.
10 339 British Thomson-Houston Co., Ltd. Electric switches. (3/4/28, U.S.)
10 340 British Thomson-Houston Co., Ltd. Amplifying systems. (3/4/28, U.S.)
10 392 H. J. Coates General Electric Co., Ltd. Electric protective systems.
10 327 Cie des Forges et Aciéries de la Marine et d'Homécourt E. Granat. Electric relays. (26/6/28, France.)
10 297 J. B. Cutting and R. E. Watts. Direction indicator for portable wireless receivers.
10 306 I.G. Farbenindustrie Akt.-Ges. Apparatus for performing electrometrical volumetric analysis. (3/4/28, Germany.)
10 341 International General Electric Co., Inc. (4/4/28, Germany.)
10 363, 10 364 Warner Electric Brake Corporation. Electromagnetic brakes. (28/4/28, U.S.)

April 4th.

10 464 British Electric Transformer Co., Ltd. Kettles, etc.
10 477 British Talking Pictures, Ltd. (L. de Forest). Reproduction of sound.
10 433 Chloride Electrical Storage Co., Ltd., and H. Dean. Accumulators.
10 407 A. C. Fothergill. Kinematographic change-over system.
10 469 H. E. Humphries and Siemens Bros. and Co., Ltd. Telephone systems.
10 399 B. Loewe. Material for high emission cathodes. (5/4/28, Germany.)
10 452 M. O. Valve Co., Ltd., and A. L. Reimann. Thermionic valves.

April 5th.

10 573 S. W. Atkinson. Electrically-driven sound recording, etc., machines.
10 618 Automatic Telephone Manufacturing Co., Ltd., T. M. Preist and S. R. Smith. Electromagnetic vibrators.
10 621 Automatic Telephone Manufacturing Co., Ltd., and L. M. Simpson. Telephone systems.
10 602 F. Bartling. Electrical purification and separation of admixtures. (5/4/28, Germany.)
10 635 P. Baxter. Motor installations.
10 644 British Thomson-Houston Co., Ltd. Frames for dynamo-electric machines. (7/4/28, U.S.)
10 645 British Thomson-Houston Co., Ltd. Amplifying systems. (7/4/28, U.S.)
10 555 H. G. Brown, D. P. Battery Co., Ltd., and B. M. Drake. Secondary cells.
10 614 Burgess Battery Co. Batteries. (28/5/28, U.S.)

10 564 E. K. Sandeman and Standard Telephones and Cables, Ltd. Telephone transmission systems.

April 6th.

10 724 A. W., S., and W. V. Butterfield and W. E. Evans. Electric switches.
10 656 J. H. O. Harries. Wireless, etc., signalling.
10 725 C. Traygott. Submarine cables.

April 8th.

10 768 F. S. Blakey. Contacts for electric fuses, etc.
10 850 A. F. Bulgin. Screen grid thermionic amplifiers.
10 853 Condit Electrical Mfg. Corporation. Motor-controlling switches. (30/11/28, U.S.)
10 745 H. M. Dudgeon and T. C. E. Rowland. Current collectors for electric tramway vehicles, etc.
10 786 F. G. Dyer. Tuning inductances.
10 762 General Electric Co., Ltd., and J. J. Gracie. Incandescent lamps.
10 874 Gramophone Co., Ltd. Thermionic valve circuits.
10 733 A. B. G. and E. H. Horstmann and Horstmann Gear Co., Ltd. Electric winding mechanism for clockwork devices.
10 821 F. Krupp Grusonwerke A.-G. Electromagnets for magnetic separators. (18/4/28, Germany.)
10 871 E. C. Moore and C. A. Smith. Electric switches, etc.
10 823 N. V. Philips' Gloeilampenfabrieken. X-ray installations. (19/4/28, Holland.)
10 839 National Carbon Co., Inc. Electric hand lamps. (22/5/28, U.S.)
10 868 R. E. Ollerenshaw. Speed control devices for electric motors.
10 869 R. E. Ollerenshaw. Electric switches.
10 788 M. Paul and P. Wangemann. Switching electric currents.
10 769 W. J. Pritchett. Electric plugs and sockets.
10 840 F. A. Schroeder. Electrostatic telephones.
10 783 D. S. Steuart. Transmitting apparatus for telephones, etc.
10 747 A. M. Taylor. Electric power transmission.
10 874 A. Whitaker. Thermionic valve circuits.
10 768 A. Williamson. Contacts for electric fuses, etc.

April 9th.

10 995 I. Ainstein and W. I. Einstein. Electrolytically covering organic articles with metallic layers.
10 957 L. Alaphilippe. Apparatus for wiring casings, etc.
10 924 J. Anderson. Protection of electric circuits, etc.
10 952 British Thomson-Houston Co., Ltd. Thermionic devices. (10/4/28, U.S.)
10 964 T. K. Cordes, Johnson and Phillips, Ltd., and W. J. P. Orton. Electric switches.
10 920 Graham Amplion, Ltd. Indicating scales for wireless apparatus.
10 919 R. M. Hamilton. Electric signs.
10 899 B. G. E. Haywood. Electrical speech reproducers, etc.
10 916 I. G. Farbenindustrie A.G. Partitions for use in electrolysis of chlorides. (23/12/27, Germany.)
10 986 Kolster-Brandes, Ltd., and P. A. Tiller. Electrical connectors.
10 988 Kolster-Brandes, Ltd. (Kolster Radio Corporation). Signal receiving systems.
10 954 M.-O. Valve Co., Ltd., and W. H. Peter. Electric discharge tubes.
10 925 J. H. Runbaken. Electric testing appliances.
11 021 J. S. C. Salmond, A. A. Symonds and A. Wilkinson. Resonance indicators for wireless transmitters, etc.
10 984 Siemens-Schuckertwerke A.G. Safety connections for relays, etc. (18/8/28, Germany.)
10 930 C. Stille. Reproducing magnets for telephones (26/9/28, Germany.)
10 931 C. Stille. Electromagnetically recording, etc., acoustic vibrations. (26/9/28, Germany.)
10 934 C. Stille. Transmission of signals.
10 935 C. Stille. Sound carriers for electromagnetic recording apparatus. (7/12/28, Germany.)

A Successful Convention.

Now that the Torquay meeting of the Incorporated Municipal Electrical Association is a thing of the past, it is easier to assess its success from various points of view. So far, the number of delegates attending last week's Convention easily beat all previous gatherings, but, as the Association continues to grow at a very steady rate, it is unlikely that this record will long remain unbroken. We have already noted that most of the papers presented for discussion were of special interest to committee members, and it was interesting to see that the innovation caused many of the Committee members to take a more intimate part in the discussions than is usual. This is, of course, all to the good, so long as the engineer members are not left out of the picture. Fears that this might be so at the Torquay meetings were proved to be unfounded, for the whole programme was of distinct interest to the engineers, even though, with one exception, the subjects discussed bore no direct relation to the engineering side. These papers and discussions must have been very useful in bringing home to many of the engineers present the realisation that their work does not end with buying coal and plant, keeping the station going and laying mains. "Watching the wheels go round" is a job which can now be left to subordinates; the supply engineer of to-day must think of other things. We were glad to note the welcome given to the suggestions that were made for the re-codification of electrical legislation. A reform of this kind would be most helpful, and we hope that the I.M.E.A. will continue to press for the simplification that is so needed. The insight which engineers were able to gain into the general position as regards wages and conditions of work on the workmen's side of the industry, and of the great amount of good that has been done by the Whitley Council movement in the industry under the able guidance of Ald. W. WALKER, was another useful feature of the business sessions. Socially, the Convention was, if anything, more successful than ever, and, although the garden party was literally washed out, the other activities were enjoyed to the full. The recent changes in the secretariat naturally threw a considerable amount of extra work on the ever-willing shoulders of Mr. A. C. CRAMB, the honorary secretary, to whose personal efforts the success of the Torquay Convention was so largely due.

The Speed Boat Menace.

AT one time it was commonly thought in the industry that electricity was an agent for reducing labour in home or factory, and few of us envisaged its use in the entertainment world. To-day there is hardly a form of public entertainment or sport which does not rely upon or at least make extensive use of electricity. The showmen talk of "electrical entertainment" in a matter of fact way, and the public is seeing at first hand something of the ubiquitous nature of the universal servant. With such a wonderful ready-made public interest in being, we are sorry to see that the new "speed boat" craze is associated with the use of an internal-combustion engine. Users of our delightful rivers and seaside resorts are daily deafened with the roar of these evil-smelling contraptions, and with only one or two exceptions—notably Brighton—local authorities have made no attempt to restrain this constantly growing nuisance. The remedy is at hand in the electric battery driven boat. Who, we wonder, will have the courage and the foresight to develop electric propulsion for pleasure craft?

Progressing Backwards.

REFERENCE to missed opportunities for employing electric batteries for driving small boats suggests that serious consideration should also be given to a similar and even more inexplicable lack of progress in the use of passenger electric vehicles. As we recall in our "Looking Backward" feature this week, it is exactly 15 years since an electric battery driven passenger car successfully made the 360 odd miles run from Dumfries to London, and, after calling at THE ELECTRICIAN offices, went on to take part in a parade of "electrics" at the I.M.E.A. Convention at Kingston-on-Thames. Though the factors which held up this promising development at a crucial stage are well recognised, there seems little doubt that since that time progress in this field has been backward rather than forward. There are now evident, we are pleased to see, signs that this period of stagnation may soon be brought to an end, and that an era of quieter, cleaner motoring will not long be withheld from users of the crowded streets of our big cities and towns. Some of us may even live long enough to see the electric taxi-cab reappear on the London streets after its long period of hibernation. Be this as it may, we would seriously suggest that every central station engineer should go his rounds in an electric, thereby acting as a genuine advertisement for his undertaking, rather than for the

Digitized by Google

ignition department of a petrol-engined vehicle. Let him ask his wife about it, or any member of the Electrical Association for Women.

The B.B.C. and Its Staff.

DURING the last week there have appeared in the daily Press many comments with respect to the recent resignations tendered by officials of the British Broadcasting Corporation, and one is almost led to believe that that the B.B.C. is likely to find it difficult to maintain its high standard of efficiency. The reason for these resignations do not concern us save that whereas two or three years ago knowledge acquired in the broadcasting service had little market value, the development of the talking film has created a demand for such experience as men in the B.B.C. have acquired. When it is remembered that the staff of the B.B.C. runs into some hundreds, it would indeed be strange were there no changes, and though some of the daily newspapers would have us believe that such changes are of recent occurrence, we have in mind similar resignations in earlier days, commencing with Mr. ARTHUR BURROWS. Another point which seems to have been overlooked is that it is probably to the good of the broadcasting service that there should be changes in the staff of the Corporation, for the more new men brought in, the more likely is it that new enthusiasm and new ideas will be introduced. The resignation of CAPT. P. P. ECKERSLEY is to be regretted but not lamented, for though he was extremely popular as a result of his Writtle performances and is now even more so as chief engineer of the B.B.C., his technical knowledge is not by any means irreplaceable, and is furthermore, we understand, still to be available to the Corporation when desired.

Electrical Development in France.

IT is of interest to the supply engineer and others connected with the industry to know that the hydro-electric development plans for France are perhaps more ambitious than those of any other country. In the construction programme now being realised the complete electrification of the country, with the exception of Normandy and Brittany, will be brought about, chiefly through the development of hydro-electric resources, the total energy available being no less than 7 500 000 kW. The completion of the work will make available 900 000 kW in the Alps alone, and this together with that in the remaining areas will be interconnected in the form of a grid. Some idea of the vastness of the scheme may be appreciated from the fact that along a distance of 100 km of the upper Rhine eight separate and distinct plants will be erected at regular intervals of about 12 km, each with its own dam and lateral canal. Locks will be built at each dam to permit the passage of vessels, while power in excess of that required in the immediate vicinity will be transmitted to Paris. In view of our own electricity schemes it will be appreciated that the adoption by the French of an even more elaborate system of interconnection is deserving of careful watching, for even though the form of generation is different, many of the transmission problems may yield something of interest which may benefit ourselves, while the development of rural areas penetrated by the general scheme also offers possible enlightenment.

The Window with a Voice.

THOUGH we have long looked upon the shop window as a "silent salesman," it seems that our views in this respect must be modified. In one of London's leading stores, window space has been devoted to demonstrations of cleaning pots and pans by means of a new polish, and in order that the demonstrator may "get the story across" a microphone has been fitted on the inside of the window, with a loud speaker on the outside. By means of these two instruments the demonstration of pan-polishing is accompanied by a series of vocal explanations, thus holding the attention of both ear and eye of the audience. This form of window selling, it is claimed, has never been used before in this country, but whether this be so or not, its advantages in a street where congestion is not likely to cause police interference seem worthy of consideration. Demonstrations, which have hitherto been confined to exhibitions or other special arrangements, could be given in the shop window, whereupon spectators could enter the shop for further particulars. In any case, the human element in a window display is always a source of attraction, but with the possibility of contact by speech its interest is greatly enhanced.

"Light's Golden Jubilee."

THIS week we are able further to support the British claim to the first discovery of the incandescent electric lamp by a statement made by Mr. KENNETH R. SWAN, a son of the late SIR JOSEPH SWAN. The facts, as set out on a later page of this issue, are perfectly clear, and there can be no suspicion of a doubt as to the priority of the SWAN invention. It being obvious that the Americans who are sponsoring large-scale celebrations of this discovery, but attributing the honour to Mr. EDISON, would not take such action without believing themselves to be right, we have sought to discover the precise grounds upon which their claim is based. So far we have been unable to reconcile any of the views put forward by our friends across the Atlantic, but in order to give readers an opportunity to see both sides of an interesting discussion we have arranged to print a statement of the American viewpoint as expressed by a colleague on our contemporary, the "Electrical World" of New York. This statement will be found elsewhere in this issue, and though we do not propose to comment on it in detail, we may say that it is a fair representation of the American attitude in this matter. Taking a general view of the controversy we feel it is a pity that the Americans insist on confining their tribute to one who, eminent as he is in many spheres, was anticipated in the incandescent lamp field by one who is no longer here to defend his own title. Apart from this point, their plan to conduct an international celebration of the jubilee of electric lighting is an extremely good one, and one in which not only this, but many other countries, would have been glad to participate. Perhaps it is not too late, even now, for the necessary steps to be taken to allow electrical people in this country to co-operate without reserve in a commemoration which so closely affects the memory of one of its many great inventors.

Suction Cleaner Markets.

THE separation of electric suction cleaners from other electrical products in the U.S. trade statistics will enable interesting comparisons to be made in future as to the development of export business in a line which is becoming increasingly important with many manufacturers over there. How important it is may be judged from the fact that the Electrical Equipment Division of the U.S. Department of Commerce has started a survey of world markets for vacuum cleaners. Last year's exports exceeded 1¼ million dollars. Britain's imports from the U.S.A. were well over half a million dollars, and there were big shipments to Canada, Australia and New Zealand. Sweden is America's chief competitor, according to the first published results of the survey work, having increased production greatly and pushed out with its exports to such purpose that the latest export figure is 111% in advance of the previously recorded yearly figure. In four or five years, Swedish manufacturers have increased their output of suction cleaners by 660%. America and Sweden, however, do not hold all the plums in the vacuum cleaner industry. Production in British works is forging ahead, and at a rate probably no less spectacular than that of America and Sweden. The question of "saturation point" does not arise, nor is it likely to disturb anyone in the trade for ages.

ELECTRICAL PRESSBOARDS.

Characteristics Under Various Conditions of the Different Grades with Particular Reference to High Grade Varieties—Remarkable Capacity for Long Service—Applications for Thicker Boards in "Grid" Transformers.

By A. R. DUNTON, A.M.I.E.E. and A. W. MUIR, D.S.O., M.C., B.Sc.

(*Concluded from page* 551.)

IN the first part of this article some account was given of the development of pressboard as now used for electrical purposes. To that account it may be added, for the credit of pressboard manufacturers, that the manufacture in this country of the original material for use in the textile industry can be traced to about the middle of the eighteenth century, and for the credit of British enterprise it may be repeated that it is largely due to British research work that the material has attained its present position as one of the most important high grade insulators.

The remainder of this article deals mainly with the characteristics, under various conditions, of the different grades, and particularly the high grade varieties of pressboard now available.

The physical properties of the four grades covered by B.E.S.A. specification 231 are set out in Table I, which is taken from "Electrical Insulating Materials," by Allan Monkhouse. The values in the table correspond closely with those adopted in the B.E.S.A. specification.

Electrical Properties.

Of the electrical properties not the least important is the low specific inductive capacity which can be obtained. The values for this property of some varieties of pressboard approach very nearly to those of insulating oil (B.E.S.A. Spec. 148), a fact which renders the material of very great value in obtaining the most uniform possible distribution of high-voltage stresses. There are instances on record of high voltage transformers insulated with other materials which have failed to give the required performance, and which it has been possible to make serviceable only by drastic stripping and re-insulation with selected grades of pressboard.

The superiority of pressboard over the best alternative materials in this respect is very marked at high service temperatures, as is indicated by the comparative test results shown in Table II. That a range of values is shown for bakelite is due to the difference in properties of various grades,

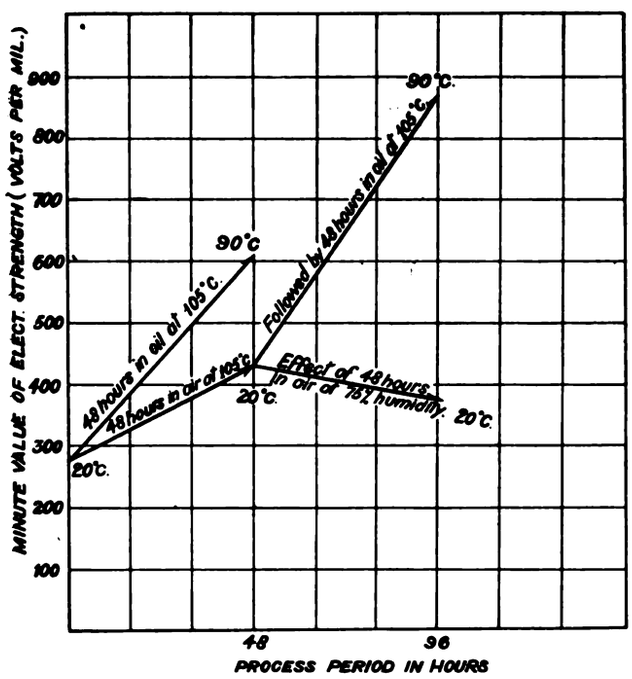

Fig. 6.—Star-graph showing electric strength/minute values for pressboard after definite periods of treatment.

and serves to emphasise the need for B.E.S.A. specifications for synthetic resin varnished paper products. Even allowing for the ranges of values, it will be noted that with rising temperature the synthetic resin products show a rapid increase in power factor and permittivity, and therefore in energy loss, since this is proportional to the product of power factor and permittivity. On the other hand, the power factor and permittivity of oil saturated absorbent pressboard, and hence its energy loss, hardly show any increase even up to 90 deg. C. Confirmation of this is given by Table III, which shows actual

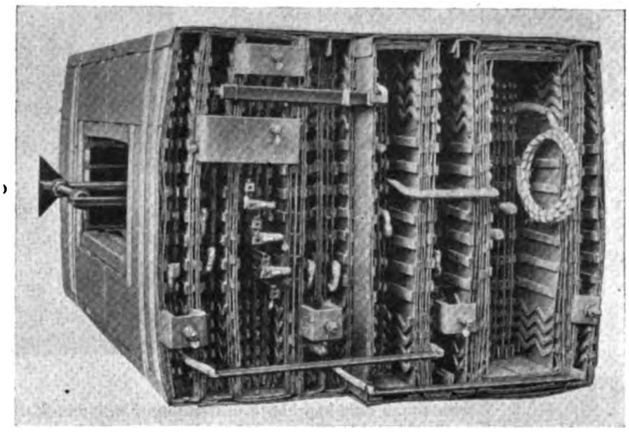

Fig. 7.—132 000 V shell-type transformer winding showing extensive use of pressboard insulation.

test values observed for watt loss in the materials in oil when stressed at 100 V per mil. at a frequency of 50 cycles. It will be noted that while at normal temperature the values for pressboard are at least as good as those of the alternative material, the values at 60 to 90 deg. C., which are of greater importance as representing the actual service temperatures of most oil-immersed apparatus, show in the case of pressboard an increase in energy loss which is very small indeed.

These characteristics have a further bearing on insulating properties in connection with the sustained electrical strength, which for any dielectric is directly influenced by the energy loss and the rate of increase of energy loss with temperature, the effects of these two influences being interacting and cumulative. The low value of energy loss in oil saturated absorbent pressboard and the low rate of its increase with temperature are thus extremely favourable to obtaining high maximum sustained voltages. Some actual test values for these voltages have already been given in Fig. 3.

It will be observed that most of the above remarks refer to oil-saturated absorbent pressboard, but it is important tc note that the electrical strength of pressboard is largely governed by the treatment to which the material has been subjected. This is illustrated in Fig. 6—a "star-graph" which shows the electric strength/minute values obtained after definite periods of various treatments. This diagram indicates again the high value of moisture-free oil-saturated pressboard.

Valuable Properties Explained.

The explanation of some of the valuable properties of pressboard may be in the fact that the material has to a considerable degree the characteristics of the oil with which it is saturated. For reasons at present unexplained, however, the electrical strength of oil-saturated dry pressboard is higher than that of either the dry pressboard or the oil alone. The best (Grade IV) B.E.S.A. pressboards $\frac{1}{8}$ in. thick when tested at 90 deg. C., are credited with a breakdown value of approximately 33 kV, and a high grade transformer oil tested under the conditions laid down in B.E.S.A. Spec. 148 is considered good if it gives a breakdown value of 30 kV between $\frac{1}{2}$ in. spheres separated by a gap of 0·156 in. With oil saturated pressboard of $\frac{1}{8}$ in. thickness, however, a minute electrical breakdown value of at least 50 deg. C. at 90 deg. C. should be obtained. A possible explanation may be found in the improved heat conductivity produced by the oil saturation and the consequent reduction of hot spot effects by the dissipation of heat through the medium of the oil.

When pressboard is used in insulating oil free from impurities very high failure values can be obtained, but even a

Digitized by Google

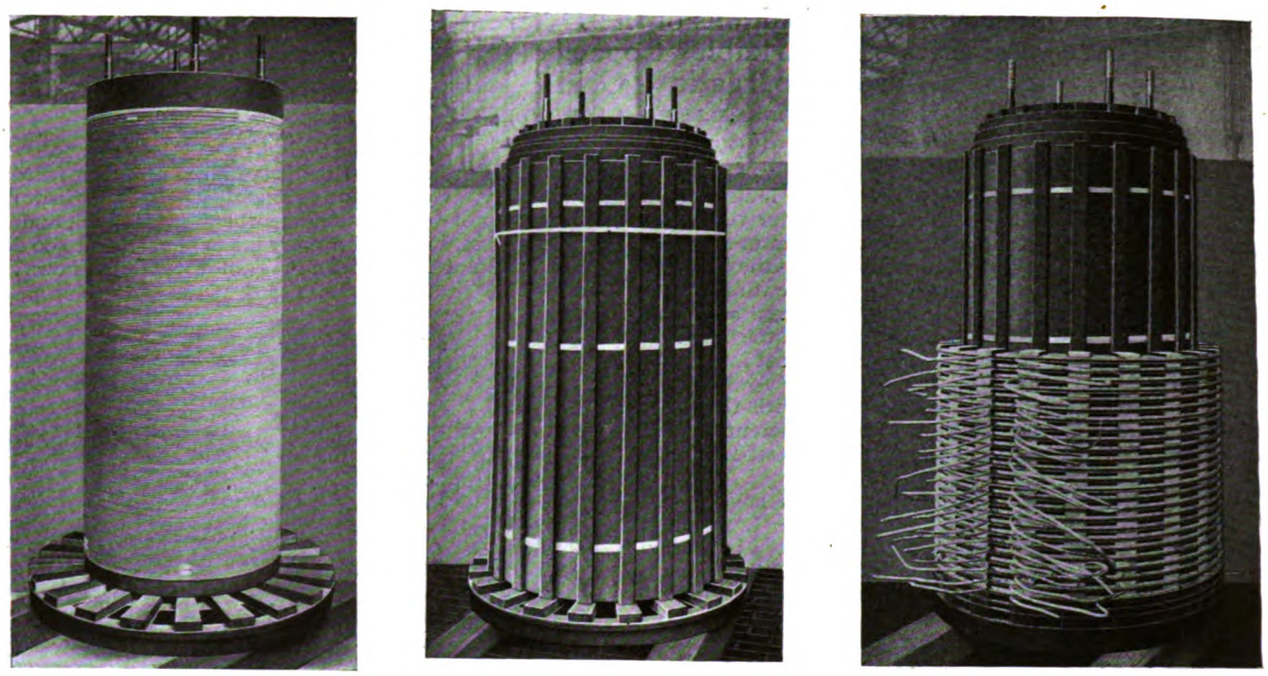

Fig. 8—Windings for a 132 000 V core-type transformer with pressboard insulation. The pictures show (left to right): The l.t. winding completed; the pressboard cylinders and spacing strips between the l.t. and h.t. winding; and finally, the h.t. winding, partly assembled.

slight trace of impurity causes a considerable reduction in electric strength, due no doubt to the impurities lining up in series along the stress paths. The ageing properties of pressboard are greatly dependent upon the class of fibre utilised in its manufacture, and for this reason every care should be exercised in the selection of pressboard for ultimate use; there are many inferior grades the appearance of which is very pleasing but the performance of which is very disappointing. A high grade board should withstand years of service even at higher temperatures than are usually accepted as good transformer practice.

A Striking Example.

A striking example may be cited in the case of a large power transformer which had been subjected to excessive temperature for apparently a number of years, and in which certain high grade pressboards were found to be still flexible and perfectly good, whereas other items of insulation had deteriorated both electrically and mechanically to such an extent that their further use was impossible. In this instance certain insulation items which originally were credited with a value of 250 V per mil. had fallen as low as 30 V per mil, but the pressboard items showed no decrease in electrical value and only a very slight deterioration in mechanical properties as indicated by reduction in flexibility.

The excellent insulating qualities of pressboard and its consequent application to large transformer units has created a demand for boards of large size and thickness, with the result that it is now possible to obtain boards up to 12 ft. long by 5 ft. wide and of practically any thickness required. The chief use of these large boards is for the washers, wave pieces and spacing strips employed in assembling the coils of large shell type transformers. Fig. 7 is an illustration of this application, showing a variety of pressboard pieces embodied in the assembly of the winding of a 132 000 V transformer for the British grid.

The thicker pressboard sheets, which are usually composed of several bonded boards of $\frac{1}{8}$ or $\frac{1}{4}$ in. thickness, are extensively used for barrier pieces between phases, for spacing blocks between coils, and where increased surface creepage paths to earth are required. Some applications of this kind are seen in Fig. 8, which shows one phase of a large core-type high-voltage transformer winding in different stages of construction.

The thicker boards are also finding extensive application for terminal boards, tapping switch bases, etc., due to a large

extent to the excellent surface flash-over values which can be obtained between contacts. A typical curve for these values as shown by test results is reproduced in Fig. 9. In respect of this service an outstanding feature of value is the fact

TABLE II.

COMPARATIVE TEST RESULTS SHOWING VARIATION OF POWER FACTOR AND PERMITIVITY WITH TEMPERATURE.

(Tests carried out at 5 000 V 50 cycles).

Temperature.	Power Factor.		Permittivity.	
	Pressboard.	Bakelite.	Pressboard.	Bakelite.
18° C.	0·031	0·025–0·087	4·6	5·9–8·0
35° C.	0·031		4·7

90° C.	0·037	0·55 –0·65	4·82	22–41

that repeated flash-over produces very little carbonisation, a characteristic in which pressboard has again great superiority over bakelite. A typical test on pressboard with stud contacts spaced 7¾ in. apart actually gave the following consecutive flash-over values: 185 kV, 260 kV, 245 kV, 170 kV, 190 kV, the last flash-over value of this series being actually higher than the first. The increased values in the second and third tests were possibly due to elimination of surface moisture by the first flash, and the later decrease was possibly due to deterioration of the oil.

The rapidly increasing and extending use of pressboard has also resulted in considerable recent developments in connection

TABLE III.

with moulded pieces and it is now possible to obtain these in many varieties, including moulded cover pieces, channels, flanged creepage rings and tubes. These parts are made directly from the wet pulp and exhibit all the desirable characteristics of the corresponding board materials. Some of these special parts, by no means covering the whole range but showing an interesting variety, are included in the group of pressboard parts in Fig. 10.

Demand for Special Grades.

There is at the present time a marked demand for certain special grades of pressboard and mainly for varieties as follows:—

(*a*) Strong porous material for oil-immersed work.
(*b*) Hard unshrinkable materials for spacing blocks.
(*c*) Low moisture absorption sheets for use in air.
(*d*) Thin hard flexible sheets for slot linings.

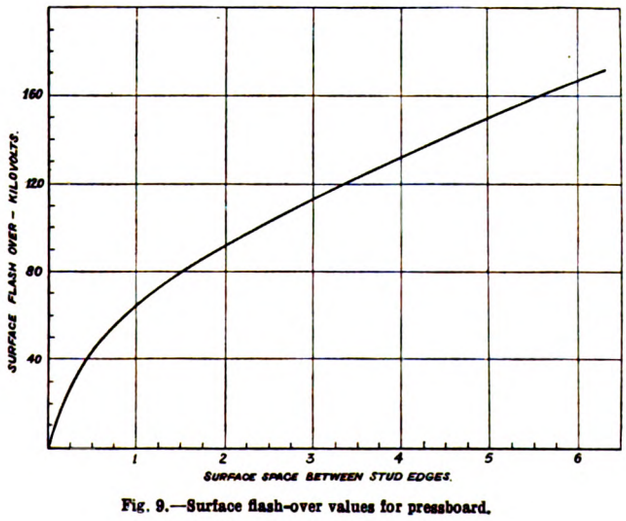

Fig. 9.—Surface flash-over values for pressboard.

Consideration has been directed in this article chiefly to the present position with regard to the first of these varieties, but it should be added that valuable developments have also been made with regard to the manufacture and application of the others. That pressboards are firmly established and recognised as high grade insulating material is indicated by the fact that in transformer applications alone there is a total of over twenty million kVA of apparatus in operation to-day

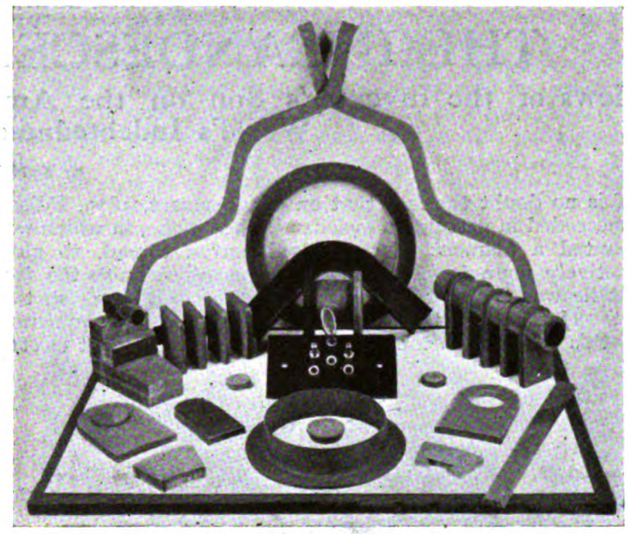

Fig. 10.—Group of pressboard insulating parts, including moulded pieces.

in which pressboard is employed as the principal insulating material.

Since the first part of this article appeared the final draft has been published* of a proposed V.D.E. specification for presspahn, and the values, particularly with regard to the standards for electrical strength, make interesting comparison with those of B.E.S.A. Spec. 231. The table from the draft V.D.E. specification is reproduced in Table IV, in which the

TABLE IV.

ordinary grade may be taken as corresponding with the British grade I and the high quality grade with the British grade IV. An examination of the values shows in the first place a straight line relation between breakdown voltage and thickness over considerable parts of the range. This, however, does not conform with the usually accepted relation of these values, which is that the B.D.V. per mil falls with increasing thickness.

Apart from this slight difference the values in the V.D.E. draft are similar to those in the B.E.S.A. specification. They do

"E.T.Z." May 16th.

Digitized by Google

not, however, represent by any means a similar standard of product, for whereas the proposed German standard tests are to be taken on dried material and presumably, for lack of statement to the contrary, at atmospheric temperatures, the B.E.S.A. tests are to be made at 90 deg. C. on material which has been subjected for 18 hours to an atmosphere of 75% humidity. The proposed German standard tests thus involve much more favourable conditions, and the fact that the minimum permissible values are of the same order indicates that the material covered by the continental specification is of considerably lower quality than the standard British pressboards.

In conclusion, the author's acknowledgments are due to Messrs. B. S. and W. Whiteley, Ltd., and the Metropolitan-Vickers Electrical Co., Ltd., for the use of illustrations and information.

THE INCANDESCENT ELECTRIC LAMP.

Views of the Inventor's Son on the American Claim for Important Discovery—The World's Indebtedness to a British Inventor.

By KENNETH R. SWAN.

IT is no doubt the fact that on October 21st, 1879, Edison succeeded in getting an evacuated glass globe, in which was mounted a filament of carbonised cotton thread, to glow effectively for a few hours, and it is no doubt also the fact that he was the first *in the United States* to accomplish this feat. If, therefore, the American nation choose to commemorate this occasion as the birthday of the incandescent electric lamp in the United States, they can no doubt find ample justification for doing so.

The late Sir Joseph Swan, inventor of the incandescent electric lamp.

But, if a broader claim than this is made, as it appears to be made in certain American articles on "Light's Golden Jubilee," then the following facts should be brought to the notice of those who are responsible for the wide and sweeping assertions made.

Early Demonstrations.

In December, 1878, and in January and February, 1879, Joseph Wilson Swan (who had commenced to study the problem of incandescent electric lighting in 1848) publicly exhibited his incandescent carbon lamp, and demonstrated the practicability of electric lighting by this means to large numbers of people in Newcastle-on-Tyne, Gateshead, and Sunderland.

The earliest date of these demonstrations was December 18th, 1878. So far as absolute priority is concerned, therefore, Swan was 10 months before the date claimed by the Americans for Edison's first demonstration. The 50th anniversary of this occasion (i.e., December 18th, 1878) has already been commemorated by the Institution of Electrical Engineers as the veritable birthday of the incandescent electric lamp.

It is further to be observed that neither Swan's lamp as exhibited in 1878, nor Edison's as exhibited in 1879, had in its initial form all the necessary qualities of a *commercially* successful lamp.

The first serviceable lamps made by Edison had filaments of bamboo. A few of these lamps were first seen in England in the spring of 1880. But even this form of filament, elegant and ingenious as it was, was not destined to achieve more than an ephemeral success.

Early in 1880, Swan, who had been working during the past months to improve the filament, devised a means of producing carbon filaments of the required strength and uniformity. These filaments were known as parchmentised cotton filaments, and the first commercial manufacture of lamps in Great Britain, commenced in 1880, was based upon this improved filament.

Edison quickly discarded his bamboo filament and adopted the parchmentised cotton filament of Swan's invention.

This form of filament held the field in America, no less than in Europe, and for several years all incandescent electric lamps, all the world over, were made with Swan's parchmentised filament.

The Squirted Filament.

In 1883 Swan devised a further improvement in the filament, namely, what was known as the squirted filament. Cellulose in the form of nitro-cellulose or (according to a later modification*) cellulose dissolved in chloride of zinc, was squirted through a small orifice, in the form of an endless thread. This was subsequently reduced to pure cellulose, then cut and shaped and carbonised.

This form of carbon filament, which immensely improved the efficiency of the lamp, superseded the parchmentised cotton filament, and resulted in the greatly extended use of incandescent electric lighting. Edison had nothing to do with this innovation in the principle of filament manufacture, but it was adopted in the so-called Edison lamp, as it was everywhere else throughout the world.

It is only necessary to add this. Though America no doubt owes much to Edison's initiative in connection with the evolution of the incandescent carbon filament lamp, it also owes much to Swan. On the other hand, the British manufacture of the incandescent carbon filament lamp in this country owes nothing whatever to the work of Edison, which the United States are now so loudly acclaiming as an event of world-wide importance.

The British manufacture of the incandescent carbon filament lamp in its practically commercial form is based wholly upon the work of Swan and his collaborators; and the same is true of the manufacture of the lamp on the European Continent.

America's claim, therefore, that the incandescent electric lamp is an American invention, is not only incorrect in its historical foundation, but shows an utter and most ungenerous disregard of the debt she undoubtedly owes in this matter to England.

The publicity which has already been given in our columns to the American celebration of "Light's Golden Jubilee" has given rise to comment in the U.S.A. The American viewpoint on this matter is expressed in the "American Letter," by Mr. F. C. Wells, news editor of the "Electrical World," on page 726 of this issue. The British point of view is summarised in the "Electrical World" of June 1st, page 1 118.

INDUSTRIAL MOTOR CONTROL GEAR.

Novel Applications of Machinery in Manufacturing—Milling by Index Table Method—Drilling Drum Controller Segments—Ingenious Grid-forming Machines.

THE design and manufacture of control gear inherently calls for a wider general knowledge and experience of electrical machines and their applications in industry than any other branch of electrical engineering. This will be readily acknowledged if one contemplates for a moment the important and onerous functions which control gear has to perform. Not only has it to control and protect the electric motor, generator or transformer, as the case may be, but it must essentially also protect the operator and protect and control the plant with which it is used.

The British Thomson-Houston Co., Ltd., Rugby, has for many years specialised in the manufacture of control gear, and the continued advance of electricity into fresh fields, and the improvements in the machinery which other branches of engineering are continually making as a result of such application, daily brings forth new problems and requirements.

The building shown in Fig. 2 forms a part of the main works at Rugby, and is entirely devoted to control gear. The tinsmiths', press shop, foundry, and the sections dealing with resistances, insulation and coil winding, are situated in other buildings. In the factory shown, the machine shop occupies the whole of the second floor, with an area of 22 500 sq. ft. It is thus situated between the two floors on which the majority of the assembly work is done, the parts for the smaller apparatus being sent up to the top floor, while parts for the larger types of apparatus go down to the first and ground floors. The latter floor is used for the assembly of contactor panels, automatic sub-station panels, transformer tap-changing "on load" and ship propulsion equipments. In the busbar section of this floor are special tools for the edgewise bending, drilling, forming, cutting and sweating of busbars. This equipment enables busbars and heavy current back connections to be made neatly and with less joints. The first floor is devoted to smaller contactor panels and to traction equipments, etc., and the second is the machine shop. This floor has been laid out with a view to keeping the material flowing continually in one direction. Raw material enters by a lift at the north end, and the finished part is finally delivered to the inspection department at the south end, where a second lift carries it to the assembly section, where the material flows in the reverse direction—i.e., south to north—thus giving the material a uni-direction flow through the building.

The arrangement shown in Fig. 5 illustrates the milling of operating arms for railway contactors on an automatic milling machine, by the index table method. These operating

Fig. 1 A.—Assembly of controllers, hand-operated and pillar-type startors and the winding of resistance tubes at the B.T.-H. control gear factory at Rugby.

arms are of malleable cast iron and the six bosses have to be machined outside and the pairs at each end are machined inside as well. The arbor carries a gang of cutters to machine two castings side by side. By using the index table, no time is wasted, as the operator is loading one jig while the cutters are working on the other one. The machine table is automatically controlled by dogs, so that the operator has only to raise the starting lever each time, the motion of the table being quick forward, feed, quick return, and stop. This particular operation has one or two special features. It is impossible, due to the shape of the centre of the casting, to machine right through at one operation, but the jigs have been so designed that four bosses are machined outside and one pair inside in a jig at one end of the table, the remaining pair of bosses being machined inside and out in a jig at the opposite end of the table, the two jigs being so aligned that the two operations are "complementary" to one another.

This arrangement made it possible to use the index table with only one jig of each kind instead of a pair of each, as is the usual practice, so that each casting only pays one visit to the machine before being finished. If two pairs of jigs had been used it would have meant machining one end of all the castings first, and then going over them all again to machine the second end.

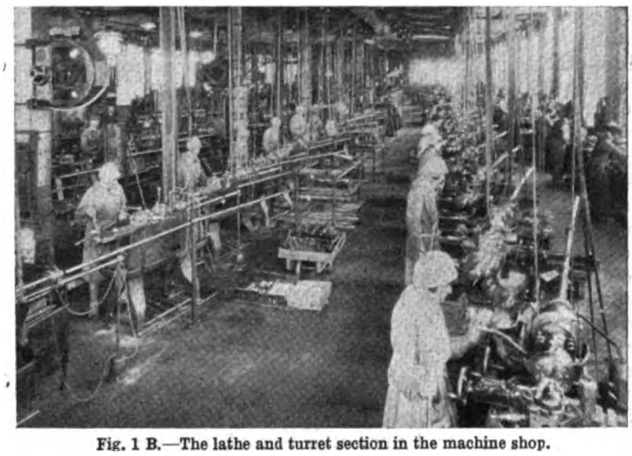

Fig. 1 B.—The lathe and turret section in the machine shop.

Owing to the fact that the large cutters have passed the outside of the end bosses before the small cutters reach there, it was found that springing took place. To overcome this the large cutters were made with large diameter bosses which were slightly greater in diameter than the small cutters. These bosses reach the outside and the bosses, which have already been machined before the small cutters, start to cut on the interior and so hold the whole job perfectly steady. Production for the complete cycle of two operations is about 30 per hour with girl operators.

Fig. 6 illustrates a device for the rapid drilling of parts with a single hole, such as contactor tips, etc. The main principle is that the downward movement of the spindle as the drill approaches the work is used to clamp the work in position. The general housing is common to a number of parts, interchangeable blocks being inserted for each separate article. The barrel attached to the spindle contains a spring plunger, to which are pinned two pairs of links pivoted on the top of the fixture. On these links is an adjustable block carrying a further spring plunger which bears against the work as the drill descends. This second plunger engages with the work and thereafter the further downward movement of the drill is taken up by the spring in the barrel. The machine is foot operated so that the operator has both hands free.

A very large variety of drum controller segments have to be drilled, and the machine shown in Fig. 4 was designed in the controller factory to take care of all these parts. The two spindles can be set at any angle between 18 and 180 deg., the angle being plainly marked on the sector on which they are mounted. Adaptors of various sizes can be inserted at the centre of the circle to accommodate segments of varying widths and diameters. These segments are mounted on their respective adaptors by means of two arms, which are also set to a scale of degrees. The drive is taken from the motor by a belt passing over the two pulleys and transmitted to the spindles through two pairs of mitre wheels. The tool used is a combined drill and counter-sinking tool, so that only the one operation is necessary to drill and counter-sink both holes in their correct positions.

The top floor, a general idea of which can be obtained from Fig. 1A, is devoted to the assembly of controllers, hand-startors and pillar type startors, and the winding of resistance tubes. Vitreous enamelled units are wound on porcelain tubes and then enamelled in an electrically-heated oven. (Seen in

Digitized by Google

Fig. 1.) The temperature is continuously recorded on a chart by a Leeds and Northrup recorder, seen on the right in the illustration. This plant is capable of turning out 9 000 resistance tubes per week. The units are enamelled at red heat and on completion will withstand overloading to similar temperatures for comparatively long periods without permanent injury. An important product of this floor is pillar type startors, both a.c. and d.c., both faceplate and drum type starting pillars being manufactured. D.c. pillars, comprising drum type startor with step-by-step ratchet motion are supplied, up to 1 200 A capacity. A.c. pillars, equipped with a similar drum type startor for the rotor circuit, and a triple pole contactor with overload relay in the stator circuit are supplied up to 500 A per phase. D.c. faceplate startors, owing to the greater quantities required, necessitate special handling by a straight assembly line method, starting with the switch base at one end and finishing with the complete startor at the other. The number of operations to be performed by each worker is planned to occupy the same time, so that there is no accumulation of work between the operators. The necessary parts required for each operator are stored in suitable receptacles, so that they may be reached with a minimum effort. At the end of the line the complete startor is tested and is ready for packing and despatch.

Cast grid and unbreakable resistances for crane controllers, trolley 'buses, tramcars, traction, neutral earthing, etc., are made in a separate building, and machines for producing and assembling these unbreakable resistances are shown in Fig. 7. These are completed by fitting terminals and assembling in frames as shown in Fig. 3, final testing taking place in the enclosure seen in the background. The unbreakable resistance is composed of a continuous wire unit, formed into grids on the machines seen in the background of Fig. 7. The wire, or strip, comes into the works in a continuous coil. It is first cleaned and then electro-plated, to render it proof against corrosion. Then it is fed to the grid-forming machine, from which it emerges as a continuous series of grids, which are coiled directly on to drums seen in the foreground of the same illustration. The next operation is that of building the grids into resistance banks, mounting on mica insulated tie rods with the necessary spacing and insulating washers, and then passing the product to the section shown in Fig. 3, where terminals and covers are fitted. If necessary a number of boxes are bolted together to form a complete unit. They are finally tested for resistance and insulation.

AMERICAN LETTER.

Why Americans Regard Edison as Hero of Semi-Centennial of Incandescent Electric Light.

By FRANK C. WELLS, News Editor "Electrical World."

NEW YORK, May 25th, 1929.

AMERICANS are accustomed to think of Thomas A. Edison as having undisputed title to the invention of the incandescent electric lamp, which they naturally regard as by far the greatest of his achievements. The phonograph, which is certainly all his, and the motion picture, in the genesis of which he had so large a part, have added greatly to the pleasure of the world and have been of business utility besides; but they have borne a relatively small part in the industrial and social revolution in which electricity has far outweighed every other factor.

Serene in their faith, various electrical organisations and societies are about to stage a vast celebration, to be known as "Light's Golden Jubilee," and spread all over North America. This celebration, for which the Edison Pioneers have selected a sponsoring committee of eminent citizens headed by President Hoover as honorary chairman, and which is backed by the National Electric Light Association, will signalise the semi-centennial of incandescent electric light, and will glorify Mr. Edison as the Jupiter from whose brain it sprang, and as the one who may rightly look at all that has followed because of it as derived from his early exertions.

Mr. Edison, those who know him well tell us, is not the man to whom such a pose appeals, and he is likely to view his own apotheosis at the age of eighty-two with an air of detachment, depreciation, and, possibly, slight impatience. The work-bench, not the limelight, has been Edison's lifelong habit. He would undoubtedly have rested amply content with the laurels heaped upon him in the past and foregone the coming culmination. But the celebration must have its hero, and by universal consent of his fellow-countrymen—Edison is he.

It is a little disconcerting that, right at this point, there should float across the Atlantic drawn-out echoes of the British celebration last year of the fiftieth anniversary of the Swan lamp. These echoes do not quite harmonise with the opening strains of America's 1929 electrical orchestra. Many English electrical men, it has been made apparent, are of the opinion that because Swan demonstrated his invention ten months before Edison's was ready, the priority is, and the tributes and popular fame in this particular connection should be, his.

Without any attempt to compare technically the two lamps, each developed with no knowledge of the other—a comparison to make which the writer has no qualifications whatever—may it not be contended that, while Swan's lamp is an interesting historical fact, Edison's is an ever-present reality? In the United States students of the history of lighting are, of course, familiar with Swan's name, but it would be safe to say that not one other citizen in a hundred thousand ever heard of him. Yet there is not in this country a school child, a Chinese laundryman or a Syrian peddler who does not associate electric light with Edison. This is because, with a practical grasp and a business sense unusual in inventors, Edison developed along with his lamp the system of electric generation, transmission and distribution that, with no fundamental change, is used to-day.

Three years after his lamp was shown to be a practical device, the famous Pearl Street power house was energising the first incandescent electric lighting system of the world—the system that illuminated downtown New York. This system Edison and his agents rapidly spread, not only over America, but over Europe as well. When England, France, Germany and Italy swang into line with the United States as pioneers in electrical development, it was Edison to whom they turned for inspiration.

While according high honour to Swan and any other inventors who worked successfully at the problem also solved by Edison, but who failed to win the last heat of the contest—with which the telegrapher from Michigan ran away—there will be few on this side of the Atlantic who will admit that the hero of the jubilee has been wrongly chosen. If in the discovery of the new world of electric light Swan was an authentic Leif Ericson, Edison is an equally authentic Columbus. The rôle of Amerigo Vespucci can never be made to fit him.

The Trade Commission Investigation.

The investigation which the Federal Trade Commission is conducting into the utility companies, their financing and their methods of propaganda goes on more or less merrily. A new feature has been bestowed upon it by the discovery that the International Paper Co., now a subsidiary of the International Paper and Power Co., recently purchased stock in thirteen to fourteen daily newspapers in various states, and permitted offers backed by it to be made for many others. The position taken by the International Paper and Power Co. is that, just as it was organised to take care of an enormous pulp and paper-mill business by adding to exclusively industrial water-power plants the control of utility operating companies whose primary purpose and duty are to furnish power to all applicants alike, so it acquired an interest in daily newspapers to assure a market for its newsprint. With apparent complete sincerity, the International company protests that it never dreamed of trying the editorial policy of the newspapers into which its subsidiary bought. As a matter of fact, one of these—in Chicago—attacked the local utility companies and supported the Federal Trade Commission's investigation. None the less, the paper company incident has not made a good impression on the public, and the electrical industry is probably nearly unanimous in regretting that it arose.

Does it not all seem part of the tremendously complicated fabric of modern business, with its ramifying and interlocked antennæ and its substitution of credit for cash? Where it will end no man knows. But if, for instance, editors are ever to be as immune from suspicion as the wife of Cæsar, they will have to own the papers for which they write, eschew advertisements and cry in the wilderness for enough subscribers at a greatly enhanced price to insure them a living from sheets greatly diminished in size. In other words, the wheels of journalism must turn backward. It is a safe prophecy that they won't. The waterwheels, too, will continue to revolve in the normal direction; electric light and power will grow more nearly universal and more nearly an absolute essential to human life, and somehow or other consumers and producers, big businesses and small, lawmakers and law breakers, reactionaries, reformers and ordinary mortals will muddle along to an adjustment or, at any rate, a *modus vivendi*.

THE HIGH TENSION CONFERENCE IN PARIS.

Over a Hundred Papers Presented to Big International Gathering—More British Representatives Attending—Fuel, Turbine, Alternator and Switchgear Problems.

By THEODORE RICH, A.M.I.E.E.

THE Fifth Biennial International Conference on Large Electric High Tension Systems was opened in Paris on the afternoon of June 6th, in the presence of M. Colson, of the French Ministry of Public Works. M. Ulrich, the President of the Conference, who is connected with some of the largest power undertakings in France, in opening the proceedings, pointed out that beginning in March, 1921, as the result of proposals made at a meeting of several engineers, the first congress was held in November of the same year, in which 150 French and 51 foreign engineers took part. The Congress had grown so rapidly that at present there were about 700 members belonging to 32 countries. The Conference was from the start under the patronage of the International Electrotechnical Commission; it worked in close co-operation with the latter organisation, preparing in many cases information regarding matters suitable for standardisation. The Conference was continuing to carry out the objects for which it was formed, namely, the interchange of information and the free discussion of matters of technical interest between government, municipal, consulting and manufacturing engineers, and also professors and others interested in the very varied problems relating to high tension systems. The official character of the Congress was recognised by the French Government, and Dr. Mailloux, of New York, was the official representative of the American Government at the Congress.

The ministries of Public Works of Belgium and Denmark sent representatives, as did also the Governments of Canada, Egypt, Italy, Norway, Holland, Poland, Roumania, Sweden, Czechoslovakia and Tunis. It is a pity, therefore, that the British Electricity Commissioners, whose primary duty it is to encourage the development of electrical power, and who have the right to a material extent to dictate to British engineers as to how their work shall or shall not be carried out, have been too busy to send one of their number to this or to any of the preceding high tension congresses. Messrs. P. V. Hunter, J. R. Beard and Johnstone Wright, the last of these a member of the Central Electricity Board, represented the Institution of Electrical Engineers, and Messrs. J. E. Cogle, P. D. Morgan, B. Whitney, and E. B. Wedmore represented the British Electrical and Allied Industries Research Association; 42 British members in all were registered for the Congress, a great improvement on the numbers supporting the session in 1927.

Britain's Contribution.

The presentation of 15 papers at the Congress from Great Britain, dealing *inter alia* with insulating oils and other materials and with circuit breakers and transformers, some papers being the results of detailed experimental work taken in hand by well-known British firms or engineering organisations, will go far to give back to British electrical power engineering that place which, despite numerous political and social obstacles in the past, it should take relative to kindred activities which are taking place in other countries.

It might be noted that the number of papers prepared for the Congress reached the figure of 108. Some of these, however, of a mathematical or purely descriptive character, lend themselves more to careful study, with utility for reference purposes, than to active discussion in the time available, although many papers on what might be termed burning topical questions have given rise to much useful debate.

M. Legouez, of Paris, who had so much to do with the development of the Congress, is retiring from active work, but as a recognition of his services he was nominated "President d'Honneur" of the Conference.

The proceedings of the first day, Friday, June 7th, were related to fuel, steam turbines, alternators parallel operation and switchgear.

Dr. Mailloux in his paper on the rational utilisation of fuels, which dealt in the main with conditions in the U.S.A., stressed the increased capacity of steam raising plant per unit of space, owing to the almost instantaneous combustion obtained with pulverisers as compared with various forms of stokers, in which the combustion per square foot of grate area must be limited by the thickness of the fuel and the difficulty of getting air into contact with it. M. Dubertret, in his paper on French High Pressure and High Temperature steam turbines, pointed out that while great progress was being made in this direction the usual conditions regarding load factor, etc., in France did not seem to warrant the capital charges necessary when going to such high limits as are being used in some other countries. Messrs. Bakker and Van Staveren, of Holland, pleaded for a higher standard of slot and end coil insulation, giving tests and notes on the means by which such improvements could be obtained.

M. G. Darreus, in his paper on the Evolution of Alternators, pointed out that unwarranted demands for a high degree of inherent self regulation were still tending to hold back alternator design. Automatic regulators and specially arranged compound excited exciters made such requirements unnecessary; a power station should be called upon to supply active power to a network, the reactive power being supplied by synchronous condensers or by other means. M. Puppikofer of Switzerland described the automatic starting and paralleling from a distance of unattended generating plant. This is of interest in countries when water power is available in quantities to feed networks which would not warrant the use of the continuous employment of attendants; there must be some places at home where such arrangements could be adopted.

Exchange of Energy.

A paper by J. Reznicek dealt with exchanges of energy between stations operating in parallel. The importance of frequency maintenance, of the supply of inter-station requirements from the most economical source, the necessity for efficient means of communication with the central bureau, and the necessity for ample powers in the hands of the despatching department were urged.

In the discussion it was pointed out that the effective capacity of a transmission line rapidly decreases with its length; that synchronous condensers have an important influence on the amount of power which can be handled in a network and that the limiting factor on the amount of power which can be operated in parallel to a material extent depends on the breaking capacity of oil switches.

In the afternoon of June 7th, switchgear was dealt with. A report was presented by the Swiss Committee charged at the end of the 1927 Congress to look into various important matters relating to oil switches. Although researches have been made and certain rules formulated in Germany, England, America, France, and Switzerland it is desirable to find some common ground by which such switchgear can be compared and rated. A questionnaire was drawn up, the answers have been tabulated and certain recommendations are made.

Messrs. Wedmore, Whitney and Bruce presented a detailed report on researches carried out with the aid of a 5 000 kW turbine at Carville covering 3 000 tests.

M. J. Kopeliowitch presented a report on oil switches, giving a number of motion pictures made with the aid of a switch in oil in a glass cylinder, illuminated by 200 000 c.p., the apparatus taking 300 images a second. Owing to the formation of carbon the large bubble of gas formed comes out black in the photographic images.

This was followed by a report with cinema films of a testing station recently inaugurated by the Ateliers de Constructions Electriques de Delle for the testing of oil switches and research regarding switch operation. The generator is of 50 000 kVA. capacity at 15 000 revs. It was pointed out that the shock on an oil switch on short circuit could be exceedingly violent, and there was a tendency to blame surges for difficulties due to mechanical causes regarding switchgear.

The electro-dynamic forces on busbar insulators could be very great, the shocks being of a very sudden character. The increased height in busbar supports asked for by some power companies simply increased the bending moments on them, porcelain not being elastic. With 200 000 A busbars 18 in. apart should stand 2 tons at the beam.

Films were given showing the effect of a short on section links and busbar supports. During the discussion on the group of papers Mr. Wedmore said that the design of commercial circuit breakers would not get down to real economy or efficiency until all factors had been separated out and examined

Digitized by Google

quantitatively and qualitatively. 'The point was, what were the conditions under which the arc was quenched. If we waited until the current came to zero and then broke, no energy was broken; if broken while current was still on there must be a large liberation of power owing to the proportion of the wave cycle that remained. One wanted a balance sheet to see where the power came from and went to.

Dr. WHITNEY said that arcs do go out sometimes when still inside the bubble of the gas produced in the oil, and one sometimes got an increase of pressure even after the gas bubble had disappeared. It was stated that as voltage increases the less the variation in results, apparently due to the fact that with medium or low voltage the current is cut off within 2 or 3 half cycles, whereas with high voltage 20 to 23 half cycles may be required.

M. SAINT GERMAIN said that laboratory results were never quite the same as in practical operation; constructors should guarantee a minimum time in which to cut off current.

When reading the reports and listening to the discussions on oil switches it seems to be a pity that the Central Electricity Board at home should be rushing into contracts relating to the supply of scores of thousands of pounds' worth of circuit breaking gear at a time when there is no urgency whatsoever and a reasonable amount of money put up to aid research work might well yield dividends running into hundreds per cent. The work on switchgear initiated two years ago is undoubtedly yielding fruit and the electrical community owes a debt of gratitude to those who are carrying out valuable research work with the expenditure of much time and money.

Below are given short abstracts of some of the papers read, together with a concise account of the discussions :—

THE STARTING UP AND PARALLELING OF ALTERNATORS IN AUTOMATICALLY OPERATED CENTRAL STATIONS. By H. PUPPIKOFER.—There is to-day a movement towards the suppression of nonproductive labour and the utilisation of all forces which may contribute towards production. A great deal of the service of the tending of plant and apparatus can be termed non-productive, the cost of labour has been largely increased, and a movement which was initiated to a large extent in America is tending towards the development not merely of automatically operated sub-stations but also of auxiliary power stations operated automatically, the principal rôle being that connected with water power.

Where synchronous generators are concerned the problem is to find a means by which a generator can be run up and put into parallel.

There are three general methods.

Three Methods.

(I) Coupling by means of reactance coils. With the aid of these in circuit if an incoming generator is run up to approximately synchronous speed and, the coupling switch closed, the current flowing is limited, the machines are run into phase, and the reactance is automatically cut out.

(II) By auto-synchronising (pull-in) methods, which have been used in America for units up to 10 000 kVA. The alternator has amortising bars, and it is run up by the hydraulic turbine to a speed near that of the synchronous circuit to which the generator is to be coupled. The incoming generator is switched in without excitation, the current running up, in some cases, to 8 times normal. By raising the excitation one can reduce the rush of current, but, for some seconds at least, it remains at double full load. Such means, which must affect local voltages, can only be used on large networks.

A third method is to run up the speed to the exact synchronism and parallel-in automatically. One means is to run a synchronous motor from the circuit in operation and connect it to the incoming machine by means of a differential gear box which can actuate the hydraulic regulation movement until synchronism is obtained. Another method is to use two modified dynamo-tacheometers cross connected.

A system is described by which a station containing two 700 kVA low tension units can be run up to speed and coupled up by the closing of a main switch which connects the feeder from the station to the main network.

In the discussion it was pointed out that as automatic power stations are usually actuated by turbines in positions difficult of access, the use of an asynchronous type of generator (which would not require paralleling) is not usually advisable, as its operation would mean the supply through the branch in question to the generating point of quantities of reactive current.

INFLUENCE OF OPERATING CONDITIONS UPON THE DEVELOPMENT OF ALTERNATORS. By M. DARREUS (Engineer of the Compagnie Electromecanique (formerly Brown Boveri of Paris).—This paper presents in a comparatively small space a comprehensive analysis of the factors influencing modern alternator design.

At one time the limited extension of networks, their low diversity factors, the absence of efficient automatic regulators or compounding devices, caused purchasers to lay undue stress on the inherent regulation of alternators. Armature reaction was held in check by large air gaps and saturation, so that no load excitation formed the major part of that required for full load. Such limitations naturally influenced short-circuit currents.

Diminished Exciting Current.

The coming of the high-speed turbo-alternator led to the abandonment of such restrictions in order to increase the output per unit of material, leakage reactance with transient short circuit phenomena being of more importance now than armature reaction. The proportion of no load to full load excitation has now reached 3 or over, but diversity factors have materially stabilised station loads, and separate excitation and automatic regulators have made such alternators satisfactory in operation. At normal excitation the permanent short circuit current has come down a great deal, and for both turbo-alternators and large slower speed alternators. The primary duty of the excitation is to balance the demagnetising ampere turns of the armature, only a small proportion of the excitation being required for no load conditions. The increase in speed and pole pitch and of the ampere turns per centimetre has led to a diminution of exciting current.

The limits of output factors at present are about 150 metres per second peripheral speed air gap induction B. 10 000 and 700 ampere turns per centimetre, which gives about 7 000 kW per square metre of air gap area. The saturation limits the air gap induction, the state of metallurgy limits the peripheral velocity, but the ampere turns per centimetre length could be still further increased by increasing the depth of slots to 30 cm., and the ampere turns from 700 to 1 800 without excessive eddy current losses in the slots, the main problem in such cases being the reduction of losses in coil ends.

Core losses have been kept down, and the relative reduction of the iron losses which do not vary with the load as compared with those which do so, will tend towards the improvement of synchronous compensators at light loads.

The continuous increase in ampere turns is often limited by special factors. For example, alternators required to feed long high voltage lines at low loads may have to supply a leading capacity current which, reacting on the flux and voltage, may reduce the necessary excitation to such an extent as to reduce the synchronising couple. There has been, therefore, a tendency to increase the air gaps, though it is doubtful whether such modifications are worth while, as more than one machine can usually be run in parallel, and absorbers of reactive power such as transformers and synchronous motors may be connected into the circuit.

Distributing networks tend to absorb excessive capacity currents and the tendency is to reserve to the generators the supply of active power, leaving to synchronous or asynchronous compensators the duty of the supply of reactive power. Asynchronous compensators, excited by polyphase commutator machines in cascade, in which the compensator-rotor ampere-turns oppose those in the stator are coming into vogue.

Problems regarding the stability of power transmission systems form a material influence as tending to limit the ampere turns, but such an influence often assumes a constant field current, which to-day ceases to be such a material factor now that reliable automatic voltage regulators are available.

For excitation the normal shunt system is not desirable, the compound system being but little better, as the demagnetising influence of the stator on short circuit has so much influence. A separately excited exciter would give an improvement in this direction. The author of the paper, however, prefers the use of a series exciter with an entirely laminated field arranged to operate on the straight line part of the no load curve. This type of exciter can be arranged with an auxiliary coil fed by a storage battery or extra exciter which can add or subtract ampere turns to an extent settled by an automatic regulator connected up on the potentiometer principle. The prejudicial effects often imputed to an excessive armature reaction are often due to insufficient study of accessory problems.

Capacity is not as troublesome as is often imputed; in fact its effect can be considered as opportune and favourable.

THE I.M.E.A. CONVENTION.

Sir John Snell on the Simplification of Distribution Systems—The President and the Promised Land—Wider Scope for Municipal Engineers—Mr. Cramb's Services.

ALTHOUGH our special illustrated report of the 34th annual convention of the Incorporated Municipal Electrical Association at Torquay last week occupied no fewer than twenty-three pages, and included reports of all the papers and of all the discussions, considerations of time and space compelled us to hold over the report of the annual dinner and of the annual meeting on Friday, now presented below.

At the annual dinner, held at the Pavilion on June 6th, SIR JOHN SNELL (Chief Electricity Commissioner) proposed "The Incorporated Municipal Electrical Association," and said that for ten strenuous years the Electricity Commissioners had been trying to bring some orderly simplicity into the electrical industry out of the tangle of numerous frequencies and pressures and systems which they found confronting them.

In his opinion, economic generation was now adequately provided for, and when it was remembered that the output of electricity—low as it had been—had doubled in the last five or five-and-a-half years, and that the average rate of increase of growth was one thousand million units per annum during the last two years, he had no reason to doubt that the large output of electricity which he had advised the Weir Committee in 1924 would probably be realised within 15 or 16 years, was in a fair way to being realised, or even exceeded.

He agreed with the President that provision for the cheap production of electricity and its main transmission was only half the story, and whether it fell to himself or to someone with fresher vigour to head the Commission in the work which lay before it, there could be no doubt that the next task which would obviously fall to the Commissioners was to bring about co-ordination in the distribution of electricity throughout the country. He did not, however, wish to be misunderstood. For years past the Commissioners had been steadily encouraging—and had been greatly assisted by many of the distributors—the gradual standardisation of their systems and the gradual supplanting of d.c. by a.c. distribution, without which, he ventured to suggest, the increasing density of load in urban areas for domestic purposes in particular can never adequately be met. That quiet preparation was, in the aggregate, going to be quite a substantial contribution to the gradual simplification and improvement of distribution systems, and was quietly paving the way for the larger step yet to be taken.

He specially hoped that the Committees of Corporations who were authorised distributors would seriously consider that it was to their own advantage that the contribution of a reasonable amount in some proportion to their revenues should be made to the funds of the Electrical Research Association.

The PRESIDENT (Mr. A. Nichols Moore), replying to the toast, said that undoubtedly the Association was making amazing progress. There were 1 020 delegates and visitors to the Convention this year, and the Association could be proud of the fact that it now had considerable influence and was playing an important part in the development of electricity supply in the country. The Association was all out, with the Commissioners and the Central Electricity Board, to make the new schemes a success, and he believed that would be done. But it was necessary to have the help and guidance of the Commissioners to take full advantage of the legislative machinery at their disposal.

At one of the meetings of the Convention an eminent consulting engineer made some reference to Biblical law and drew certain analogies. Whilst that gentleman was speaking he could not help thinking of another analogy. Sir John Snell had referred to the momentous date of 1940 and had indicated the development that might then be expected. This year 1940 reminded him that there was an experience in Biblical history of another period of 40 years when the Children of Israel wandered in the wilderness for 40 years looking for the Promised land. The electrical supply industry was looking for the Promised land, and it was perhaps possible to carry the analogy a little farther. The Children of Israel wandered 40 years in the wilderness and in that period they sent spies into the Promised land to see what it was like. These spies came back with their report and pronounced the Promised land to be very beautiful.

All this rather struck him as being like the gentlemen who prepared the Weir Report. There were in the Biblical history to which he had referred, false spies who came back with reports which did not tell the truth. He could only hope that those gentlemen who came back with the Weir Report had not done the same thing, because the false spies met with a sticky end.

Ald. E. HUNTSMAN (chairman, Nottingham Electricity Committee) proposed "The County Borough of Newport and the Borough of Torquay" which was replied to by the Mayor of Newport and the Mayor of Torquay.

The final toast, that of "Our Guests and the Ladies," was proposed by Mr. R. A. Chattock (Past President), who coupled with it the name of Mr. Frank Hodges.

Mr. Frank HODGES, in the course of his reply, said that although the members of the Central Electricity Board dealt with the problems they had to face in a strictly impartial manner, he foresaw the day when private enterprise in matters electrical would offer no more in scope, no more in ambition and no more in salary than municipal work. He believed that we should become more municipal as time went on, but municipalities would never survive or thrive on small men. Neither would they survive or thrive on too limited territorial definitions. When municipalities had the courage to look forward and operate on the basis of wider areas, when they co-operated in large industrial populations and geographical areas, then the scope for the municipal engineer would widen far beyond the possibilities of the scope provided for him by the inevitably delimited territory of private enterprise.

The Annual Meeting.

The annual general meeting was held on June 7th, in the Pavilion, and was, as usual, private.

The result of the election of officers and Council for 1929-30 was as follows:—

PRESIDENT.—Mr. J. K. Brydges (Borough Electrical Engineer, Eastbourne).

VICE-PRESIDENT.—Mr. A. J. Fuller (Borough Electrical Engineer, Fulham).

HON. SOLICITOR.—Mr. J. H. Rothwell (Brighton).

HON. TREASURER.—Mr. H. Faraday Proctor (Bristol).

HON. SECRETARY.—Mr. A. C. Cramb (Croydon).

The following were elected to fill vacancies on the Council:—LARGE UNDERTAKINGS: Major E. A. Barker (Barnsley); Mr. A. W. Barham (Watford). (To fill the vacancy caused by the election of Mr. Fuller as Vice-President, Mr. J. W. Burr (Swansea) was elected for one year). SMALL UNDERTAKINGS: Mr. C. J. Wood (Sale). LOCAL AUTHORITY REPRESENTATIVES: Ald. E. Huntsman (Nottingham); Ald. T. Shires (Huddersfield).

The report and accounts were adopted, and the meeting closed with cordial votes of thanks to the retiring President.

The PRESIDENT, in acknowledging the vote of thanks, spoke of the services of Mr. Cramb as Hon. Secretary and of the special difficulties which he had to face in organising the Convention this year. The fact that everything in connection with the Convention had passed off with comparative smoothness and had been carried out according to plan was due entirely to Mr. Cramb, and he proposed a hearty vote of thanks to him. The vote was carried with acclamation.

Mr. CRAMB, acknowledging the vote of thanks, said it was always a pleasure to him to do anything he possibly could for the Association. The development in the last ten years, however—during which time he had been Hon. Secretary—had been such as to render it impossible for him to give as much time to the affairs of the Association as he had in the past. The Association was now getting so big that he sometimes felt a little bit afraid for the future, because it had reached such a position of importance that it was necessary to live up to it. His own duties to his Corporation were increasing rapidly, and the fact that he would be able to devote less time to the affairs of the Association in the future was a matter to which the Council would have to give careful consideration.

Cordial votes of thanks were also passed to the Mayors of Newport and Torquay, to the Chairmen of the Electricity Committees of those towns, and to the officials of the Torquay Corporation in connection with the arrangements made for the Convention.

MORE I.M.E.A. CONVENTION SNAPSHOTS.

THE above snapshots, supplementing our special pictorial record of the I.M.E.A. Convention at Torquay last week, show: (1) *A group of visitors alongside the "Henley" demonstration van.* (2) *Mr. Barnes Kay (Haslingden) and Mr. F. G. Nesbitt (Credenda) in the sun-porch before breakfast.* (3) *Mr. H. F. G. Woods, of Torquay, filling up outside the Pavilion.* (4) *Mr. C. W. Marshall as the snapper snapped.* (5) *A view of Beacon Cove taken by the special coloured floodlighting at night.* (6) *The good ship "Magicoal" in dock; she attracted many visitors.* (7) *A group of engineers, all of whom graduated at Croydon. They are: Back row (left to right)—C. W. Salt (Carlisle), W. C. Bexon (Ayrshire Electricity Board), J. H. Parker (West Hartlepool), H. Wilson (Ashford); front row (left to right)—J. W. Burr (Swansea), A. C. Cramb (Croydon) and A. P. MacAlister (Islington).*

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

Trade Charges in the Electrical Installation Industry.

[To the Editor.]

Sir,—The writer of the article under the above heading in your issue of May 17th is to be congratulated, and it is to be hoped that those contractors who do not make a careful analysis of their trading figures and balance sheets will do so.

The remarks on the Cost of Ignorance ought to be brought before every contractor to-day, but the difficulty is that thousands of the " small men " do not even invest in the trade journals that publish such valuable information, with the result that they never know any better. I feel sure that it is this appalling ignorance that is one of the chief causes of price-cutting and the ruinous cut-throat competition to-day, because the culprits have very little idea of what overhead expenses should be taken into consideration in basing their prices for work, or in the costing of jobs done.

There is bound to be a considerable difference in percentage of total P.C. in connection with various items, for the simple reason that the business done by contractors varies so much. Take several businesses, each doing, say, £20 000 per annum, one firm with premises in a back street of a provincial town, paying a low rent and specialising in power work. The bulk of this work may be done on four or five jobs in the year, with the result that the percentage of many items on the prime cost would be far less than those of another business doing the same turnover, with showrooms in a front street, more elaborate offices, showroom attendants, etc., and the total turnover accounted for by many small house and shop lighting jobs, sales of fittings, radiators, etc., from the showroom, and a large number of jobbing repairs.

These percentages for rent, advertising, management, postage, and nearly all other items mentioned in the analysis will vary in accordance with the class of business.

This does not, however, minimise the fact that contractors should be alert and have a very careful check each year on the percentage of the items mentioned by your writer, because it enables the proprietor to see at a glance the true proportions of the ingredients that go to making up his overhead expenses, also, incidentally, often enables him to put his finger on the item or items which ought to be reduced.

For the benefit of the writer of your article, and also any of your readers who are interested, I am enclosing a table of percentages extracted from my firm's last two years' balance sheets and which may be useful as a comparison for others who desire to make a detailed analysis of their own accounts.

For obvious reasons I cannot give the actual figures of the business or the name.

Percentage Table.

	1929. Per cent.	1928. Per cent.
Wages paid to employees	26·10	24·90
Carriage charges	0·95	0·94
Rent, rates, lighting and insurance	2·85	2·82
Printing and stationery	0·71	0·61
Advertising	1·47	1·15
Telephones	0·44	0·41
Postages	0·75	0·70
Travelling expenses (exclusive of workmen's expenses)	1·31	0·90
Sundry trade and petty cash expenses	0·74	0·64
Bad debts	0·08	0·81

I am, etc.,

Analysis.

Mains Operated Wireless Sets.

[To the Editor.]

Sir,—Having recently installed for a customer an expensive mains operated wireless receiver of well-known make, considerable inconvenience is being experienced as a result of " clicks " being heard in the loud speaker whenever anyone switches on the electric light. These clicks occur, apparently, irrespective of whether the light switched on is next door or 30 yards down the road, and at times when neighbours retire for the night the noise from the loud speaker is appalling.

I have tried screening the set, altering the direction of the aerial and various other means, but without success.

Should any of your readers know of a remedy then I shall be glad if they will communicate with me through your correspondence columns.—I am, etc.,

" Electrician."

Frinton-on-Sea.

[Correspondence on this subject is invited.—Ed.]

" The Boiling Plate of To-day."

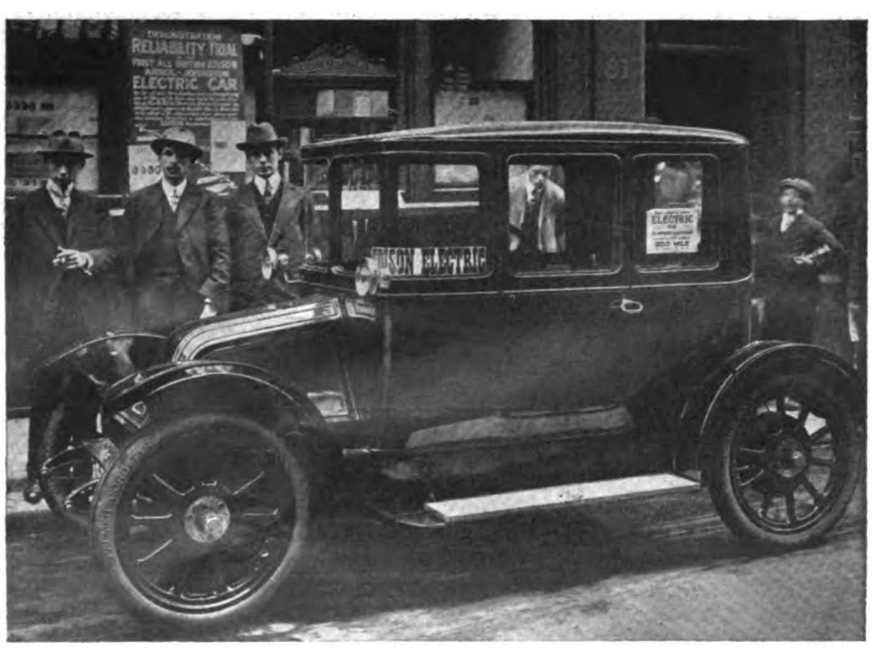
[To the Editor.]

Sir,—We have read with interest the article by Mr. S. Bickell on boiling plates, and whilst we agree with all he says, we think that in all fairness to the enclosed-type boiling plates the comparative test figures for 2, 3 and 4 pints should have been given. Perhaps Mr. Bickell will oblige ?—I am, etc.,

L. P. Haussauer,
Managing Director,
Sadia, Ltd.

London, W.1.

CAN THE PASSENGER ELECTRIC BE REVIVED ?



THIS question is appropriate in view of the reference, on the opposite page, to the exploits fifteen years ago. The car in question is seen in the accompanying photograph outside The Electrician *offices at the finish of its run from Dumfries. Although this was not the first long-distance trial made with an electric vehicle in this country, it was the first time that a distance of nearly 400 miles was covered by such a vehicle in a total time for running and charging of 58 hours. The run incidentally demonstrated that a town-type vehicle could be used for touring purposes over the roughest roads and under the worst possible conditions. In the group alongside the car are seen Mr. M. E. Fox (left), who drove the car, and Mr. W. E. Warrilow (right), who acted as observer on behalf of* The Electrician. *A 60-cell battery, weighing 900 lb. requiring a normal charging current of 30 A for 7 hours was used, but owing to the circumstances of the run the average charge actually given was about 100 A. On a total mileage of 362 the car averaged 12·3 m.p.h. at an average cost of 0·67d. per mile run.*

NEWS IN BRIEF.

Electrical Wages—I.E.E. Students' Summer Tour—Manchester and Electrical Contractors—Poplar and Its Canal—Peterborough Has a Fire.

A THROUGH telephone circuit between London and Milan has now been put into operation.

A fire occurred at the Peterborough electricity works station on June 3rd, involving the coal-handling plant.

The time for the receipt of applications for the position of borough electrical engineer and manager at Torquay is extended to June 27th.

Cheltenham Electricity Committee has authorised the Borough Electrical Engineer to obtain tenders for the supply of meters, transformers and cable.

It was announced recently that the U.S.A. Senatorial Inquiry into the radio telephone and telegraph monopolies would commence during the present week.

The Summer Tour of the Students' Section of the I.E.E. will be held in Paris and Northern France from August 3rd to August 12th.

The 4th annual sports meeting of the Hackbridge Electric Construction Co., Ltd., will be held on June 22nd, at Molesey Road, Hersham, Walton-on-Thames.

A large portion of a wall in St. Leonard's Road, Poplar, collapsed, on Tuesday, as a result of disturbance by work carried out by a contractor in connection with the widening of the canal which runs alongside the road. The broken wall, in slipping down on to the canal bank, carried about 40 ft. of the Borough Council's cable with it, but, fortunately the cable is not damaged, and the supply of current is not affected.

Mansfield Electricity Committee recently recommended that all future work under the assisted wiring scheme be placed with the Corporation electricity department. Five tenders had been received from contractors for certain work, and the department's estimate was 35 per cent. higher than the lowest tender. Although an amendment to accept the lowest tender was defeated, the Council ultimately agreed to refer the matter back to the Committee.

The Preston District of the St. John Ambulance Association suggests that employees of the tramways and omnibus departments should receive special instruction in first aid work, and be supplied with first aid equipment.

The staff of Greenock municipal electricity department had their annual outing recently. Ex-Bailie Lemmon, convener of the Electricity Committee, Mr. D. McDougall, engineer and manager, and Mrs. McDougall were included in the party, which travelled to the Isle of Bute.

The School of Foreign Travel, New York, is sending for the second season a group of engineering students and young engineers to Europe to study the problems of industrial administration and labour management. The party, which will consist of about 17 persons and will be under the direction of Prof. N. C. Miller, chairman of the University Extension Division of Rutgers University, the State College of New Jersey, will have an interview with Sir Ernest Benn, Bart., in London on July 16th.

In reference to the fire which occurred in a cable subway on the Victoria Embankment, London, on June 6th, the Post Office has issued a statement that some 630 telephone subscribers' lines on the Central Exchange, and 280 on the City exchange and more than 1 000 junction lines were put of service. A number of temporary junction circuits have been brought into operation, and arrangements have been made for alternative means of routing to and from affected exchanges.

Shipley Electricity Committee has decided that the electricity required for an exhibition house established by builders, furnishers and electrical contractors shall be provided free of cost.

At last week's meeting of Manchester City Council a motion was submitted by a labour member that the electricity department should be permitted to carry out the work of wiring municipal houses for electric lighting in competition with private firms of electrical contractors. Ald. Dagnall, chairman of the Electricity Committee, said that if the proposition were accepted, it would be necessary to take on a special staff, and it could not be certain that it would be busy all the time. The Council rejected the proposition.

A sub-committee of the London Traffic Advisory Committee is considering a proposal to adopt automatic traffic control signals for road traffic in Oxford Street.

Mr. E. Allsopp lectured, at the Bradford electricity offices on June 4th, on "The Development of the Electric Cooker." He said Franklin demonstrated in 1749 that electricity could be applied to cooking. It was only recently that the invention of nickel-chromium had made it possible to deal with the high temperatures. British cookers were greatly in advance of any others. The lecture was arranged by the British Electrical Development Association.

Trials have been made recently at Canterbury of a system of road traffic signals supplied by Switchgear and Cowans, Ltd. In St. Lawrence Road, the approach of a car to the main (New Dover) road depresses "pedals" which connect with mechanism showing an amber light, and, after a certain time, a red light, to the main road. In the side road (the St. Lawrence Road) a red light, succeeded by an amber light, is shown. As an additional warning to the main road traffic, an electric gong and an electric siren are also used.

The number of telephones in operation in the United Kingdom at March 31st, 1929, was 1 754 641, an increase of 123 450 or 7·6% during the year ending on that date. The number of public call offices (including kiosks) working at March 31st last was 25 864, of which 5 599 were connected with London exchanges and 20 265 with provincial exchanges.

The Sub-Committee appointed by the National Federated Electrical Association and Electrical Trades Union in conformity with the National Wages Agreement of September 22nd, 1921, to give effect to the agreements of August 7th, 1920, and September 22nd, 1921, by ascertaining and declaring at four-monthly intervals the variations due (if any) and the net rates of wages payable under the terms of the agreements to each grade for the ensuing period of four months, has declared that the variation in cost of living justifies a 28% reduction in the basic rates of wages (April, 1921) and that the net rates of pay applicable to the respective grades of the agreements are as follows: Grade A, 1s. 10½d. (decrease ½d.); grade B, 1s. 7½d., and grade C, 1s. 6d. (no change); grade D, 1s. 4½d. (decrease ½d.). These rates will come into effect on the second pay day in June, 1929, and will remain current up to and including the period covered by the first pay day in October, 1929.

LOOKING BACKWARD.

FIFTY years ago THE ELECTRICIAN, *dated June 14th, 1879, recorded that:—*

The Edgware Road Station of the Metropolitan Railway was electrically illuminated for the first time. There were two Serrin lights, placed 240 ft. apart.

Experiments were being carried out in France with a system of ploughing by electricity.

The International Telegraph Conference was meeting in London.

* * *

Twenty-five years ago it was recorded in THE ELECTRICIAN, *of June 17th, 1904, that:—*

The I.E.E. Council attended the unveiling at Colchester of a picture of Dr. Gilbert (1544–1603), *author of the famous book "De Magnete," and "founder of the science of electricity and the discoverer of terrestrial magnetism." The picture was presented by the Institution.*

The Postmaster-General said it would not be in the public interest to exercise its powers for the compulsory purchase of the National Telephone Co.'s system.

* * *

Fifteen years ago, according to THE ELECTRICIAN, *of June 14th, 1914:—*

A feature of the I.M.E.A. Convention, held in London, was that a paper on Heating and Cooking was discussed in camera.

A passenger electric vehicle completed, without any breakdown, the 362 *miles run from Dumfries to London.*

NEW ELECTRIC TRUCK.

NO more apt example of the utility of electric plant for cargo handling can be found than at West Toxteth Dock Sheds, Liverpool, where Elder, Dempster and Co., Ltd., have their berths. For about ten years they have been using

An electric truck at the West Toxteth Docks, Liverpool, with attachment for loading and stacking cotton bales, etc.

various types of electric trucks for specialised transport operations in the dock sheds. The latest addition to the resources is an electric truck with an attachment for transporting, elevating and stacking various classes of import cargoes. Twenty-two electric trucks, comprising Lansings, Greenbats and Walkers, are in service here, and six of these are in process of conversion to elevating trucks. These can be employed to pick up a load from a dock scale, transport it and dump it on a pile 6 ft. 6 in. high without the use of any manual labour excepting, of course, that of the driver of the truck. The whole of the operations are mechanical.

The load carrying platform of the truck is made up of arms in a fork formation elevated in channel guides carried at the driving end of the chassis. It is possible for the vertical guides to be hinged down from a height of 6 ft. 6 in. in order to allow the truck to pass through a doorway of normal dimensions, but in this case the hinged portion is counterbalanced.

The lifting motor of ¾ H.P. at 48 V, complete with solenoid operated brake, worm reduction gear and lifting barrel, is fitted on the guides. An important feature of the elevating gear is that it is counterbalanced in such a manner that the return springs for resetting are quite small and the energy absorbed in elevating only the platform is just sufficient to overcome the normal frictional losses in the worm gear, pulleys and working parts.

FARADAY HOUSE OLD STUDENTS.

THE Faraday House Old Students' Association have elected Dr. Alexander Russell, F.R.S., their President for this year to commemorate the fortieth anniversary of his appointment on the staff of the College. The number of students who have joined the College during this time is about 2 050, and the number of members of the O.S.A. is 920. The Council hope that as many qualified Faradians as possible will join this year, as they are anxious to make the numbers exceed the thousand mark during Dr. Russell's Presidency. Mr. Robert G. Burton, of A. Reyrolle and Co., has presented an oil painting of the Principal to the Governors of the College, in commemoration of Dr. Russell's forty years' connection with the College.

PERSONAL.

SIR Hugo Hirst was amongst those received by the Duke of York on Monday.

Mr. Owen Young, chairman of the Reparations Committee, left Paris for Cherbourg on Monday, on his way to America.

Mr. Nicholas G. Gedye has been elected chairman of the Committee of the Association of Consulting Engineers for the ensuing year.

Bristol Salaries Committee recommends increasing the salary of Mr. T. H. Gait, the chief electrical engineer, from £500 to £600 per annum.

Stockport Town Council has confirmed the appointment of Mr. G. H. Oldroyd, as deputy electrical engineer, at a salary of £700 per annum.

Mr. S. Hooper, electrical engineer and manager of Alexander's Electric Light Works, Carlow, has accepted a new appointment in Dublin.

Mr. J. H. Ward, electrical engineer at Chatham Dockyard, was the recipient of a parting gift on the occasion of his retirement at the end of May.

Mr. D. Williams, of Leicester Corporation Electricity Department, has been appointed consumers' engineer at the Rugby Electricity Works.

Mr. Alan Kirk has relinquished his appointment with Engineering Works (Electrical and General), Ltd., and joined the staff of Troughton and Young, Ltd.

Mr. D. G. Petrie, of Young, Osmond, and Young, Ltd., has been appointed a member of the Provisional Council of a Chamber of Commerce formed for Welwyn Garden City.

It is understood that Mr. Noel Ashbridge will be appointed to succeed Capt. P. P. Eckersley as chief engineer to the British Broadcasting Corporation as from September 30th.

After serving 50 years with the firm of J. Smith and Son (Brighton), Ltd., Mr. Harry Crowther has been presented with a silver plated tea service, armchair and illuminated address.

Mr. W. H. Speedy is vacating the position of junior assistant engineer with the Newport (Mon.) Electricity Department, to take up an appointment as shift engineer at Darwen Electricity Works.

Stepney (London) General Purposes, Staff and Education Committee recommends that to the present designation of Mr. W. C. P. Tapper, of borough electrical engineer and manager, be added that of consulting electrical engineer.

Torquay Electricity Committee has decided that the borough electrical engineer, Mr. H. F. G. Woods, be paid 500 guineas in respect of the special services which he has rendered as consulting engineer for the extension of the generating station, and the installation of additional plant.

We are fortunately able, without suspicion of political bias, to give full expression to our family pride in the appointment of Mr. Wedgwood Benn as the Secretary of State for India. It is now nearly 25 years since Mr. Benn was associated in any active capacity with Benn Brothers, Ltd. In the early 'nineties, after a scholastic career culminating in B.A. (Lond.) with first place in Honours, and later a Fellowship of University College, he joined the staff of "The Cabinet Maker," and later acted for a time as editor of that paper. In 1897 he edited and managed a magazine of home decoration, "The House." He was appointed a director in 1906, and remained a member of the Board after he entered Parliament in that year. In 1910, however, in obedience to the self-denying ordinance which Mr. Asquith imposed upon his ministers, Mr. Benn resigned his position as a director of the company, and thus ended his work in connection with it. He is a large shareholder. Mr. Benn's appointment to the highest Cabinet rank is a fitting recognition of his long experience of public and political work. He represented St. George's Division of the Tower Hamlets as Liberal from 1906-1918, when, owing to his refusal to accept the Lloyd George coupon, he left St. George's and accepted an invitation to fight Leith, also in the Liberal interests. For the following nine years he was the member for Leith, until in 1927 he joined the Socialist party and resigned his seat. A few months later he successfully contested North Aberdeen and re-entered Parliament as a Labour member. He has enjoyed a wide experience in matters of government, having served in every Parliamentary grade from Private Secretary upwards. He was a Junior Lord of the Treasury from 1910 to 1915; he acted as Representative of H.M. Office of Works in the House of Commons from 1912 to 1914, and of the Insurance Commission in 1914. On the outbreak of war Mr. Benn was appointed first Chairman of the National Relief Fund, but after a few months joined the Middlesex Yeomanry.

THE I.M.E.A. EXHIBITION.

A Further Review of the Exhibits at Torquay—Many New Equipments for Domestic Use—Variety in Electric Cookers.

(*Concluded from page* 689.)

THE exhibit of the BRITISH THOMSON-HOUSTON CO., LTD., included lighting fittings and equipment, amongst which were the "Hermetica" lantern with double well-glass for industrial use, the "Glassteel" diffuser and the gas-tight dispersive reflector.

In the floodlighting section was shown the type 599 projector in its latest form, and the new spherical projector lantern as installed throughout the North-East Coast Exhibition. Examples of the "Luxor" dining-room pendant and "Eye Restolite" floor standard were also on view. Other lighting equipment shown included street lighting fittings such as the "Zona," the "Rugby" and "Manchester" pole top units. Tungar rectifiers were exhibited, a new type being the high and low tension model. On the d.c. side the output is, for low tension batteries 0·8 A at 2, 4 or 6 V, and for high tension batteries 0·1 A at 60, 90 and 120 V. Another exhibit was the new electric refrigerator. Other items were fractional H.P. motors for various purposes and a selection of radio apparatus.

YOUNG, OSMOND AND YOUNG, LTD., The Broadway, Bexley Heath, included on their stand "Unity" tubular electric heaters for the heating of schools, churches, offices, factories, cinemas, houses, etc., thermostats, towel airers, car heaters, linen cupboard heaters, four-bar radiators with or without 3-heat control, gas-tight and water-tight heaters for petrol depots, cellulose paint shops, powder factories, etc., window heaters to prevent condensation on shop windows, and heaters for traction work available up to 1 500 V.

A New Kettle.

The BRITISH ELECTRIC TRANSFORMER CO., LTD., Wellington House, Strand, London, W.C., showed a new "Tricity" table type cooker suitable for twelve persons. Another exhibit was a kitchen kettle, recently patented, embodying double automatic safety devices. The makers state that, so far as they are aware, this is the first kettle of its kind, inasmuch that protection is ensured against boiling dry, in addition to switching off when the appliance is lifted. Cookers in alternative vitreously enamelled and black and nickel finishes were shown fitted with enclosed and open boiling plates, while in the "Sunray Parlour" a new model was introduced which incorporates hot wire bars on the "Sunray" principle.

FERRANTI, LTD., Hollinwood, Lancs, exhibited electric thermal storage water heating equipment, thermostats, load levelling relays and accessory control equipment, as well as a small scale working model of a household water heating installation. A new range of "Ferranti" parabolic reflecting fires of improved design was included on the stand, and these are available in a variety of finishes, 2½ kW loading. With the exception of the household water heating equipment shown, the other exhibits have been described in earlier issues.

Water is stored at 185 deg. to 195 deg. F., and control of the heat is automatic. The heating elements may be removed without interference with the water system, and provision is made for emptying the tank for cleaning.

Water Heating.

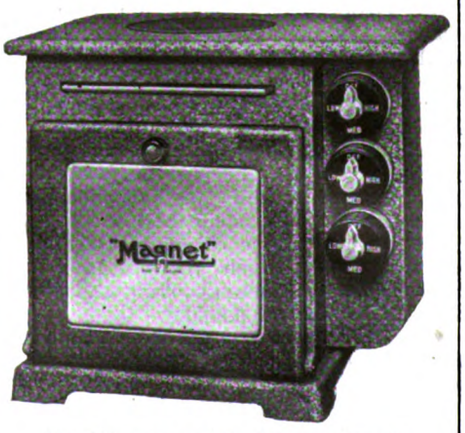
DRAKE AND GORHAM (WHOLESALE), LTD., 67, Long Acre, London, W.C.2, displayed 1½ gallon "push through" type hot water cisterns, 4½ to 55 gallon gravity feed type cisterns; and the new "Inventum" barber's cistern, fitted with a new "mixing tap," giving a wide range of temperature control. A new bed warmer was seen, and this was of the accumulator type. The makers state that there is no solder incorporated in this device, the whole job being pressed metal. The appliance is so made that it cannot be placed in the bed while the current is on. Other new items were bathroom heaters, with "pull cord" pattern switches, a cooking plate, window and ceiling heaters. A working model of the "Parmotor" relay operated by a thermo-switch and pilot wire from the supply station or other point selected for remote control was shown, the model exhibited being designed to show control of street lighting on one side of the relay, and night tariff water heating on the other. Other exhibits were e.h.t. ring main controllers, and e.h.t. oil switch fuses.

On the stand of the CREDENDA CONDUITS CO., LTD., Oldbury, Birmingham, were shown examples of the latest models of "Creda" electric cookers. Various detail improvements have been incorporated since these were shown last year at Bath, chief among these being improvements in the wiring arrangement for the boiling plates and an improved type of grill pan. Oven temperature indicators are now fitted which are easier to read than the ordinary mercury oven thermometers, and much cheaper. Samples were also exhibited of two new wash boilers, models C23 and C24, which have been designed to meet the need for cheap and efficient appliances of this nature. The exhibit was completed with models of automatic water storage heaters and "Credalux" street lighting fittings.

"Burco" electric wash boilers was featured by BURNLEY COMPONENTS, LTD., Rose Grove, Burnley, one of the special exhibits being a boiler fitted with an automatic safety cutout, which opens the circuit immediately the boiler is dry. This cutout is of robust design, and the switch contacts are large enough to cope with 20 A at 250 V. The device is clamped to the pan bottom, and two parallel contact fingers close a circuit between two pairs of contact pillows. The cable and element connections are completed to the contacts. The contact is maintained against the pressure of a coil spring by means of a stud, which is made in two portions soldered together. When the pan of the boiler is dry the solder melts,

The new electric washer which was shown by Entwistle and Kenyon, Ltd.

The "Ferranti" fire in an attractive setting.

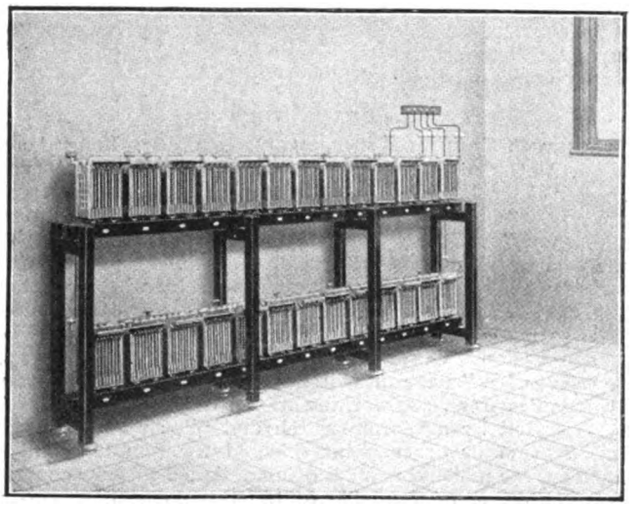


One of the many cookers which were shown on the stand of the General Electric Co., Ltd.

D

Digitized by Google

thus allowing the stem of the stud to telescope into the head, the coil spring forcing the contacts apart. The switch can be reset by inserting a new fuse plug or resoldering the used one. Another exhibit was a combination boiler, designed for sterilising milk or for heating milk for cafés, etc.



One of the many types of batteries shown by the Edison Swan Electric Co., Ltd.

THE BRITISH QUAIN SUNLIGHT, LTD., exhibited artificial sunlight apparatus for tonic treatment at home, without medical supervision, an outstanding feature of which is that when not in use as sun bath it may be used as an electric fire. Another exhibit was a twin-arc model "Ideal" sun bath suitably mounted on a telescopic stand giving a 20-A radiation at half this current. This model works from either a.c. or d.c., and is recommended for nursing homes, clinics, etc., and for home treatment under medical supervision. The balancing resistance which is connected to the reflector may be used separately as an electric fire when the apparatus is not required for therapeutic purposes. Other items shown were the "B.Q." ozoniser and an electric fan primarily intended for use with the ozoniser. Together, they form an efficient ventilation device.

The "Ewbank" electric washer, shown by ENTWISTLE AND KENYON, LTD., of Accrington, was another new machine. The appliance, driven by a ¼ H.P. B.T.H. motor, is of the rotary type fitted with an electrically-operated wringer equipped with rubber rollers 2 in. in diameter and 16 in. long. Risk of injury is reduced by the adoption of a spring assisted release to the wringer control, which allows the rollers to be under the operator's instant command. Protection to the user, machine, or motor, is afforded by the fitting of automatic friction drive to the clothes container and wringer rollers, while the driving mechanism and motor are under lock and key, encased away from water or dirt. The gear box is claimed to be of special design, and allows the drive to run in oil. When not in use the machine can be folded into a useful kitchen table.

MOORWOODS, LTD., Harleston Iron Works, of Sheffield, featured electric cooking equipment, including three models of the "family type" and two cookerettes. Electric fires were another exhibit, and though no new items were included on the stand, there was still much to interest the visitor.

SADIA, LTD., 22, Newman Street, London, W.1, showed a wide selection of wall type water heaters, stand type 66 gallon water heaters, a full range of self-winding time switches, a new universal mercury thermostat, a full range of boiling plates, a wide range of enamelled table stoves, aluminium utensils, motor-driven thermostatic controls, and drying stands. The aluminium cooking utensils have been especially designed for electric cooking.

On the stand of BELLING AND CO., Bridge Works, Southbury Road, Enfield, Mx., was shown a new series of electric cookers with all-metal boiling plates and a new boiler-griller plate with all-metal top. The "Baby Belling" cooker was also on show. There was a display of electric immersion heaters suitable for fitting into existing tanks or cylinders and for use in conjunction with the ordinary domestic hot water system. New sizes have been introduced, so that the range now offered covers all capacities of tanks or cylinders and the loadings range from 250W to 3 kW. Practical demonstrations were given of the new "Parmotor" relay for automatically controlling electrical circuits.

The exhibits of SIEMENS ELECTRIC LAMPS AND SUPPLIES, LTD., 38-39, Upper Thames Street, London, E.C.4, consisted of "Xcel" cookers of various types fitted with totally enclosed boiling plates, and "Imperial" type cookers as supplied to colonial undertakings. Another feature was a representative range of "Cosyglo" fires with moving flame and smoke effect, fitted with the new improved rotor. The remainder of the exhibits consisted of safety kettles, immersion heaters, tube heaters, and towel rails. There was also shown, for the first time, a sample of the "Xcel Minor" cooker. This has a small oven with a new design of dual grill boiling plate. It can be supplied for table use or with a stand to form a complete cooker.

The EDISON SWAN ELECTRIC CO., LTD., 123/5, Queen Victoria Street, London, E.C.4,. made a special show of stationary batteries, house wiring systems, washing machines, and ironing and cleaning appliances. A specimen of one of the batteries exhibited is shown in the previous column.

The exhibit of the TORQUAY ELECTRICITY DEPARTMENT was confined to types of apparatus let on hire to consumers, and literature concerning prices, hire rates, etc.

A. REYROLLE AND CO., LTD., Hebburn-on-Tyne, featured an electric steam raiser, for use where a small quantity of steam is required, and a domestic water-heater. The steam raiser has a total capacity of 18 kW and will raise steam in 10 to 15 minutes, the pressure being 80 lbs. per sq. in. The heating elements are built up of three 6 kW units and the required selection is made by means of a standard Reyrolle earthed plug. Three sockets are provided, so arranged that either one, two, or three units are in circuit, giving 6, 12, or 18 kW respectively. The domestic water-heater shown was one of the smaller type, holding about three gallons of water; the 500-W heating element is controlled by means of a thermostatic switch. In addition, a representative collection of small metal-clad air-break switches, for domestic and other purposes, was shown. Another interesting exhibit was a metal-clad, flame-proof, horizontal, draw-out switch panel, suitable for working in mines, etc.

VENNER TIME SWITCHES, LTD., 45, Horseferry Road, London, S.W.1, exhibited time switches, both hand and electrically wound, for the control of electric water heating off peak, street lighting for individual post and group control, with examples controlled by solar dial; models for the control of maximum demand indicators and two-rate meter operation; types for renting for the control of late shop window lighting, and stop watches reading to 1/10th of a second. Amongst other exhibits may be mentioned the new thermostat, an improved model easily convertible for use either in horizontal or vertical position; new models of time switches for poultry farms; a new solar dial controlled electrically wound time switch, as used by the G.P.O. in telephone kiosks; a new type of domestic water heating control switch giving three on and three off operations per day, and a 5 A 15-day run time switch with selective devices controlling earlier hour and/or Sunday operation.

Further Domestic Items.

The exhibits of ELECTRIC FIRES, LTD., Heatrae Works, Norwich, included a 5-gallon thermal storage water heater mounted on a framework complete with ball valve tank, basin for the draw-off water and sump, and pump for the return of water to the high level, the whole being a portable and self-contained unit for demonstration purposes. A 2-gallon thermal water heater was arranged on a trunnion for easy inspection of all working parts, while a 10-gallon open-type ball valve tank with low loading was also included. Another exhibit was a small tank, type R.T.B., suitable for direct connection to water supply and for delivery of hot water at one point only. A few samples of electric fires were shown, these being chosen to demonstrate the three standard types of fire bars used by the firm to suit varying conditions. A small combined cooker-radiator was also included. Samples of various terminal ends fitted to "Heatrae" hot pipes, as required by the various types of tubular heating installations, were shown, together with floor and wall pattern towel rails. Five different warming plates, a spray boiler, whistling kettles, low temperature radiators, and a 4 kW geyser were also exhibited. A 9 kW oil heater was another feature, and although these are made for loadings up to 60 kW as standard, the example on the stand showed the general design and the method of construction.

BUSINESS ITEMS.

THE transmission of pictures of the Derby to an express train was successfully attempted on the day of the race. The apparatus used was a " Fultograph " picture receiver coupled to a " McMichael " portable set.

A special record of the chimes of Big Ben is being made by the Gramophone Co. (H.M.V.) and this will be electrically reproduced through an installation of " Marconiphones " at the Aldershot Tattoo on June 18th to 23rd.

One of the chief attractions at the Theatrical Garden Party on Tuesday was the B.B.C. marquee, where artistes performed for the benefit of the charity. " Marconiphone " loud speaking equipment was installed for relaying the performances.

A French agent in Paris desires to secure for France and the French Colonies the representation of British manufacturers of plant and equipment for metallurgical works, electrical power stations, etc. The Department of Overseas Trade will supply further particulars. (Reference 488.)

The ENGLISH ELECTRIC Co., Ltd., has received an order from Darlington Corporation for six complete four-wheel single-deck railless 'buses. Each 'bus will seat 32 passengers, and the equipment will consist of a 60 H.P. motor, and foot-operated controller, and rheostatic braking is provided.

The business of KIRK, WILSON, LTD., electrical engineers and contractors, Wragby Road, Lincoln, has been acquired by WM. WRIGHT AND SONS (LINCOLN), LTD., Park Street, Lincoln. The business will now be known as KIRK WRIGHT AND CO., and the services of Mr. J. P. Kirk have been retained in the capacity of general manager. Kirk, Wright and Co. have recently taken up the agency for the DAKOL ELECTRIC CO., LTD., Newcastle-on-Tyne.

The METROPOLITAN-VICKERS ELECTRICAL CO., LTD., announces that as from June 17th the Newcastle branch will be moving into new premises, which will afford greater warehouse and office accommodation. The trade counter will be open from 8 to 6 p.m., but due to the severity of the winter, the new showroom will not be complete, and the present address in Saville Row will be continued for showroom purposes until the end of August. The new address both for Metropolitan-Vickers Electrical Co., Ltd., and Metro-Vick Supplies will be :— Metro-Vick House, Northumberland Road, Newcastle-on-Tyne.

The MIDLAND ELECTRIC MANUFACTURING CO., LTD., attained their majority during the current year, the company being incorporated in 1908. The occasion was celebrated by several functions. There was a dinner at the Midland Hotel, at which all the executive staff and outside representatives were present, followed by a musical evening, at which there were present five of the small band who helped to found the company. There were also present about fifty who had been employed by the firm for ten years and over, to whom commemorative presentations were made.

PATENT LAW REFORM.

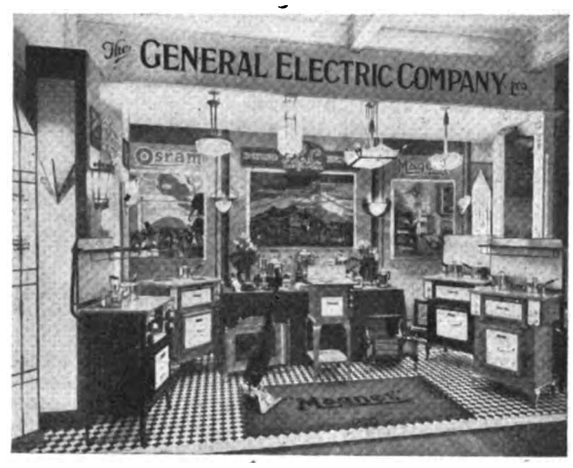
Bar Council Approves Report of British Science Guild as to Improvements.

THE proposals for reform of the British Patent System recently put forward by the British Science Guild have been reviewed by a Committee of the Bar Council, the members of which included, amongst others, Sir Duncan Kerly, K.C. (Chairman), Mr. James Whitehead, K.C., the Hon. Stafford Cripps, K.C., and Mr. Trevor Watson. The Bar Council warmly commends the report of the British Science Guild, which was the work of a committee whose chairman was Dr. W. H. Eccles, F.R.S. ; they consider that most of the proposals of the report are reasonable and likely to be useful. The Council expressed the view that a patent ought not to be invalidated by mere Paper anticipations—that is, by the publication many years ago of ideas which were stillborn and have never become known to the trade. They agree that there should be stronger remedies against unwarranted threats by persons wrongly claiming to possess patent rights, and they also support the proposal that appeals from the decisions of the Comptroller of the Patent Office should be heard by a special judge in chambers instead of by the Attorney-General or Solicitor-General. They do not agree that the Comptroller of Patents should be empowered to act as a Court of first instance for the trial of infringement actions ; but they propose (*a*) arbitration by consent of the parties, and (*b*) agreement between the parties whereby the issues to be tried in court should be restricted.

TRADE PUBLICATIONS.

A NEW booklet dealing with the " Alfilt " CO_2 system of fire protection has been sent to us by FOAMITE FIREFOAM, LTD., 55/57, Gt. Marlborough Street, London, W.1.

A special fan folder, publication No. 1070, has been published by VERITYS, LTD., 31, King Street, London, W.C., space being provided for printing contractors' names, etc.



THE stand of the General Electric Co., Ltd., at the I.M.E.A. Exhibition. The exhibits shown here were described last week.

" Facts and Figures Concerning the Firm You Deal With " is the title given to a new publication by the LANCASHIRE DYNAMO AND MOTOR CO., LTD., of Trafford Park, Manchester.

A circular letter giving particulars of the new " Henley " pavement frames and covers has been sent to us by the W. T. HENLEY'S TELEGRAPH WORKS CO., LTD., Holborn Viaduct, London, E.C.1.

A new booklet relating to the A.T.M. Doignon Baudot multiplex printing telegraph system has been published by the AUTOMATIC TELEGRAPH MANUFACTURING CO., LTD., Strowger Works, Liverpool.

The WHOLESALE FITTINGS CO., LTD., 23/37, Commercial Street, London, E.1, has issued a new electrical accessories catalogue of some 70 odd pages. A comprehensive index, arranged in alphabetical order, is included.

RADIO INSTRUMENTS, LTD., 12, Hyde Street, London, W.C.1, have sent us a folder dealing with the new " Hypermu " transformer, while a forty-page catalogue describing the range of " R. I." components has also been issued.

Amongst the recent publications of PHILIPS LAMPS, LTD., of 145, Charing Cross Road, London, W.C.2, are leaflet No. 403 dealing with " Philiray " shop window reflectors, and list No. 181, giving details and prices of " Argenta " lamps.

The ZENITH ELECTRIC CO., LTD., Villiers Road, London, N.W.2, has sent us a new list of regulating resistances of interest to schools, colleges and research laboratories, as well as to the test rooms of all electrical and allied manufacturers.

The MULLARD WIRELESS SERVICE CO., LTD., Denmark Street, London, W.C., has published Volume 3, No. 1 of " Radio for the Million " in which is described the " S.G.P. Master Three " receiver incorporating screen-grid and pentone valves.

The GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, London, W.C.2, has published a number of revision sheets for inclusion in the blue bound catalogue. The sheets are gummed and a list indicating the positions of the new sheets is available.

The WARDLE ENGINEERING CO., LTD., Elsinore Road, Old Trafford, Manchester, has issued folders dealing with " Wardelytes " and " Inverlytes," and street lighting equipment. A leaflet on factory lighting equipment has also been published.

The works and manufactures of ATELIERS DE CONSTRUCTIONS ELECTRIQUES DE CHARLEROI, 56, Victoria St., London, S.W.1, are described in a new issue just received. The booklet comprises nearly 100 pages and contains a large number of illustrations.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, where available.

BRISTOL CORPORATION.—Wiring of 15 houses on Fishponds' Knowle, St. John's Lane, and Sea Mills estates. Specifications from the Housing Department, 1, St. Stephen's Street, Bristol.

MACCLESFIELD EDUCATION COMMITTEE, June 14th.—Electrical installation at Technical School Annexe. Specification from the Education Office.

BRIDLINGTON SCHOOL, June 15th.—Re-wiring certain buildings at Bridlington School and Avenue Boarding House. Specification, etc., from Mr. J. Edwin Storr, 14, Park Row, Leeds, until June 15th; deposit £1 1s.

Lancashire Cable Contract.

FARNWORTH URBAN DISTRICT COUNCIL, June 15th.—Supply of l.t. cables. Specifications, etc., from Mr. A. J. Hutchinson, engineer and manager, Electricity Department, Albert Road, Farnworth, Lancs.

BELFAST CORPORATION, June 17th.—Manufacture and supply of (a) h.t. combined cubicle and truck-type switchgear (Specification W. 85); and (b) transformer kiosks (W. 88); and manufacture, supply, and erection of (c) 1 000 kW rotary convertor (W. 86); (d) 500 kW rotary convertor (W. 87); (e) c.c. switchgear for sub-stations (W. 89); (f) h.t. armour-clad switchgear for sub-stations (W.90); and (g) h.t. truck-type switchgear for sub-stations (W. 91). Specifications from Mr. F. H. Whysall, city electrical engineer and manager, East Bridge Street, Belfast; deposit £2 2s. for each.

EAST GRINSTEAD URBAN DISTRICT COUNCIL, June 17th.—Supply, laying and jointing of l.t. cables. Specification, etc., from the Clerk, Council Offices, London Road, East Grinstead; deposit £1 1s.

EDINBURGH EDUCATION AUTHORITY, June 17th.—Electrical installation at Colinton, Davidson's Mains, Gilmerton, Granton, Juniper Green, Willowbrae, and Milton House Schools. Specifications from Executive Officer, Education Offices, Castle Terrace, Edinburgh.

GLASGOW CORPORATION, June 17th.—Electric lighting installations at Allan Street and Braidfaulds Street, No. 2 housing schemes. Specifications from the General Manager, Electricity Department, 75, Waterloo Street, Glasgow, C.2.

GRANGE-OVER-SANDS URBAN DISTRICT COUNCIL, June 17th.—Supply and laying of underground and erection of overhead lines. Specifications from Mr. J. Sims, Electricity Works, Grange-over-Sands.

LEEDS EDUCATION COMMITTEE, June 17th.—Electric lighting of schools. Particulars from Education Offices (Architects' Section), Calverley Street, Leeds.

SWANSEA CORPORATION, June 17th.—Electrical requirements of Municipal Secondary Schools, Dynevor Place, and De la Beche Street, Swansea. Schedule, etc., from the Borough Architect, 3, Prospect Place, Swansea.

WEST HAM EUDCATION COMMITTEE, June 17th.—Electric light installation at Fyfield Open Air School Extension, near Ongar, Essex.

NORTHERN IRELAND GOVERNMENT, June 18th.—Electric light installation at Criminal Lunatic Asylum, Londonderry. Form of tender from Londonderry Employment Exchange, or from the Ministry of Finance, 15, Donegall Square West, Belfast.

TRURO RURAL DISTRICT COUNCIL, June 18th.—Three separate installations of ejectors, or high lift centrifugal pumping plant, electrically driven and controlled. Specification (£5) from Mr. J. D. Haworth, 3, Central Buildings, Westminster, S.W.1.

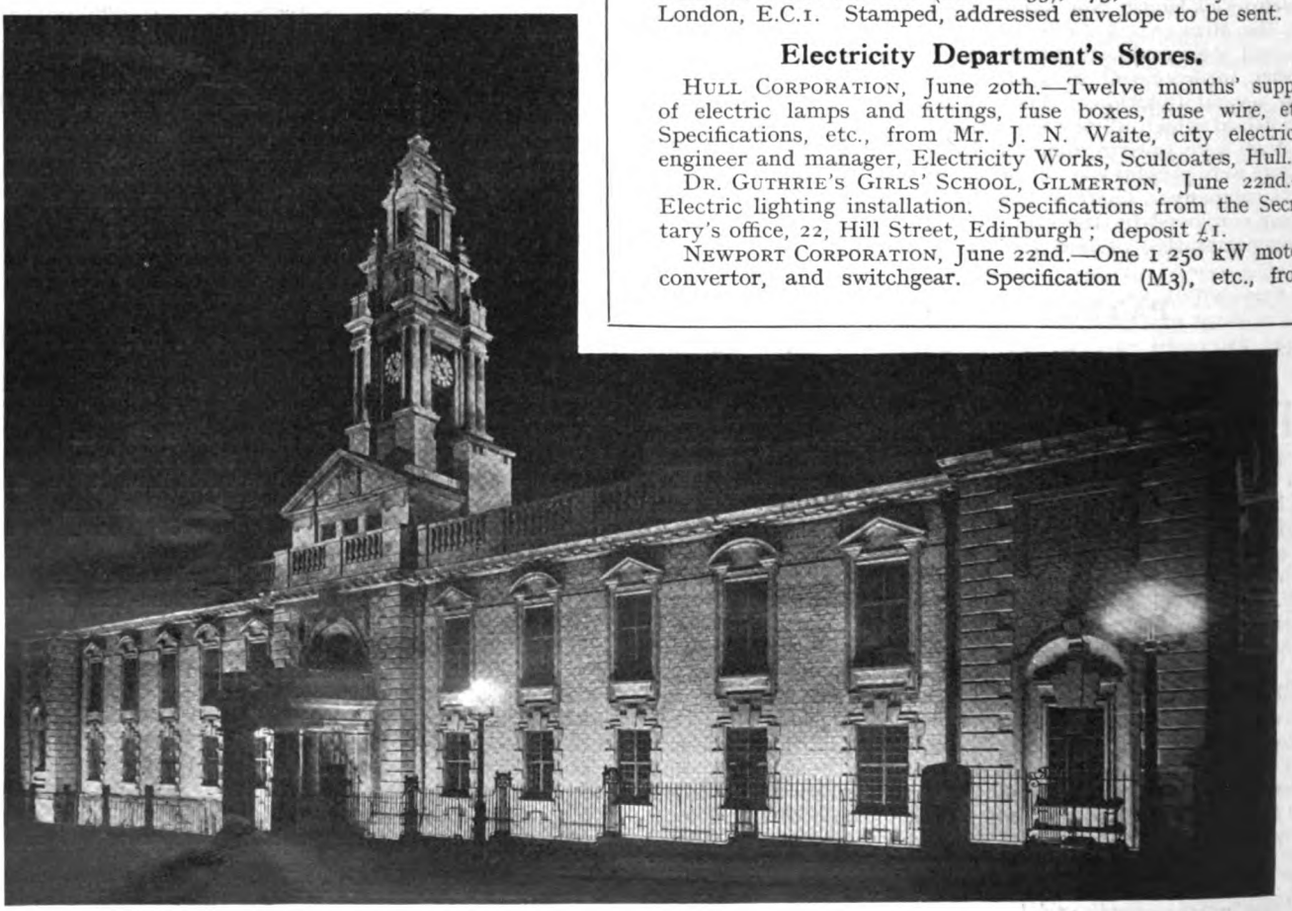
METROPOLITAN WATER BOARD, June 19th.—Supply of electric lamps for six or 12 months. Tender form (No. 24) from the Board's Offices (Room 155), 173, Rosebery Avenue, London, E.C.1. Stamped, addressed envelope to be sent.

Electricity Department's Stores.

HULL CORPORATION, June 20th.—Twelve months' supply of electric lamps and fittings, fuse boxes, fuse wire, etc. Specifications, etc., from Mr. J. N. Waite, city electrical engineer and manager, Electricity Works, Sculcoates, Hull.

DR. GUTHRIE'S GIRLS' SCHOOL, GILMERTON, June 22nd.—Electric lighting installation. Specifications from the Secretary's office, 22, Hill Street, Edinburgh; deposit £1.

NEWPORT CORPORATION, June 22nd.—One 1 250 kW motor convertor, and switchgear. Specification (M3), etc., from



THE Town Hall, at Torquay, which was illuminated by G.E.C. floodlight projectors during the period of the I.M.E.A. Convention. Further reference to the Convention and details of the exhibition are given on pages 730 and 735.

Digitized by Google

Mr. A. Nichols Moore, Town Hall, Newport, Mon.; deposit £3 3s.

STOKE-ON-TRENT CORPORATION AND STAFFORD COUNTY COUNCIL, June 22nd.—Electric light and power installation in new buildings at North Staffordshire Technical College, Stoke-on-Trent. Further particulars from the Clerk to the Governors, Town Hall, Hanley; deposit £5 5s.

HARROGATE CORPORATION, June 24th.—Wiring, etc., of 58 houses, included in Devonshire Place housing scheme, No. 7. Specifications from the Borough Engineer.

NOTTINGHAM CORPORATION, June 25th.—Supply of general stores to electricity department for 12 months. Forms of tender from the Engineer, Electricity Works, Talbot Street, Nottingham; deposit 5s.

REIGATE CORPORATION, June 25th.—Construction of refuse disposal works, including electricity generating plant. Forms of tender, etc., from Borough Engineer, Municipal Buildings, Reigate; deposit £5 5s.

ACTON EDUCATION COMMITTEE, June 27th.—Electric lighting installations in schools. Specifications from the Borough Engineer, Municipal Offices, Acton, London, W.3; deposit £1 1s.

STAFFORDSHIRE EDUCATION COMMITTEE, July 2nd.—Electric light installation in Kingswinford Brockmoor Council School and in new buildings on the adjoining site. Specification, etc., from Messrs. Moffett, Rosher and Mann, consulting engineers, Union Chambers, Temple Row, Birmingham; deposit £5 5s. Only registered electrical contractors are invited to tender.

LONDON COUNTY COUNCIL, July 8th.—Manufacture, supply and maintenance of (*a*) 150 electric tramcar bodies; (*b*) 150 sets of swing bolster bogie trucks; (*c*) 150 sets of electrical equipment for tramcars, with assembly of bodies, trucks, electrical equipment, etc., into complete tramcars; and (*d*) 150 sets of magnetic track and wheel brake equipments. Specifications, etc., from the Clerk, County Hall, Westminster Bridge, S.E.1; deposit £2 for each section or £7 for the four.

SUNDERLAND CORPORATION, July 8th.—Manufacture and supply of 12 months' requirements of (*a*) paper insulated, lead sheathed cable, (*b*) rubber insulated wire, (*c*) consumers' meters, and (*d*) gas-filled and vacuum lamps. Specifications from the General Manager, Electricity Offices, Dunning Street, Sunderland; 10s. deposit for each section. Applications must state the classes of goods for which specifications are desired.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, July 10th.—Supply and erection at Ironbridge power station of three boilers, each having normal rating of 225 000 lb. of steam per hour, with economisers, air heaters, fans, ironwork, pipework, coal pulverising plant, ash handling plant, etc. Specification (No. 3), etc., from Mr. E. F. Hetherington, chief engineer and manager, Phœnix Buildings, Dudley Road, Wolverhampton; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, July 22nd.—Supply and erection of central indicators and telephones in connection with the Central Scotland Electricity Scheme. Specification (C.S.-S.S. 15) and form of tender from Mr. R. H. Fox, secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

CAPE TOWN MUNICIPALITY, June 17th.—Supply of three-phase motors. (Reference B.X. 5 366.)

VICTORIAN RAILWAY COMMISSIONERS, June 19th.—Supply of 550 miles of insulated copper wire. (Reference B.X. 5 335.)

COPENHAGEN MUNICIPALITY, June 21st.—Supply of switchgear in connection with extensions to Faelledvej sub-station. (Reference B.X. 5 367.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, June 25th.—Supply of hard drawn copper wire, tinned soft copper wire, and cadmium copper wire. (Reference A.X. 8 040.)

TURKISH ADMINISTRATION OF RAILWAYS AND PORTS, July 4th.—Supply of electric wire and cables and general lighting accessories. (Reference B.X. 5 368.)

INDIAN STORES DEPARTMENT, July 8th.—Supply of 30 kW oil-engine-driven generating set for Military Engineering Services, St. Thomas Mount, Madras. (Reference B.X. 5 364.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, July 23rd.—Telegraph instruments (schedule C. 436). (Reference B.X. 5 323.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, July 25th.—Supply of two 2-ton electrically-driven hoist blocks (tender No. 1 471). (Reference A.X. 8 072.)

SOUTH AFRICAN POSTS AND TELEGRAPHS, August 1st.—Supply of telephone cable (tender No. 160). (Reference B.X. 5 345.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, August 6th.—Supply of 120-ton, four-motor, overhead travelling crane and runway (specification No. S.M. 358). (Reference A.X. 7 810.)

NEW ZEALAND POSTS AND TELEGRAPHS, August 7th. Enamelled and silk covered resistance wire (No. P. and T. 151/1497). (Reference B.X. 5 322.)

NEW SOUTH WALES PUBLIC WORKS DEPARTMENT, August 12th.—Supply and erection at Burrinjuck of auxiliary hydro-electric generating plant. (Reference B.X. 5 365.)

EGYPTIAN MINISTRY OF THE INTERIOR, August 13th.—Supply of electric power plant, with underground and overhead network, for the town of Maghagha, Minieh Province. (Reference B.X. 5 318.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, August 13th.—Water turbine driven generating sets and switchgear, for Waitaki power development (section 2). (Reference B.X. 5 278.)

PIETERSBURG (TRANSVAAL) MUNICIPALITY, August 13th.—Supply of h.t. and l.t. cable, lamps and sundries, in connection with extensions of the electricity undertaking. (Reference B.X. 5 312.)

PIETERSBURG (TRANSVAAL) MUNICIPALITY, August 13th.—Supply and erection of steam raising plant, engine, alternators, and switchgear (contract A). (Reference A.X. 7 983.)

AUCKLAND ELECTRIC POWER BOARD, August 19th.—Single-phase transformers. (Reference B.X. 5 324.)

NEW ZEALAND GOVERNMENT RAILWAYS, September 4th—Supply of motor generator (specification 287). (Reference B.X. 5 308.)

Tenders Accepted.

GLASGOW CORPORATION.—Siemens Electric Lamps and Supplies, Ltd., 75 electric cookers.

BEDFORD CORPORATION.—Robert M. Russell, erection of overhead line to Clophill and Maulden, £2 404.

SWANSEA CORPORATION.—British-Thomson-Houston Co., Ltd., supply of 10 000/12 500 kW turbo set, £34 476.

DUMFRIES CORPORATION.—Brush Electrical Engineering Co., Ltd., turbo-alternator plant, £7 913, plus £870 for extras.

NEWTON ABBOT URBAN DISTRICT COUNCIL.—Tangyes, Ltd., centrifugal pumps, pipes and valves, electric motors, control panels, etc., £795.

DUMFRIES CORPORATION.—British Thomson-Houston Co., Ltd., supply and erection of 1 500 kW, 3 000 r.p.m. turbo-alternator; Premier Cooler and Engineering Co., Ltd., erection of cooling tower.

LIVERPOOL CORPORATION.—Metropolitan-Vickers Electrical Co., Ltd., supply and erection at Clarence Dock power station of one 50 000 kW maximum continuous rating, turbo-alternator, with accessories, £193 370.

SALFORD CORPORATION.—Saunders and Taylor, Ltd., provision of electric thermal storage system in extension of offices at Frederick Road power station, £995; Hackbridge Electric Construction Co., Ltd., supply of three-phase oil-immersed power transformers for 12 months; Metropolitan-Vickers Electrical Co., Ltd., supply of e.h.t. switchgear at Cromwell Road sub-station, £536; W. T. Glover and Co., Ltd., supply of 1 170 yd. single core cables, £626 13s. (All recommended).

HORNSEY CORPORATION.—A. E. Sandilands, further electrical installation at Highgate school, £356 8s. 6d.; A. Reyrolle and Co., Ltd., h.t. switch panel, £317; Bruce Peebles and Co., Ltd., supply of 300 kW motor convertor, £1 887; A. Reyrolle and Co., Ltd., supply of h.t. switchgear, £1 404 19s. 6d. Hewittic Electric Co., Ltd., supply of 300 kW rectifier set, £2 460; Bertram Thomas, supply of l.t. switchgear, £1 073; Standard Telephones and Cables, Ltd., h.t. and control cables, £2 711 14s. 4d. (All recommended).

CARLISLE CORPORATION.—English Electric Co., Ltd., two 8 000 kVA transformers, £5 370; G. and J. Weir, Ltd., supply of turbo-feed pump of 200 000 lbs. capacity, £575; British-Thomson-Houston Co., Ltd., 3 300 V switchgear equipment, £3 451, and switchgear for auxiliary turbine, £810; Bertram Thomas, supply of switchgear for rotary convertor, £312; Worthington-Simpson, Ltd., circulating pump equipment and oil catchers, £933; Harland Engineering Co., Ltd., supply of 1 000 kW rotary convertor, £1 876 12s. 6d.; Blakeborough and Sons, Ltd., supply of circulating water screens, £2 892 15s.

ELECTRICITY SUPPLY.

Assisted Wiring at Stone and Gillingham—Lincoln's Electric Houses—Extension of Sheffield Electric Street Lighting—Worksop Extension Proposals—Bulk Supplies for London Boroughs—Extension of Plymouth Wiring Scheme.

STONE U.D.C. has adopted an assisted wiring scheme and will instal slot meters when required.

Gillingham (Kent) T.C. has decided to prepare a scheme for the installation of fittings and wiring.

Epsom U.D.C. has applied for a loan of £1 000 for assisted wiring, and for £1 200 for a new switchboard.

Oswestry has refused to consent to the erection of overhead lines in the borough by the North Wales Power Co.

Salford Electricity Committee seeks sanction to borrow £5 230 for the erection and equipment of sub-stations.

Croydon Electricity Committee has decided to arrange for an increased supply to Messrs. Creeds, at a cost of £1 150.

It is proposed to convert the bulk supply from Rawtenstall to Bacup from 3 000 to 6 000 V, to avoid stoppages at the mills.

Marazion Parish Council has accepted the terms of the West Cornwall Electric Light and Power Co. for electric street lighting.

Leek U.D.C. has applied for loans of £2 500 for cables, etc., in connection with a supply to Longsdon, and £2 490 for laying a new feeder cable.

Blackburn T.C. has approved agreements for a supply to Messrs. J. Fish and Co., of Cardwell Mill, Livesey, and Messrs. James Livesey's Mill.

Burnley Electricity Committee has approved an extension of an existing main from Holmby Street sub-station to the Cold Stores, at a cost of £4 602.

At the meeting of Haslingden T.C. on June 6th the Housing Committee's decision that electricity only should be installed in the houses at Stonefold was confirmed.

Electricity for all purposes is to be installed in 12 non-parlour, four-bedroom type houses which are to be erected on the St. Giles estate for Lincoln City Council.

Gainsborough U.D.C. has rejected an offer by the Yorkshire Electric Power Co. to take over the Council's undertaking. The Council takes a bulk supply from the company.

Birkenhead Electricity Committee seeks sanction to borrow £25 000 for mains and services.—The Committee has received sanction to borrow £5 000 for sub-station equipment.

Walsall Electricity Committee is to lay electricity mains in the Ring Road at a cost of £400 and to carry out a scheme for the electric lighting of central streets at a cost of £600.

Sheffield Watch Committee has authorised the fixing of 280 electric lamps at a cost of £1 269.—The electricity department is to extend mains at an estimated cost of £24 891.

The Newcastle and District Electric Lighting Co. has consented to supply electricity to 280 houses in section C of the Two Ball housing estate, subject to a satisfactory agreement with the Corporation.

Peterborough T.C. recently considered in committee an offer for the acquisition of the city electricity undertaking from a group of financiers. It is understood that the offer made is approximately a million sterling.

It is stated that landowners in Sefton rural district are urging Liverpool Corporation to expedite the supply of electricity in the district, as they desire to supply farms and cottages on their estates with electricity before the winter months.

Mr. H. A. Nevill, borough electrical engineer and manager, Peterborough, recommends the installation of an additional boiler, an economiser, a chimney and pipework at the electricity station, at a cost of about £65 000. The proposals are to be placed before the Central Electricity Board.

An agreement has been reached between Wallasey and Birkenhead Corporations in regard to the future electricity supply for Moreton. Hitherto the supply has been through Birkenhead, but Wallasey has now agreed to pay £15 000 for the electricity plant at Moreton, including standards, cables, etc.

It has been resolved at a conference of representatives of the Isle of Wight local authorities to support the application by the Isle of Wight Electric Light and Power Co. for a Special Order to cover that portion of the Isle of Wight where existing local Orders now apply. Under the company's proposal ten existing Orders would be replaced by one Order for the whole island.

Worksop U.D.C. has applied for a Special Order to include Whitwell in the area of supply. There are about 40 prospective consumers, and the cost of the scheme will be £8 689. The Council has applied for a loan of £13 652, part of which is for a main transmission line linking Manton Colliery with Rhodesia, and passing close to Whitwell.

Islington (London) B.C. has received an offer from the London and Home Counties Joint Electricity Authority for a bulk supply and, as other local authority undertakers in London are in a position similar to Islington as regards obtaining additional supplies, the Town Clerk has sent a letter inquiring whether such authorities will attend a conference to discuss the subject generally.

Hull Electricity Committee has approved a scheme to improve the coal handling facilities at the Sculcoates power station. A new bridge over the Beverley and Barmston Drain, and another siding are to be constructed. The provision of an additional cooling tower, pumping plant, piping, etc., at a cost of £22 000, has also been authorised.—Electric lighting is to be adopted at the Central Public Library.

The Holderness Trust is erecting lines in its area, and is under contract to commence supply Withernsea in November. Hull electricity department is to give a bulk supply at the boundary of the Corporation area of supply.—The Electricity Committee has rejected the proposal of the Holderness Trust that the Corporation should hand over the Order authorising supply in the Beverley area to the company.

Chorley Markets Committee has considered a proposal submitted by Mr. A. Gaskell, to install electricity on a number of stalls in the general market, and the Committee recommends that the application be not entertained. The Markets Superintendent has been instructed to ascertain the demand for electricity for lighting purposes, and to report on arrangements already made with regard to wiring, etc.

Leeds Corporation has decided that the portion of the undertaking of the Yorkshire Electric Power Co. which is situate in parts of the Hunslet, Tadcaster and Wharfedale rural district be purchased from the company for £44 500, and that so much of the undertaking of Electrical Distribution of Yorkshire, Ltd., as relates to the former township of Eccup be purchased from the company for £500.

Glasgow Tramways Committee has now agreed to recommend that arrangements be made for giving the Clyde Valley Co. the temporary supply of d.c. current required by the George Bennie Railplane Trust, Ltd., on condition that the firm pays to the department the cost incurred in respect of plant, etc., in connection with the supply, and on such other terms and conditions as the manager may consider necessary.

Plymouth Electricity Committee has decided that the scheme for free wiring be extended to consumers using ordinary meters, a deposit of 10s. without interest being made, and in case of transfer from prepayment meter to ordinary meter, the cost of the transfer being borne by the consumer. The scheme is also to be extended to the hire purchase of radiators for private houses, the quarterly payment to be at the rate of 1d. per 1s. or fraction of 1s. of the cost of the installation.

Hornsey Corporation has received an offer of a supply of electricity in bulk from the London and Home Counties Joint Electricity Authority, and the Council has been recommended to accept it. The Authority's offer is to give to the Council a supply of energy sufficient to meet the total requirements of the borough during the next seven years, at a price less than the estimated cost of generation by the Council during that period. The Authority will take all the energy actually produced at the Council's generating station and will repay to the Council the actual cost of generation.

Torquay Electricity Committee recommends that the Corporation oppose an application by Mr. W. G. Heath for a Special Order to supply electricity in Ivybridge urban district and in several parishes in the Kingsbridge and Totnes rural district, in so far as the Order affects the rural district of Totnes, and that application be made for an Order authorising the Corporation to supply electricity in several parishes in the rural district of Totnes. The Committee recommends the Corporation to offer £10 500 to the Teignmouth Electric Lighting Co. for the Buckfastleigh electricity undertaking.

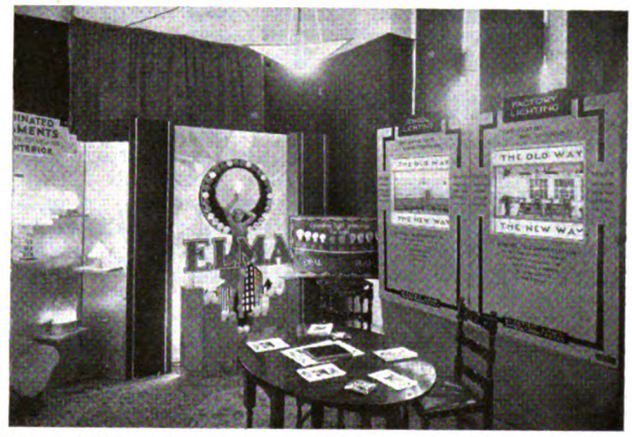
ELECTRICAL NEWS OF THE WEEK IN PICTURES.

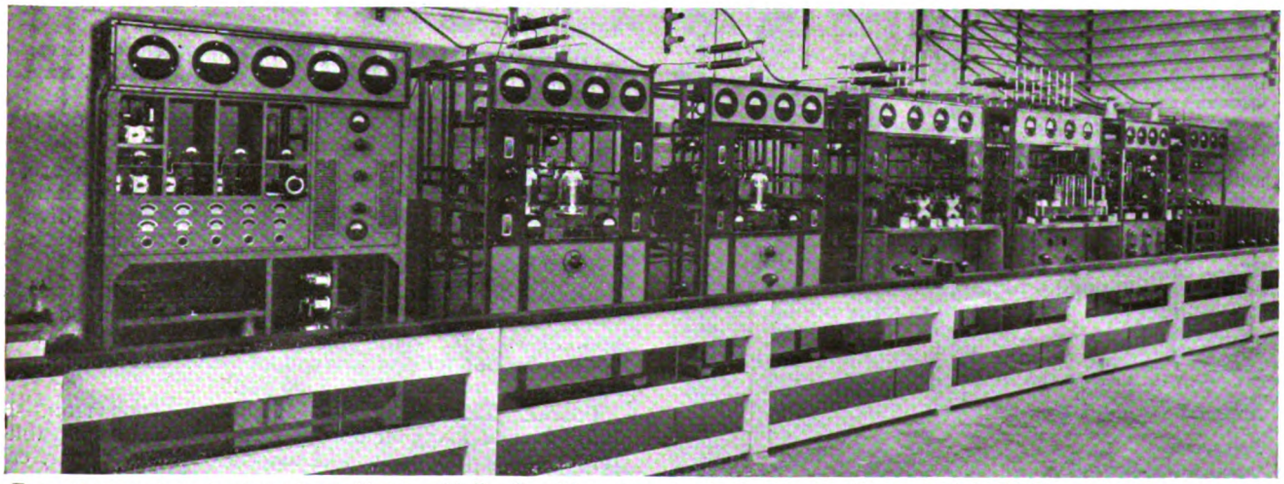
Mr. R. B. Renwick, son of Sir Harry Renwick, and his bride, Miss Dorothy Parkes, daughter of Major Harold Parkes, of Alveston, Stratford-on-Avon, leaving St. Margaret's, Westminster, after their wedding, on Monday.

The cable-ship "Faraday" last week marked the course of 63 miles from Norbreck, near Blackpool, to Port Grenaugh before laying the submarine telephone cable to the Isle of Man, and on Saturday last the first telephone communication between that island and this country was established. One of the ends of the cable may be seen here being hauled ashore.

The modified design of Broadcasting House, the future home of 2 LO, contracts for the building of which have now been placed. The new design makes fuller and more practical use of the space afforded by the site, while still retaining the super-studio included in the former design. A feature of the building will be a retaining wall enclosing the site.



The exhibits in the E.L.M.A. Lighting Room at the I.M.E.A. Exhibition. The exhibit was described in our last issue, and it is interesting to note that in connection with the model street and showroom window displays which attracted so much attention, two special booklets dealing with these subjects have now been published by the Bureau.



Recently tests have been made at Huizen (Holland) with a new short-wave transmitting station (PHI), working on a wave-length of 16·88 m. The new station is intended for working the Dutch Indies, the service being under the control of the "Philips Omroep Holland Indie," abbreviated to "Phohi." The transmitter, which consists of seven groups, is by reason of its maximum anode output of 60 kW, the most powerful short-wave station in existence. Signals from the new station have been heard with outstanding clearness in many countries. This is the second broadcasting station erected by Philips, the first being the well-known station PCJ.

COMPANY NEWS.

Appreciation of Siemens and Henley's Shares—Arrangement between Siemens Bros. and Co. and Siemens and Halske—Callender's Prosperous Condition—Directors' Reports and Dividends—New Companies Registered.

THE principal feature disclosed by the week's dealings in electrical shares has been the buying of Siemens and W. T. Henley's ordinary shares, the quotations for which have, as a consequence, risen. Siemens shares have advanced from £1 7s. 6d. to £1 12s. 6d., and Henley's from £6 2s. 6d. to £6 6s. 3d. English Electric preference have weakened from 8s. 9d. to nearly 8s. In the electricity supply section, Newcastle issues have improved somewhat, Newcastle and District ordinary touching 30s.; Yorkshire Power ordinary shares are 1s. up at 36s. Underground Electric Railways ordinary shares are 6d. down at 23s. Eastern Telegraph Stock has lost 5 points, and Marconi's Wireless are 3s. 9d. lower at 75.

PENNSYLVANIA WATER AND POWER CO.—Div. on common shs. $⅝ p. sh. for qrtr. ending June 30.

ELECTRIC SUPPLY CORPORATION, LTD.—Fin. div. of 7% on ord. shs., makg. 11% for year; fwd. £17 013.

VICTORIA FALLS AND TRANSVAAL POWER CO., LTD.—Net earngs. for year ended March 31, 1929, £294 609.

BRITISH COLUMBIA POWER CO.—Qrtrly. div. of 50 cents p. sh. on class "A" shs., less tax, is announced.

SHAWINIGAN WATER AND POWER CO.—Div. of $1½ p. sh. on common shs. for qrtr. endg. June 30 is announced.

HYDRO-ELECTRIC SECURITIES CORPORATION.—Initial qrtrly. div. of 25 cents p. sh. on common shs. will be payable on June 14.

LEATHERHEAD AND DISTRICT ELECTRICITY CO., LTD.—An issue of £20 000 5½% 1st mtge. debs., at par, was announced last week.

CANADIAN GENERAL ELECTRIC CO., LTD.—Qrtrly. div. of 1¾% for three months ending June 30, 1929, on pref. stk. will be payable on July 1.

RICHARD JOHNSON AND NEPHEW, LTD.—Rpt. for period from May 24, 1928, to March 31, 1929, shows gross pft. £37 057, Ord. div. at rate of 8% p.a. Fwd. £10 833.

PARA TELEPHONE CO.—Net pft. for 1928, £7 442, agst. £6 833. To depreciatn., etc., £5 296; div. 5% agst. 4%; fwd. £1 963, agst. £3 318.

GENERAL ELECTRIC CO. OF NEW YORK.—Extra div. of $1 p. sh. on common stk. has been declared, plus reg. div. of $1 on common stk. and 15% on the special stk.

ELECTRIC AND GENERAL INVESTMENT CO., LTD.—Divs. for year ended May 31, 1929, at full rate of 2s. p. sh. (10%) on ord. and 1s. p. sh. on dfd. shs. are recommended.

POLISH TELEPHONE CO.—An issue of £550 000 of 6% debs. at par was made at Stockholm on June 7. The issue was guaranteed by the Telefonaktiebolaget Ericsson.

CALCUTTA TRAMWAYS CO., LTD.—Rev. for 1928, £180 989, agst. £163 350. Div. on ord. shs. 10d. p. sh., tax free, makg. 1s. 2½d., agst. 1s., tax free, for 1927. Fwd. £11 020, agst. £7 758.

BARCELONA TRACTION, LIGHT AND POWER CO., LTD.—Net rev., $2 759 674, plus $208 148 brt. in. Divs.: 1% on ord. shs., makg. 2% for year, and 1% additional on pref. shs., makg. 9% for year. Fwd. $413 159.

AMERICAN CITIES POWER AND LIGHT CORPORATION.—Qrtrly. div. at rate of 2½% on "B" stk. payable on Aug. 1 in the form of further shs. of "B" stk. Net earnings available for "B" stk. amtd. to $2 379 000 for qrtr. ended March 31.

CONSUMERS' POWER CO.—Gross earngs. for 1928, $30 464 127, agst. $26 612 448, gross income $15 430 230, agst. $12 889 384, and net income $12 604 204, agst. $10 336 440. Divs. on pfd. cap. amtd. to $3 551 863, agst. $3 349 334.

CANADIAN HYDRO-ELECTRIC CORPORATION.—Gross rev. for 1928, $4 367 393; exes., $874 383; int., $2 272 810; disct. on funded debt, $146 708; depreciatn., $297 426; and pfd. divs., $750 000. Surplus for year $26 065; total surplus, $6 842 734.

WINNIPEG ELECTRIC CO.—Gross inc. 1928, $2 542 210, agst. $2 498 288. After provisn. for int., taxes, depreciatn., etc, blce. carried to surplus, $767 553. Regular qrtrly. divs. paid on pfd. stk. and two divs. of $1 p. sh. on common stk., and $77 500 was placed sinkg. fund res.

CANADA NORTHERN POWER CORPORATION.—Gross earngs. for 1928, $3 088 592, agst. $2 812 514; net earngs. $2 198 737, agst. $1 961 701. Surplus $1 410 218, plus $817 615 brt. in. After deduction for pref. and common divs. and for depreciatn., surplus is $1 196 460, agst. $489 994.

POSTAL TELEGRAPH AND CABLE CORPORATION.—Reg. qtrly. div. of $1·75 on the 7% pfd. stk. will be payable on July 1. Net pft. of co. and associated cos. for qrtr. ended March 31, $691 900, equal, after provision for taxes, depreciatn., int., etc., to $2·27 p. sh. of 7% pfd. stk.

CALCUTTA ELECTRIC SUPPLY CORPORATION, LTD.—Rev. for 1928, £955 129, agst. £930 291. Div. 12%, plus cash bonus of 4d. p. sh. (same as last year). Electy. sold 147 957 366 kWh, agst. 129 090 227. Sales for three months ended March 31, 1929, 38 151 824 kWh, agst. 32 504 346.

WEST KOOTENAY POWER AND LIGHT CO.—Gross earngs. for 1928, $2 133 562, agst. $1 923 701. Exes., $536 405; bond int., $152 494; depreciatn., $507 510; written off, $209; divs., $35 000; tax adjustmts., $26 667. Surplus for year, $798 491. Previous surplus brt. fwd., $1 045 390.

HYDRO-ELECTRIC SECURITIES CORPORATION.—Rev. for 1928 $1 296 439; net inc. $1 159 134, exclusive of divs. paid in shs. of market value of $635 568. At Dec. 31, 1928, surplus was $1 021 837, compared with $498 328 at Dec. 1927. Investments at Dec. 31, 1928, stood at market value of $51 420 711.

TORPOINT ELECTRIC SUPPLY CO., LTD.—An offer has been made by Edmundson's Electricity Corporation, Ltd., to purchase whole of issued shs. of Torpoint Electric Supply Co. at 26s. 4d. for each pref. sh. and 10s. for each ord. sh., the offer being conditional upon acceptance by hldrs. of at least 80% of both classes of shs.

CAWNPORE ELECTRIC SUPPLY CORPORATION, LTD.—Surplus for 1928, £86 861, agst. £67 637. Int. on debs., £11 798; to depreciatn. and renewals, £27 500; written off sh. issue exes., £4 002; income tax, £2 000; sinkg. fund, £7 587. Pref. sh. divs. absorb £12 600 and intm. div. of 3% on ord. £6 000. Fin. div. 7%, makg. 10%. Fwd. £3 824.

LA PLATA ELECTRIC TRAMWAYS CO., LTD.—Gross recpts., 1928, £114 686, agst. £110 058; net recpts., £29 748, agst. £31 463. Int. on debs., £4 547; to deb. stk. redemptn. fund, £1 382, leavg. £23 548, plus £4 641 brt. in. To renewals fund, £8 000. Board recmmds. paymt. of div. for year on 6% pref. shs. and 1½% on acct. of arrears of div. on pref. shs.

NEW ENGLAND POWER CO.—Gross earngs. for 1928, $31 835 604, agst. $28 778 661. Available for divs., $5 441 576, agst. $4 477 934. New 60 000 H.P. Bellows Falls hydro-electric plant has been completed and connected with system. Constructn. commenced on new 300 000 H.P. hydro-electric development on Connecticut river. Contract concluded with Edison Electric Illuminating Co., of Boston, for purchase by it of 150 000 000 kWh a yr. for 20 yrs.

WESTERN UNION TELEGRAPH CO.—Gross operatg. rev. for 1928, $136 449 613; income from divs. and int., $2 93 808; operatg. exes. $120 310 256; int. on bonds $3 609 406; to surplus acct., $15 467 659. This added to surplus at Dec. 31, 1927, $78 528 582 and premium on cap. stk. issued to employees during year, $518 100, makes a total of £94 514 341. Deducting divs. paid, $8 084 634, and adjustmts. of surplus, $72 524, leaves surplus at Dec. 31, 1928, $86 357 183.

MADRAS ELECTRIC SUPPLY CORPORATION, LTD.—Net pft. for 1928, £65 934, plus £6 656 brt. in. Nine months' div. on pref. stk. required £13 000, and intm. (2½% actual) on ord. $11 830. Fin. three months' pref. div. £4 493, and fin. 5½% actual on ord., making 8% for yr., tax free, £26 026; to res., £9 855; fwd. £6 906. Tramways workg. for 1928 showed available blce. £14 402, includg. amt. brt. fwd. Pref. div. absorbed £6 699. Fwd. £1 703.

International Telephones.

INTERNATIONAL TELEPHONE AND TELEGRAPH CORPORATION.—Earngs. of the Corporation and associated cos. for 1928, $81 234 824, agst. $32 645 500. Net earngs., $23 053 828, agst. $12 582 923. Int. and divs. on pfd. stk., etc., required $6 882 491 and int. on 25-year 4½% gold deb. bonds $1 575 000, leaving net income $14 596 337. Reg. divs. at rate of 6% p.a. have been distributed, and net earned surplus at end of year was increased by $5 835 659. The total earned and cap. surplus Dec. 31, 1928, amtd. to $34 709 760.

OFFICIAL QUOTATIONS.—The Stock Exchange Committee has granted official quotations to 287 250 £50, fully paid, ord shs., 251 934 £100, fully paid 7% non-cum. participatg. pref. shs., and £1 677,060 5% 1st mtge. 50-year bonds of the Barcelona Traction, Light and Power Co., Ltd.; 100 000 £1, fully paid, ord. shs. of the Enfield Cable Works, Ltd.; 140 833 £1, fully paid, ord. shs. of the Oriental Telephone and Electric Co., Ltd., and, 11 996 £1, fully paid, ord. shs. of the Underground Electric Railways Co. of London, Ltd.

ELECTRICITY IN TIN MINING.—The rpt. of the directors of the Associated Tin Mines of Nigeria states that great importance is attached to acquisitn. of a half in. in Kurra Falls Hydro-Electric undertakg. Since date of report enterprise has become vested in Nigerian Electricity Supply Corpn., in which the co. holds about half the ord. shs. A long-term contract has been entered into with the corporatn. for supply of electric. power. The utilisatn. of this power will, it is anticipated, be reflected in a very substantial reductn. of workg. costs.

UNITED RIVER PLATE TELEPHONE CO., LTD.—Rev. for 1928, £2 764 625. Deducting £2 261 508 workg. exes., £13 500 deb. stk. int. and £192 400 for div. on pref. shs. to Dec. 31, 1928, and intm. div. on ord. shs., leaves £297 217, plus £165 000 brt. in. Fin. div. of 5% on ord. shs. recommended, makg.

Sir Hugo Hirst at the G.E.C. Sports, which were held at Wembley on Saturday, June 8th. The picture also includes Mr. H. W. Roberts, on the left.

8% for year, tax free. Fwd. £158 219. Results have not enabled usual div. to be met without drawg. upon amt. brt. fwd. This is principally due to reductn. of tariffs forced upon the co. in last qrtr. of 1928. Further progress has been made with conversion of Buenos Ayres to automatic system. An offer made in Dec., 1928, by International Telephone and Telegraph Corporation of New York to purchase the ord. shs. was accepted by majority of shhldrs.

Company Meetings.

GREAT NORTHERN TELEGRAPH CO., LTD.—At the meeting on June 7th the Chairman said, in replying to an inquiry from a shareholder, that a settlement of the account outstanding with the Japanese Administration, as referred to in last year's report, had quite recently taken place through the payment to the company of approximately £143 000, by which amount the revenue for 1929 would thus extraordinarily be augmented.

COMPANIA HISPANO AMERICANA DE ELECTRICIDAD, S.A.—Mr. F. de A. Cambo, presiding at the meeting in Madrid on May 25th, said revenue had increased from 103 726 432 pesetas in 1927 to 114 670 761 pesetas in 1928, and net profit from 43 196 874 pesetas to 50 884 560. This permitted the board to propose a total dividend of 15% gold, compared with 14%. The sale of 200 000 series "E" shares at a rate much above par had provided the company with a net profit of 98 460 350 pesetas, which it was proposed to carry to the reserve fund. The conservative policy of dividend payments which had been adopted had permitted them, without any strain on their cash resources, to carry out the construction of their super-station at Buenos Ayres, which was the most perfect in the world. The report and accounts were adopted.

VENEZUELA TELEPHONE AND ELECTRICAL APPLIANCES CO., LTD.—Resolutions in regard to an increase of the capital were submitted at an extraordinary meeting on Monday. Sir Alexander Roger, who presided, said the conversion of the company's system in the Caracas area to automatic operation had been well received, which had decided the directors to introduce automatics into other sections of the system, and an investigation by experts showed that further development would be profitable. The remaining unissued capital amounted to £6 050 only, and it had therefore been decided to put proposals before the shareholders to increase the capital by £320 000, in the form of non-voting "A" ordinary shares of £1 each, with the same dividend and capital rights as the existing ordinary shares. It was proposed to offer immediately about 140 000 of the new shares.

SIEMENS BROTHERS AND CO., LTD.—At an extraordinary general meeting on Tuesday, a resolution approving alterations of the articles of association was confirmed. Sir William Bull, chairman, said it was becoming increasingly difficult to keep abreast with the developments made by the large American and Continental concerns, which, owing to their very much larger capital and turnover, could afford, and did incur, expenditure on development work and research on a scale which would mean an excessive strain on the company's resources. It was natural, therefore, that they should examine the possibilities of obtaining the advantages of the research

Digitized by Google

and technical development undertaken by some of these powerful groups in concessions and any necessary long-term credit business rather than undertake the obligations in whole upon themselves in competition with those groups. They were able to make satisfactory arrangements without in any way affecting the British control of the company, and they succeeded in making an agreement with regard to their telephone business with Messrs. Siemens and Halske, Berlin, the biggest manufacturers of telephones on the Continent of Europe, and with a very powerful international group. They had also entered into an agreement with Siemens and Halske to arrange for a complete exchange of research, development work and factory experience in regard to all other fields that were common to both companies, and they had arranged to issue to Siemens and Halske 450 000 ordinary shares, and they were issuing to Siemens Brothers and Co. 6 557 shares (700 marks nominal value each) in Siemens and Halske.

New Companies.

ALLOM BROTHERS, LTD.—Cap., £3 000. To acquire business now carried on at 15, George Street, Hanover Square, London, W., and elsewhere, as "Allom Brothers," and to carry on business of electricians, electrical, wireless and general engineers, etc.

RAILWAY RADIO CO., LTD.—Cap., £1 000. To acquire inventions, patents and secret processes in connection with establishment of radio communication to and from railway trains or other forms of transport; to manufacture and deal in wireless apparatus and radio accessories, etc. Reg. office: 12/13, South Place, London, E.C.2.

POWELL AND HANMER, LTD.—Cap., £300 000. To acquire business of manufacturers of and dealers in lamps and accessories carried on by Powell and Hanmer, Ltd. (incorporated in 1904) and carried on in Birmingham and elsewhere, and to adopt an agreement with the said company and A. E. Phillips. Solicitors: Pinsent and Co., Birmingham. (Public co.)

CALLENDER'S CABLE AND CONSTRUCTION CO., LTD.

Orders from the London Company and for the Central Board's "Grid"—Excellent Prospects for the Coming Year.

SIR Fortescue Flannery, presiding at the thirty-third ordinary general meeting on June 6th, said he was fortunate once more to be able to present a balance-sheet and accounts which maintained the wonderful record which the Callender Co. enjoyed. The details of the "grid" were now known, and several contracts had been placed in connection therewith, one of which had been secured by their company for the southern section of England, between the Thames and the sea coast as far as Worthing, and this contract represented a value of approximately half a million of money. The effect of the "grid," when completed, would, they believed, be to increase the quantity of underground cable required for distribution and general services, especially in the towns which it served, and therefore the tendency would be to considerably enlarge business for the underground cables, which it was their company's speciality to manufacture. On the other hand, the orders obtained for the ordinary run of underground cables and for the wires and cables required inside premises represented a highly satisfactory business, which continually tended to increase and helped materially to produce the profit shown in the balance-sheet. Great progress had been made in research work to assist in producing cables for higher pressures, which had been very helpful in assisting the company to obtain the large orders for mains of 66 000 V recently placed with them to be laid in London to form the interconnecting link between the various local generating stations, thus also giving to those stations supply from the Government network. One of the three such districts in London had been entrusted to the company.

The chairman then gave particulars regarding the purchase of the business of W. T. Glover and Co., Ltd., and referred to the figures in the accounts, which were abstracted in our issue of May 31st. The board, he said, proposed a dividend of 15 %, which would be payable on the shares numbered 1 to 800 000 only. They had excellent reports as to the Okonite-Callender Cable Co., with which they were so closely identified in the United States. Mr. Watson, the technical manager and head of their research department at Erith, had just returned from a visit to America, and they were satisfied from his report that the American company was making cables of the utmost excellence, that the field in connection with their use was steadily increasing, and that good orders were being obtained. The board suggested that £186 000 be taken from the reserve funds so as to enable fully-paid ordinary shares to be distributed to the shareholders in the proportion of one bonus share to every five ordinary shares held. He concluded by moving the adoption of the report and accounts.

Sir T. O. Callender, deputy chairman and managing director, said Mr. Hunter, one of his chief assistants, was proceeding, in the position of representative of the Institution of Electrical Engineers, to the conference which was being held that week in Paris on the subject of electrical distribution as it affected, especially, high-tension mains. He would be joined by Mr. Watson, head of their research department, and those two gentlemen were responsible for a most important paper, which would be read at the meeting, on the expansion of conductors in super-tension mains. Although, during the past year, they had had some large contracts, they had not had the volume of them they would like to have had. They had laid many miles of high-tension mains for the London Company, and that had been followed by an equally important contract for the Central Electricity Board in the 66 000 V cable to which their chairman had referred. Their small trade was coming in in large amounts, and was likely to increase, and he looked upon the prospects of the company during the coming year as excellent.

In Burmah, for the Burmah Oil Co., they completed, after nearly two years' work, the power line which connected their various oilfields; later they completed a somewhat similar line for the Anglo-Persian Co. at their works at Abadan, in the Persian Gulf, and they had just finished the electrification of the island of Bahrein, the headquarters of the wonderful pearl fishery in the Persian Gulf. A big installation had been carried out at Benares by them with their cables. They had barely finished their work in Benares when they were called upon to send cables and men to Jerusalem. The work there had been practically completed. It was carried out under the auspices of Messrs. Balfour, Beatty and Co. As to the other places in India where they had done work, they owned the concessions for the island of Salsette, a new district being opened up in connection with Bombay. It would, he felt sure, prove to be a very valuable market for the supply of cable in that district. They had also done business in Santiago, in Chile, where last year they supplied quite a large amount of cable. They had also done work in Rio, in Brazil. As to South Africa, they were still doing a lot of work there, and also in all parts of the world.

The report and accounts were adopted.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

A. AND B. HARRIS, LTD., electrical and general engineers, 47, Victoria Street, London, S.W., and at Kings Lynn. This company, following a meeting of creditors, passed resolutions for voluntary liquidation. At the statutory meeting of creditors the liquidator reported that the liabilities were £2 234, and the net assets £289, or a deficiency of £1 945. He stated that at the date of his appointment certain creditors had levied execution, and the Sheriff had advertised a sale by auction. The sale should have taken place on May 24th, and he made efforts to get it postponed, but was unable to prevent the sale taking place. The goods belonging to the company were sold the previous day by public auction at Kings Lynn, and realised £410, whilst the amount required to pay the execution creditors and costs was £415. In addition to the assets appearing in the statement of affairs, there was work in progress in connection with uncompleted contracts for machines. It was possible that if those contracts were completed a sum of something like £300 profit might be made. In answer to a question, the liquidator said that the premises at Kings Lynn were the property of the local authorities, and as the rent had not been paid the landlords had given notice terminating the lease. The latter expired in December next. The company was formed with a nominal capital of £4 000, and the accounts showed that during the year to June, 1927, there was a net loss of £1 466, whilst in the following 12 months there was a net loss of £634. It was estimated that since June last there had been a loss of £1 780, but that figure included certain depreciations written off the assets, and preliminary expenses of £102. A resolution was passed confirming the voluntary liquidation of the company.

London Gazette, etc.

Companies Winding-up Voluntarily.

BRIGHTLINGSEA ELECTRICITY SUPPLY CO., LTD. By special resolution, May 21st, confirmed June 6th. A. C. Lucas, 167, Strand, London, W.C.2, Chartered Accountant, appointed as liquidator.

SHEFFIELD WIRELESS DEPOT (1926), LTD. By reason of its liabilities, May 30th. H. Cunningham, King's Chambers, Angel Street, Sheffield, Incorporated Accountant, appointed as liquidator.

Bankruptcy Information.

LATHAM, John James, 3, Brickhouse Street, Burslem, Stoke-on-Trent, wireless dealer. Receiving order, June 4th. Debtor's petition. First meeting, June 18th, 11 a.m., Official Receiver's Office, 12, Lonsdale Street, Stoke-upon Trent. Public examination, June 20, 11 a.m., Town Hall, Hanley, Stoke-on-Trent.

WILMINGTON, Granville, 75, Railway Street, Nelson, electrical and radio engineer. Receiving order, June 6th. Debtor's petition.

Notices of Dividends.

CRUMP, Augustus Henry, lately carrying on business at 202, Walworth Road, S.E.17, as SELWYN ELECTRICAL ENGINEERING CO., electrical engineer. First and final dividend, 4s. 7d. per £, payable Bankruptcy Buildings, Carey Street, London, W.C.2.

NORMAN, George Arthur, 11, Freeman's Yard, Barnsley, electrical engineer. First and final dividend, 5s. 2d. per £, payable June 11th, Official Receiver's Office, County Chambers, King Street, Wakefield.

Notice of Intended Dividend.

BOWLER, Thomas William (separate estate), 314, Yardley Wood Road, Moseley, Birmingham, trading with another as TAYLOR AND WYNNE, at back 180, Green Lanes, Small Heath, Birmingham, electrical engineer. Last day for receiving proofs, June 17th. Trustee, Clement Hoult, 191, Corporation Street, Birmingham, Official Receiver.

Application for Discharge.

JOLIVARD, Kenneth Paul James, described in the Receiving Order as K. Jolivard and Co., 66, Victoria Street, London, S.W., electrical engineer. Hearing, June 21, 11 a.m. Bankruptcy Buildings, Carey Street, London, W.C.2.

Partnerships Dissolved.

BREWER AND BRUNT (Arthur George BREWER and William Henry BRUNT), 17, Albert Road, Hoylake, electrical engineers and electricians, by mutual consent as from September 30th, 1928. Debts received and paid by W. H. Brunt, who will continue the business.

RELIANCE ENGINEERING CO. (Edwin POBJOY and Grove Thomas BOOTE), electrical engineers, 339, Richmond Park Road, East Sheen, Surrey, by mutual consent as from May 29th. Debts received and paid by E. Pobjoy, who will continue the business.

W. H. TRACE AND SON (William Henry TRACE and Harold Greenaway TRACE), electrical engineers, 26, Upton Road, Birkenhead, by mutual consent as from January 31st, 1929. Debts received or paid by H. G. Trace. The business will be carried on in the future by H. G. Trace in conjunction with Walter Thomas Trace and George Arthur Smith Trace.

Bankruptcy Proceedings.

HUNT, Sydney Everest, 8a, Torwood Street, Torquay, electrical engineer and contractor. This debtor's statement of affairs shows liabilities amounting to £2 312 against assets of £601, less preferential claims of £102, or a deficiency of £1 813. Debtor attributes his failure to heavy overhead charges; interest and rent; bank charges, etc., preventing him earning sufficient to meet living and personal expenses; shop which cost £5 a week being inconveniently suited to attract custom; loss of £100 on largest contract; and costs, through being suddenly sued, since last June. At the statutory first meeting of creditors, Mr. E. H. Hawkins, of Poppleton, Appleby and Hawkins, 4, Charterhouse Square, London, E.C., was appointed trustee of the estate.

THE LEAD MARKET.

The market has remained steady throughout the week and according to James Forster and Co., the highest prices were paid on Wednesday, when £23 16s. 3d. was touched for June, and £23 15s. for September. Prices have since been easier with the tone steady at the close.

Closing prices on June 7th were £23 12s. 6d., for all positions, or 1s. 3d. to 2s. 6d. per ton up on the week.

The I.E.E. Summer Meeting.

THE summer meeting of the Institution of Electrical Engineers which concluded in London, on Sunday, after a highly delightful time in Paris and the Pyrenees, was voted one of the most successful yet held. The hospitality of the French hosts was most marked and the social functions of the meeting were well carried out. It will be gathered from the snapshots which we published in our last issue, and still others this week, that everyone attending the meeting will look back upon the visit as well worth remembering. The party, numbering well over one hundred, saw much that was novel and instructive, as our reports of the proceedings indicate. The fact that the President of the Institution, Col. K. EDGCUMBE, was so much at home in the matter of language and that so many members of outstanding interest attended the meeting, will have had a considerable influence on the French appreciation of the visit. Appreciation which will without doubt stand us in good stead for many years to come and which will perhaps result in a reunion on similar lines at some future date. Both in Paris and in the Pyrenees the members of the Institution received welcome and hospitality from technical associations, power companies and others connected with electricity. The Orleans and the Midi Railway companies acted with the greatest generosity regarding the transport of the party by special train, and thanks are due to M. BUNET and M. GROSSELIN and to the Société Française des Electriciens. Regarding the Pyrenees, many were struck by the way in which difficulties had been got over, to enable new industries and interests to grow up, and many of the party expressed a wish to pay before long another visit to a district blessed by nature with such wonderful scenery and by man with so many places and things of historic interest.

The Incandescent Electric Lamp.

WITH reference to the gala effects which were shown at Atlantic City this month in connection with the National Electric Light Association's Convention, whereat Edison was proclaimed the inventor of the incandescent electric lamp, we publish elsewhere in this issue copies of two letters which are of interest. Both these communications emanated from the Institution of Electrical Engineers, and the more important of the two was addressed to the U.S. National Illumination Committee, drawing attention to the fact that Sir JOSEPH SWAN, and not Mr. T. A. EDISON, was the true inventor of the incandescent electric lamp. Our attitude with respect to the "jubilee" to be held in October is well known, and the fact that our views, together with the Institution's letters, have not had the desired effect of coupling the name of SWAN with the celebrations is, to say the least, disappointing. It is, of course, now too late to make as enthusiastic an acknowledgment of SWAN'S invention as we would like, while the publicity given to the EDISON claim will take a long time to lose its effect; nevertheless, we feel that even now the United States should do something to pay tribute to the name we ourselves have honoured.

N.E. England Electricity Scheme.

THE Electricity Commissioners have to date submitted six electricity schemes, of which five have already been adopted by the Central Electricity Board. The sixth relates to North-East England and has just been submitted for approval, while still other schemes to cover S.W. England (including South Wales), and East Anglia are expected to be developed before the end of the year. In the early part of next year the Commissioners hope to complete schemes to cover the outstanding parts of Wales and Scotland. With regard to the N.E. England scheme, this deals with about 5 050 square miles covering Northumberland, Durham and a part of the North Riding of Yorkshire. The area had a population at the last census of approximately 2 674 800 and embraces coal-mining, shipbuilding, iron and steel, engineering and the chemical trades. It also covers wide tracts of agricultural territory which, with a few isolated exceptions, are at present unprovided with any system of supply. At present there are 32 authorised undertakers in the area, owning between them 15 public generating stations. The consumption in 1927/28 was about 247 kWh per head of population and it is estimated that this will increase to an average of 410 in 1935/36. Under the proposals, six existing stations will be selected and operated for the Board, namely, Carville (A), Carville (B), Dunston, North Tees, Darlington and Sunderland. It is not anticipated that any new stations will be required, but the scheme provides for five further stations to be worked under temporary arrangements for a few years. There are several waste-heat and private generating stations connected up to the system of undertakers in the area, and it is assumed that these undertakers will continue the arrangements already entered into with the owners of

Digitized by Google

these sources of supply. Broadly speaking, four of the selected stations, namely Carville (A) and (B), Dunston and North Tees, will supply the base load, while the remainder will be used for meeting the peak load in the area.

The Transmission System.

THE stations will be interconnected by high pressure main transmission lines designed in a series of ring mains. These are not necessarily completed in the present scheme, but the primary transmission system has been laid out so as to permit of later amplification under schemes for adjoining areas. The main transmission system will comprise 102 route miles of line and five transforming stations. The secondary transmission system will involve a further ten transforming stations. Incidentally, the interconnection of these stations will result in the release for revenue-earning purposes of about 80 000 kW of plant now kept as spare and representing about £1 360 000 of capital. The greater part of the electrical development in the area has been carried out on a frequency of 40 cycles, and the scheme contemplates standardisation in 25 undertakings at an estimated eventual cost of £5 963 070.

The E.C.A. Conference.

STILL another important occasion this month is the fourth annual conference of the Electrical Contractors' Association which opened at Bournemouth on Wednesday. As popular as were the Brighton, Scarborough and Cheltenham conferences, that at Bournemouth is even better attended. As is our usual custom, we shall, in our next issue publish a full report of the conference, including the discussions, and exclusive snapshots of most of the outstanding personalities and social functions. That the E.C.A. is growing in importance no one doubts; that it will grow even more is a foregone conclusion, for, in spite of many difficulties, the association has already shown its ability to protect the interests of its members in many ways; and furthermore, has raised the status of the electrical contractor above that set by many of those who have not yet joined its ranks. While it is yet too early to say that the papers and discussions at this week's conference will add still further glory to the Association, it may, however, be stated without hesitation that they will undoubtedly serve the purpose for which the Association was formed, namely to assist the electrical contracting industry as a whole.

The National Radio Exhibition.

THE applications for space at the National Radio Exhibition, which will open at Olympia in September, have exceeded all previous records, and the organisers have experienced considerable difficulty in satisfying a number of intending exhibitors with the space allotted to them. That any dissatisfaction should exist at all at this early stage is disappointing, for though the majority, if not all, of the firms who feel that they will be exhibiting with less advantage than others, are outside the membership of the R.M.A., they form nevertheless a good percentage of the total exhibitors. We agree that members of the Association should have some preference in the matter of stands, but such preference should not be held out as one of the reasons why radio traders should join the R.M.A. As it is, members of the Association are found in the best stand positions at Olympia, with non-members in the less important places, and, in our opinion, this is lacking in that co-operative spirit which the future success of the radio industry demands. Were the R.M.A. members to hold an exhibition themselves, that is to the exclusion of all non-members, the show would be considerably less attractive than is at present the case. With its membership of 100 odd the Association would make a poor show at Olympia when compared with, say, the last exhibition. The list of exhibitors for the next show indicates that the numbers of members and non-members are approximately equal, and, in view of this, surely no one exhibitor should be treated differently from his neighbour purely on the question of membership. The exhibition has become so established, and the demand for space so large, that the present method of balloting appears to have become inadequate, and we suggest, therefore, that some other arrangement, based perhaps on the priority of date of application be considered by the organisers. In any case the suggestion that the non-success of some firms to procure good space is likely to influence them into becoming members of the R.M.A. is not likely to be popular.

The Talking Film and British Apparatus.

IT is satisfactory to note that some of the largest talking film companies in America have decided to lease their pictures to exhibitors who have installed British apparatus. Prior to this decision the position was understood to be that those American film companies who are licensees of the Western Electric Company's system, placed a ban on the leasing of their talking films to exhibitors who had not installed exclusively the Western Electric apparatus. Exhibitors, therefore, who were obliged to rely to a great extent on films produced by those companies, were compelled to instal reproducing equipment of American manufacture. Since there are in Great Britain alone something like 4 500 cinemas which, but for the ban, would by now probably have been fitted with electrical reproducing equipment, the American film companies have only themselves to thank that not more "talkies" are exhibited. The British electrical engineer has already shown his superiority as a designer of loud speaking equipment, and since the success of the talking film, both in production and exhibition, is largely a matter of electrical engineering, American producers will quickly find that not only is a British-made reproducing equipment for use with American films a more popular proposition, but that British-made talking films are a serious rival to the American product. The ban on the use of British reproducing equipment has hitherto held up the film producing side in this country, but now that the ban is lifted both apparatus and films have got their chance.

A Chance for the Electric Vehicle.

THE new rules made by the Ministry of Transport regarding motor traffic as a result of complaints of undue noise are a strong argument in favour of the electric vehicle. Though much of the noise created by road traffic is due to causes other than the petrol motor, the latter is nevertheless responsible for a good deal. Acceleration, careless gear changing, an ill-designed exhaust, all tend to noise, and the number of petrol driven vehicles which do not offend in one way or another must be very few. In the case of the electric vehicle noises due to mechanical construction are completely absent. Quiet acceleration, no smell and no engine noise are obvious advantages which, if applied to, say, the London motor traffic, would result not only in giving greater comfort to travellers themselves, but also to pedestrians. The distance between, say, Charing Cross and the Bank is not far, but the number of times the driver of a motor vehicle is required to change gear in that distance must be high. When that number is multiplied by the number of such vehicles passing a given point on that particular section of the road the noise resulting from gear changing alone must surely be of considerable volume. The fact that gear changing is necessary to such an extent in so short a distance is a further argument in favour of the electric vehicle, for, from the point of view of economy, all traffic blocks and hold-ups give in this case a conservation of energy, whereas with the petrol motor, the driver who by way of saving his "juice" stops his engine and at the policeman's bidding has to restart, is, to say the least, unpopular. It seems to us that the new regulations which come into force on August 1st offer an opportunity which makers of electric vehicles should not fail to grasp. Public opinion is on the side of the authorities on the noise nuisance, let us show a way to solve the problem, if not entirely, then to a very considerable degree.

CONCRETE POLE PROBLEMS.

Advantages of Concrete Over Wood—Methods of Overcoming Weight—Hollow Shell or Solid One-Piece Poles?—Hair-Line Cracks—Preliminary Expansion of the Steel Used.

By WILLIAM T. TAYLOR, M.Inst.C.E., M.I.E.E.

THERE are many problems that cannot be dealt with in this short article and must therefore be left over for a further period.

It would seem that the quicker we come to a conclusion respecting the best line or system, which is that one delivering a given amount of energy for the lowest cost, and includes relatively best reliability, the quicker and more definitely we shall arrive at a decision in favour of reinforced-concrete pole-line construction as against wood or steel for transmission lines in particular. For conditions in general, the margin of profit between the manufacturing and selling prices of energy can quickly be consumed in the wood-pole line when we account fully for the annual costs resulting from relative life, maintenance, pole changes, interruptions, etc.

Some of the advantages of reinforced-concrete over wood or steel, are: greater durability, non-rusting, non-decaying, fire-proof, absence of maintenance costs; it does not require any preservative, it is not attacked by termites or salt or acid (air or moisture) from the atmosphere; it is readily adaptable to any shape, and it is easily dimensioned to any load. However, certain practices militate against the general use of reinforced-concrete poles. Neglecting for the moment the strange factor of safety at present enforced by law, we are jeopardised by present methods of making, and transporting and handling and erecting. Dangers and high costs confront the three latter operations before the pole is in place, and it is these (along with the *compounded* safety factor) that militate against the inherently superior qualities of the reinforced-concrete pole for overhead transmission and distribution lines in general.

To lessen the heavy weight and cost of transport and handling, designers have sought various processes of making them, either with a hollow shell or in separate sections. The former methods endeavour to force up the strength of a given concrete mass-section, with the result that hair-lines and cracks are far too common, due to the relatively thin shell of concrete, the relatively high expansion of the reinforcing steel and other reasons, which conditions result in failures or in decreased life and strength; the latter methods endeavour to facilitate transport by making them in sections with telescopic or butt jointing, both of which are undesirable and offer a pole with joints that, for equivalent unit length and cost, become weaker with age and increase the maintenance costs, etc.

Solid One-Piece Poles.

For any given figure of cross-section, the solid one-piece pole is always the stronger and always the most reliable, but it costs more, due to the cost of transport and handling, and the little extra concrete for the core. To offset all the objectionable costs, it is necessary to obviate almost entirely such costs as transport by rail, haulage by road, handling from works to site, erection, etc. In this way we can build a reinforced-concrete pole line at a total initial cost equivalent to that of a wood-pole line of equal strength—decidedly superior strength and rapidly decreasing annual expenditures always favouring the concrete pole-line during the life of the line. Also, apart from the heavy costs of transport, haulage, handling, erecting, etc., all of which can be avoided, as shown here, there is ever present the added danger or risks of totally or partly destroying or fracturing the poles during any one of these operations.

For the building of a more robust line offering the least annual expenses, practically every electricity supply undertaking will see the justice of paying a higher price per mile length of completed line. To more properly understand the merits referred to above, the reader is requested to examine page 419 of THE ELECTRICIAN of April 5th, 1929. When comparing the wood-pole and the concrete-pole line, the merits of the latter are soon made self-evident, that is to say:

(*a*) Longer spans can be used with better all-round reliability; the first cost is very little higher, and the extra cost is more than worth it because a concrete-pole line (which is the proper basis of comparison, not a pole) is less expensive with operating time—i.e., it becomes increasingly cheaper and more dependable with time as compared with the wood-pole line.

(*b*) Relative life favours concrete construction, especially the concrete pole referred to here, which is made from a rich proportion and is finished off while damp with a very rich mixture that interjoins organically with the pole and tightens all possible wounds.

(*c*) No preservative is required and no maintenance cost is involved; the pole line takes care of itself, at least as well as the best wall of any concrete building.

(*d*) As the very large majority of system troubles and interruptions are from insulators and birds, with this construction the number of insulators are less per mile of line, and troubles from birds are entirely eliminated because the arms are specially shaped to give the best electrical and mechanical results. The concrete pole is flexible, and is more dependable for balancing up unequal span-stresses; the flexibility is very much more dependable with age as compared with a wood or a steel-pole line.

Permissible Pull.

The allowable pull on reinforced-concrete poles is usually based on a working stress which, for steel, is around 17 000 lb./sq. in.; for concrete it is around 750 lb./sq. in. Such a steel would have an ultimate strength of around 55 000 lb./sq. in., and a yield point not less than 34 000 lb./sq. in. For high-grade concrete we may take 850 lb./sq. in. as the highest concrete bending compression. The factor of safety of 3·5 for both materials is a strange combination, because the one material does not bear relation with the other, and, for steel, it is out of all proportion. This factor of safety requires more steel or the use of a higher grade steel with a yield point not less than 50 000 lb./sq. in., as compared with $34\,000 \times 2{\cdot}5/3{\cdot}5 = 24\,300$ lb./sq. in. for a factor of safety of 2·5.* One difficulty to such high-grade steel is that it must be warmed before bending, which increases the cost, and is an objection from this viewpoint. Mild steel is bent cold and also has the facility of being stretched while cold.

The compressive strength of concrete may be taken at 2 600 lb./sq. in., based on testing in usual compressive cubes. This gives a factor of safety of $2\,600/750 = 3{\cdot}5$, but as reinforced concrete sustained to bending moments will show from 30 to 40% higher compressive strength, in a pole sustained to bending moments the factor of safety for the concrete will be much nearer $(3\,600 \times 1{\cdot}3)/750 = 4{\cdot}5$, which is the figure given by the writer on page 418 of the April 5th issue of this journal. Obviously, as concrete strength is more variable than strength of steel, a greater factor of safety for the concrete should always be stipulated.

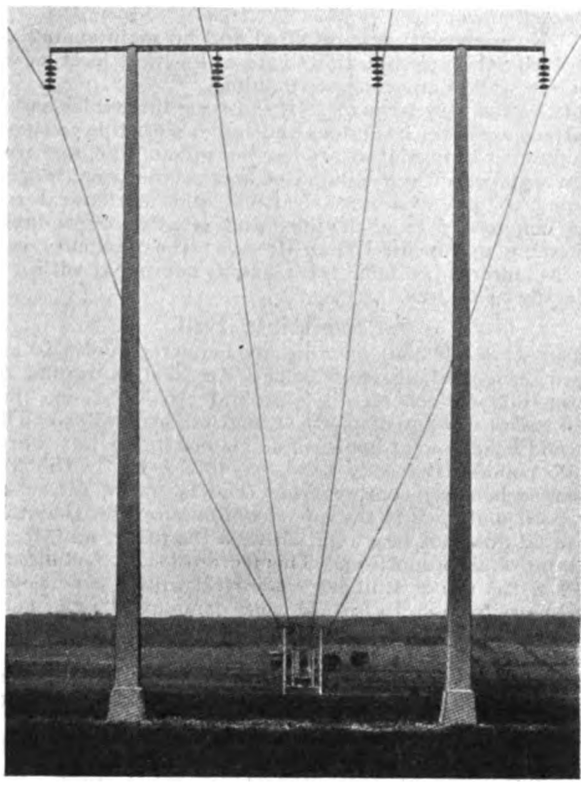
Taking the allowable bending compression at 750 lb./sq. in., there is just reason for assuming that the first minute cracks or hair-lines (although not visible to the naked eye) will appear when the pole (especially a hollow-type pole of ordinary shell-thickness) is subjected to a working stress no greater than, say, 50% of this value where the reinforcing steel has not previously been given a preliminary stretch; the hair lines will increase in number, and will also broaden and lengthen as the working stress is increased up to its full allowable value.

Many of the troubles attributed to improper curing or puddling or high water-content, have been nothing more than insufficient depth of steel covering, or, using a figure of reinforcement of the cross-section of the pole (especially a round or curved figure) where the steel tensions on individual rods vary widely, due to their positions within the figure, or, absence of a preliminary expansion of the steel reinforcing, or, no means available for making the steel assist the compression of the concrete *after* the latter has hardened. For a hollow-type pole in particular, the steel reinforcing rods should be given a preliminary expansion, just as is done with conductors during the process of stringing—for concrete poles of the hollow type this is particularly important. Thus, in this state, the steel is embedded in concrete and, during and after a sufficient hardening period for the concrete, the reinforcing rods endeavour to contract, but, owing to the adhesion of the concrete, the condition creates a compression of the

* No sound reason can now, or ever, be given for not taking the same *steel* factor of safety as for usual all-steel poles. In New Zealand and Australia they are justified in using a factor of 2·0 because among other reasons their designs are of *solid* construction throughout.

Digitized by Google

concrete throughout the whole pole and its sectional area. This compressive condition gives a much greater crack security than exists with all present makes and methods of working. The greatest security is obtained when the rods have received a preliminary straining at the time of casting the pole, and, when secured and held from possible contraction until the concrete is thorougly hardened. This creates in the concrete a very important additional compression strength, the magnitude of which varies with the chosen figure of reinforcement—the best type favouring the solid pole of rectangular and square outline.



Solid reinforced concrete pole for line of 120 000 V, carrying four 0·20 sq. in. conductors, including one spare 900 ft. span The height of the poles above the ground is 54 ft.

The total drawing capacity acting equally on *all* longitudinal rods should equal $T = e\,A_s$. During the time the concrete is thoroughly hardening, the steel rods endeavour to contract to their original length, but the surrounding concrete prevents this, and in this way compression in the concrete is caused. This results in a better concrete, also an excellently desirable state of equilibrium of steel and concrete. In practice we should seek to equate $e\,A_s = e^1 A_c$, the result of which we obtain an axial concrete compression in the whole cross-section, or $e^1 = e(A_s/A_c) = B\,e$, wherein, B is the figure of reinforcement of the cross-section of the pole. From this we see that there is created in the concrete a certain compression which is dependent on the figure of reinforcement B, as well as the preliminary steel expansion e, or/and ratio of steel to concrete.

About 440 lb./sq. in. can be reckoned as the preliminary expansion point of the steel. At below 440 lb./sq. in. concrete bending-tension, the first minute cracks appear, but are not visible to the eye. If a preliminary steel expansion is first given the steel, almost double the security can be secured against cracks; results can be achieved either by increasing the concrete mass or by decreasing the steel expansion, or vice versa. As the area of steel cannot be decreased for a given pole strength, the answers are obvious. A total preliminary steel expansion of 8 800 lb./sq. in. is approximately equal to a 5% steel reinforcement, that is 440/8 800 = 0·05; and a 5 700 lb./sq. in. preliminary steel expansion is approximately a 7·5% steel reinforcement, or 440/5 700 = 0·075. The lowest value of reinforcement, resulting from the elastic limit of the steel, is not far from 1·6%. As hair-line cracks are the real beginning of most of the damage or weakening and failures by exposure of the steel to air and moisture, it would appear most important and necessary to introduce preliminary expansion of the steel in the casting of every hollow-type pole, especially those of thin shell and curved outline, and in this way obtain from 50 to 100% greater security against *effectively permanent* hair-line cracks. When using unstretched steel in the hollow-round pole, an *excess* of concrete pressure can much more easily be borne by the reinforced-concrete than the *very smallest* excess lateral pull (or draw) which, through the minute loosening of the concrete texture, exposes the steel to air and moisture, causing failure or decreased strength or decreased life.

For a given diameter of pole, a solid figure will take greater bending moments than a similar-shaped hollow figure; a square will take greater bending moments than a hexagonal, and, so forth for the different forms and shapes and concrete mass-section of poles.

With respect to relative total costs, the most objectionable high costs (as already mentioned) are transport, haulage, handling and erecting—not the cost of casting concrete poles. It is not the relatively higher initial cost for the concrete pole that should be objectionable, it is the excessive annual expenditure for the relative wood or steel pole line. A good concrete-pole line should always be cheaper after a few years' operation than either wood or steel; the concrete-pole line has in its favour nearly all the advantages required for maximum annual economy and best operation. The arms, etc., for insulators are cast to any shape for greatest strength, lowest height of load application, best spacing of conductors, best earthing and/or bonding and, for *total absence of bird troubles*, etc. For the line construction mentioned on page 419 of April 5th, 1929, issue of THE ELECTRICIAN, the writer now presents the following as one reinforced-concrete pole line example of costs that permits of a reasonable margin of profit to the manufacturer and builder.

The heavier the line, the more favourable are the costs, reliability, flexibility, strengths, etc., to reinforced-concrete pole-line construction. In order to show as favourable a condition as possible to wood-pole construction, the smallest permissible size of conductor and the minimum number of circuits, are taken:

One three-phase, 11 000 V, 0·025 sq. in. copper line (giving relative costs per mile of complete line, assuming three changes of direction every two miles of line. Allowing 15% for insurance, depreciation, supervision, etc.; also allowing 5% capital-interest against annual expenses).

	First cost. £ s. d.	Annual expenses. £ s. d.
Wood-pole line	208 0 0	27 4 0
Steel-pole line	275 12 0	22 10 0
Reinforced-concrete-pole line ..	218 16 0	13 0 0

Hence:

	Wood-pole Line. £ s. d.	Steel-pole Line. £ s. d.	Reinforced-concrete-pole Line. £ s. d.
Cost of construction	208 0 0	275 12 0	218 16 0
Upkeep cost for 10 years	482 0 0	500 12 0	348 16 0
Upkeep cost for 20 years	756 0 0	725 12 0	478 16 0

Therefore, during 20 years the wood-pole line will have cost at least £277 more *per mile* than the reinforced-concrete pole line—this is more than the initial first cost of the reinforced concrete pole line. If we cancel out the annual expenses for the concrete construction, then we have a wood-pole and steel-pole line cost amounting to 3·1 *times* greater than reinforced-concrete pole-line construction.

If we really are looking into the future, and, if *the* responsible authorities are truly desirous of reducing the cost of electrical energy to rural consumers, then the time has arrived when much more consideration should be given to the composite safer and more reliable construction mentioned herein.

From the above-mentioned figures of costs—which are just and reasonable—the following facts are brought out:

(1) By building and operating the wood-pole line instead of the concrete-pole line, there is a saving of £10 16s. per mile of line in first cost for the former, *but*

(2) To make this saving, we must pay £14 10s. more per annum for maintaining the line 20 years, i.e., we must borrow money at 14·5% interest per annum for a period of 20 years to operate the wood-pole line.

(3) Considering four 11 000 V circuits aggregating 100 miles total length, each circuit capable of delivering 250 kW, or a total of 1 000 kW, then, annual saving of the concrete line over the wood-pole line is £1 450.

(4) By adopting the concrete-pole line the electricity undertaking would be able to deliver electrical energy for £1 9s. *cheaper* per kW than over the wood-pole line.

THE HIGH TENSION CONFERENCE IN PARIS.

Properties of Insulating Materials—Test Pressures for Transformers—An American View—Overhead Line Considerations—The Ageing of Oils—The Calculation and Construction of Lines.

By THEODORE RICH, A.M.I.E.E.

(*Continued from page* 750.)

TWO papers were presented on insulating materials. The first of these was by M. GROSSELIN, General Delegate of the Société Française des Electriciens, being the results of the labours of a committee formed in 1927 by the Conference to study solid insulating materials.

The report deals with two groups of materials: the first being fibro-cements, silico-calcareous materials and asbestos boards; and the second, moulded insulators based on synthetic resins. The materials of the former group always retain moisture unless impregnated. They have but a poor dielectric rigidity, but offer security in the neighbourhood of an arc of short duration. The materials of the latter group have become of great importance, especially for telephonic high and low tension work, being suitable for immersion in oils.

Desirable electrical test methods relate to transverse and superficial resistivity, the dielectric constant, breakdown tests, effective volts per min. thickness, and energy loss, phase angle tests, which tend to indicate the dielectric qualities of an insulator, due to what has been termed dielectric viscosity.

The mechanical tests are to determine resistance to traction, compression, bending and shock, with Brinnell tests for hardness.

The thermal qualities are of great importance. Materials should be measured at different temperatures with regard to their mechanical properties, deformation, and so on. Where an insulating material contains organic matter, however small the quantity, it will of necessity be combustible if not inflammable.

The chemical properties are studied by tests of solubility or attack by water, oils, acids and various bases; moisture-absorbing tests are often measured by resistivity.

A paper on research on insulating materials by H. BRUCKMAN, of the Delft Polytechnic College, deals with apparatus for the dielectric testing of compound, and on methods used for testing the adhesion of compound to the lead of sheaths or the metal walls of joint boxes.

Reports on Transformers.

A group of three papers on transformers was taken on the morning of June 8th with the assistance of Mr. S. AUSTIN STIGANT (of Messrs. Johnson and Phillips). The first, by PAUL GIRAULT, dealt with "Test Pressures for Transformers with Neutrals Earthed." It was pointed out that national regulations have existed for some time fixing dielectric test conditions from windings to the body and between turns where no point is connected to earth. These tests, for the sake of simplicity, assume certain possible eventualities without taking into account the particular constitution of the line and apparatus to be connected up, nor atmospheric conditions. The first tendency would be to deduce a new set of rules from the old ones. This gives rise to certain difficulties, a general proposition has to take into account various types of winding, star, delta or zig-zag on the h.t. or l.t. sides, separate single-phase transformers, with three cores, of the shell type or of the triple flux-return type, various arrangements of neutral connections and the direct or with resistances and reactances. The French "Union des Syndicat Rules" lay down a test for three-phase transformers when the h.t. is in star and the l.t. in mesh, of twice normal pressure plus 1 000 V. The author thinks the same rule should apply when the neutral is solid earthed as well as when it is not, especially as transformers have often to operate after accidents with one of the terminals to earth.

In America the view is being taken that attacks on transformers are mostly due to atmospheric phenomena; supply authorities have, however, in many cases strengthened up the insulation of their lines to the detriment of the transformers, the idea being to harmonise the installation as a whole, with the line terminals and transformer windings, taking account of the various insulators, gaseous, liquid and solid, and their relative resistance to over-tensions, and in order to reduce break-down inconveniences to localise flash-overs by a reduction of line insulation at some convenient point near the transformer station.

Mr. S. AUSTIN STIGANT presented a paper on "The Interturn Insulation of Transformers," being the outcome of investigations of the Transformer Technical Committee of the B.E.A.M.A. At one time many failures of end turn insulation used to take place owing to lightning, switching and arcing grounds; external auxiliary protective devices such as gaps, reactances and reinforced end turns were adopted, but while they helped matters they did not tend to stop interturn shorts between internal windings. Some operators tried to improve arrestors; others believed in improved insulation between turns. Most recent failures have been in the body of the winding. It has been customary to ask for reinforcement for 5% of the turns at one end or both, with reinforcement around tapping leads, the end turns to be graded so that while 1% of the turns have to stand full pressure, the next 4% can be arranged so that 5% of the total turns from the extreme end shall stand one-fifth of the total line pressure. A sudden change in insulation at any one point tends towards a weak spot. Researches tend to show that abnormal interturn insulation is unnecessary. The pressure drops across different winding points vary with transient wave shapes and the type and disposition of the windings. About 10% of the crest value of an impulse striking a terminal may be found between end turns; with static end rings this can be reduced to 3%.

Basis of Proposals.

With overhead lines the greatest pressure which can occur under impulse flash-over forms a basis for the proposals made. The maximum pressure possible on a system with an insulated neutral without arrestors is approximately six times the phase voltage. With the aid of curves showing the volts per turn with various waves in proportion to the transient voltage at the terminals, as limited by the line spill-over values, the maximum stress can be calculated per turn. It is considered that 10 seconds of test is sufficient with coils at 90 deg. C., stresses usually being short in duration. Curves are given of test pressures and insulation grading.

Many engineers believe that the output per transformer should influence the pressure tests to be used and certain correction factors are proposed with regard to this. The author thinks there should be minimum limits of output of transformers which can be conveniently reinforced as proposed; curves are given regarding this.

As high interturn pressures have been found at neutral points, reinforcement should also be made at such winding ends. Tables are given regarding the proposed proportioning and testing of interturn insulation.

CO-RELATION OF TRANSFORMER INSULATION AND LINE INSULATION. By H. S. Holbrook, transformer engineer of the B.T.-H. Co.—There are many anomalies regarding the ratio between the insulation to earth of transformers and that of the overhead lines to which they are connected. For example, several inquiries were recently received for transformers. One undertaking using lightning arrestors wanted a high test; the other was satisfied with a low test. It used no arrestors, and was proposing to adopt a high line insulation. In another case, where sea salt deposits were to be feared, 33 000 V insulators were adopted for a working pressure of 11 000 V, no protecting devices being adopted.

To get minimum capital expenditure with maximum economy, the insulation in all parts should be balanced; no one part should be too weak or too strong. Repairs are not easy on transmission lines, so operating companies, to give reliable service, use the maximum amount of insulation consistent with economics, especially reinforced in mountainous countries; the insulation of such lines therefore tends to form a basis for the whole, but an excess of insulation may prevent local flash-over relief; all transient voltages below flash-over strength will enter sub-stations and also windings unless protective steps are taken.

Cathode ray and klydonograph methods have enabled figures to be obtained. Switching surges form but a small proportion of those experienced. They are of comparatively low frequency with few stresses exceeding five times the normal. Lightning effects are very local. Two million volts

Digitized by Google

have been experienced. The steep waves do not travel very far, but the induced voltage is a function of the height of the line. Earthed overhead wires are an advantage in this respect.

A transient voltage may set up internal oscillations in the complex combination of inductance and capacitance that is

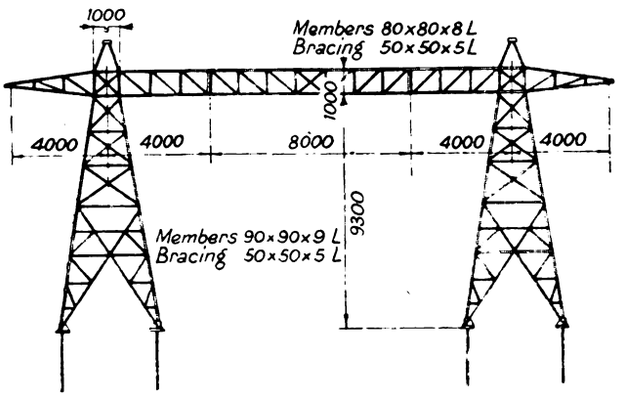

Fig. 1.

formed by a transformer winding; any resonance that might occur is quickly damped. Transformer insulation, paper, oil, and so on, stands up well for a short time. A line beyond the limit of half a mile from a transformer could be strengthened without risk. A 50-cycle basis of testing is found to be satisfactory, as the effect of different impulse wave forms is similar. It has the same effect on a line insulator, wet or dry.

Curves are given between line characteristics recommended to be used within half a mile of a transformer and the insulation of the latter. The breakdown of insulation is a cumulative effect. There is in transformers a lower limit up to which stresses can be applied indefinitely. The function of overvoltage protectors is to keep all stresses within this limit. Lightning arrestors are not designed. To avoid outdoor insulator trouble a spark-gap over transformer insulator bushings has been proposed. This practice may lead to dangerous shorts following flash-overs. A definite discharge gap at a convenient point within 100 ft. of the transformer is to be preferred.

In the discussion on the three papers, M. Marchand was of the opinion that the tests proposed in Mr. Stigant's paper were on the low side; tests with steep fronted waves were difficult to apply, although extra insulation of end turns could be overdone to the extent of weakening the winding mechanically. It was not sound practice to give relatively better insulation to large than to small transformers. A large transformer might mean a lot of capital out of duty, with disturbance of many customers, while if one small transformer broke down, probably all those of a similar type would give trouble.

Two Parallel Section Windings.

Another speaker recommended a winding wound in two sections in parallel, with the outward ends at or near earth potential and the h.t. side in the middle connecting loops being made between a number of points of equal potential through the walls of, and then inside, the core-insulating cylinder. Such an arrangement tended to act as a capacity bushing, thus damping out oscillations and giving good results.

M. Borgquist said that in Sweden lightning arrestors had been abandoned for the last 15 years, graded insulation being used. It was found to be worth while to go a little farther in the way of insulation than proposed by Mr. Stigant. A weak point was arranged on the accessible supports at sub-stations, Petersen coils being put in the transformer circuits. There was a tendency when a surge flowed into a sub-station for it to be reflected back radially over incoming lines. Mr. Holbrook said he recommended the use of sphere gaps at transformer stations as a final protection.

Now that various oils are used in such large quantities for transformer and switchgear filling, and for the insulation of paper cables, their properties are of great importance in the electrical world. In accordance with proposals made at the 1927 Conference, an international commission was set up to co-ordinate research, and a series of eight reports was presented. Messrs. Weiss and Salomon, of the École Supérieure de Pétrole of Strasburg, gave a general report on the researches made by members of the committee in different countries. These researches were divided into two sections; the first covered power factor as a measure of durability, the dielectric qualities and the electrical resistivity of oils; the second, the alteration of oils during service. Messrs. Weiss and Salomon at the Strasburg Petroleum Laboratory carried out tests to determine the alteration of oils. The oil is heated in a copper vessel at 115 deg. C. in the normal atmosphere, and the time taken to produce the first asphaltic deposit is noted, and the quantities deposited after extended times are taken and the results plotted.

Prof. Smouroff, of Russia, dealt with the ageing of oils. Mr. T. N. Riley, of the International Standard Electric Corporation, with the power factor of heated oils, and M. Masson, of the Est-Lumière Co., of Paris, pointed out the relation between resistivity, deterioration and water content, tests being made with an ingenious portable appliance, operating with a direct current from a Wilmshurst machine worked by hand. The effect of water with various fibres in suspension was investigated with the aid of a spark gap. Oils of various qualities, new or taken from transformer tanks, in most cases well shaken, after being subjected to heat at 50 to 60 deg. C. for four or six weeks or tested as received, were investigated. In some tests emulsions were used. Investigations showed the deleterious effect of the prolonged heating sometimes carried out to dry oil; Messrs. Weiss and Salomon thought that centrifuging, and not heating, should be used to separate out water, though the effect of the consequent aeration required study.

Research Results.

Mr. J. E. Cogle gave details of research carried out for the B.E.A.M.A., partly at University College and partly at the laboratories of the Metropolitan-Vickers Co. His investigations covered the effect of fibres from cotton or pressboard, dust, carbon, from arcing, of water alone, and of water with the above-mentioned impurities; also of gaseous matter, mainly air, and of acids and sludge formed in the oil by oxidation. The greatest deterioration takes place when both water and impurities are present.

Prof. Crustein gave a report on researches carried out at the Utrecht University to study dielectric losses, the variation of the dielectric constant with temperature, the electro-optical Kerr effect (the double refraction of a liquid in the electric field), sediments and oxidation.

M. Cassegrain, in a report on the testing of the electrostatic strength of transformer oils, gives details of his studies regarding the effect of the shape of electrodes, vertical or horizontal, points, discs or spheres, etc., the disc plus point arrangement in a horizontal plane giving the most

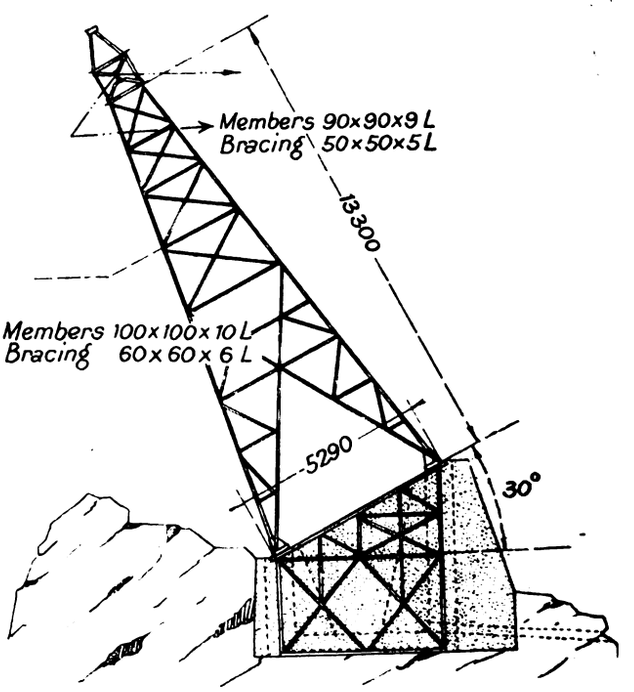

Fig. 2.

constant results. The disc or spherical electrodes give the best indications in the presence of wet fibres.

M. Pellissier communicated the results of researches made on the networks of the Société Alsacienne and of the Lorraine (Power) Company on the alteration of oils in transformers of 5-10 and 75 kVA after one and two years. His

Digitized by Google

researches show that the alteration in small transformers is much greater than that in those of largest size, the alteration in transformers intermittently used being greater than in those in continuous operation, whether loaded or not. During the work done at the Sharburn Laboratory it was noted that lead seems to have a deleterious effect on transformer oil, in one case lead was found in suspension in a colloidal state. Copper can affect oil injuriously.

In their consideration of the work of the committee, Messrs. Weiss and Salomon consider that the power factor researches should be continued, also those on resistivity, dielectric, rigidity and alteration of oils. With regard to this last matter, they think investigations are desirable regarding the following: Alterations of oil under load in open-air stations and in transformer tanks not in service, and also on the influence of materials used in transformers on the oil, the alteration of oil in switches, and the effect of frequent centrifuging.

The Discussion.

In the discussion of the group of papers Prof. WEISS said that insulating oils, when new and clean, were almost all good insulators, but they were almost all deteriorated by water, dust, fibres, etc. Their properties could be renewed for a time by filtration, but in time they become oxydised; and in respect of this property oils differ as greatly. The experiments of M. MOISSON showed that power factor tests were more reliable as a measure of quality than breakdown tests. Mr. RILEY said the rate of deposition of sludge was not uniform. The initial test of power factor was not always a good test of the quality of an oil. Changes in power factor took place with alteration of chemical composition. M. KRIEGER said that when dust was dry its effect was small. If the temperature was not above 60 deg. C. the carbon created by arcing could be filtered out.

M. ROTH said that up to 45-60 kV various oils stood up very well to switch rupturing strains, but their behaviour was different according to quality at much higher voltages. It was not convenient for operating companies to have to keep two kinds of oil, one for transformers and the other for switchgear.

M. TRAVERSE said that resistivity tests up to a point gave consistent results regarding quality which are sufficiently good for operators as cos φ tests could not be so well carried out by them.

Overhead Lines in the French Alps.

A group of seven papers on the calculation and construction of lines was discussed on June 10th. The first report concerned two long spans at 60 000 V of the Société des Forces Motrices du Vercours, by M. R. FAVIER. This company owns several water power stations in the Grenoble region of the French Alps, and also acts as an undertaking for the collection of hydraulic power and the forwarding of it in the direction of the Rhone and Saint Etienne.

For the construction of a trunk line (10 000 kW) in this district two very long spans had to be negotiated, one at La Balme and the other at Gour Martel, to enable a plateau 400 to 500 metres high to be negotiated. As normal types of aluminium, steel or bronze cables did not give sufficient strength, it was decided to make a special cable with a high proportion of steel to aluminium, with an elastic limit of 4 tons and ultimate strength of 7·1 tons.

The spans horizontally are 1 274 and 1 152 metres, the real distance between supports 1 330 and 1 200 metres, the difference between heights of supports 435 and 336 metres, and the distance of level between the valley floor and upper supports 435 and 520 metres respectively. A weight of 2·30 kg. of sleet per metre run of cable was allowed for at −10 deg. C. The supports were designed so that no permanent deformation would result from any combination of broken conductors.

There are four conductors, one of which serves as a reserve, being normally grounded. The type of cable used, made by the Société de Matériel Français of Grenoble, was given a practical test with a similar span at Valence when a long crossing was run into by an Italian aviator; the plane was cut in two and the cables broke, but the cable anchorages were not damaged and the supports were not twisted.

Figs. 1 and 2 show two of the supports. Details of the calculations are given in the paper. A light cableway was used during the construction. Since its installation, under operation for six months from the time when the report was prepared, the line stood up to frosts of 26 deg. C. and several tempests. The distance of 8 metres between conductors has not so far given rise to any difficulties.

(*To be continued.*)

BOOK REVIEW.

Electric Circuits. By O. G. C. DAHL. Vol. I. Short Circuit Calculations and Steady-State Theory. (London: McGraw-Hill Publishing Co.) Pp. x+390. 25s. net.

Of all the problems that beset the electrical engineer, those of networks, unbalanced circuits, and transmission lines, form a very large percentage. Many works have been written on specialised subjects, as such, yet attention to the circuit theory in general has been rather neglected. Now, however, that the various "grid" schemes are materialising for this country, there will come into being a whole host of electric circuit problems to which attention has hitherto not been directed.

In a few years there will be throughout the country a network comparable to some of the great American schemes. It will, therefore, be appreciated that considerable complexity can arise in the calculation of the capacities at a point in such a network, or the effects of unbalanced loading, and the power loss and interference due to harmonics, to say nothing of the problem of the long overhead transmission line itself.

For this reason it would seem that "Electric Circuits" has made a very opportune appearance, since it deals with problems of the above kind very fully.

Kennelly's "Equivalence of triangles and three-pointed stars," may be well-known, and also the extension to the polygon given by Mr. Rosen in his "New Network Theorem"; but whether this is so or not, it is treated again by Mr. Dahl in "Electric Circuits," well, and with effect, and some very useful worked examples are given in demonstration of the practical application.

This feature of tables, and worked examples, is developed to quite a large extent, and is by no means the least admirable point in the book.

The first chapter deals with the theory of short circuit currents, transients, and the transient reactance of synchronous machines. There are given some tables of decrement factors, from which can be read the number of times full load current that will result at specified times after the advent of short circuit; and these for different reactances.

To the treatment of the transmission line, Mr. Dahl has allotted two chapters. In the first, which covers the short line—up to 40 miles, allowance has been made for only two of the four parameters—resistance and inductance. These are taken as lumped impedances, either at each end of the line, in the middle, or both.

In the case of the long line, all four parameters are acknowledged, and calculations made accordingly.

These two chapters, together with one on harmonics, another on transmission line charts, and the last on the steady state problems, form a very comprehensive treatment of the transmission line question. Furthermore, it is interesting to note that the formulæ employed are applicable to a.c. and d.c. problems by substituting zero value for the frequency in the latter case.

A chapter is also included on synchronous machine charts, and in this, as well as in that for transmission line charts, the theory and calculation involved in the preparation of them, are fully treated.

This chapter is preceeded by one on general circuit constants, in which is clearly defined the relationship between voltage and current sending, and voltage and current receiving, both for networks generally, and transmission lines in particular. Special reference is made to the work of Evans and Sels, and a modified form of their chart is used to give the performance of lines and transformers. All charts and tables are worked out for a frequency of 60 cycles, which is a little unfortunate for British engineers.

The method of dealing with unbalanced circuits is that based on Fortescue's method of symmetrical co-ordinates, and it is extended by Mr. Dahl to include the unbalanced loading of transformers, and induction motors on unbalanced voltages.

The whole work is evidently to comprise two volumes, of which this, the first, deals with short-circuit currents and the steady state. Such a subject is more easily to be made complex than clear. This author has treated it lucidly, and with a sufficient brevity to include without occluding. The mathematics rise to the occasion yet do not go to the head, and one can only await the appearance of the second volume with interest. In this first volume there appears to be only one insignificant numerical error—on page 9.

I.E.E. SUMMER MEETING.

150 and 90 kV Transmission Lines—Motor Buses-de-Luxe—The Egeuzon Station—Electric Traction Facilities at the Largest Single Span Station in Europe.

(*Continued from page 755.*)

ON Sunday, June 16th, a cheery party left the Quay D'Orsay station for the south, in a special train provided free of cost by the administrations of the Orleans and Midi Railway Companies. The party was about 115 strong, made up of 100 from the Institution and a group of 15 belonging to the French hosts, the Société Française des Electriciens. Among the former may be mentioned Col. and Mrs. Edgcumbe, Mr. L. B. Atkinson (Past-President) and Mrs. Atkinson, Dr. C. C. Garrard and Mrs. Garrard, Mr. McMahon, Col. Cortez-Leigh, Mr. P. F. Rowell, the energetic secretary of the Institution, Mr. F. W. Crawber, Mr. Borlase Matthews, Mr. and Mrs. Hope Jones, and Mr. D. S. Munro. Among those from the Société Française des Electriciens were M. Bunet, the President, and Madame Bunet, and M. Grosselin.

A Train View.

The 90 kV twin transmission line from the south to Chevilly, outside Paris, keeps comparatively close to the railway after the plateau has been reached; the h.t. line loops in or branches into rotary convertor sub-stations arranged with outdoor transformers and switchgear, the busbars being supported by a lattice steel superstructure. The overhead equipment of the railway for 1 500 V d.c. operation is of a sound and solid character, rolled steel joints being used for the uprights in most cases; a third rail exists for a short distance outside Paris.

Soon after leaving Paris one noted distributing h.t. and l.t. overhead lines on both sides of the track, many of them being supported on concrete posts of very neat appearance, those made of grey Portland cement being perhaps more pleasing than others made of the quicker setting aluminous cements. Until the train was well into the Loire Valley one was rarely out of sight of a distribution line of some kind (usually three-phase 6 to 15 kV). The river Loire was crossed at Orleans, a very fine view being had of the Cathedral from the bridge. The river is very wide, and in the dry season has sandbanks, which, with the aid of electrically-driven grabs and cableways, form sources of supply of concrete for making large numbers of concrete fencing posts, power posts, and structures. The river at Orleans is not usually navigable, although it used to be so in the time of Joan of Arc, the cutting down of many forests in the Loire Valley since the middle ages having tended to aggravate the extremes in the dry and flood seasons. It is of interest, therefore, to note that in both France and Spain hydro-electric power authorities are taking a very friendly interest in re-afforestation as a means towards equalising the seasonal precipitation in water beds and the flow of rivers, thus making the construction and operation of water power installations an easier matter than otherwise. It was noted that many of the telegraph insulators alongside the railway are of green glass with steel cross-arms, and in a number of places alongside the line concrete bases were to be seen, some of them being of the split type. It can be realised that the cost of putting up a new post on a line with, say, 60 to 96 conductors is a more important item than the cost of the post itself; therefore by cutting off the post a little above the ground and putting in a concrete base, a post that has gone wrong below can in many cases have its life increased at a comparatively small cost. At present the trunk line from the south at 150 kV ends at Chainey, outside Orleans, where it is linked up with the twin 90 kV line that starts from Egeuzon and continues to Chevilly, near Paris, where it is linked up with the steam power stations of the outer Paris area. The 150 kV line, as a rule, is run cross-country farther away from the railway than the 90 kV, on account of the latter having to serve the rail-side convertor sub-stations which are placed 15 to 26 km. apart, the actual distance depending on the gradients and traffic density. At Orleans turbine-type synchronous condensers are used for voltage regulation along the 90 000 V distributing line, the condensers being connected up to the system by means of a third winding on the 150/90 kV interconnecting transformers. The rotary converters at sub-stations are operated in series pairs, each machine having 750 V across the terminals. Each pair has a capacity of 2 000 kW continuously, 3 000 kW for two hours and 6 000 kW for five minutes, while the pole pieces and slots are designed to minimise interference with railway circuits by a.c. ripples.

After lunch, the party disembarked at Egeuzon and boarded a number of country motor buses, which must have already made many journeys to market with chickens, ducks, bottles, and so on, the antics of one car during the putting in of the clutch ending in one electrical enthusiast being deposited on the floor! It was a merry party therefore that arrived at the Egeuzon station to admire the large amount of gear on view. The transformer station is divided into two sections, one for 150 kV and the other for 90 kV. The gear is placed out-of-doors, the busbars being supported by lattice steel structures. There is, however, a workshop with tackle, into which a phase transformer or switch can be taken for repairs. The phases are separated in the transformers and switchgear, directional h.f. circuits being used for inter-station communication. The sub-station lies on a hill above the dam, connection to the power station at the foot of the dam being made by underground cables at the generating pressure of 10 000 V. The dam is 61 metres (201 ft.) high and 355 metres long. The water is held up for several miles on the river Creuse, and there are five generators, each 10 000 kW. When the water is low, as it is at present, the reservoir is filled up and the load arranged so that a substantial daily peak can be taken. When there is an abundance of water the station can relieve the Paris end of the line, and further efforts are made so that only under exceptional conditions will water run to waste over the weirs, so that with the aid of observers up-stream the power available can be used to the best advantage. It must be remembered that once a dam and other headworks are installed, an increase in generating plant above that corresponding to the mean annual flow costs but little extra; reservoirs such as the one at Egeuzon are therefore of great value, even if they store water in quantities comparable in hours rather than weeks of water-turbine output, as their daily flow can be accumulated to a material extent to handle peaks; that is to say, to supply power at a time when it is most valuable.

The Backbone of the French "Grid."

There are three circuits to the south from Egeuzon, one at 150 kV and two at 90 kV. The former is switched in at peak loads, as at present there is no object in taking charging current. The power station at Coindre, farther to the south, is now completed and in operation, but as soon as further power stations on the flanks of the central plateau have been finished, there will be a much better transmission line load factor than there is to-day. The line from Paris to the south can be termed the backbone of the French grid system.

The party rejoined the railway at San Sebastian, dined on the train, and reached Bordeaux, via Toulouse, at dinner-time. Bordeaux is the north-western terminus of the Midi Railway, electric locomotives running from there to the Spanish frontier along the Bay of Biscay and inland to Toulouse.

The station of Bordeaux is the longest single-span station in Europe; the steam trains run in from the north and are coupled up to 1 500 V d.c. electric locomotives made by the Constructions Electrique de France at Tarbes. Bordeaux, the largest wine handling port in Europe, on the wide river Gironde, is a large city with some fine streets, and many dating back a century or more. The lighting is mainly by span wires, a number of concrete posts, ornamental and otherwise, being used in connection with both tramways and lighting. In the same way that surplus power from the central plateau flows towards Paris, so surplus from the Pyrenees flows towards Bordeaux, although electro-chemical works in the power generating area absorb a very material proportion of that power not wanted by the Midi Railway. On leaving Bordeaux the line runs for a long distance in the pine forests that cover the district of the Landes. Before the electrification many claims used to be made alleging that the steam locomotives had set light to the forests, and the money thus entailed was one of the reasons why the section was electrified. The Midi Railway is using special locomotives for very high speed traction from Bordeaux to Dax and Biarritz and the Spanish frontier; it is claimed that the express trains on this section are the fastest in Europe. The locomotives, which are of 2 250 H.P. (80 miles per hour), have twin vertical motors above each driving axle, with back-to-back bevel gear and spring connected quill

driving axles; the comparatively high centre of gravity thus obtained being an important feature with high speed running. The railway company has 140 electric locomotives in operation and a further 100 on order, with 29 auto-cars in operation and 15 on order.

The 150 kV Double Feeder Line.

For a long way to the south of Bordeaux the 150 kV double feeder line runs on each side of the railway, the distribution line for the supply of sub-stations being at 60 kV. There is a further line at 10 kV for the supply of stations, villages and small towns on the line of route.

The Pyrenees run from the shore at Hendaye to the shore at Port Bon on the Mediterannean, water power being available or awaiting development at intervals nearly the whole way. The western group of stations is in operation, namely, the Ossean Valley, Hourat, Miegebat, Artouste, with Soulom and Eget, in parallel valleys. With the exception of two small stations, the railway water power in the eastern area is in project. In connection with a group of stations above Hospitalet, near the frontier of Andorra, it is proposed to use down-the-valley flood-water to pump a smaller quantity of water into a high level lake for use during the dry season.

The party arrived at Pau at 4.30, one section visiting the old château of Henry of Navarre, while a party of engineering enthusiasts visited a railway sub-station equipped with six 400 kW Brown Boveri 6-phase rectifiers with step-down 3-phase transformers taken off a 60 000 V distributing line.

In the evening of the same day a dinner was given at the Hotel de France, at Pau, by the South-West Section of the Société Française des Electriciens, during which M. Grosselin, organiser of that society, was presented with a salver as a memento of the occasion.

On June 18th the party left in charabancs for the Ossean Valley, where the sub-station of Haut-de-Gan, feeding a section of the new Canfrane trans-Pyrenees line was visited. Like most of the stations on the Midi Railway, this station had 785–750 V rotary convertors running in series pairs to give 1 500 V d.c. on the line. Current is furnished by the Aspe-Valley Power Co. at 60 000 V. There are three 3-phase transformers feeding three pairs of convertors. The transformers are of the 3-phase type, with 6-phase l.t. windings 585 V, with 2½ and 5% up and down tappings and an auxiliary winding to give 32 kVA, which is used for station auxiliaries and for starting up the rotary convertors. The rotaries are fitted with centrifugal over-speed trip-out gear, designed for 375 kW nominal loading with 100% overload for two hours and 200% for five minutes. The commutators are fitted with zinc-cum-iron shields to minimise the effect of any flashovers, amortising bars are fitted to the poles. A special patented device, fitted to the rotaries, is an auxiliary transformer, the primary of which is in a d.c. series position with the armature, the secondary is across the commutating pole windings of the machine, and a sudden change, positive or negative, induces across the commutating pole winding a positive or negative temporary flow that aids or reduces the commutating pole flux. Extra-rapid 2 000 A circuit breakers are put on the d.c. side. The complete plant at the station was made by the Société Alsacienne de Constructions Mécanique, now incorporated with the French Thomson-Houston Company, under the name of the "Alsthom."

After visiting the sub-station the journey was continued to Hourat, near Laruns, the lowest of three stations in the valley of the Ossean, Miegebat and Artouste being two further stations up the valley. The turbines at Hourat, with about 700 ft. head, are of the Francis type; at the other two stations the heads are about 1 310 and 2 560 ft., Pelton turbines being installed. The generators are of the "English Electric" pattern made by the Constructions Electriques de France. Each hydraulic unit is of 10 000 H.P., each alternator is of 7 000 kW at Cos φ 0·878, running at 500 r.p.m.; the two lower stations each contain five units, and the upper one three. These three stations form the centre to a group of 16 stations which are worked in co-operation with the Union of Power Producers of the Western Pyrenees. The lowest station has a reservoir of 75 000 cu. metres capacity, the centre 125 000, and the top station is served by a lake with the aid of a pressure breaker, the inlet canals are 5·7, 7·65 and 8·5 kms. long respectively, all in tunnel. The valley wall tunnel system is very largely used in the Pyrenees. During construction a pathway is cut in the rocky valley walls or a series of cableways is constructed, and by means of electrically-driven air compressors and side headings the tunnel can be attacked every few hundred yards or so, the canal tunnel being placed well inside the rock, clear from risk of damage or troubles from snow or avalanches.

One might ask, why have three stations in one valley, one above the other? The answer is that if one were full the water coming down the lower side valleys would be lost, as it would join up below the head race; by having, therefore, three stations, water some way below the highest can be used. The top station has available several weeks' supply, but the lower stations about a day's supply, so that the despatcher for the co-operative system working at Lannemezan, and who is informed of the state of the reservoirs and streams at each of the 16 stations under his directional control, can arrange a sort of balance between the stations with no storage, those with a peak load storage, and those with weeks of storage. The chemical works buy power in various categories, as, for instance, those who want large quantities of power at any time of the year and who are supplied by arrangements in advance, and those who buy certain blocks at maybe a day's or an hour's notice, as convenient to the Co-operative Society. Power supplied on this last system is naturally the cheapest. By mutual co-operation on these lines the amount of water run to waste, even in flood-time, is reduced to a minimum, as those with reservoirs utilise the storage available, and naturally chemical people at such times accumulate stocks of manufactures to be completed, packed, and so on, when the rush time is over. It is owing to this co-operative system that economic use of seasonal water power becomes a possibility.

The local interconnecting lines are primarily at 60 000 V. On the trunk line there is a step-up transformer station, 60/150 kV, at Hourat, and one at Lannemezan, with step-down stations at Toulouse, Dax and Bordeaux.

Lunch was taken at Eau Bonnes, a thermal springs resort in the mountains, the wild pass of Aubusque was crossed, and the party stayed the night at Lourdes. During the season on many occasions the outline of the Basilica Church which stands above the celebrated grotto is lit up with electric lamps, part of the spire being illuminated by floodlighting; another interesting point is that on a hill outside the town there is a large cross of steelwork illuminated with electric lamps, the outline of which is visible at night from miles around.

On Wednesday, June 19th, the party left Lourdes in cars, and on the way to the electro-chemical works of the Tunis Phosphates Company, at Soulom, was photographed on the hill-side. (See page 793.)

At Soulom there is a power station put up by the Midi Railway Company taking water power at two different heads from two branching valleys. The station was originally designed to supply single-phase power to the railway and surplus power to neighbouring chemical works. The Tunis Phosphates Company, whose works are a few hundred yards from the railway power station, draws its current partly from this station and interlinked networks and partly from its own station up the Gavarnie Valley.

At Gavarnie.

After the visit to the chemical works the party proceeded to Gavarnie, a hollow in the mountains, which run to over 10,000 feet in height, with a reeking torrent running down the valley, and a small glacier up against a steep face of rock. After lunch the party returned down the valley and visited the Luz power station of the Gavarnie Valley Power Company. The head race sluices have automatically balanced overflow gear. The power station contains three units, each 11 000 kVA, wound for 10 000 V Cos φ 0·8 at 500 r.p.m. The generators are of the Grammont type, each being driven by a twin wheel 12 000 H.P. Pelton turbine made by Messrs. Neyrer, Beylier and Picard Pictet, of Grenoble. Each turbine wheel is of cast one-piece steel. There are two jets to each wheel, each jet being fitted with a needle valve. Besides the needle there is to each nozzle an annular jet divertor. In the event of a sudden throwing off of a material proportion of the load, in order to prevent a water-shock to the pipe line that works under a 280 metres (930 ft.) head, the divertor, which is actuated by the governor gear, throws part, or nearly the whole, of the jet off the cups of the Pelton wheel (depending on the load thrown off), and the needle valve slowly follows up, the radial divertor moving back the jet on to the cups again as the needle valve takes up the loading. The step-up transformers are of the 3-phase type, 10 000 to 66 000 V; the station being linked in with the West Pyrenees co-operative power undertaking. The complete power plant was designed by M. Bunet, the present President of the Société Française des Electricians, who accompanied the party.

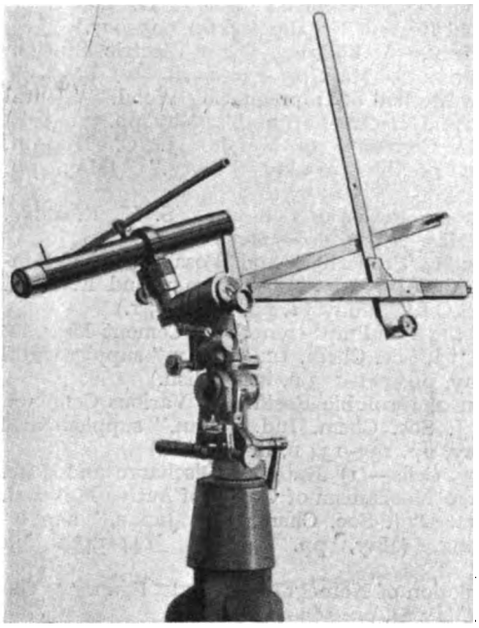
DETERMINING SAG IN OVERHEAD LINES.

An Instrument for Use in Long Span Transmission Line Engineering—Measuring the Separation of Crossing Lines.

THOSE engaged in erecting high-tension transmission lines on the long span system will be familiar with the difficulties encountered in adjusting the lines to a definite amount of sag, and in subsequently controlling the individual spans. Methods involving the use of sighting staves or single measuring staves (Vaupel, " E.T.Z.," 1923, No. 7), or even photography, are slow and troublesome, besides which they allow an undesirable element of error.



Illustrating the Küppers altimeter for use in the erection of overhead transmission lines.

The " Küppers" altimeter (patented in Germany), it is claimed, is easy to use and provides the means of rapidly ascertaining the amount of sag with accuracy. The distinguishing feature of the apparatus is a parallelogram device coupled with a telescope that is free to swing in any direction.

When stringing overhead wire with suspension insulators it is usual to pay out sufficient wire to cover several spans and to carry it over wheels placed at the ultimate suspension points on the cross-supports, so that the wire can balance itself uniformly through the several spans. A block and pulley worked from one end of the length of wire is used to regulate the amount of sag. The Küppers altimeter is erected at a conveniently accessible point, and its does not matter in the least whether the place chosen is in the middle or outside of the field of span. The distance selected should preferably be not less than about the height of the line supports. The plane of the parallelogram must be perpendicular to the plane of the span and the fulfilment of this condition is ensured by the familiar method of bringing down right angles. The sighting needle fitted to the instrument to facilitate rapid direction-finding will then be parallel with the wire.

The measuring apparatus is set truly perpendicular by means of a circular spirit level. The telescope is then used to sight first one of the suspension points, after which it is swung over to the second point; using the fine adjustment screws, the two points are made to coincide on the cross-web. The telescope will then describe a straight line between the two suspension points. In order to facilitate more rapid setting, the telescope is provided, as already stated, with a sighting needle by means of which the approximate connecting line can at once be set with the naked eye. There is a graduated scale which at once shows the angle of inclination between the line connecting the two suspension points and the horizontal. By tilting the telescope, the connecting line is brought down exactly parallel; the operator having next ascertained, by swinging to and fro, that the plane of the line of sight is identical with a plane tangent to the overhead line, only a small further calculation is needed.

The usual procedure is to set the measuring parallelogram so that the distance scale, which is graduated in millimetres, is pointed horizontally to a reference line, whilst the altitude scale, likewise divided in millimetres, is perpendicular to the former, this being achieved by pushing it up to a stop firmly attached to the instrument.

After setting the altitude scale to a proportional distance figure on the horizontal distance scale, the first reading can be taken as soon as the two suspension points appear in the cross-web. The second reading is provided by the tangential point. The difference between these two readings is then corrected by reference to a correction table provided, the adjustment varying according to the angle by which the line connecting the suspension points is inclined out of the horizontal.

Suppose, for instance, the line between the two suspension points has been found to be 12 deg. out of the horizontal, and the difference for sag 6·50 m, the exact amount of sag will be

$$F = \frac{6{\cdot}50}{\cos 12^\circ} = \frac{6{\cdot}50}{0{\cdot}978} = 6{\cdot}65 \text{ m.}$$

It will readily be appreciated that with this instrument any perpendicular heights occurring along the course of the transmission lines can be measured. For that purpose, the distance arm, which when measuring the sag is best set horizontal, is coupled to the telescope and pointed towards the foot of the height to be measured. The altitude scale is brought up against the stop in a manner similar to that previously described and is set to a proportionate distance figure. The summits having been sighted, the actual height can be read off on the altitude scale without any intermediate calculation. The same method can be used to determine the separation of transmission lines when they cross each other.

Supposing that the sag at a distance of C cm. from one point of suspension has been found to be f_c (cm) and that the length of the span, i.e., the distance between the suspension points is A cm., and that the weight of the cable in terms of 1 cm. of length and 1 sq. cm. of bearing section in kg. per cubic cm. is S. then the tensile stress of the cable, according to the well-known formula, will be :

$$p = \frac{S.c\ (a\text{-}c)}{2\ f_c} \text{ kg/cm}^2.$$

According to Vaupel, " E.T.Z.," 1923, No. 7, it is possible, when we know the tensile stress p and the atmospheric temperature t (°C.) to calculate for any cable by using this formula, the maximum tensile stress liable to arise under the most unfavourable conditions due to additional stress caused by wind or ice, p (kg. per sq. cm.) at a temperature of t_o (°C.). This sufficiently demonstrates the importance of subsequently determining the actual stress of the cable in relation to normal values based on the correct stress as prescribed.

This device has been patented by Mr. A. Küppers of Blankenburg-Harz, and is manufactured by Askania-Werke A.-G., of Berlin-Friedenau.

CONFERENCE BY TELEPHONE.

Meeting of the Verband Deutscher Elektrotechniker to be held in July.

THE annual meeting of the Verband Deutscher Elektrotechniker will be held at Aachen from July 7th to 9th, inclusive. A new departure will be the exchange, over the trunk telephone lines, of the speeches at the V.D.E. meeting at Aachen and those of electrotechnical associations which will be held simultaneously at the Hague (Holland), Vienna (Austria) and Budapest (Hungary), the distance between the most distant of these towns being 900 km. At the Aachen meeting, the president of the V.D.E., Dr. Ing.E.R. M. Krone, will make a report on the condition and development of electrical science and industry during the past year. Papers will be read by Dr. Ing.E.R. Frank and Dr. Ing.E.R. Rüdenberg on the " Linking-up of Networks," by Dr. Ing. Piloty on the " Effect of Interconnection upon Operation," and by Dr. Ing. Rogowski on " Kathode Oscillographs and Overhead Transmission," and numerous classified reports on electro-technical subjects will also be submitted.

I.M.E.A. CONVENTION PICTURES.

Many requests have been received from readers for copies of the photographs specially taken for THE ELECTRICIAN during the I.M.E.A. Convention, and published in our special Convention number of June 7th. To simplify the handling of such orders, readers desiring prints should write direct to the photographer, Mr. F. Parkin, 88, Kenwyn Road, Torquay.

Our attention has been drawn to the fact that in a picture on page 676 of the Convention Number Mr. J. Wetherell, borough electrical engineer of Leytonstone, was inadvertently referred to as Mr. H. H. Denton.

Digitized by Google

N.E. ENGLAND ELECTRICITY SCHEME.

Scheme for the North-East Coast—Large Rural and Industrial Areas Covered—No New Stations Anticipated—Names of Selected Stations—Route of Transmission Lines.

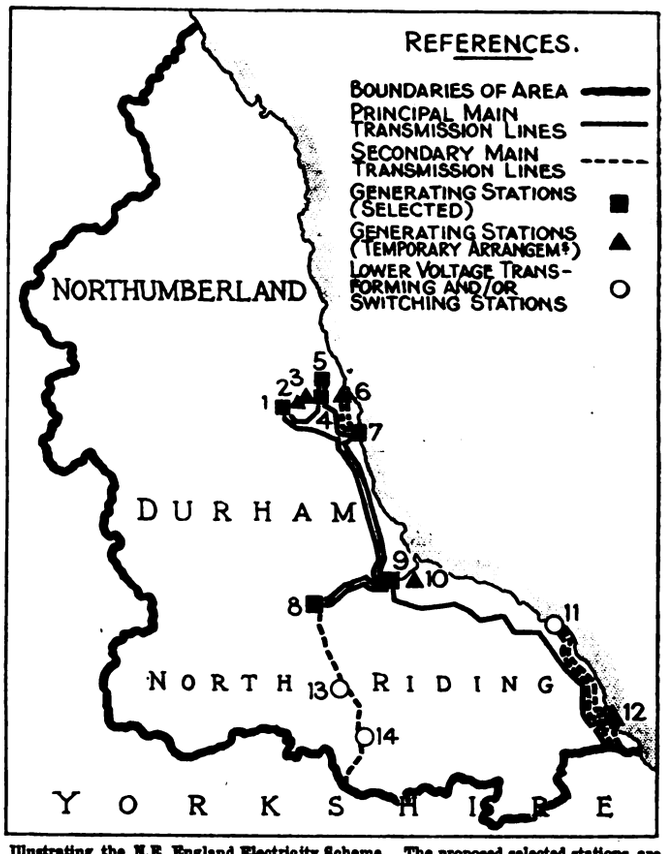
THE sixth of the schemes, submitted by the Electricity Commissioners to the Central Electricity Board in pursuance of section four of the Electricity (Supply) Act, 1926, covers the north east area and is called the North East England Electricity Scheme. The scheme is now being considered by the Central Board, which has, it will be remembered, already adopted five of the previous submissions of the Electricity Commissioners.

The area covered by the N.E. England Scheme deals with about 5 050 square miles, consisting of the administrative county of Durham; the county boroughs of Darlington, Gateshead, South Shields, Sunderland and West Hartlepool; the administrative county of Northumberland; the city and county borough of Newcastle-upon-Tyne; the county borough of Tynemouth; so much of the administrative county of the East Riding of Yorkshire as comprises:—the urban districts of Filey and Norton; the rural district of Norton; so much of the administrative county of the North Riding of Yorkshire as comprises:—the municipal boroughs of Redcar, Richmond, Scarborough and Thornaby-on-Tees; the urban districts of Eston, Guisborough, Hinderwell, Kirklington cum Upsland, Loftus, Malton, Northallerton, Pickering, Saltburn-by-the-Sea, Scalby, Skelton and Brotton and Whitby; the rural districts of Aysgarth, Bedale, Croft, Guisborough, Helmsley, Kirkby Moorside, Middlesbrough, Northallerton, Pickering, Reeth, Richmond, Scarborough, Startforth, Stokesley and Whitby; the parishes of Brandsby cum Stearsby, Crayke, Dalby with Skewsby and Thormanby and the townships of Angram Grange, Brafferton, Carlton Husthwaite, Coxwold, Helperby, Husthwaite, Newburgh, Oulston, Raskelf, Thornton on the Hill, Wildon Grange and Yearsley in the rural district of Easingwold, and so much of the township of Easingwold as lies to the north of the road from Huby to Tollerton; the rural district of Leyburn except the parish of Colsterdale; the townships of Amotherby, Appleton-le-Street, Aryholme and Howthorp, Barton-le-Street, Brawby, Broughton, Butterwick, Coneysthorpe, Fryton, Great Habton, Hildenly, Hovingham, Little Habton, Ryton, Scackleton, Slingsby, Southholme, Swinton and Wath in the rural district of Malton; the rural district of Thirsk except so much of the townships of Ellenthorpe, Kirby Hill, Langthorpe and Milby as lies within the circumference of a circle drawn with the south entrance door of St. James' Church in the township of Boroughbridge as centre and a radius of one and a half miles; the townships of Asenby, Baldersby, Cundall-with-Leckby, Dishforth and Rainton-with-Newby in the rural district of Wath; and the county borough of Middlesbrough.

The proposed selected stations for inclusion in the scheme are Carville A, Carville B, Dunston and North Tees (Newcastle-upon-Tyne Electric Supply Co., Ltd.); Darlington (Darlington Corporation); and Sunderland (Sunderland Corporation), making six altogether.

The suggested extensions and alterations of selected stations, are: (i) Carville A: an addition of 25 000 kW of three-phase 50-cycle generating plant and equivalent boiler plant for operation by the winter of 1932-33; a further addition of 25 000 kW and boiler plant for operation by 1934-35; and another addition of 25 000 kW of three-phase 50-cycle generating plant and equivalent boiler plant for operation by 1935-36; (ii) Carville B: an addition of 25 000 kW and boiler plant for operation by 1938-39; 25 000 kW of three-phase 50-cycle generating plant and equivalent boiler plant for operation by 1939-40; and a further addition of 25 000 kW and boiler plant for operation by 1940-41; (iii) Darlington: an addition of 25 000 kW of three-phase 50-cycle generating plant and equivalent boiler plant for operation by the winter of 1937-38; (iv) Dunston: an addition of 35 000 kW of three-phase 50-cycle generating plant and equivalent boiler plant for operation by the winter of 1936-37; further additions of 35 000 kW for operation by 1937-38; 50 000 kW for operation by 1938-39; 50 000 kW for operation by 1941-42; and 50 000 kW for operation by the winter of 1942-43; (v) North Tees: an addition of 25 000 kW of three-phase 50-cycle generating plant and equivalent boiler plant for operation by the winter of 1940-41; and a further 25 000 kW of generating and equivalent boiler plant for operation by 1942-43.

The principal main transmission lines for interconnection of selected stations with one another and with the systems of authorised undertakers or of the Board, are: (1) Extra high pressure overhead lines and/or underground mains; three-phase overhead lines designed for operation at 132 000 V between phases, and capable in each case of transmitting not less than 50 000 kW or (where such lines cannot reasonably be constructed) overhead lines or underground mains designed for operation at such voltages between phases as may subsequently be approved by the Electricity Commissioners, by the most convenient route in each case, from:—(1) Scarborough to Hull as far as the boundary of the area of the scheme; (2) Scarborough to North Tees; (3) North Tees to Carville A and B via or with connection to Sunderland; (4) North Tees to Carville A and B via or with connection to Dunston; and (5) North Tees to Darlington.



Illustrating the N.E. England Electricity Scheme. The proposed selected stations are (1) Carville A; (4) Carville B; (5) Dunston; (8) Darlington; and (9) North Tees. The temporary arrangement stations are (2) Close; (3) Manors; (6) South Shields; (10) Grangetown; and (12) Scarborough. The l.t. transforming and/or switching stations are (11) Whitby; (13) Northallerton; and (14) Thirsk. The principal main transmission lines, together with their secondary lines, are also indicated.

In connection with these main transmission lines, transforming stations are to be provided at such points as to the Board may seem convenient for the purposes of supply to or from the following places, each such station to comprise transformers having in aggregate a rating in kilo-volt amperes of not less than that specified unless otherwise determined:—Carville (60 000); Darlington (30 000); Dunston (60 000); North Tees (90 000); Scarborough (20 000); and Sunderland (35 000).

For interconnection between the system of the Board and the systems of authorised undertakers entitled to receive a supply or indirectly from the Board. Three-phase overhead transmission lines designed for operation at 33 000 V or other approved voltage between phases, or underground mains designed for operation at such voltages between phases as may be approved later by the Commissioners, are to be erected by the most convenient route in each case, from:—(1) Scarborough to Bridlington as far as the boundary of the area of the scheme; (2) Scarborough to Whitby; (3) Darlington to Boroughbridge via or with connection to Northallerton and Thirsk as far as the boundary of the area of the scheme; (4) Sunderland to South Shields; and (5) Dunston to Manors via or with connection to Close.

Transforming stations in connection with these secondary

Digitized by Google

main transmission lines, will be provided at points convenient for the purposes of supply to or from Close (30 000); Darlington (1 000); Manors (15 000); Northallerton (600); Scarborough (6 000); South Shields (8 000); Thirsk (1 000); and Whitby (2 000); the figures in each case representing kVA.

The existing frequency of 40 cycles per second employed in a number of undertakings and selected stations are to be amended or altered to a frequency of 50 cycles per second, the undertakers and stations affected being:—Amble U.D.C.; Annfield Plain U.D.C.; Auckland R.D.C.; Cleveland and Durham County Electric Power Co.; County of Durham Electric Power Supply Co.; County of Durham Electrical Power Distribution Co., Ltd.; Crook U.D.C.; Eston U.D.C.; Guisborough U.D.C.; Hexham and District Electric Supply Co., Ltd.; Houghton-le-Spring and District Electric Lighting Co., Ltd.; Middlesbrough Corporation; Newcastle and District Electric Lighting Co., Ltd.; Newcastle-upon-Tyne Corporation; Newcastle-upon-Tyne Electric Supply Co., Ltd.; Northern Counties Electricity Supply Co., Ltd.; Redcar Corporation; Richmond Corporation; Seaham Harbour U.D.C.; Skelton and Brotton U.D.C.; Stanley U.D.C.; Stockton-on-Tees Corporation; Tanfield U.D.C.; Tynemouth Corporation; and West Hartlepool Corporation.

The temporary arrangements for the scheme, include Carville A, Carville B, Dunston, and North Tees stations of the Newcastle-upon-Tyne Electric Supply Co., Ltd.; the Close station of the Newcastle and District Electric Lighting Co., Ltd.; Darlington (Darlington Corporation); Grangetown (Cleveland and Durham County Electric Power Co.); Manors (Newcastle-upon-Tyne Corporation); Scarborough (Scarborough Corporation); South Shields (South Shields Corporation); and Sunderland (Sunderland Corporation).

The accompanying map indicates the routes to be taken by the transmission lines and the position of the selected and temporary generating stations, and transformer stations.

The cost of the scheme to the Board for the erection of the transmission system is estimated at £1 131 467. In addition, there will be an expenditure by undertakers of about £775 000 on extensions of certain existing stations. It is estimated that the full advantages of the scheme can be secured with a saving of about £2 040 958 on capital expenditure (up to the year 1935/36).

The Commissioners have outlined a provisional plan of working the stations with the necessary estimates. These suggestions are, of course, tentative, since the working of the scheme, including the fixing of tariffs, is the responsibility of the Board, but taking the figures as they stand, it is interesting to note that the Commissioners estimate that in the five years 1931/36 there will be a saving to the undertakers in the area of about £382 173.

"LIGHT'S GOLDEN JUBILEE."

I.E.E. Correspondence in Connection with the American Celebration.

WE reproduce below the text of two letters, copies of which have been sent to us by the Secretary of the Institution of Electrical Engineers, in connection with the celebration of "Light's Golden Jubilee."

May 30th, 1929.

The Secretary,
U.S. National Illumination Committee,
DEAR SIR,

The representatives of this Institution on the British National Committee of the International Illumination Commission have drawn the attention of the Council of the Institution to the proposed celebration of the jubilee of the electric light, which is noted with great interest and satisfaction.

Your Committee will probably have observed that this Institution, on December 20th last, celebrated the jubilee of the making and public exhibition of the first carbon incandescent lamp by the late Sir Joseph Swan, whose name was subsequently associated with that of Mr. Edison in the Edison and Swan Electric Light Co., of Ponders End, near London.

The celebration on this side took the form of a lecture on the work of Swan, delivered by Mr. James Swinburne, F.R.S., one of our Past Presidents, at the Institution on December 20th last. The lecture was illustrated by a comprehensive exhibition of Swan's early lamps, including the original specimen which had been publicly exhibited at a lecture given by Swan at Newcastle-on-Tyne on December 18th, 1878. This lamp—a successful design of incandescent carbon vacuum lamp—is now preserved in the National Science Museum at South Kensington, London.

Actually it will be seen that the production of this lamp slightly ante-dated the independent invention of the incandescent carbon lamp by Mr. Edison and the fact that Swan's was the first practical incandescent lamp is one of which we in England have always been rather proud.

It would be a source of gratification to this Institution if your Committee would recognise the pioneer work of Sir Joseph Swan by associating his name in some way with the celebrations. You will observe that in Mr. Swinburne's address a tribute was paid to the pioneer work of Mr. Edison.

It gives us great satisfaction to associate ourselves with you in honouring the great name of Edison, whom we are proud to count among the Honorary Members of our Institution. As there is good reason to hope that your general invitation will result in celebrations of a world-wide character, a copy of this letter has been sent to the appropriate organisations in other countries, coupled with an expression of our good wishes for the success of any steps they may be able to take towards making the proposed celebrations effective and fruitful.

I am, dear Sir,
Yours faithfully,
(Sgd.) P. F. ROWELL.
Secretary.

The Secretary,
National Illumination Committee of.....

May 30th, 1929.

DEAR SIR,

The proposals for the world wide celebration of "Light's Golden Jubilee" have aroused much interest here and I am desired by my Council to enclose for your information a copy of a letter which has been addressed by this Institution to the Secretary of the National Illumination Committee of the United States as organisers of the celebrations.

As you are aware the International Illumination Commission will hold its triennial session in England in 1931, and this will be coupled with an important Illumination Congress.

All the illumination interests in this country are so much occupied with preparations for the congress that this Institution, which is strongly supporting the congress, feels that it would prejudice the success of these preparations if any extensive part were taken in further celebrations before that date. So far as this country is concerned it is felt that the cause of good lighting can best be served by concentrating our attention upon the forthcoming congress.

The Institution of Electrical Engineers has, however, every sympathy with the efforts that will be made this year to attract widespread public attention to the subject, and we heartily wish you success in any action which you may take towards making the forthcoming jubilee celebrations effective and fruitful.—I am, etc. P. F. ROWELL.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

"Light's Golden Jubilee."

[TO THE EDITOR.]

SIR,—If Mr. Frank C. Wells is sincere in his letter published in the issue of your journal of June 14th, then we must thank him for an enlightening revelation of the working of the American mind.

His statement that "Swan's lamp is an interesting historical fact, Edison's an ever-present reality," is effectively and completely disposed of by letters from, among others, Messrs. K. R. Swan and A. A. Campbell Swinton. It will be sufficient to remark here that if indeed Edison's lamp is an ever-present reality in America, it is quite time that some kindly-disposed person introduced our cousins to the gasfilled metal filament lamp.

Mr. Wells's chief point appears to be that a great public, which presumes to represent world opinion, clamours for a hero around whom they may cut their capers. The Chinese laundryman is familiar with the name of Edison, but is unaware that priority of invention of the incandescent electric lamp cannot be claimed by him or for him, so let Edison be the hero. This proves nothing except that the organisers of the "jubilee" are merely pandering to public opinion instead of educating it.—I am, etc. E. C. CHILDS.

Ilford, Essex. June 21st.

[A number of letters are unavoidably held over—ED.]

NEWS IN BRIEF.

Blackpool and Domestic Equipment—King's College Centenary—Tramways Conference—An Edison Stamp—Western Centre I.E.E.—Electrical Contractors at Coventry.

CLACTON U.D.C. requires an assistant electrical engineer at a commencing salary of £260 per annum.

A number of German municipal trade union officials are to visit the Stuart Street station of Manchester Corporation this week.

Lincoln City Council has decided that electricity for all purposes shall be installed in 12 houses being built in Geneva Avenue.

Fountains Hall, an old mansion near Ripon, is now lighted electrically, the energy being supplied by a generator driven by a water turbine in the old mill on the river Skell.

The new Burnley electricity showrooms in St. James' Street, have been opened.

An assistant engineer is required in Basingstoke Corporation's electricity department.

Electric lighting is to be adopted in St. Mary's Church, Hounslow, at an estimated cost of £150.

Among sanctions received by Blackpool Corporation is £8 000 for hiring-out apparatus in connection with the electricity undertaking.

The City Electrical Engineer of Liverpool has been authorised to invite tenders from selected firms for overhauling and repairing the Worthington cooling towers at the Lister Drive power station.

Members of the Cheltenham, Mid-Gloucestershire, Bristol and South Wales and Monmouthshire sections of the Electrical Association for Women visited Cardiff on Wednesday. The members inspected the General Electric Co.'s new showrooms, where Mr. W. F. Arnold delivered an illustrated lecture on "The Development of Artistic Electric Lighting Fittings." Luncheon and tea at the City Hall were also items in the day's entertainment. See page 800.

West Ham Corporation invites applications for the position of engineer and manager of its electricity undertaking.

A large number of members of the North Wales branch of the Electrical Association for Women on June 19th visited the generating station of the North Wales Power Co. at Dolgarrog.

The United States Government has issued a two-cent postage stamp inscribed "United States Postage, Edison's First Lamp, Electric Light's Golden Jubilee," to commemorate the golden jubilee of "Edison's invention of the incandescent lamp."

LOOKING BACKWARD.

FIFTY years ago it was recorded in THE ELECTRICIAN *of June 28th, 1879, that:*

Havre was experimenting with gas and electricity for harbour lighting.

The "Brooks" underground telegraph cable differed from all others in that the insulation for the line was paraffin oil, run into the iron pipe which contained the cable.

* * *

Twenty-five years ago, according to THE ELECTRICIAN *of July 1st, 1904:*

The preamble of the Electric Lighting (London) Bill was proved by a Select Committee of the House of Commons.

The City of Birmingham Tramways Co. trained their employees on their cars to deal expeditiously with breakages of electric wires, prizes being offered every three months.

* * *

Ten years ago THE ELECTRICIAN *of June 27th, 1919, announced that:*

For the first time since the outbreak of war the I.M.E.A. assumed, at its annual convention, some of the old aspects which made it a social as well as an engineering function.

The Cabinet had approved the recommendation of the Electricity Commissioners that an electrical engineer-in-chief to the Government be appointed.

Bradford Education Committee invites applications for the appointment of assistant lecturer in electrical engineering in the Technical College.

Viscountess Astor, M.P., has consented to serve as president of a branch of the Electrical Association of Women which is being organised at Plymouth.

A lady canvasser-demonstrator, with experience of cookers and other electrical apparatus, is required in the Preston electricity department.

Coventry Watch Committee recommends acceptance of a tender amounting to £570 for six additional sets of automatic traffic control signals of British manufacture.

Among workshops and factories at which arrangements have been made to receive scholars in connection with Accrington Rotary Club's Young Citizens' Week, is the Corporation's electric power station.

Bradford electricity department has received applications from a number of residents in the area of Clayton U.D.C. for electric cookers on hire. In view of the possibility of the early incorporation of Clayton in the city, the committee is willing to hire electric cookers to the U.D.C.

In connection with the Bournemouth Conference of the Electrical Contractors' Association, Messrs. W. T. Henley's Telegraph Works Co., Ltd., has issued an interesting booklet containing complete particulars of the arrangements for the Conference and also details of the electric lighting and power installations in the new Pavilion and on the giant Cunard liner "Aquitania."

The Duke and Duchess of York, the Duke of Connaught, the Archbishop of Canterbury and numerous delegates from other universities were present at the opening of the centenary celebrations of King's College, London, on Monday. The visitors inspected antique and modern electrical and other scientific instruments and witnessed various scientific demonstrations. The Duke of York claimed a sort of family association with the College's contributions to scientific discovery, as he believed the physics laboratory of the College was established through the gift of a collection of scientific instruments by Queen Victoria.

The annual conference of the Tramways and Light Railways Association will take place in Sheffield from July 3rd to 6th. There will be an informal reception on July 3rd and the delegates will be welcomed by the Chairman of the Sheffield and District Manufacturers' Reception Committee (Mr. P. B Brown). On July 4th the Lord Mayor of Sheffield will officially welcome the delegates, who will be entertained to dinner at the Royal Victoria Hotel by the Sheffield and District Manufacturers' Association. The proceedings will include a trip into Derbyshire, and a reception by the Lord Mayor and Lady Mayoress.

A trial of lighting effects on the façade of the new Underground Railway headquarters at St. James's Park, London, was made last week. Floodlights from the roof of the main building in the north block were turned on to the face of the central tower.

At the annual general meeting of the Western Centre of the Institution of Electrical Engineers, Mr. S. B. Haslam was elected chairman, Mr. W. A. Scott second vice-chairman, and Messrs. J. M. Bowman, R. Illingworth, T. E. Lewis, S. Thomas and A. M. Willis were added to the committee. Mr. C. T. Allan, 27, Newport Road, Cardiff, is hon. secretary.

About 150 members of the Western Section of the E.C.A. paid a visit to the works of the General Electric Co., Ltd., at Coventry on June 12th. The visitors were received by Sir William Noble, a director, and chairman of the Coventry Chamber of Commerce, and were entertained to luncheon in the pavilion on the works sports ground. They were subsequently conducted round the factory and shown the processes in the production of modern telephone and radio equipment.

At the meeting of the Physical Society at the Imperial College of Science, London, to-day (Friday), a demonstration of some contact devices used in an apparatus for the measurement of electrical resistance at high temperatures will be given by Dr. J. L. Haughton, and papers will be read on "The Relation Between Hydrogen Pressure and Filament Resistance in a Tube Containing Glowing Tungsten," by Dr. Teresa J. Dillon, and "The Absolute Measurement of Sound Intensity," by Mr. F. D. Smith. The Society has arranged a visit to Birmingham on July 6th.

BUSINESS ITEMS.

IT is understood that the equipment of each of the locomotives for the Great Indian Peninsular Railway, the contract for which the METROPOLITAN-VICKERS ELECTRICAL Co. recently received, includes an " Exide-Ironclad " battery of 24 cells, type LMV3, manufactured by the CHLORIDE ELECTRICAL STORAGE CO., LTD., at Clifton Junction, near Manchester.

THE General Electric Co., Ltd., has put into service a motor van equipped with a number of electric cookers and cooking appliances. This van will make a tour of the country; and appeared for the first time at Torquay during the I.M.E.A. Convention.

The four winning Bentley cars in Le Mans Race, 1929, were wired throughout with " Rubite " cables for ignition, lighting and starting. The insulation of these cables is similar in every respect to the " Rubite " cables made by the METROPOLITAN ELECTRIC CABLE AND CONSTRUCTION CO., LTD., Grove Road, Chadwell Heath, as used in collieries, railways, dye houses, bleach houses, etc., where uninterrupted service is essential.

The West Midlands Joint Electricity Authority has just placed an order with the BRITISH THOMSON-HOUSTON CO., LTD., Rugby, for the complete electrical generating plant required for the first section of the new base load power station being erected at Ironbridge on the river Severn. Included in the contract are a 50 000 kW (67 000 H.P.) turbo-alternator, three 21 000 kVA outdoor type transformers, 33 000 V switchgear, and the necessary auxiliary equipments. The turbo-alternator consists of a 50 000 kW maximum continuous rated two-cylinder double-flow steam turbine with direct coupled three-phase 11 000 V 80% power factor 50-cycle alternator provided with closed system air cooler. The turbine is designed for a steam pressure at the stop valve of 375 lb. per sq. in. gauge, 750 deg. F. total temperature; the condensing plant will be manufactured by HICK HARGREAVES AND CO., LTD., Bolton. Connected solid with the alternator are three single-phase oil-immersed self-cooled outdoor type transformers of B.T.H. manufacture arranged in delta on the primary side and in star on the secondary side, giving 33 000 V between phases. These transformers are claimed to be the largest self-cooled units ordered in this country for power station service. Cooling water for condensing plant will be taken from the Severn, a separate pump house being erected on the river bank for this purpose. DRYSDALE AND CO. will act as sub-contractors for this part of the contract. The main power station switchgear is of the remote electrically operated, duplicate busbar, oil-insulated, vertical plugging, metal-clad type, suitable for 33 000V and fitted with oil circuit breakers having a rupturing capacity of 1 500 000 kVA. The 62 500 kVA generator equipment and the two 75 000 kVA grid transformer equipments are provided with duplicate circuit breakers, and the two group feed equipments have single breakers. In addition, there are two sets of group feeder reactors. Auxiliary 33 000 V switchgear for two distribution feeders, two standby feeders and two works supply feeders, together with a bus coupler and two group feeder isolating equipments, are also included in this order. It is of the duplicate busbar, compound-filled, horizontal plugging, metal-clad type arranged for remote electrical operation. The oil circuit breakers have a rupturing capacity of 500 000 kVA at 33 000 V.

PERSONAL.

MR. S. E. Garcke has been elected a vice-President of the Institute of Transport.

Mr. H. F. Castle has been appointed electrical engineer and manager to Bridport Town Council.

Mr. J. L. Gunn, the new manager of the Aberdeen Corporation tramways, took up his duties on June 17th.

Mr. R. Lessing announces that he has changed his address to 94A, Horseferry Road, Westminster, London, S.W.1.

From a list of 65 applicants, Mr. E. T. Price, of Cardigan, has been appointed electrical engineer to the Newcastle Emlyn and District Electric Supply Co., Ltd.

We offer our congratulations to the Earl of Bective, chairman and joint managing director of the Bective Electrical Co., Ltd., on the birth of a daughter on June 20th.

Sir Andrew Duncan and Mr. Archibald Page, who have been making an extensive tour of the American and Canadian electricity undertakings, returned to England last week.

Amongst those presented to President Doumergue of the French Republic during the E.H.T. Conference in Paris, were Mr. J. R. Beard, Mr. P. V. Hunter and Mr. R. Borlase Matthews.

St. Helens Electricity Committee has appointed Mr. W. S. Johnston, manager of the Dumfries electricity works, as borough electrical engineer and manager, at a commencing salary of £800, rising in four years to £1 000.

In our notes on the result of the General Election, in our issue of June 7th, we stated that Sir Frederick Hall's majority at the 1924 election was 15 611. This was the number of votes polled by Sir Frederick Hall in 1924, his majority being 8 435.

On the occasion of his leaving Odhams Press, Ltd., to join Edison Storage Batteries, Ltd., as assistant manager, Mr. W. E. Warrilow was presented with a handsome cut glass vase and a silver salver bearing the signature of his colleagues in the advertisement department.

We are informed that Mr. F. E. Stevens has retired from the Stanley Engineering Co. owing to continued ill-health. The partnership which hitherto existed between Mr. H. Jay-Coward and Mr. Stevens has been dissolved. Mr. Jay-Coward will continue the business under the same name and style.

Major Basil Binyon has been appointed a director of the Marconi International Marine Communication Co., Ltd., and the following rearrangement of duties of its higher officials will be effective from July 1st: Mr. J. Lewis, personal assistant to Mr. F. S. Hayburn, deputy managing director; Messrs. A. R. Harding and R. Ferguson, joint general managers; Mr. J. A. Carswell, general manager for the North; Commander J. A. Slee, manager, marine electrical equipments; Mr. Wm. Platt, manager B.W.M.S. (vice Mr. R. Ferguson); Mr. J. Connell, deputy manager B.W.M.S.; Mr. B. Newton, contract manager (vice Mr. A. R. Harding).

Mr. J. Williams, technical assistant to the city electrical engineer, Salford, has been appointed technical assistant to the engineer, South-East England, Central Electricity Board. Mr. Williams was for many years on the staff of the Yorkshire Electric Power Co., where he held successively the positions of assistant engineer in the operation department and superintendent of the testing department. He was at one time with the English Electric Co. at Stafford and was formerly a college apprentice at Metropolitan-Vickers' works in Trafford Park. On the occasion of his departure from Salford, Mr. Romero, the city electrical engineer, on behalf of the staff, presented Mr. Williams with a sectional bookcase. A presentation of a " Kodak " camera was also made by Mr. Bunting on behalf of the members of Mr. Williams's department.

Obituary.

MR. HENRY JOHN SUTHERLAND MACKAY, on June 19th, aged 57 years. He was vice-President of the Batti-Wallahs' Society, and was managing director of the Stirling Boiler Co., Ltd. Mr. Mackay was born in Peebles, and attended the Hillhead High School; he was a graduate of Glasgow University, and continued his education at the Glasgow and West of Scotland Technical School. In 1889 he was apprenticed to Alec. Chaplin and Co., of Govan, subsequently gaining drawing office and engine shop experience with D. and W. Henderson. From 1894 to 1898 he served as marine engineer with MacClay and McIntyre, of Glasgow, the last two of those years as chief engineer. He was a member of the Institution of Mechanical Engineers, of the Institution of Marine Engineers, and was an associate member of the Institute of Naval Architects.

COUNTRY HOUSE LIGHTING.

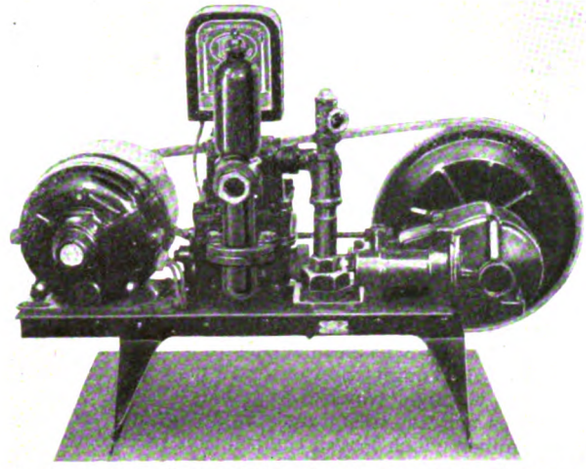
MESSRS. BLACKSTONE AND CO., LTD., of Stamford, and Aldwych House, Aldwych, London, W.C.2, manufacture home lighting and power plants in various sizes. The sets embody the Blackstone petrol engine direct coupled to the dynamo, mounted on a cast-iron base common to both. In all models, cooling is by thermo-syphon in conjunction with radiator and fan. The carburettor is fitted with a patented device, actuated by the governor, which regulates both quality and quantity of the mixture according to the load. The approximate petrol consumption varies between 1·44 pints per kWh for the 1 kW set and 1·1 pints per kWh for the 3½ kW set. We give below particulars of some representative Blackstone plants.

The 1 kW set is supplied to give either 50 or 100 V. The engine is rated at 2·5 B.H.P., and has a petrol tank with 1·25 gallons capacity, giving about 7 hours running. The lubricating oil consumption is 1 pint per 37 hours running. The 1½ kW plant is very similar in general characteristics. It is designed for 100 V only, and can produce 2 kW with full load on engine. The 2½ and 3½ kW sets have engines rated at 5 and 7 B.H.P., respectively, and will run for approximately 6 and 4·69 hours with one filling of the petrol tank. These Blackstone plants are not of the fully automatic type.

Storage batteries for use with Blackstone lighting plants are supplied for 25/37, 50/73 and 100/146 V. End-cell regulation is recommended. Iron-clad type switchboards fixed on the dynamos are sold as standard for the 1 kW and 1½ kW sets, while enamelled slate panel switchboards mounted on brackets for wall fixing are supplied with the larger engines. Simplicity is the keynote in the design of the switchboards, which contain a minimum amount of apparatus for controlling the dynamo and storage battery. When the engine is running at the correct speed, the starting switch is carried farther over and closes the charging circuit by bringing the cut-in into operation. Should the engine stop through any cause, the cut-in opens and prevents the battery discharging back through the dynamo.

When larger and more economical plants are required, Blackstone "Spring Injection" oil engine-driven generator sets are suggested. The inclusive cost of producing current with these plants is from ½d. to 1d. per kWh.

The Delco-Light Department of FRIGIDAIRE, LTD., Chapter Street, London, S.W.1, is ready to supply five different types of automatic water systems suitable for large or small country houses, farms and other purposes. Model 200 has a capacity of 166 gallons per hour, with a maximum suction lift of 22 ft. The motor is ⅙ H.P. Model 400 is of the same type, but has a capacity of 333 gallons per hour. The pump is of the double-action twin-cylinder type, driven by a ¼ H.P. motor by means of a "V" belt. This model is equipped with an automatic switch which allows any size or type of pressure tank to be installed in connection with it. Model 425 has the same characteristics as model 400, but includes a pressure tank of 20 gallons capacity. Model 202 differs from model 200 in that it is equipped with a pressure chamber of 1·66 gallons. The tanks permit automatic regulation and provide for



An example of the "Delco-Light" automatic pumps for country houses.

"direct pressure." Model 225 is similar to models 200 and 202, but has a pressure tank of 20 gallons capacity. This unit will supply water under pressure at two or more outlets at the same time. It is claimed to be "ideal" for home use.

The new service of trackless trolley vehicles between Maltby, Rotherham and Conisborough was commenced recently.

London County Council Highways Committee is to extend and reconstruct the tramway sub-stations at Limehouse, Tooting and New Cross, at a cost of £65 500. In each case three 1 000 kW rotary convertors are to be installed.—The committee is to obtain tenders for the supply of 150 modern type tramcars.

After inspecting the trackless trolley 'bus systems in Doncaster and Rotherham, Hull Tramway Committee has decided on a similar system for operation on existing petrol 'bus routes, and has asked the Manager to furnish a detailed estimate of cost per mile of construction and operation.

The construction of an oil-electric engine for hauling trains between Shildon and Middlesbrough, on the L. and N.E. Railway, has been commenced. A similar oil-electric locomotive is in experimental operation on the L.M. and S. system between Lytham and Blackpool.

THE first annual outing of the E.D.A. Circle, formed under the auspices of the Shropshire, Worcestershire, and Staffordshire Electric Power Co., was held recently, and approximately a hundred members—manufacturers and contractors and representatives of the company—spent a very pleasant day, the start being made from the central offices of the company. The journey was made in Midland "Red" motor coaches via Worcester, Evesham, Broadway, to Shipton-under-Wychwood, where a halt was made for lunch at the old Crown Inn. Following lunch and the customary toasts, the party left for an inspection of the high-power radio station at Leafield, where they were very cordially received by the engineer-in-charge, Mr. C. McDonald, and his assistants. After tea at the Cadina Café the party was conducted by Mr. G. A. King, a member of the Circle, round some of the places of interest in Oxford. Unfortunately, Mr. J. T. H. Legge, chief engineer and manager of the company, was detained in London, but he was ably represented by Mr. E. E. Hamar, commercial engineer of the company, and hon. secretary of the Circle. Mr. Hamar was assisted by Messrs. H. Roberts and G. A. King in the arrangements for the day.

E.T.B.I. COMPETITION.

Cable Route Problem—First List of Prizes and Donors.

AS announced in our last issue, the Electrical Trades' Benevolent Institution is to launch a competition with a view to increasing its funds. Tickets for the competition will be available as from July 1st, and at the time of going to press a list of 66 prizes has been prepared.

The competition is based on the following extract from the will of the eccentric uncle of a young electrical engineer :—

" To my nephew, John Harris, I give and bequeath the sum of Twenty Thousand Pounds, provided he can prove to my Executors that the money I have already expended on his education and in enabling him to qualify as an Electrical Engineer has not been wasted.

" He must, therefore, within 14 days of reading these words, have submitted to my Executors the exact mileage of cable he would require to lay a cable by the shortest possible route from the G.P.O., London, through the General Post Offices of the following towns and back again to the G.P.O., London."

Each of the competition entry forms contains clues to the 16 towns through which the cable will run. The towns themselves are not definitely stated, but are indicated in a novel manner which leaves the solution to the general knowledge of the competitor.

The entry forms are given free on receipt of a donation of 2s. 6d. towards the funds of the Institution.

The following is a list of the firms who have so far given prizes :—

Name of Firm.	Prize.
The A.E.G. Electric Co., Ltd. ..	Radio voltmeters (3); time switch; electric kettle; electric heating pad; rotating vector diagram slide rule for meter testing; one year's subscription to " A.E.G. Progress."
The Arctic Fuse and Electrical Manufacturing Co., Ltd. ..	Electro-velocity radials.
The Arora Co., Ltd.	Electric fire.
Belling and Lee, Ltd.	Set of insulated indicating terminals.
Benjamin Electric, Ltd.	" Benjamin " products to the value of £3 3s.
Berkeley and Young, Ltd. ..	10 in. desk and bracket electric fan.
Berry's Electric (1928), Ltd. ..	Electric coffee percolator.
The British Thomson-Houston Co., Ltd.	C2 horn-type loud speaker.
The Brownie Wireless Co., of Great Britain, Ltd.	No. 2 Brownie Crystal Receivers (2).
Burne-Jones and Co., Ltd. ..	" Magnum " wave-trap.
Cryselco, Ltd.	Electrical goods to the value of £3 3s.
Drake and Gorham Wholesale, Ltd.	" Inventum " 1½ gallons electric hot-water cistern.
J. Dyson and Co., Ltd.	" Godwinex " h.t. eliminator.
Mr. Justus Eck	Pewter rose bowl (presentation to the person disposing of the winning ticket).
The Edison Swan Electric Co., Ltd.	Electric radiator, electric iron, and electric toaster.
Ferranti, Ltd.	Valve tester.
The Formo (Arthur Preen) Co., Ltd.	Radio components to the value of £2 2s.
Mr. J. Fotheringham	Electric radiator.
The General Electric Co., Ltd. ..	Portable " Gecophone " screen-grid 4 wireless-set.
J. Gledson and Co.	Domestic electric iron.
Graham Amplion, Ltd.	Standard cabinet cone loud speaker (A.C. 25).
Graham Farish, Ltd.	" Graham Farish " coupler, complete with resistances.
Hart. Bros. Electrical Manufacturing Co., Ltd.	" Harbros " radio wiring specialities.
The Houghton-Butcher Co., Ltd.	" Ensign " folding all-distance camera, and " Ensign " tropical No. 12 camera in hide case, with f/4·5 Aldis-Butcher lens.
Messrs. Kunzle	1½ lb. box of " Art Dessert " chocolates.
Lectro Linx, Ltd.	Case of " Clix " specialities.
Marryat and Place	" Neon " sign for any name of 12 letters.
The Mentmore Manufacturing Co., Ltd.	Mottled " Spot " fountain pen and rolled gold " Spot " pencil.
The Mullard Wireless Service Co., Ltd.	" H " type loud speaker; " C " type loud speakers (2); high-tension units (2).
John Player and Sons, Ltd. ..	Casket of medium " Navy Cut " cigarettes.
Philips' Lamps, Ltd.	Loud speaker (2).
Premier Electric Heaters, Ltd. ..	" Smoothwell " electric iron; " Accident proof " electric kettle.
Rothman's, Ltd.	Greywood cabinet of " Pall Mall " Virginia cigarettes.
John Shaw and Sons, Wolverhampton, Ltd.	" Trojan " electric iron.
Siemens Electric Lamps and Supplies, Ltd.	" Xcel " nickel-plated safety kettle, " Cosyglo " electric coal fire.
L. G. Sloan, Ltd.	" Waterman's Ideal " fountain pens (6).
Stuart Turner, Ltd.	" Stuart " model dynamo.
" Swan " Pens (Mabie, Todd and Co., Ltd.)	" Swan " No. 4 self-filling fountain pen with rolled gold clip.
Tungsram Electric Lamp Works (Great Britain), Ltd.	Tungsram barium valves (2 sets).
Varley (Oliver Pell Control, Ltd.)..	" Varley " radio components.
Ward and Goldstone, Ltd. ..	" Goltone " radio products to the value of £3 3s.
Wingrove & Rogers (Polar), Ltd...	" Polar Claricone " loud speaker.

Buxted P.C. has adopted a resolution passed by a meeting of the parishioners in favour of taking steps to secure the revocation of the powers of the Uckfield Gas and Electricity Co. so far as they apply to the portion of the parish which is outside the area supplied by the Weald Electricity Supply Co., with a view to obtaining a supply from the latter company.

ELECTRICITY SUPPLY.

BEDFORD Electricity Committee is to seek sanction to borrow £10 000 for meters.

Clophill P.C. had adopted a proposal for obtaining a supply from Bedford Corporation.

St. Pancras (London) electricity department is to lay additional feeder mains at a cost of £11 480.

Winslow R.D.C. has approved of a scheme submitted by the Northampton Electric Power Co. for supplying Winslow.

Dewsbury T.C. has received sanction to a loan of £7 164 in connection with the new infirmary and district electricity scheme.

Middlesex County Education Committee has decided to adopt electric lighting in the North Road Council School, Southall.

Considerable opposition is being offered by the local authorities of villages in the Cleveland district to the proposed use of overhead lines.

The Cumberland Waste Heat Co., Ltd., has informed Bootle R.D.C. Council of its intention to apply for an Order to supply Seascale.

The offer of the Irish Free State Electricity Supply Board of £5 800 for the Dungarvan Electric Light Co.'s undertaking has been accepted.

Bradford Markets Committee has asked the City Electrical Engineer to obtain estimates of the cost of re-wiring and lighting Kirkgate Market.

Wolverhampton Electricity Committee is to carry its supply to the Oxbarn housing estate, Wrottesley Hall and the Children's Camp at Kingswood, at a cost of £6 864.

Holywood U.D.C. is applying to the Electricity Commissioners for Northern Ireland for sanction of a loan of £10 000 in connection with the Holywood electricity scheme.

Marple U.D.C. has sanctioned capital expenditure amounting to £38 100 for giving a supply of electricity in the township. This should be available for the early winter demand.

Southend Corporation has applied for loans of £66 000 for three 1 200 kW land type Diesel-driven generators, with accessories, and £6 645 for a 1 500 kW converting plant.

Chailey R.D.C. has decided to offer no objection to the use of overhead lines by the Central Sussex Electricity Co., Ltd., from Haywards Heath, through Newick and Chailey to Uckfield.

Featherstone U.D.C. has accepted new terms offered by Electrical Distribution of Yorkshire, Ltd., for public lighting, by means of 150 W lamps at £4 5s. each per annum, and 100 W lamps at £4 each.

Bangor (Co. Down) Corporation has received sanction from the Ministry of Commerce to the borrowing of £37 000 for its electricity scheme. It has been resolved that tenders be invited for carrying out the work.

Aberystwyth R.D.C. has approved a draft Special Order authorising the Electric Development and Securities Trust, Ltd., to supply electricity in the district. The Trust intends to extend the cables to Borth and Gow Street.

A supply of electricity, provided by Aylesbury Corporation for the village of Chinnor, was switched on recently by Mr. W. E. Benton. The supply is by means of overhead lines, and the charge for all domestic purposes is 1½d. per kWh.

Hastings Electricity Committee has obtained sanction to borrow £2 500 for services and £1 500 for transformers.—A supply to Staplecross Village and Cripps Corner is to be provided at a cost of £5 362.—The Electricity Committee has voted £4 000 for improving the front line lighting.

Godstone R.D.C. has decided to object to the use of overhead lines by the Sevenoaks and District Electricity Co. at Oxted, as, in the Council's opinion, there is no room in the highway for the purpose and overhead lines would destroy the amenities of the neighbourhood.

In connection with the application of the High Street Traders' Association for the outside lighting of business premises, Ealing Town Council has agreed to provide current for such lighting at 3d. per kWh, subject to current being consumed by each lantern for not less than 800 hours per annum.

Last week a supply from Lytham St. Annes to Warton and Freckleton was officially inaugurated. The three municipal authorities concerned in the electrical development of the Fylde area are Blackpool, Lytham St. Annes, and Preston. From the electricity works at St. Annes there is a 6 600 V line to the sub-station at Warton, where current is transformed to 240–420 V and then distributed to the various supply areas.

ELECTRICAL NEWS IN PICTURES.

A group of members of the Electrical Contractors Association of Scotland, taken before the annual golf match played between the East and West, at the Ferenze Golf Club, Barrhead. This year the West team were the victors, beating their opponents by a narrow margin. Further activities of the Scottish contractors are given on page 794.

Mr. H. J. S. Mackay, vice-President of the Batti-Wallahs' Society, whose death last week is referred to on page 790.

The ninth annual "Exide" Service Agents' Convention was held this year at the Royal Pavilion, Brighton, on June 11th and 12th. A civic welcome was accorded to them by the Mayor of Brighton, Alderman H. J. Galliers, whose firm are "Exide" service agents, in Brighton, Hove and Worthing. This photograph shows the Mayor speaking with Mr. D. P. Dunne and other officials of the Chloride Electrical Storage Co.

The next Selling Campaign window of the E.D.A. is, it will be remembered, designed to serve both July and August. The features, as will be seen from this reproduction, are small domestic appliances which tend to keep their users cool. The cubes are again introduced, together with the cut-out, the whole making a very pleasing display. The usual advertising and special literature are, of course, applicable to both months.

A group of I.E.E. members, and some of their French hosts, photographed outside Lourdes during the Summer Meeting. Both in Paris and the Pyrenees, the members of the Institution received welcome from every association connected with the French electrical industry. The Orleans and Midi Railway Companies provided special trains, while M. Bunet, President of the Société Francaise des Electriciens, made an ideal host. This year's meeting is voted one of the most successful, well over one hundred members and their friends attending. Further photographs will be found on page 783.

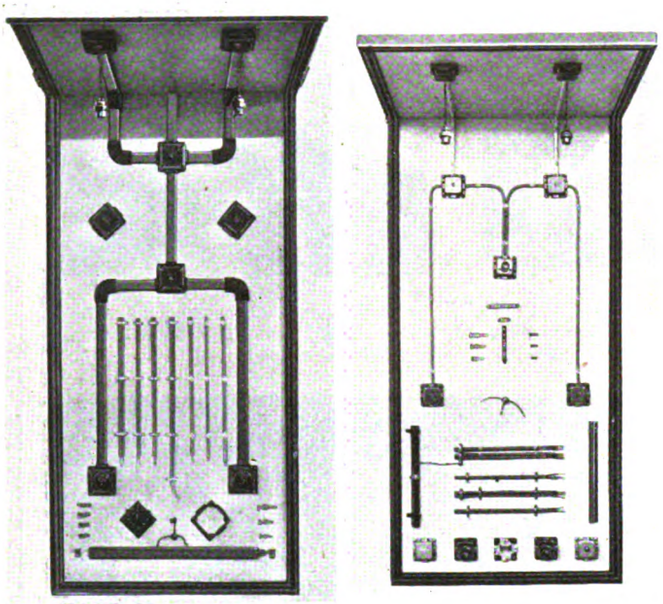
NEW WIRING SYSTEMS.

TWO new systems of wiring have been developed by the EDISON SWAN ELECTRIC CO., LTD., of 123, Queen Victoria Street, London, E.C.2, which warrant the attention of the trade.

The first system is unearthed for use with "Virite," and C.T.S. cables, and the second is an earthed system for use with metal sheathed cables.



Showing, on the left, the new "Ediswan" unearthed system of wiring, and, on the right, the earthed system for metal sheathed cables.

The unearthed system, a comprehensive illustration of which is given above, incorporates moulded bakelite boxes which are in three parts, the cover and base being common. A suitable intermediate piece is fitted to complete the required type of box, that is, 4-way, tee, 2-way (straight through), 1-way, and while there is no filing or chipping of the box necessary, there are no unused ways. All entries are fitted with extension pieces to shroud the ends of the wood channel, thus obviating the necessity for careful shaping or fitting of the latter, and each entry will take up to 3/·036 in. 3-core or 7/·036 in. twin, "Virite" or flat C.T.S. cable. Four connector pillars are moulded on to the base, these being of substantial design and cross drilled to facilitate wiring. Provision is also made for back entry. A special cover with a novel cord grip is provided to convert the box into a ceiling rose, the grip being a push fit into the cover. No screws are required, and the arrangement is suitable for twisted or circular flexible wires.

The channel is made in magnolia, and the fixing clips fit internally; the channel therefore butts close up to the wall leaving no space for dust to enter.

The clip fixing hole is elongated to allow of alignment after erection and ribs are provided in the base of the clip to give rigidity, and to prevent the head of the fixing screw coming into contact with the cable. The channel is suitable for all sizes up to 3/·036 in. 3-core or 7/·036 in. twin "Virite" or flat C.T.S. cable. Moulded corner pieces are provided to eliminate mitreing. At present only two types have been made, viz., surface and internal angle. The former allows for any necessary twist in the cable. Both types are made to shroud the ends of the wood channel, thus allowing the channel to be cut roughly.

For "Virite" cable the Edison Swan Electric Co. has made up a series of shaped saddles in tinned brass, which grip the cable at the junction between the cores and are an improvement on the standard saddle. For C.T.S. buckle clips are recommended and these are stocked in three sizes and are of special design. The base portion is indented, the indentations forming a rigid base for the cable and ensuring a good grip, while only one fixing screw is necessary even for the largest size.

The boxes for the earthed system, designed for metal sheathed cables, are obtainable in mild steel, tinned, or black bronze on copper plate, and are an improvement on the W.S. 1007/15 type. They have a larger capacity, are attractive, easy to erect, and have a positive visible bond. There are only two screws in the whole of the box, and all unused ways are closed. The bonding is automatic, is externally visible and is efficient when cables of varying diameters are employed. There is provision for back entry, the bonding device for both back and surface entry being common. Mild steel is employed for both cover and base. A cord grip and special cover is fitted for the ceiling rose box, a thin bakelite washer being inserted between the cord grip and the cover as additional protection.

In addition to the standard 1-way, 2-way and 3-way porcelain connectors, there is a new design somewhat similar to the Ramie one-piece porcelain, but an improvement on this connector in that the ends of the wire are gripped together by a conical spiral spring which makes its own thread on the conductor as it is screwed on. It is impossible to pull off the insulated cap and there is no fear of it becoming loose under normal conditions. A porcelain twister can also be supplied for giving an initial twist to the bunched ends of the conductors and also for tightening or loosening the insulated cap.

The new types of bonding strips are claimed to be more efficient than the old system, and have, in addition, a separate earthing terminal fitted to the two larger sizes. The indentations on the top plate provide a rigid contact surface, and a positive electrical contact. Each way will take two twin cables (up to 3/·036 in.), thus reducing the number of screws and the overall length.

The I.E.E. size of earth wire is 7/·029 in. and the earth terminal is designed for this.

Buckle clips are recommended for cable fixing, and these have already been described under the unearthed system. For damp situations and outdoor use, lead alloy saddles are recommended and sufficient sizes of these (semi-shaped) to cover normal requirements are available. Wood channel should be recommended for fixing lead covered cables where appearance is important. The earth clip is simple, the indentations ensure a firm grip on the pipe. The earth wire should be fitted between the shaped washer and the clip. The special shaped washer keeps the wire in position and there is no possibility of it becoming detached, as the second nut acts as a lock-nut.

SCOTTISH CONTRACTORS.

Annual Meeting of the Electrical Contractors' Association of Scotland—The Golf Match.

THE annual meeting of the Electrical Contractors' Association of Scotland was held in the Masonic Halls, West Regent Street, Glasgow, on June 12th, when there was a good turn-out of members from the various branches. The accounts of the association submitted showed the funds to be in a satisfactory state. The report of the Central Board dealt in detail with the various activities of the association, and the hope was expressed that before long a Fair Trading Agreement would be adjusted which would be acceptable to all branches of the industry. A year ago a Benevolent Fund was established within the association for the benefit of members and their families who were in distress. It was noted with satisfaction that all branches of the association had contributed to this fund and that already the fund had been found to be of considerable use. A satisfactory increase in the membership was reported during the year.

The following office-bearers were elected: President, Mr. J. Johnston Foggo, Edinburgh; Vice-President, Mr. D. H. Morris, of Lowdon Brothers and Co., Ltd., Dundee; Secretary, Mr. Walter Finlay, Edinburgh.

The Central Board representatives are: From Glasgow—Messrs. T. Rigg, D. Bennett, J. Allan, A. S. Nairn, H. Meighan, and R. A. Ure. From Edinburgh—Messrs. A. Pratt, R. E. Douglas, William Mackintosh and George Lyall. From Dundee—Messrs. J. Smith and R. Kilpatrick. From Aberdeen—Mr. J. L. Anderson.

After the annual meeting the members present were entertained to lunch by the Glasgow Branch in the Royal Hotel, and in the afternoon the usual golf match, East *v.* West, was held at the Fereneze golf course, Barrhead, the West team winning by the narrow margin of one match. All the members present much enjoyed the afternoon's outing.

A photograph showing a group of members taken before the golf match is reproduced on page 793.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, where available.

FELLING URBAN DISTRICT COUNCIL, June 28th.—Electric light wiring and fitting of the Council Offices. Particulars from Mr. C. W. Hall, surveyor, Council Buildings, Felling.

ST. THOMAS' CHURCH, HENBURY, June 28th.—Electrical installation. Specification from the Rev. H. A. Potbury, Henbury Vicarage.

ERITH URBAN DISTRICT COUNCIL, June 29th.—Electric light wiring of West Street Schools. Specifications can be seen at the Education Offices, Picardy, Belvedere.

NORTHERN IRELAND GOVERNMENT, July 1st.—Electric light installation at R.U.C. Barracks, Newcastle, Co. Down. Form of tender, etc., from the Barracks or from the Ministry of Finance, 15, Donegall Square West, Belfast.

Power Plant.

PORTRUSH URBAN DISTRICT COUNCIL, July 1st.—Supply and erection of an additional 260 B.H.P. cold starting oil engine, direct coupled to 140 kW dynamo balancer, with auxiliary motor driven air compressor, pipes, tanks, etc., and two-panel extension of switchboard. Specification, etc. (10s.) from the Clerk, Town Hall, Portrush.

SALISBURY CORPORATION, July 1st.—Electric light installation at new police station. Particulars from Mr. W. J. Goodwin, city engineer; deposit £2 2s.

WEYMOUTH AND MELCOMBE REGIS CORPORATION, July 1st.—Electric wiring and fitting at Maternity and Child Welfare Centre and Public Health Office. Specification can be seen at Borough Surveyor's Office, Weymouth.

WHITTLESEY GUARDIANS, July 1st.—Electric light installation at the Institution. Specification can be seen at the office of Mr. J. W. Bowker, clerk to the Guardians, Arnold's Lane, Whittlesey.

BELFAST CORPORATION, July 2nd.—Twelve sets of upholstered spring seats for tramcars. Tenders to the Town Clerk.

HOLYWOOD URBAN DISTRICT COUNCIL, July 2nd.—(1) Three-phase transformers; (2) l.t. underground and overhead mains, laying and erection; (3) l.t. switchboard, erected; (4) h.t. armour-clad switchgear, erected; (5) h.t. truck type switchgear, erected; (6) h.t. cable, laid and erected. Specifications from the Town Clerk, Town Hall, Holywood, co. Down; deposit £1 1s. per specification, or £2 2s. per set.

STAFFORDSHIRE EDUCATION COMMITTEE, July 2nd.—Electric light installation in Kingswinford Brockmoor Council School and in new buildings on the adjoining site. Specification, etc., from Messrs. Moffett, Rosher and Mann, consulting engineers, Union Chambers, Temple Row, Birmingham; deposit £5 5s. Only registered electrical contractors are invited to tender.

GLASGOW CORPORATION, July 3rd.—Electric lighting installation at Plantation Baths and Washhouses. Specifications, etc., from the Office of Public Works, 64, Cochrane Street, Glasgow.

STEPNEY (LONDON) GUARDIANS, July 4th.—Installation of two electric lifts at South Grove Lodge, and one electric lift at St. George-in-the-East Hospital, Raine Street, Old Gravel Lane. Specifications from the Clerk, Bancroft Road, Mile End, E.1; deposit £1 1s. for each.

BELFAST ASYLUM COMMITTEE, July 8th.—Supply and erection of electric lighting equipment for main avenues. Specifications, etc., from the Secretary, Mental Hospital, Saintfield Road, Belfast.

EDINBURGH CORPORATION, July 8th.—Automatic electric elevator, for Portobello power station. Specification (No. 101) from Mr. E. Seddon, engineer and manager, Electricity Department; deposit £1 1s.

LONDON COUNTY COUNCIL, July 8th.—Manufacture, supply and maintenance of (*a*) 150 electric tramcar bodies; (*b*) 150 sets of swing bolster bogie trucks; (*c*) 150 sets of electrical equipment for tramcars, with assembly of bodies, trucks, electrical equipment, etc., into complete tramcars; and (*d*) 150 sets of magnetic track and wheel brake equipments. Specifications, etc., from the Clerk, County Hall, Westminster Bridge, S.E.1; deposit £2 for each section, or £7 for the four.

RHONDDA URBAN DISTRICT COUNCIL, July 8th.—Three centrifugal pumps, with two electric motors and a crude oil or gas engine. Specification, etc., from the Engineer, Council Offices, Pentre, Rhondda.

SUNDERLAND CORPORATION, July 8th.—Manufacture and supply of 12 months' requirements of (*a*) paper insulated, lead sheathed cable, (*b*) rubber insulated wire, (*c*) consumers' meters, and (*d*) gasfilled and vacuum lamps. Specifications from the General Manager, Electricity Offices, Dunning Street, Sunderland; 10s. deposit for each section. Applications must state the classes of goods for which specifications are desired.

DUNDEE CORPORATION, July 10th.—Supply of seven panel, e.h.t., compound filled sub-station switchboard, for 6 600 V, three-phase, 50-cycle system. Specifications from Mr. D. H. Bishop, Electricity Supply Department, Dudhope Crescent Road, Dundee.

METROPOLITAN ASYLUMS BOARD, July 10th.—Supply and fixing of a wireless installation at Princess Mary's Hospital, Cliftonville, Margate. Specification, etc., from the Board's Office, Victoria Embankment, London, E.C.4; deposit £1.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, July 10th.—Supply and erection at Ironbridge power station of three boilers, each having normal rating of 225 000 lb. of steam per hour, with economisers, air heaters, fans, ironwork, pipework, coal pulverising plant, ash handling plant, etc. Specification (No. 3), etc., from Mr. E. F. Hetherington, chief engineer and manager, Phœnix Buildings, Dudley Road, Wolverhampton; deposit £2 2s.

CARLISLE CORPORATION, JULY 12th.—Supply and erection of switchgear for use in 11 000 V, three-phase, 50 cycle sub-station. Specification, etc., from Mr. C. W. Salt, city electrical engineer; deposit, £2 2s.

ILKLEY URBAN DISTRICT COUNCIL, July 12th.—Supply and erection of 11 000 V combined cubicle and truck type switchgear, transformer kiosk, 300 kVA and l.t. feeder gear; and 11 000 V feeder and l.t. distributors. Specifications from Mr. S. H. Fowles, Electricity Offices, Chantry Drive, Ilkley; deposit £1 1s. for each.

HULL CORPORATION, July 16th.—Installation of electric lift at Central Public Library. Specification from the City Architect, Guildhall, Hull.

CENTRAL ELECTRICITY BOARD, July 22nd.—Supply and erection of central indicators and telephones in connection with the Central Scotland Electricity Scheme. Specification (C.S.-S.S. 15) and form of tender from Mr. R. H. Fox, secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, July 27th.—Supply and erection of 132 000 V overhead transmission lines, in connection with the Mid-East England Electricity Scheme. Specification (No. M.E.E.-P.L. 1), etc., from Mr. R. H. Fox, secretary, Central Electricity Board, Trafalgar Buildings, Charing Cross, W.C.2; deposit £2 2s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

GRONINGEN MUNICIPALITY.—Supply of a second-hand 3 000 kW, 10 500 V turbo-alternator. (Reference B.X. 5 394.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, June 30th.—Supply of two 5-ton electrically-driven hoist blocks, complete with overhead conductors, and switches. (Reference A.X. 7 867.)

CHILEAN PORTS ADMINISTRATION, July 1st. (extension of time).—Four electric travelling cranes for Valparaiso and 12 for Anzani. (Reference A. 8 122.)

VICTORIA STATE ELECTRICITY COMMISSION, July 1st.—Supply and delivery of 44 000 V transformers. (Reference B.X. 5 293.)

MELBOURNE AND METROPOLITAN TRAMWAYS BOARD, July 3rd.—Supply of two electrically-driven rail grinding machines (contract 704). (Reference A.X. 8 097.)

NEW ZEALAND POSTS AND TELEGRAPHS, July 3rd.—Supply of black adhesive insulating tape. (Reference B.X. 5 378.)

Digitized by Google

TURKISH ADMINISTRATION OF RAILWAYS AND PORTS, July 4th.—Supply of electric wire and cables and general lighting accessories. (Reference B.X. 5 368.)

IXELLES COMMUNAL ADMINISTRATION, July 5th.—Supply of a.c. meters. (Reference B.X. 5 400.)

NEW ZEALAND POSTS AND TELEGRAPHS, July 6th.—Supply of v.i.r. wire (No. P. and T. 151/1 576). (Reference B.X. 5 411.)

NEW ZEALAND POSTS AND TELEGRAPHS, July 10th.—Supply of enamelled and cotton core, lead sheathed cable. (No. P. and T. 151/1 577). (Reference B.X. 5 413.)

INDIAN STORES DEPARTMENT, July 8th.—Supply of 30 kW oil-engine-driven generating set for Military Engineering Services, St. Thomas Mount, Madras. (Reference B.X. 5 364.)

LOURENCO MARQUES PORT AND RAILWAYS BOARD, July 8th.—Supply of two 5-ton electric portal cranes (Circular No. 60). (Reference A.X. 7 904.)

STATE ELECTRICITY WORKS, MONTEVIDEO, July 8th.—Construction and equipment of 50 000 kW power station.

NEW ZEALAND POSTS AND TELEGRAPHS, July 9th.—Supply of dial cords (No. P. and T. 151/1 557.) (Reference B.X. 5 412.)

POSTMASTER - GENERAL'S DEPARTMENT, MELBOURNE, July 9th.—Resistances and reactances. (Reference B.X. 5 281.)

NEW SOUTH WALES GOVERNMENT RAILWAYS, July 10th.—One 750 kW turbo-alternator; 2 200 V ironclad switchgear; two switch operating batteries; and two motor generator sets. Specifications from the Chief Electrical Engineer, 61, Hunter Street, Sydney.

PORT ELIZABETH MUNICIPALITY, July 11th.—Transformers, overhead line equipment, etc. (Reference B.X. 5 375.)

INDIA STORE DEPARTMENT, July 12th.—Supply of three continuous wave wireless transmitting sets (580 to 3 000 metres). Forms of tender (5s.) from the Director-General, Belvedere Road, London, S.E.1.

EGYPTIAN STATE RAILWAYS, July 13th.—Supply of underground, lead-covered, paper core telephone cables (approximate value £E.25 000.)

EGYPTIAN MINISTRY OF THE INTERIOR, July 15th.—Supply and erection at Mena power station of one Diesel engine driven a.c. generating set of 250 kVA. (Reference B.X. 5 331.)

VICTORIA ELECTRICITY COMMISSION, July 15th.—Two 750 kVA transformers and spares (No. 29/42). (Reference B.X. 5 325.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, July 16th.—Supply of 250 galvanised steel transmission line towers to carry copper conductors, or 190 towers to carry steel-core aluminium conductors. (Reference A.X. 7 735.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, July 23rd.—Telegraph instruments (schedule C. 436). (Reference B.X. 5 323.)

VICTORIAN RAILWAY COMMISSION, July 24th.—Electric overhead travelling cranes, spare motors, and down shop trolley wires (contract No. 42 672). (Reference A.X. 8 092.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, July 25th.—Supply of two 2-ton electrically-driven hoist blocks (tender No. 1 471). (Reference A.X. 8 072.)

Electric Crane.

SOUTH AFRICAN RAILWAYS AND HARBOURS, August 1st.—One 10-ton electrically-driven overhead travelling crane, for Maritzburg workshops (tender No. 1 487). (Reference A.X. 8 105.)

SOUTH AFRICAN POSTS AND TELEGRAPHS, August 1st.—Supply of telephone cable (tender No. 160). (Reference B.X. 5 345.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, August 6th.—Supply of 120-ton, four-motor, overhead travelling crane and runway (specification No. S.M. 358). (Reference A.X. 7 810.)

NEW ZEALAND POSTS AND TELEGRAPHS, August 7th.—Enamelled and silk-covered resistance wire (No. P. and T. 151/1 497). (Reference B.X. 5 322.)

SOUTH AFRICAN POSTS AND TELEGRAPHS, August 8th.—Telegraph material, including g.i. tubular side-arms, insulators, paper sleeves, insulator spindles, etc. (tender No. 161). (Reference A.X. 8 112.)

NEW SOUTH WALES PUBLIC WORKS DEPARTMENT, August 12th.—Supply and erection at Burrinjuck of auxiliary hydro-electric generating plant. (Reference B.X. 5 365.)

EGYPTIAN MINISTRY OF THE INTERIOR, August 13th.—Supply of electric power plant, with underground and overhead network, for the town of Maghagha, Minieh Province. (Reference B.X. 5 318.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, August 13th.—Water turbine driven generating sets and switchgear, for Waitaki power development (section 2). (Reference B.X. 5 278.)

PIETERSBURG (TRANSVAAL) MUNICIPALITY, August 13th.—Supply of h.t. and l.t. cable, lamps and sundries, in connection with extensions of the electricity undertaking. (Reference B.X. 5 312.)

PIETERSBURG (TRANSVAAL) MUNICIPALITY, August 13th.—Supply and erection of steam raising plant, engine, alternators, and switchgear (contract A). (Reference A.X. 7 983.)

EGYPTIAN MINISTRY OF THE INTERIOR, August 15th.—Supply and erection of additional Diesel engine and alternator at Zagazig power station. (Reference B.X. 5 393.)

CHILEAN STATE RAILWAYS, August 16th.—Material for overhead lines, underground cable and cable boxes (Group 41); and material for lighting of locomotives and carriages (Group 43). (Reference C. 3 069*.)

CHILEAN STATE RAILWAYS, August 16th.—Supply of instruments of staff or tablet type, for installation at 36 stations between Alameda and Talca, locking apparatus for switches, batteries and telephone combinations. (Specification C. 3 070*.)

AUCKLAND ELECTRIC POWER BOARD, August 19th.—Single-phase transformers. (Reference B.X. 5 324.)

NEW ZEALAND GOVERNMENT RAILWAYS, September 4th.—Supply of motor generator (specification 287). (Reference B.X. 5 308.)

VICTORIAN ELECTRICITY COMMISSION, September 30th.—Supply, erection and maintenance of coal conveying plant. Specification (No. 29/68) from the Agent-General, Victoria House, Strand, London, W.C.; deposit, £2 2s.

Tenders Accepted.

BLACKBURN CORPORATION.—British Insulated Cables Ltd., supply of 10 drums of l.t. cable, £1 289.

OLDHAM CORPORATION.—Hall and Stinson, electric light installation at 200 houses on Limeside estate.

WREXHAM CORPORATION.—Jones and Williams, electric light wiring of 6 houses at Hightown, £297 10s.

GLASGOW CORPORATION.—Bolckow, Vaughan and Co., Ltd., 2 000 tons of No. 8 B.B. steel tramway rails.

PRESTON CORPORATION.—English Electric Co., Ltd., supply and erection of 600 kW motor generator set at Ribble power station, £2 235.

CROYDON CORPORATION.—Purdie, Lumsden and Co., Ltd., erection of concrete cooling tower, £18 680; Aiton and Co., Ltd., pipework, £5 352. (Recommended.)

BRADFORD CORPORATION.—Metropolitan-Vickers Electrical Co., Ltd., supply of two 300 kVA indoor type rotary convertors; A. Reyrolle and Co., Ltd., supply of 6 600 V metal-clad switchgear, for Valley Road power station. (Both recommended.)

SOUTHEND-ON-SEA CORPORATION.—British Mannesman Tube Co., Ltd., 14 heavy traction poles, £168; Frederick Smith and Co., three miles of trolley wire, £364 7s. 4d.; Chloride Electrical Storage Co., Ltd., materials for repair of battery at Chalkwell Park, £992; John Le Boutillier, Ltd., pistons and cylinder heads for Diesel engines, £660.

DURHAM COUNTY EDUCATION COMMITTEE.—Electric lighting installations at schools:—Law and Burns, electrical laboratory at Jarrow Secondary School, £222 8s. 8d.; F. Reid, Ferens and Co., Ludworth New Council School, £101 19s.; Robson and Coleman, Ryton New Council School, £220; F. Reid, Ferens and Co., New Seaham New Council School, £262.

GRIMSBY CORPORATION.—Stothert and Pitt, supply of an electric capstan, £252; Johnson and Phillips, Ltd., erection of overhead transmission line to Louth, £5 477 16s.; Metropolitan Electric Cable and Construction Co., Ltd., £3 593 4s., supply of extra high pressure feeder cable and pilot cable, required in connection with completion of ring main between Old Clee and Tetney, £3 593 4s. (All recommended.)

DEVIZES RURAL DISTRICT COUNCIL.—Edwards and Armstrong, Ltd., electric light installation at 42 houses: £212 17s. Also tendered: A. R. Fox, £197 5s.; Tower Electrical Supply Stores, £203; H. Rossiter and Co., £214 11s.; James Bros., £219; W. Drysdale, £227; Harden and Chinnery, £231 11s. 6d.; Ramsay and Sons, £232 13s. 6d.; David Henderson, £240 6s. 9d.; Thos. Humphries, £260 15s.; Cross Bros., £261; H. H. Burrows, £276 18s. 6d.; J. W. E. Simpson, £294 1s.; Webb and Rogers, £300; V. H. Dipple, £320 10s.; F. Wadman, £420; Marsh and Yeomans, £480 3s. 5d.

LONDON COUNTY COUNCIL.—Alpha Manufacturing and Electrical Co., Ltd., electrical work at extension of Hammersmith School of Arts and Crafts and Hammersmith Building Trades School, £1 585. Also tendered: Smethurst and Co., Ltd., £1 660; Stegman and Co., £1 695; H. J. Cash and Co.,

Siemens Bros. and Co., Ltd., one 0·25 sq. in. 4-core T box, £4 ; six 0·15 sq. in. 4-core T boxes, £24 ; two 0·15 sq. in. 3-wire T boxes, £10 ; one 0·15 sq. in. 3-wire, 4-way box, £6 ; one 7-way pillar for 0·25 sq. in. 4-core cables, £46 ; one 7-way pillar for 0·15 and 0·06 4-core cables, £40 ; one 4-way pillar for 0·25 sq. in. 4-core cables, £31 ; two 3-way pillars for 0·15 sq. in. single cables, £41. General Electric Co., Ltd., h.t. cubicle, £283, and l.t. board, £220. Hackbridge Electric Construction Co., Ltd. 300 kVA transformer, £215. (All recommended.)

BENN BROTHERS' ANNUAL OUTING.

ON Saturday, June 15th, the staffs, including the country representatives, of Benn Brothers, Ltd. (proprietors of THE ELECTRICIAN and numerous trade journals and annuals) and Ernest Benn, Ltd. (the associated company engaged in the production and publication of books) had their annual outing. The party, numbering nearly 250, travelled by special train to Eastbourne, were favoured with fine weather, and spent a very enjoyable day. Luncheon and tea were served in a most satisfactory manner at the Assembly Rooms, Saffrons Road. Sir Ernest J. P. Benn, who was accompanied by Lady Benn, said he regarded it as an enormous privilege to be allowed to preside over that great "fellowship of work" at Bouverie House. He believed that the firm had founded a concern that would last, and which would become a good and permanent part of the life of society. This was the firm's 49th year, and he wanted all the members of the staff to think out suggestions for celebrating its jubilee next year.

THE SOCIAL SIDE.

THE staff of Siemens Lamp Works, Preston, held an 18 holes Medal Play Competition on June 1st, on the links of the Dick Kerr Club at Ashton Park. The competition was for the "Dr. Wright Prize," and the successful competitors were S. Facer, 75 ; W. Higginson, 77 ; and J. W. Lawrence, 82.

The staff and employees of Christy Bros. and Co., electrical engineers, Chelmsford, had an outing on June 15th when they visited Bristol. At Paddington they were joined by the employees from St. Neots, and the party was accompanied by the governing directors, Mr. Frank Christy and Mr. L. F. Christy. Luncheon was served at Cheddar, and was presided over by Mr. Frank Christy, who said that the firm had been in business 45 years, and this was the first time everyone had been brought together at an outing.

On Saturday, June 15th, the seventeenth annual athletic sports organised by the employees of Metropolitan-Vickers Electrical Co., Ltd., took place at Belle Vue Gardens, Manchester. The cycling events were competed for on the Salford Football Ground on the previous Wednesday evening, as there is now no cycle track on the Belle Vue ground. While these last-named events were highly competitive and very interesting, there were not many spectators owing to heavy rain in the early part of the evening.

The annual sports meeting of the Hackbridge Construction Co., Ltd., and its sister company the Hewittic Electric Co., Ltd., were held on the sports ground adjoining the works at Hersham, on June 22nd. Twenty-eight events were scheduled, including members', open and children's events. In spite of the rather showery weather, all the events went off to time, Mr. A. Taylor winning the challenge cup in the men's and Miss P. Nightingale in the ladies' events. It was largely through the efforts of Mr. Taylor that the drawing office won the Inter-departmental Challenge Shield. Mrs. W. W. Hughes presented the prizes and the response to Mr. T. F. Lister's (general manager) request for cheers shows that the wife of the chairman of the Hackbridge Construction Co., Ltd., is not unknown to the staff. Mr. W. W. Hughes thanked the members and friends on behalf of his wife and left them to enjoy at leisure the excellent side shows provided in the fair ground adjoining. The Addlestone Military Band gave an excellent musical programme.

ELECTRICAL SPORTS.

A NUMBER of electrical sports have been held this month, and the two top pictures show (left) the ladies' obstacle race, and (right) the tug-o'-war at the Charlton ground of Siemens Brothers and Co., Ltd., on June 15th. The bottom pictures are snapshots taken at the sports of the Metropolitan-Vickers Electrical Co., Ltd., on the same day. The push ball match was played by the apprentices, "Home" v. "Overseas." The latter team were dressed as Maoris (see right-hand picture), and the "Home" team wore "costumes" of special M.-V. design.

COMPANY NEWS.

Quiet Market in Electrical Securities—German Television Developments—Marconi One-Pound Shares—General Electric Co.'s Report—Conversion of Hastings Tramways to Railless System Completed—New Companies.

THE market in electrical stocks and shares this week has been steady, and there are few changes to record. In the electricity supply section, County of London ordinary rose 1s. and Yorks Electric Power ordinary 6d. British Electric Traction preference rose from 127½ to 130½, doubtless as a result of the excellent report submitted at the recent meeting, but there was little movement in other traction securities. British Insulated ordinary have risen from 71s. 10½d. to 77s. 6d. Callender's ordinary from 75s. to 77s. 6d., Henley's, from 130s. to 132s. 6d., and Siemens Bros. and Co. from 31s. 3d. to 37s. 1½d. Marconi's ordinary declined from 77s. 6d. to 75s. 9d.

CORK ELECTRIC SUPPLY CO., LTD.—Intm. div. of 5% has been declared.

WORCESTER ELECTRIC TRACTION CO., LTD.—Div. at rate of 5% for year has bn. declared.

MIRRLEES, BICKERTON AND DAY, LTD.—Nett pft. for year ended March 31st, 1929, £31 895, agst. £20 162. Div. of 7% less tax, recommended on ord. shs. for year, agst. 6%. Fwd. £8 504, agst. £5 829.

COOKHAM AND DISTRICT ELECTRICITY CORPORATION, LTD.—Rev. for 1928, £7 553, agst. £6 607. To depreciatn. res., £1 250; written off cost of changing over to bulk supply, £1 000. Div. on ord. shs., 4%.

W. T. HENLEY'S TELEGRAPH WORKS CO., LTD.—Fin. div. on ord. shs. of 2s. 6d. p.sh., less tax, makg. w. intm. div. of 1s. 6d. p. sh. paid on Dec. 1, 1928, 4s. per sh. for year, and cash bonus of 2s. p. sh., less tax, will be payable on July 13.

CHADBURN'S (SHIP) TELEGRAPH CO., LTD.—Gross pft. for year ended March, 1929, £20 805, agst. £18 301. Divs. at rate of 6% p.a. on pref. shs., less tax, for half years ended Sept., 1925, and March, 1926, will be paid on July 1st. Fwd., £1 421.

NEW GERMAN TELEVISION CO.—It is stated that, at the request of the German Government, a company has been formed comprising the Baird Television, Robert Bosch, Zeiss, Ikon and Loewe Radio interests. Loewe Radio is a well-known company in the radio manufacturing industry.

GREENWOOD AND BATLEY, LTD.—Blce. to credit of pft. and loss acct. for year ended March 31, 1929, £28 385, to wh. is added blce. brt. in from previous year, £13 459. To depreciatn., £6 000; intm. divs. paid to Dec., 1928, pref. 3½% and ord. 2½%, absorbed £12 224. Fin. divs., pref. 3½% and ord. 2½%, also require £12 224. Fwd. £11 396.

MARCONI £1 SHARES.—The committee representing the £1 ord. shhldrs. announces that it has come to the conclusion that it is not justified in proceeding with the formation of an investment co. to which hldrs. of £1 ord. or pref. shs. of Marconi's Wireless Telegraph Co., who elected to stand out of the merger company could transfer their shs., as the total support from both pref. and ord. shhldrs. amts. to only about 30% of the total number. The committee states that it has not altered its views that the £1 shhldrs. who stand out of the merger co. will ultimately benefit by so doing, and that a number of the larger hldrs. of £1 ord. shs. have decided to follow this course.

DELHI ELECTRIC SUPPLY AND TRACTION CO., LTD.—Net rev. for 1928 £59 558, agst. £49 639. After addg pft. on exchange, int. and miscellaneous income, and deductg. administratn. charges, and exes. in connectn. w. reorganisatn. of cap., pft. for year was £62 887 (agst. £50 583), plus £1 583 brt. in. Intm. div. of 4% absorbed £6 000. To gen. res., £25 028, depreciatn. and renewals £10 000; res. for taxatn., £8 000; staff benefit, £1 500. Fin. div. 8%, makg, 12% for year. Fwd. £1 941. Extraordinary mtg. will be held on July 1 to consider resolutions to increase the directors' remuneration and to amend the articles of association so as to permit profits of the co. to be capitalised.

MARCONI'S WIRELESS TELEGRAPH CO., LTD.—Directors announce that sufficient shs. of the co. have already been deposited with the Bank of England under the plan, dated May 14th, to warrant them concludg. that the required percentage of "assented" shs. will be obtained to enable the plan to become operative. Having regard, however, to the imperial and national importance of the merger scheme, the directors hope that the number of "assented" shs. will be much in excess of the minimum required merely to put the plan into operatn., and the directors desire to impress upon shhldrs. the importance of sendg. their sh. certificates to the Bank of England forthwith. Unless the time is extended, to-day, (June 28th), is the last day by which shs. can be so deposited.

GENERAL ELECTRIC CO., LTD.—Pfts. for year ended March 31, 1929, £1 084 077 (increase £26 000), plus £338 456 brought in. Deb. stk. int. required £222 380, depreciatn. £206 055, contributn. to pension fund, £24 662, div. on 6½% "A" pref. shs. for year, £117 000, and on 7½% "B" pref. shs., £135 000, and £130 000 has been placed to res. Div. of 10% on ord. shs. for year is recommended. Fwd. £362 072. The co.'s works have

Digitized by Google

been fully employed. Output, both at heavy engineering works and at telephone works, has reached a high level, and volume of orders received has been satisfactory. Demand for gen. elect. commodities has shown steady expansn., which has

MEMBERS of the Cheltenham, Mid-Gloucestershire, Bristol and South Wales and Monmouthshire branches of the Electrical Association for Women were entertained to luncheon by the Lord Mayor of Cardiff, Ald. W. R. Williams, and the Lady Mayoress, on June 19th. Following the luncheon, the party visited the new showrooms of the Cardiff branch of the General Electric Co., Ltd. The party numbered some 250, and the above group, taken during the visit, includes Mr. W. E. Hobbs, district manager G.E.C., Cardiff branch; Mr. H. B. Duce, assistant manager; Mr. W. F. Arnold, who lectured on modern domestic fittings; the Lady Mayoress of Cardiff; Ald. W. R. Williams; Miss C. Haslett; Mrs. A. L. Snow (hon. secretary of the South Wales branch) and Mr. F. Goddard (G.E.C.).

to some extent counteracted a tendency towards lower prices. Volume of overseas trade has been well maintained. Branches in India and Argentine have again had a successful year's trading. Some improvemt. is visible in South Africa; in Australia and China, however, conditns. have remained difficult. New h.t. switchgear and transformer works have been erected at Witton, and head office has been extended.

OFFICIAL QUOTATIONS.—Official quotations have been granted by Stock Exchange Commee. to following securities: 21 432 £1, fully paid, ord. shs. of Brompton and Kensington Electricity Supply Co., Ltd.; 140 833 £1, fully paid, ord. shs. of the Oriental Telephone and Electric Co., Ltd.; 4 702 £1, fully pd. ord. shs. of Underground Electric Railways Co. of London; 8 989 £1, fully pd. ord. shs. of Chelsea Electricity Supply Co., Ltd.; £1 496 £22, fully paid, 6% bearer certificates of Constantinople Telephone Co.; 395 200 5s., fully paid, ord. shs. of Ever Ready Co. (Great Britain), Ltd.; 550 000 £1, fully paid, 6% cum. pref. shs. of Mersey Power Co.

GLOBE TELEGRAPH AND TRUST CO., LTD.—Net rev. for year ended May 31, 1929, after deductn. of exes., £347 390, makg., with £52 322 brt. fwd., £399 712. Intm. divs. of 5s. p. sh., tax free, on ord. shs., and 3s. per sh., less tax, on pref. shs. have been paid, and fin. div. of 5s. p. sh., tax free, on ord. shs., and 3s. p. sh., less tax, on pref. shs. will be paid on June 30, leavg. £77 371 to carry fwd. the next account. The Earl of Midleton has been elected chairman of the co., in successn. to late Sir John Denison-Pender, and Mr. F. A. Johnston has been appointed to fill vacancy on the board. A resolutn. will be submitted to mtg. on June 25 providg. for widening of co.'s present restricted powers of investmt. to enable it to participate in further development of communicatns. and electrical enterprises. In view of more extensive operatns. of co., directors consider it advisable to add to their number, and shhldrs. will be asked to increase directors' remuneratn. to £4 500 p.a. tax free.

WHITEHALL ELECTRIC INVESTMENTS, LTD.—Rpt. for year ended March 31, 1929, states that whole of co.'s investmts. in co.'s operatg. in Chile and Mexico have bn. sold to American and Foreign Power Co., Inc. Pft. from sale, £2 738 793, has bn. transferred to cap. res. acct. There has bn. charged agst. this, £625 000, which has bn. contingently passed to special res. acct., and £729 313 written off disct. on issues of deb. stk., etc., thus releasg. taxed income formerly allocated for this purpose. Gross income for year £517 105; net income £292 193, plus £80 000 brt. in. Pref. div. absorbs £187 500, leavg. £184 693. Addg. pfts. previously applied in writg. off discts., etc., including income-tax correspondg. thereto, £915 707, there is total of £1 100 400. Div. proposed for year on ord. shs. 2%, with bonus div. of 18%; fwd., £100 400. Two subsidiary co.'s. have bn. formed—Hallminster Investments and Whitehall Canada—for carrying out financial transactns. not appropriate to the Whitehall co. as a holdg. co. While in the past the co.'s investmts. have bn. confined to co.'s. in which sh. control was held, future interests will be more widely distributed and will not necessarily carry sh. control.

Company Meetings.

MINEHEAD ELECTRIC SUPPLY CO., LTD.—At the recent annual meeting, Mr. Harry D. Leather (chairman) said the business had shown a very satisfactory extension. In a short time the extensions would more than pay for the outlay involved. The past year's profit was £5 317, compared with £4 377. It was decided to pay a dividend of 8½%, tax free, on the ordinary shares and to carry forward £463, subject to the payment of directors' remuneration.

HASTINGS AND DISTRICT ELECTRIC TRAMWAYS CO., LTD.—Mr. G. T. Moody, presiding at the recent meeting, said the circular route trolley bus service came into operation on May 15th, completing the conversion to the new system. The road conditions in Hastings were probably more adverse than those which obtained in the twenty other towns during their trolley 'bus system construction, as in almost every instance those systems were owned by the local authorities, who would take care to facilitate the regular running of their own 'buses. A further cause of trouble arose from the fact that immediately following the passing of their Trolley Vehicles Act in 1927, Hastings Corporation proceeded to license a large number of petrol vehicles to run in competition with the company's, although previously they had refrained from that course, and had maintained at a Ministry of Transport enquiry the undesirability of additional traffic being thrown on their roads. When they were no longer disturbed by road reconstruction and their staff was able to work under normal running conditions, they might anticipate more satisfactory results than those disclosed in the figures now submitted. The reports and accounts were adopted.

BRAZILIAN TRACTION, LIGHT AND POWER CO., LTD.—Mr. Miller Lash, presiding at the meeting on June 20th, said, in reference to the reconstruction and extension of the mechanic shops in Rio de Janeiro and São Paulo, their scope was not limited to repair work, but a great deal of material required for the company's business was manufactured in them more quickly and at less cost than if the material was imported. With regard to the telephone section of the enterprise, the installation of the automatic telephone system at Bello Horizonte, the capital of the State of Minas Geraes, was being proceeded with, and the telephone system in the neighbourhood of Cataguazes, consisting of about 1 000 telephones and 1 200 km. of toll lines, was being acquired. During the last year the long-pending dispute with the holders of the French issue of the second mortgage bonds of the Rio de Janeiro Tramway, Light and Power Co. had been settled on satisfactory terms, and on June 1st of the present year the first mortage bond issue of the São Paulo Tramway, Light and Power Co. was redeemed. Mr. A. W. K. Billings, chief engineer and a vice-president of the company, referred to the progress with the hydraulic developments at Serra and Parahyba, and expressed the opinion that the electrical business, both in Rio and São Paulo, was now secure against the injurious effect of even a serious drought. The report and accounts were adopted.

UNITED RIVER PLATE TELEPHONE CO., LTD.—Mr. H. M. Pease, presiding at the meeting on June 18th, said: In December last, an offer was made to the ordinary shareholders by the International Telephone and Telegraph Corporation of New York to purchase their holdings upon certain terms, of which you are aware, which offer was accepted by a majority of the ordinary shareholders. The company has continued to make fair progress, but the accounts have been adversely affected by the cancellation last October of the increase in the tariffs granted in October, 1922, without the company being heard. Consequently, we find ourselves only able to maintain the usual dividend upon the ordinary shares by drawing upon past profits, and instead of showing, as usual, an addition to the amount carried forward, we end the year with a reduced amount. A serious strike which took place in Rosario last July resulted in considerable loss before a settlement was arranged, and later in the year we were threatened

Digitized by Google

with a strike in Buenos Aires. Many conferences were held with the men, but it was not until the early part of March that an arrangement was come to between the company and the employees. This arrangement will entail a considerable increase in the working expenditure, and we are now looking to the Argentine Government to sanction adjustments of the tariffs so as to enable the company to earn the reasonable return to which it has been accustomed. Our total stations have increased during the year by 16 684, and are now 194 566, and of these, 131 154 are in the Federal capital of Buenos Aires and suburbs, against 119 265. We have continued our programme of converting the manually-operated exchanges in the City of Buenos Aires to automatic, and a few weeks ago our most important exchange "Avenida," was successfully changed over to this system. We are continuing our automatic programme, and, at the present moment, equipment equal to 53 000 lines is in course of installation or manufacture. When these are completed—at about the end of 1931—the City of Buenos Aires will be approximately 90% automatic. The report and accounts were adopted.

WHITEHALL ELECTRIC INVESTMENTS, LTD.—Mr. Clive Pearson, presiding at the meeting on June 20th, said: You were advised by letter dated October 9th, 1928, of the sale of our holdings in the various Chilean and Mexican companies which then constituted the entirety of our investments. I consider we have made an advantageous sale both from the point of view of profit, and because our investments need no longer be confined to two countries only. Our investments having been sold as at January 1st, 1929, cum accrued interest and dividends, our gross income for the year amounted to the reduced sum of £517 105. After charging debenture interest and expenses and providing for income-tax, net revenue amounts to £292 193. The preference share dividend absorbs £187 500, leaving £104,693, to which has to be added the amount brought forward from last year of £80 001, and the amount previously applied in writing off discounts, etc., £915 706, making a total of £1 100 400. Your directors recommend a dividend of 2% for the year on the ordinary shares, with a bonus dividend of 18%, which will require £1 000 000, and leave a carry-forward of £100 400. Reference is made in the report to the formation of two subsidiary companies. As an investment or holding company it would not be our practice or policy to traffic in securities, and we have formed Hallminster Investments, Ltd., and Whitehall Canada, Ltd., as trading companies. These will act as preliminary investigators, and only the finally selected investments will take their place among the securities held direct by this company. Through the intermediary of Whitehall Securities Corporation, Ltd., we have acquired controlling interests in a number of companies operating electric undertakings in Devon and Somerset. So far as plans have matured, this enterprise will require an investment of some £750 000 over the next two or three years. Your directors are considering other investments in electrical and other public utility undertakings, in some of which, although not necessarily in all, we anticipate obtaining share control. The report and accounts were adopted.

NEW COMPANIES.

R. S. MACKERETH, LTD.—Cap., £1 000. Electricians, manufacturers of and dealers in wireless apparatus, etc. Reg. Office: 11, Lord Street, Liverpool.

BAKER CLARKE AND CO., LTD.—Cap., £500. Electrical engineers and merchants, etc. Solicitors: Lach Smyrma and Co., 18, Old Compton Street, London, W.1.

ACME ELECTRIC WELDING AND MARINE SCALING CO., LTD.—Cap., £2 500. Electric and oxy-acetylene welders, etc. Reg. Office: 59, Govan Road, Glasgow, S.W.1.

CHESHAM AND DISTRICT ELECTRICAL INSTALLATION CO., LTD.—Cap., £100. To carry on business indicated by title. Reg. Office: 111, High Street, Chesham, Bucks.

SUNLIGHT AND HEALTH CENTRE (LEEDS), LTD.—Cap., £500. Medical and general electricians, proprietors of medical and electric baths, etc. Reg. Office: 63, Albion Street, Leeds.

PEACOCK AND WALLER, LTD.—Cap., £2 000. To acquire business of electrical engineers, etc., carried on by A. T. Peacock and F. Waller at Leicester Road, Hinckley, as "Peacock and Waller."

EASITIME, LTD.—Cap., £1 000. To acquire the business of merchant and dealer in electrical appliances, etc., heretofore carried on by C. J. L. Green at 45, Hallewell Road, Edgbaston, Birmingham.

REGIONAL RADIO, LTD.—Cap., £500. Radio engineers and contractors, wireless electricians, manufacturers of wireless apparatus and accessories, etc. Reg. Office: 9, Southampton Street, London, W.C.1.

T. G. HUNTER AND SONS, LTD.—Cap., £1 000. Electricians, electrical engineers, etc. Reg. Office: 3, St. James's Square, Manchester.

VIBRATONE CO., LTD.—Cap., £1 000. Manufacturers of and dealers in electrical instruments, apparatus, machines, accessories and goods, etc. Solicitors: E. C. Kilsby and Son, 21, College Hill, London, E.C.4.

ELECTRIC SPELLING SIGNS, LTD.—Cap., £5 000. To acquire from W. Stafford benefit of certain patents and foreign rights relating to electric sign controllers, etc. Reg. Office: 11, Southwark Street, London, S.E.1.

LONDON PLATINUM SCREW MFG. CO., LTD.—Cap., £1 000. Mfrs. of platinum, iridium screws and electrical parts and accessories, electro-metallurgical engineers, etc. Reg. Office: 116, Albany Street, London, N.W.1.

ELECTRIC CARBONS AND SUPPLIES, LTD.—Cap., £100. Electrical engineers, manufacturers of and dealers in wireless receivers' television instruments, carbons, projectors, etc. Reg. Office: 73/5, Albion Street, Leeds.

AUTO CALL CO., LTD.—Cap., £1 000. To carry on business of electrical engineers; to let on hire or hire-purchase, sell, deal in and manufacture articles of an electrical character, etc. Reg. Office: 27, Martin Lane, Cannon Street, London, E.C.4.

CHASETOWN AND DISTRICT ELECTRICITY CO., LTD.—Cap., £100 000. To acquire business of electricity distribution authorised by Chasetown and District Electricity Special Order, 1924, and carried on by Cannock Chase Colliery Co., Ltd. Reg. Office: Parliament Mansions, Victoria Street, London, S.W.1. (Public co.)

B.O.W. PATENTS, LTD.—Cap., £300. To adopt agreement with A. Wright and H. J. Osborn, to develop and turn to account inventions forming the subject of British, colonial and foreign patents comprised in said agreement, to carry on the business of electrical engineers, etc. Reg. Office: 451, Southbury Road, Enfield.

PROTOS ELECTRIC, LTD.—Cap., £1 000. To manufacture, export and import and deal in electrical apparatus, to adopt an agreement between Siemens Schuckertwerke A.G. and J. A. Milne for acquisition by latter of licence from former to sell in Great Britain goods bearing the trade mark "Protos." Reg. Office: New Bridge Street House, 30-34, New Bridge Street, London, E.C.4.

NORTHERN CABLES, LTD.—Cap., £500. Electricians, electrical and general engineers, manufacturers of and dealers in wireless component parts and accessories, telegraphic, telephonic, wireless and television apparatus and appliances, wires, cables, batteries, dynamos, generators, accumulators, insulators, magnetos, electrical signs, etc. Reg. Office: Wells Mills, Northgate, Huddersfield.

FARADEX-SERAPHONE CO., LTD.—Cap., £125 000. To acquire businesses (1) of Rooke Bros., Ltd., portable and mains wireless receiver manufacturers, etc., carried on at Cardington Street, Euston Road, London, N.W.1, with British patents, covering "A new and improved method of coupling thermionic valves for the amplification of electrical impulses, etc," and the trade mark "Faradex"; (2) of the Seraphone Co., Ltd., manufacturers of wireless sets, etc., with the trade marks "Seraphone," "Daneaphone" and "Orkestraphone." Reg. Office: Friars House, 39/41, New Broad Street, London, E.C.2. (Public co.)

BRITISH POWER AND LIGHT CORPORATION (1929), LTD.—Cap., £2 000 000. To acquire (1) not less than 90% of issued share cap. of North Wales Power Co., Ltd., and (2) not less than 90% of the respective share caps. of East Suffolk Electricity Distribution Co., Ltd., Trent Valley and High Peak Electricity Co., Ltd., South Somerset and District Electricity Co., Ltd., West Hampshire Electricity Co., Ltd., and Ringwood Electric Supply Co., Ltd., to carry on business of electric light and power co., electrical engineers and manufacturers, power or otherwise, manufacturers of and dealers in plant, etc. Reg. Office is at 27, Old Broad Street, London, E.C.2. (Public co.)

County Court Judgments.

[NOTE.—*The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debt. They may be for actions. But the Registry makes no distinction. Judgments are not returned to the Registry if satisfied in the Court books within 21 days.*]

ATTRACTA SIGN ELECTRIC CO., Attracta Yard, Morriston. £16 9s. 7d. May 15th.

COLLER, J. AND F., 218, Hinckley Road, Leicester, wireless dealers. £11 7s. 8d. May 11th.

CORBETT, Mr. P. W., Stratford Road, Shirley, wireless dealer. £17 17s. 1d. May 10th.

COULSON, Fred A., Archway Stores, 273, Archway Road, Highgate, wireless factor £16 18s. 6d. May 14th.

ELECTRADIO CO., LTD., 25, Westbourne Grove, W., wireless dealers. £17 2s. 6d., May 14th; £21 13s. 11d., May 18th.

GARD, Mr. W., Townhall Chambers, Coleford, electrical engineer. £18 1s. 6d. April 15th.

HUBER, Mr. J. Meyer, 3, Chorley Lane, Leeds, electrical contractor. £12 5s. May 15th.

LITTLEWOOD, Mr. G. H., Church End, Finchley, wireless dealer. £17 1s. 1d. May 10th.

RAIES GRAMOPHONE SALON, 107, Devons Road, Bow, wireless dealers. £16 10s. 10d. April 15th.

SECRETT, Mr. B., 57, Dingwall Road, West Croydon, wireless dealer. £12 19s. 10d. May 14th.

SHAW, Mr. W. A., 23, Empress Avenue, Manor Park, wireless engineer. £18 17s. 6d. May 16th.

SMITH, Mrs. L. M., 249, Ewell Road, Surbiton, wireless dealer. £17 3s. 5d. May 14th.

Deeds of Arrangement.

BENNETT, Maurice Lee, War Memorial Square and Orwell House, Norwich Road, Fakenham, wireless dealer. Dated June 12th, filed June 19th. Trustee, F. G. F. Platten, 7, Queen Street, Norwich, I.A. Liabilities unsecured, £1 395; assets, less secured claims, £326.

GARDNER, Colin Hamilton, trading as MELLOWTONE, 27, High Street, Stourbridge, wireless accessories dealer. Dated June 14th, filed June 18th. Trustee, E. P. Q. Carter, 33, Waterloo Street, Birmingham, C.A. Liabilities unsecured, £874; assets, less secured claims, £431.

HARDIMAN, Horace John, trading as ISCA ELECTRICAL ENGINEERING CO., 177, Sidwell Street, Exeter. Dated June 17th, filed June 24th. Trustee, H. H. Fielding, Westminster Bank Chambers, High Street, Exeter, C.A. Liabilities unsecured, £1 139; assets, less secured claims, £401.

Receiverships.

ALSACE-LORRAINE AND GENERAL PRODUCTS CO., LTD. W. B. Paton, C.A., of 8, Breams Buildings, Chancery Lane, W.C., was appointed receiver and manager on June 15th, 1929, under powers contained in debenture dated October 27th, 1928.

RICHMORE VALVE CO., LTD. C. H. Shelvoke, of 33, New Hall Street, Birmingham, was appointed receiver on June 7th, 1929, under powers contained in debentures dated October 18th, 1928.

TRIOTONE, LTD. S. B. Hereford, of 41, Wigmore Street, W., was appointed receiver and manager on June 12th, under powers contained in debenture dated June 7th, 1929.

London Gazette, etc.

Companies Winding-up

EARLSDON RADIO SUPPLIES LTD. Winding-up order, June 20th.

THE RADIO ELECTRIC CO. (BOURNEMOUTH), LTD., 188, Old Christchurch Road, Bournemouth. Winding-up order, June 18th.

Companies Winding-up Voluntarily.

ASTRA DYNAMO CO., LTD. By reason of its liabilities. June 14th. H. C. Faulkner, 27, Disraeli Road, Putney, S.W.15, appointed as liquidator. Meeting of creditors at Gladstone Club, Goldhawk Road, Shepherds Bush, W.12, on Thursday, July 4th, at 10.30 a.m.

MIDLAND FACTORS, LTD. By Extraordinary Resolution, June 11th. R. V. Newland, 159, Great Charles Street, Birmingham, appointed as liquidator.

PERRING-THOMAS WIRELESS SYNDICATE, LTD. By reason of its liabilities, June 20th. A. Williams, 82, Queen's Road, Brighton, appointed as liquidator.

Bankruptcy Information.

DEAN, Joseph, electrician, lately 4, Gogerddan Place, Aberystwyth. First meeting, July 1st, 2 p.m., 3, Baker Street, Aberystwyth. Public examniation, July 11th, 2 p.m., 3, Baker Street, Aberystwyth.

PENMAN, Alexander Nisbet, electrical engineer, 35, Ivanhoe Crescent, Wishaw, Lanarkshire. Estates sequestrated, June 21st. Meeting to elect the Trustee and Commissioners at 11 a.m. on Wednesday, July 3rd, within the Solicitors' Library, County Buildings, Hamilton. A composition may be offered at this meeting.

WARNES, Elizabeth Ann (widow), 10, Crescent Gate, Wilmslow Road, Rusholme, Manchester, electrical and radio engineer, formerly trading as "VICTORIA RADIO CO.," but now as E. A. WARNES AND CO. First meeting, July 2nd, 2.30 p.m., Official Receiver's Offices, Byrom Street, Manchester. Public examination, September 13th, 10 a.m., Court House, Quay Street, Manchester.

Partnership Dissolved.

NELSON AND HALEY (Herbert NELSON, Percy HALEY, and Simeon LISTER), electrical engineers, 25, Grosvenor Road, Manningham, Bradford, by mutual consent as from May 1st, 1929.

Bankruptcy Proceedings.

BLOOD, Ralph, 44 and 46, Station Road, Padiham, Lancs, wireless dealer and electrician. The public examination herein was held last week at the County Court House, Bankhouse Street, Burnley, when the debtor attributed his failure to insufficient turnover and keen competition. A statement of affairs was disclosed showing ranking liabilities of £476 and there was a deficiency of £309. It would seem that the debtor commenced trading on his own account as a wireless engineer and electrical dealer in September, 1923, with £80 capital. He used the front room of the dwelling house at 20, St. John's Road, Padiham, as a shop, and continued his employment as an engineer, his wife supervising the business. It was successful for about five years, and in March, 1928, he left his employment, and devoted his time entirely to his business. His weekly turnover since March, 1928 has been £10, with a gross profit of 15 per cent., against weekly expenses of £2 17s. 6d., and drawings amounting to £4. He became aware of his position six weeks before he filed his petition. The house at St. John's Road, Padiham, was purchased in 1922 in the joint names of himself and his wife for £390, of which £300 was advanced on mortgage by a local building society. Of that amount £257 13s. was still owing. The examination was adjourned for closing.

JOHN, Daniel Blodanfryn, trading as D. B. JOHN AND BROTHERS, 8, Commercial Place, Pontycymmer and the Nanthir Stores, Nanthir Road, Blaengarw, Glamorganshire, ironmonger and electrical engineer, etc. The public examination of this debtor was held on June 20th at the County Court, Wyndham Street, Bridgend. The debtor stated that the real cause of his failure was the loss on a contract for wiring 1 300 houses, through quoting 14s. per point, whereas the actual cost worked out at 18s. per point. His father had lent him £485, but that amount had not been included in the deficiency account, which amounted to £1 005. The examination was adjourned in order that the debtor might submit additional accounts.

McBEAN (John Horace), trading as H.W.D. BATTERY CO., 29, Bradford Road, Batley Carr, electrical engineer. This debtor, examined by the Deputy Official Receiver, said his liabilities were £386, assets £17, and deficiency £369. In 1915 he commenced as an electrical engineer at Clarence Mills, Bradford Road, Batley, with £10 capital. On February 8th, 1921, the business was formed into a limited company as J. H. McBean, Ltd. On April 26th, 1923, a resolution to wind up the company was passed, and Appleyard and Co. were the liquidators. Debtor further said he again commenced business on his own account as an electrical engineer at 14, South Street, Dewsbury, without capital, but owing to ill-health he gave up the business in October, 1923, at which time he had £100 liabilities. In March, 1926, he recommenced business at 29, Bradford Road, Batley Carr, without capital, as the H.W.D. Battery Co. He had promise of capital, but only £5 was forthcoming. His deficiency account showed that on March 1st, 1928, his liabilities exceeded his assets by £210, but an amended account showed that that figure was wrong and the liabilities over assets were £337. His business had been a failure, except just at the commencement of his career. Lack of capital, ill-health and bad trade were the causes of failure. There were twenty-eight judgment and suing creditors at the date of the receiving order, and a commitment order issued against debtor led him to file his petition. The principal creditors' claims dated back to 1923 and 1924. The examination was concluded.

THE LEAD MARKET.

A slightly more active tone was seen in the market last week, and, according to James Forster and Co., prices opened firmer on Monday and slowly advanced until on Wednesday £24 1s. 3d. was paid for June. The American price is unchanged at 7 cents.

Closing prices on June 21st were £23 16s. 3d. for June, £23 15s. for July, £23 13s. 9d. for August, and £23 12s. 6d. for September, 3s. 9d. to 1s. 3d. per ton higher on the week.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

310 829 S. G. S. Dicker (N.V. Philips' Gloeilampenfabrieken). Electric discharge tubes. (17/7/28.)
279 861 Dr. S. Loewe and W. Kunze. Receiving-circuits employing local oscillation, applicable for use with multiple thermionic valves. (28/10/26.)
280 214 Siemens and Halske A.-G. Method of and means for electrically controlling a sub-station from a remote main station. (3/11/26.)
310 759 British Thomson-Houston Co., Ltd., and A. P. Young. Electromagnetic acoustic devices. (30/11/27.)
310 760 W. R. Bullimore. Thermionic valves. (30/11/27.)
310 984 A. Reyrolle and Co., Ltd., B. H. Lesson, and O. C. F. King. Electrical selective remote-control systems. (6/12/27.)
310 761 A. H. Marks and P. Russell [legal representatives of E. C. R. Marks (deceased)]. (A. O. Smith Corporation). Still, more particularly for use in oil-refining, and method of making same by electric arc-welding. (24/12/27.)
283 208 Fansteel Products Co., Inc. Electrolytes for electrolytic rectifiers or the like. (7/1/27.)
310 902 Hotpoint Electric Appliances Co., Ltd., and W. J. Sims. Electric heating units. (3/1/28.)
310 986 J. Neale. Moving-coil apparatus for controlling illumination and like purposes. (4/1/28.)
283 165 Allgemeine Elektricitats-Ges. Device for transmitting signals from the railway track to a moving train. (5/1/27.)
310 903 Edison Swan Electric Co., Ltd., and L. H. Soundy. Thermionic valves. (24/1/28.)
310 764 Edison Swan Electric Co., Ltd., and L. H. Soundy. Circuit arrangements employing thermionic valves. (24/1/28.)
310 766 Nalder Bros. and Thompson, Ltd., and C. L. Lipman. Electric alternating current measuring instruments. (26/1/28.)
310 824 H. F. Joel, Sen. Portable electric battery lamps. (27/1/28.)
284 357 Dr. E. Giebe and Dr. A. Scheibe. Piezo-electric crystals. (28/1/27.)
310 826 G. Heptonstall and W. Shaw. Service and meter boards for electric supplies. (30/1/28.)
285 056 Siemens-Schuckertwerke A.-G. Driving of reciprocating machines by asynchronous electric motors. (10/2/27.)
310 787 Automatic Telephone Mfg. Co., Ltd., and W. H. Paulett. Automatic cleaning devices for instrument dials and like designation plates, etc.
310 915 N. W. McLachlan. Electric oscillation generators. (3/2/28.)
290 152 Westinghouse Brake and Saxby Signal Co., Ltd. Electrical controlling-apparatus. (7/5/27.)
310 997 A. Stanley. Wireless loud-speakers, microphones, and the like. (6/2/28.)
285 373 I.G. Farbenindustrie A.-G. Manufacture of electrolytic zinc. (14/2/27.)
311 011 E. Elliot. Terminal for electric leads. (9/2/28.)
311 013 W. T. Taylor. Electrical transmission and/or distribution systems. (9/2/28.)
285 062 Neufeldt and Kuhnke Betriebs-Ges. Photo-electric signalling, regulating, or measuring device. (10/2/27.)

Applications for Patents.

April 10th.

11 074 Associated Electrical Industries, Ltd., and N. R. Davis. Induction furnaces.
11 093 E. A. G. Baker and W. A. Lake. Electric switches.
11 141 British Thomson-Houston Co., Ltd. Windings for transformers. (13/4/28, France.)
11 033 C. B. Brown. Coupling magneto-electric generators, etc., to driving shafts.
11 086 E. P. S. Cattle. Electric junction boxes.
11 087 E. P. S. Cattle. Conduit fittings.
11 083 L. A. Chapman. Wireless telephony, etc.
11 090 Drake and Gorham, Ltd., and A. F. Harmer. Electric switches.
11 131 W. G. Graham. Thermionic valves.
11 127 C. M. L. Grundy. Telephone mouthpieces.
11 098 T. S. Horgan. Wireless aerial lead-in, etc.
11 039 R. J. Jay. Terminals for electric cables.
11 096 A. P. Lundberg and Sons, Ltd., and G. Pegg. Combined switches and wall connectors.
11 151 A. J. Payne. Electric discharge tubes.
11 147 W. Rogers. Electric switches.
11 128 F. Rother. Light electric cells. (14/5/28, Germany.)
11 078 J. H. Runbaken. Portable electric lamps.
11 085 W. B. Savage. Apparatus for smoothing pulsations of electric rectifiers.
11 111 Siemens-Schuckertwerke A.G. Manufacture of telephone cables. (23/5/28, Germany.)
11 152 H. J. Taylor. Electric discharge tubes.
11 140 Wireless Music, Ltd. Sound radiating apparatus.

April 11th.

11 202 Allmanna Svenska Elektriska Aktiebolaget. Reverse current relays (14/4/28, France.)
11 226 British Thomson-Houston Co., Ltd. Thermionic valve amplifying systems. (11/4/28, U.S.)
11 227, 11 229 British Thomson-Houston Co., Ltd. Electrically wound clocks. (12/4/28, U.S.)
11 228 British Thomson-Houston Co., Ltd. Thermionic electrodes. (12/4/28, U.S.)
11 272 F. G. G. Davey and Wireless Music, Ltd. Electromagnetic vibratory devices.
11 300 J. C. N. Eastick. Electrical wander plug.
11 287 E. F. Ehrhart (Soc. des Usines Chimiques Rhone-Poulenc). Photo-electric cells.
11 215, 11 216, 11 217 F. G. Flower and R. May. Combined wireless receivers and gramophones.
11 197 General Electric Co., Ltd. Measuring apparatus, etc.
11 297 D. N. Handcastle. Magnetos.
11 223, 11 224, 11 225 International General Electric Co., Inc. Manufacture of insulating material. (11/4/28, Germany.)
11 282 J. H. Keep. Device for use with telephone instruments.
11 247 Marconi's Wireless Telegraph Co., Ltd. Commutating, etc., devices.
11 286 A. Negromanti. Electric heating appliances.
11 168 R. Neill. Inductance coils.
11 271 E. R. Ritter and Scherbius and Ritter. Vacuum switches. (2/5/28, Germany.)
11 167 H. R. Soutter. Electrically heated irons, etc.

April 12th.

11 310 C. P. Allinson. Thermionic amplifiers.
11 348 Allmanna Svenska Elektriska Aktiebolaget. Induction furnaces. (21/4/28, Sweden.)
11 391 Belling and Lee, Ltd., and W. J. Byrne. Electrical plug connections.
11 328 L. Blundell and W. H. Curtis. Induction coils.
11 327 H. Courteen. Imitation candle lamps.
11 349 E. Fabianke. Electric illumination for tents.
11 341 Graham Amplion, Ltd., and A. D. A. Hodgson. Electricity supply means for wireless apparatus.
11 342 Graham Amplion, Ltd., and C. F. Phillips. Incandescent lamps and holders.
11 311 E. K. Gray. Electric boiler.
11 339 T. Harden and H. A. Mepham. Reinforced lead-covered cables.
11 351 L. P. Haussauer. Automatic electric water heaters.
11 361 W. T. Henley's Telegraph Works Co., Ltd., and H. C. Hoban. Electric circuit testing device.
11 408 I.G. Farbenindustrie A.G. Electrolysis of molten substances. (14/4/28, Germany.)
11 326 F. W. Lanchester. Armatures for dynamos, etc.
11 405 Marconi's Wireless Telegraph Co., Ltd. Means for combining electrical energies, etc. (12/4/28, U.S.)
11 404 Siemens and Halske A.G. Manufacture of discharge devices. (12/4/28, Germany.)
11 336 W. J. Taylor. Wireless speaker unit for gramophones.
11 322 A. J. Wilkins. Wireless aerials.

April 13th.

11 497 A. G. Clark, W. O. Heyne and Plessey Co., Ltd. Wireless cabinets.
11 454 H. Clarke and Co. (Manchester), Ltd., and H. Ingham. Electrical energy supply systems.
11 471 W. T. Henley's Telegraph Works Co., Ltd., and W. H. Nichols. Electric cut outs.

April 15th.

11 505 J. E. Adey. Electrical driving means.
11 549 A. Boeker and Norddeutsche Sekabeelwerke A.G. Machines for laying cables.
11 589 British Thomson-Houston Co., Ltd. Power installations. (14/4/28, U.S.)
11 687 British Thomson-Houston Co., Ltd. Switch-operating mechanism. (13/4/28, U.S.)
11 653 Burndept Wireless (1928), Ltd. Control mechanism for gramophone motors.
11 567 D. A. Christian and Siemens Bros. and Co., Ltd. Telephone control systems, etc.
11 506 S. O. Cowper-Coles. Talking pictures.
11 599 W. J. Davis. Variable resistance devices.
11 596 J. W. Dennis. Accumulator holders.
11 680 Electrical Research Products, Inc. Sound transmission systems. (4/5/28, U.S.)
11 548 J. Engler and Norddeutsche Seekabelwerke A.G. Machines for laying cables.
11 588 International General Electric Co., Inc. Electric discharge devices. (13/4/28, Germany.)
11 652 J. R. Johnson. Electric rectifiers for radio apparatus.
11 635 B. Lange and A. Schwarz. Alternating current measuring bridge.
11 545 C. Lanham. High tension battery.
11 660 K. Lenzkes. Device for stopping electrically driven looms. (17/4/28, Germany.)
11 597 Marconi's Wireless Telegraph Co., Ltd. Coupling devices for high frequency circuits. (24/4/28, U.S.)
11 629 A. H. Midgley. Telephone transmitters, etc.
11 585 N. V. Philips' Gloeilampenfabrieken. Incandescent lamps. (27/4/28, Holland.)
11 586 N. V. Philips' Gloeilampenfabrieken. X-ray tubes. (19/4/28, Holland.)
11 587 N. V. Philips' Gloeilampenfabrieken. Electric discharge tubes. (19/4/28, Holland.)
11 503 R. T. Norton. Electric heaters.
11 647 Ever Ready Co. (Great Britain), Ltd., and J. Lister. Electric torches.
11 542 General Electric Co., Ltd., L.B.W. Jolley, and J. W. Ryde. Incandescent lamps.
11 543 General Electric Co., Ltd. Systems for grinding ores, etc.
11 544 General Electric Co., Ltd., and E. Weintraub. Mercury vapour rectifiers. (12/10/28, France.)
11 594 General Electric Co., Ltd., and E. Weintraub. Silk spinning motors.
11 612 F. V. A. Green and Kolster-Brandes, Ltd. Wireless receivers.
11 613 F. V. A. Green and Kolster-Brandes, Ltd. Electric condensers.
11 614 F. V. A. Green and Kolster-Brandes, Ltd. Thermionic valve amplifiers.
11 637 M. Harper. Electric switches, etc.
11 659 E. Hennessen. Supports for electric irons.
11 643 D. W. Hute. Switching mechanisms for synchronised electric machines.
11 669 Soc. Cema Constructions Electro.-Mecaniques d'Asnieres. Automatic burglar alarms, etc. (14/4/28, France.)
11 590 L. Nouwen-Somers. Apparatus for operating electric switches.
11 652 Universal and General Radio Co., Ltd. Electric rectifiers for radio apparatus.
11 546 P. Webber. Electric lamp stands.

COMING EVENTS.

Friday, June 28th.

Electrical Contractors' Association.—Bournemouth. Annual Conference. Paper by Mr. H. R. Taunton on "Possibilities for Contractors in Rural Electrification"; 9.30 *a.m.* Short address by the new President, Mr. H. Willoughby Ellis, 12 noon.

Physical Society.—Imperial College of Science, Imperial Institute Road, South Kensington. Demonstration of an Apparatus for the Measurement of Electrical Resistance at High Temperatures, by J. L. Haughton; Papers on "The Relation between Hydrogen Pressure and Filament Resistance in a Tube containing Glowing Tungsten," by Teresa J. Dillon; "The Band Systems of Titanium Oxide," by Frances Lowater; and "The Absolute Measurement of Sound Intensity," by F. D. Smith, 5 *p.m.*

Monday, July 1st.

Royal Institution.—21, Albemarle Street, London. General meeting. 5 *p.m.*

Tuesday, July 2nd.

Institution of Electrical Engineers (South Midland Centre). Summer meeting. Visit to the Avonmouth Docks.

Electrical Contractors' Association (Derby Branch).—Ordinary meeting. 5 *p.m.*

Tuesday, July 2nd—Thursday, July 4th.

North-East Coast Institution of Engineers and Shipbuilders.—Summer meeting. Newcastle-on-Tyne.

Wednesday, July 3rd.

Electrical Contractors' Association (Bath Sub-Branch).—Ordinary meeting.

Electrical Contractors' Association (London Branch).—15, Savoy Street, Strand, London. General meeting.

Electrical Contractors' Association (Southern Branch).—Ordinary meeting.

Electrical Contractors' Association (Cardiff Branch).—Ordinary meeting. 2.30 *p.m.*

Wednesday, July 3rd—Friday, July 5th.

Tramways and Light Railways Association.—Sheffield. Annual Congress.

Thursday, July 4th.

Electrical Contractors' Association (Newcastle Branch).—Ordinary meeting. 11 *a.m.*

Electrical Contractors' Association (Bristol Branch).—Ordinary meeting. 3.15 *p.m.*

Friday, July 5th.

Overhead Lines Association.—Summer meeting. Charabanc tour in the Mid-Cheshire area, starting from Winsford (L.M. & S.), 12.15 *p.m.*

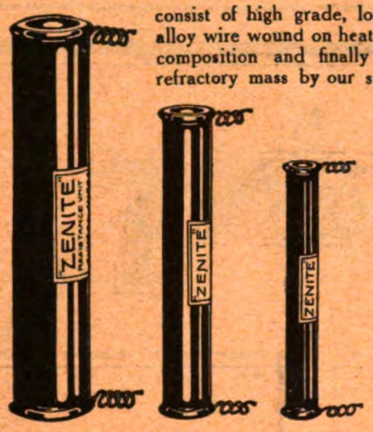
REGISTERED "ZENITE" TRADE MARK

VITREOUS ENAMELLED, EMBEDDED

RESISTANCE UNITS



consist of high grade, low temperature co-efficient alloy wire wound on heat-resisting tubes of special composition and finally embedded in a vitreous refractory mass by our special process.

For use in Motor Starters, Speed Regulators, Dimmers and for Protective purposes.

They can be supplied in seven sizes, 2" × ⅛" up to 8½" × 1¼", and 130 standard windings between the limits of 0·1 ohm and 44 amperes and 150,000 ohms and 0·02 ampere; and can now be fitted with brass caps like cartridge fuses, a feature which makes for increased convenience.

WIRELESS WORK

"ZENITE" Units on account of their permanence are particularly suitable for "leaks" in connection with Medium Power Thermionic Valves as well as in the construction of Resistance Capacity Amplifiers.

COMPETITIVE PRICES and PROMPT DELIVERIES

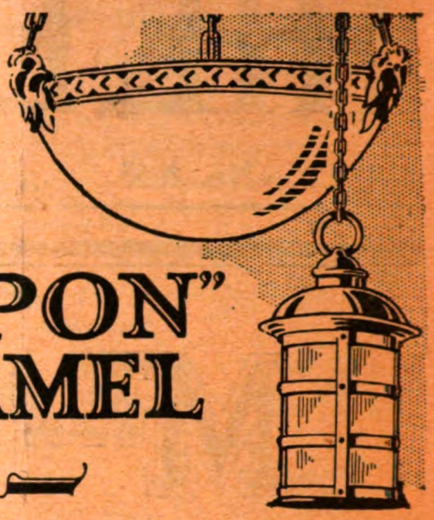
for all electrical fittings



"ZAPON" ENAMEL

"Zapon" Enamel is a cellulose lacquer especially suitable for electrical equipment. Whether applied by spray, brush or dipping, it forms a hard tough skin on the metal which is impervious to moisture or the chemicals of the atmosphere, does not discolour in the sun or in moderate heat, and yet does not dull the brightest surface.

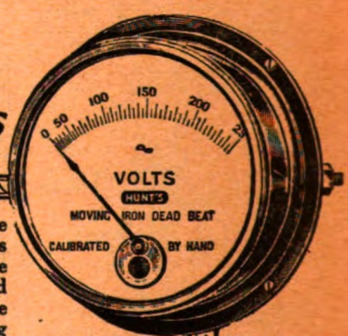
OIL SWITCHES

Ammeters and Voltmeters (Commercial Types)



WE can offer a wide range of Ammeters and Voltmeters whose high quality, low cost and generous terms make them an outstanding proposition to Switchboard Manufacturers.

For most standard readings and finishes we can give delivery from stock

All Instruments are hand-calibrated against standard and conform to B.E.S.A. specifications as regards insulation.

We have been Sole Agents for these instruments for over 15 years, and therefore offer them to Manufacturers with an exceptional degree of confidence.

Voltmeter Type MI/DB/S/bc. (moving iron, dead beat, switchboard fitting, back connections) as illustrated, black and nickel finish 6" dial 0/250 volts

HIGH TENSION OIL WATER

No. 1255B "Ohmaline"
(BLACK INSULATING VARNISH)
MEETS EVERY NEED
Di-electric Strength 1500 Volts per mil.
Falls after 48 hours in water
only 3·3 per cent.
HOT OIL PROOF
Particulars of Golden Varnish 213 "Armacell" on page xxv.

"SHAYDOLITE"
LAMP LACQUERS

SURPASS
ALL SPRAYED LAMPS FOR
RICHNESS OF COLOUR.

A Wide Range of Colours in
Clear, Opal & Frosting Finish

APPLIED IN A MINUTE.

"INSULDERM" ENAMEL

HEAT-RADIATING.
OIL-PROOF. FLEXIBLE
PREVENTS SPARKING AT COMMUTATOR ENDS.
Breakdown Voltage 3600 Volts p·0·1 mm
SUITABLE for HARD-WORKED TRACTION MOTORS
"We never had a breakdown with
INSULDERM"
said a New Zealand Tramway Co. after
Insulderm had overcome constant trouble.
Also for coating Cotton-Covered and Enamelled Wire.

"ANTI-SULPHURIC" ENAMEL

IS STILL THE FINEST
PROTECTOR
from Acid Fumes and Spray in Battery
Rooms, Chemical Works, Mines, &c., &c.
QUICK-DRYING. GLOSSY.
In all usual colours.

The Bournemouth Pavilion is the crowning glory of the architecture of this south coast watering place. It took four years to build & cost £250,000. It is the first Bournemouth building in which a three-phase supply has been used.

E.C.A. Conference, Bournemouth

June 26th 27th 28th

The venue for several of the important functions at this annual conference of members of the E.C.A will be the *New Pavilion* in which are installed

24 Miles of HENLEY

C.M.A. (Regd) CABLE

The giant Cunarder "AQUITANIA," which will be visited by delegates on Friday, June 28th, is the largest steamer to be built in Great Britain. She is illuminated with 13,000 lights and Henley Cables are installed throughout.

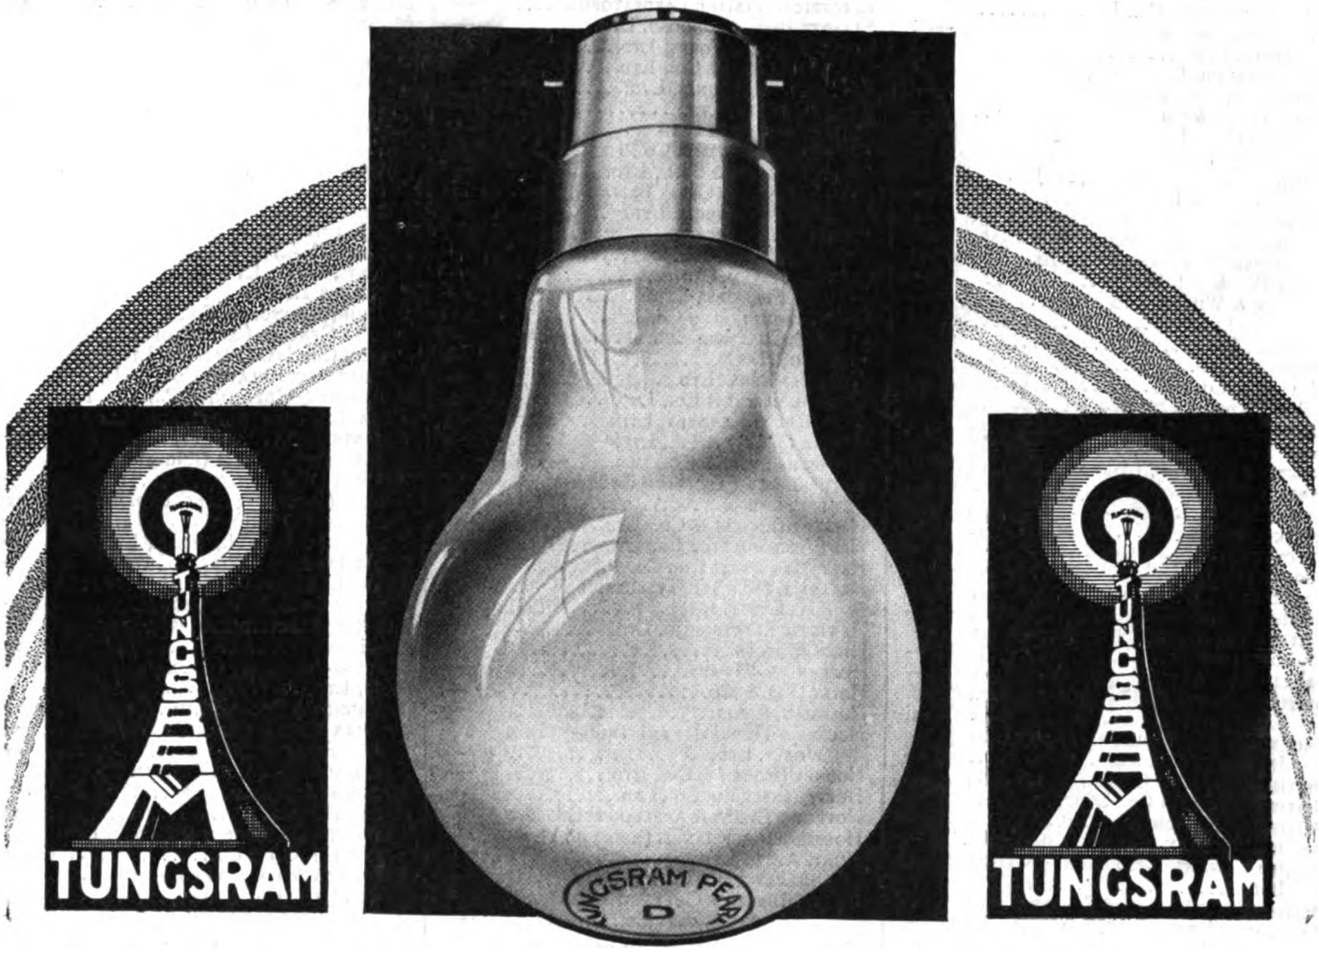
FOR SOFT LIGHT



"D" PEARL LAMPS

Soft, well diffused light with complete absence of harsh shadows is universally appreciated. This is the light given by Tungsram "D" Pearl Lamps—the Lamps that incorporate our famous "D" filament, combining efficiency with the ability to withstand vibration and excessive shocks.

Tungsram "D" Pearl Lamps are frosted inside by a new process giving a smooth exterior which can be easily cleaned, and to which dirt does not readily adhere. TUNGSRAM "D" PEARL LAMPS COST NO MORE THAN CLEAR LAMPS.

Ask your usual Supplier for full particulars.

TUNGSRAM ELECTRIC LAMP WORKS (Great Britain) Ltd.

Isolating Switches

'EMPIRE' Isolating Switches are made in the horizontal inverted type, the horizontal upright type and the vertical type shown above.

These Switches have been proved in service under the most rigorous weather conditions in various parts of the world, a simple but efficient contact being employed which will withstand snow and ice conditions, and one confidently recommended for Rural supply and Distribution requirements, where low capital expenditure and maintenance are important considerations.

Attention is particularly directed to the special features (described in a pamphlet available on request) which are designed to facilitate erection or to conduce to the longer life of the unit.

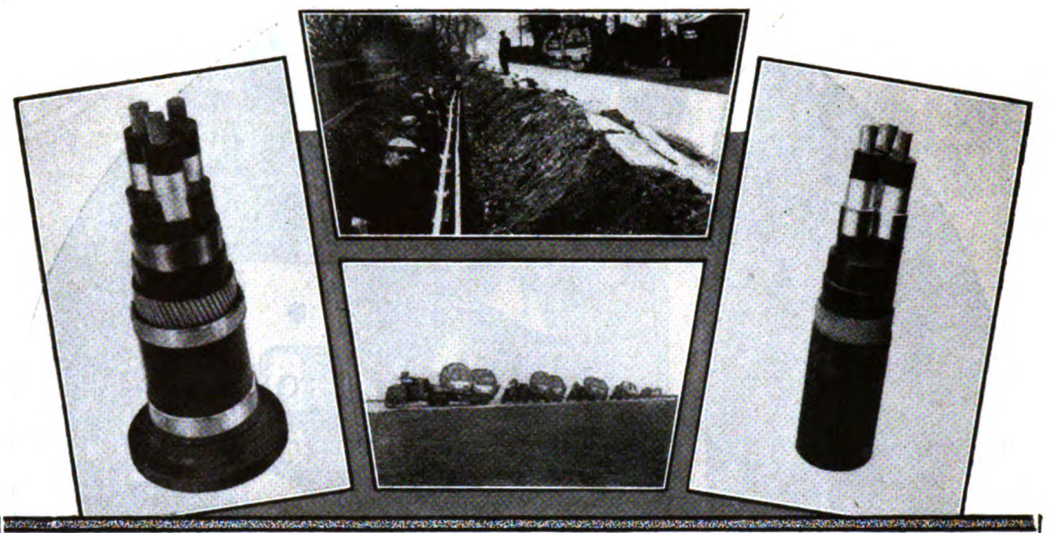
ONE OF THE J.&P. AGENTS



A PROBLEM SOLVED

The problem of 33,000-volt cable transmission is solved by the "H" and "H.S.L." types of cable, in which, by the metallised layer immediately over the paper insulated cores, which expands *and contracts* along with the dielectric, the formation of voids in the dielectric is obviated, the fillers are relieved of all electrical stress, and the stresses in the dielectric are made purely radial.

When properly made and jointed, the factor of safety of such a 33,000-volt cable is ample and permanent, as shown by our "stability tests" made on the many miles of such cable manufactured and laid by us within the last few years.

We have experimental and research work in progress on cables for still higher voltages. The results so far achieved are very promising, but it has always been our deliberate policy to make absolutely certain before placing any such products on the market. When the time comes for us to do so, our customers can be quite sure that this problem also has been solved beyond possibility of failure.

"The Lamp with Two Skins"

The Lamp that attracts attention–

Whilst glareless lighting is now universally recognised as an enormous advance on the employment of the clear glass lamp, and our Pearl lamps discreetly hide the glare of the filament—we particularly recommend

CRYSELCO

Gasfilled OPAL LAMPS

The ultimate in glareless lighting

because the famous two skin construction not only ensures a brilliant white light with a gently diffused radiance but means actually less deterioration in use. That is why they attract such wide attention.

TENDERS INVITED.

CITY OF CARLISLE.

ELECTRICITY DEPARTMENT.

TENDERS are invited for the supply, delivery and erection of Switchgear for use in an 11 000 Volt 3-phase, 50 cycle Substation.

Specification and Drawing may be obtained from the undersigned on payment of Two Guineas, which sum will be refunded provided a *bona fide* tender has been sent in and not withdrawn.

Tenders, endorsed "Tenders for E.H.T. Switchgear" and sealed with wax, to be sent to the undersigned at the Electricity Offices, Victoria Viaduct, Carlisle, not later than 12 noon Friday, July 12th, 1929.

The lowest or any tender will not necessarily be accepted.

CHAS. W. SALT, M.I.E.E., City Electrical Engineer.

Electricity Offices, Victoria Viaduct, Carlisle.
June 11th, 1929.

COUNTY BOROUGH OF SUNDERLAND.

ELECTRICITY DEPARTMENT.

THE Corporation of Sunderland are prepared to receive Tenders, from actual makers only, for the supply of the following items for the twelve months ending September 30th, 1930.

Specifications and forms of tender may be obtained from the General Manager, Electricity Offices, Dunning Street, Sunderland, upon payment of a deposit of ten shillings for each specification and form of tender (in duplicate), which deposit will be returned after a *bona fide* tender has been received and adjudicated upon.

In writing for specifications, applicants should state for which of the following Sections they are required, viz:—

Paper Insulated, Lead Sheathed Cable, for general main laying requirements.
Rubber Insulated Wire.
Consumers' Meters.
Incandescent Lamps, Gas Filled and Vacuum.

Sealed tenders (which must be upon the forms provided with the specifications), addressed to "The Town Clerk, Town Hall, Sunderland," and endorsed "Tender for Electricity Supplies," must be delivered at my office not later than first post on Monday, July 8th, 1929.

The Corporation do not bind themselves to accept the lowest or any tender.

H. CRAVEN, Town Clerk.

Town Hall, Sunderland.
June 1st, 1929.

CITY AND ROYAL BURGH OF DUNDEE.

ELECTRICITY DEPARTMENT.

THE Corporation invites Tenders for the supply of: EXTRA HIGH TENSION and LOW TENSION PAPER INSULATED LEAD-COVERED AND DOUBLE STEEL TAPED ARMOURED CABLE, all to B.E.S. Specification, for working pressures up to 6 600 volts and 660 volts respectively

Specifications, quantities, etc., may be obtained on application to the undersigned.

Tenders (sealed in envelopes provided) to be lodged with the Town Clerk, City Chambers, Dundee, not later than by Wednesday, July 10th, 1929.

The Corporation does not bind itself to accept the lowest or any Tender.

D. H. BISHOP, B.Sc., M.I.E.E., General Manager and Engineer.

Electricity Supply Department, Dudhope Crescent Road, Dundee.
June 24th, 1929.

STAFFORDSHIRE EDUCATION COMMITTEE.

INSTALLATION OF ELECTRIC LIGHT.

TENDERS are invited from firms whose names appear on the National Register of Electrical Installation Contractors for the installation of electric light in the existing Kingswinford Brockmoor Council School and in new buildings now in course of erection on the adjoining site. A specification and drawings may be obtained by application to Messrs. Moffett, Rosher and Mann, Consulting Engineers, Union Chambers, Temple Row, Birmingham, with a cheque for a deposit of £5 5s., which will be returned upon the submission of a *bona fide* tender. Tenders endorsed "Lighting Installation, Kingswinford Brockmoor Council School" must be delivered by the 2nd July, 1929, to the undersigned.

F. A. HUGHES, Director of Education.

County Education Offices, Stafford.
May 29th, 1929.

NOTICE.

ELECTRICITY (SUPPLY) ACT, 1926.

NORTH-EAST ENGLAND ELECTRICITY SCHEME, 1929.

WHEREAS the Electricity Commissioners have prepared and transmitted to the Central Electricity Board a Scheme bearing the above short title and relating specifically to—

The Administrative Counties of Durham and Northumberland;
Parts of the Administrative Counties of The East Riding of Yorkshire and The North Riding of Yorkshire;
The City and Borough of Newcastle-upon-Tyne;
The County Boroughs of Darlington, Gateshead, South Shields, Sunderland, Tynemouth, Middlesbrough and West Hartlepool;

and dealing with the matters mentioned in Section 4 (1) of the Electricity (Supply) Act, 1926.

Notice is hereby given that the Central Electricity Board have caused the said scheme to be published and that any authorised undertakers or other persons interested in the said Scheme and desiring to make representations thereon may do so by forwarding the same by registered letter addressed to the undersigned and posted not later than the 30th day of July, 1929. Copies of the said Scheme and of a volume of Particulars supplementary thereto may be obtained at the prices of One shilling and sixpence and Three shillings and sixpence each respectively from H.M. Stationery Office, Adastral House, Kingsway, London, W.C.2, and 120, George Street, Edinburgh.

Dated this 24th day of June, 1929.

RICHARD H. FOX, Secretary to the Central Electricity Board.

Trafalgar Buildings, 1, Charing Cross, London, W.C.2.

EDUCATIONAL NOTICES.

EXAMINATIONS HELD BY THE INSTITUTION OF ELECTRICAL ENGINEERS.

MR. A. J. ANIDO, B.Sc., A.C.G.I. (late R.E.), specialises in the personal preparation of candidates in all subjects of the above examinations. Arrangements are made to suit those engaged in business.

APPOINTMENTS VACANT.

BOROUGH OF BASINGSTOKE.

ELECTRICITY DEPARTMENT.

APPLICATIONS are invited for the position of Assistant Engineer in the Electricity Department of the Corporation.

Applicants must be British subjects under the age of 35 years, and have had experience in the operation and maintenance of Diesel Engines, direct and alternating-current machinery, and distribution. Salary £300 per annum.

Applications in candidates' own handwriting, stating age, education, Diesel Engine experience, technical qualifications and experience, etc., together with copies of three recent testimonials, must be forwarded to the undersigned in sealed envelope, endorsed "Assistant Engineer" not later than 9 a.m. on Tuesday the 2nd July, 1929

Canvassing Members or Officers of the Council directly or indirectly will disqualify.

F. H. SMITH,
Town Clerk.

Municipal Buildings,
Basingstoke,
June 17th, 1929.

DRAUGHTSMAN required for high and low tension switchgear. Experience in outdoor E.H.T. gear desirable.—Apply stating age, full experience and salary required to the GENERAL ELECTRIC CO., LTD., Witton, Birmingham.

WANTED, for service in South America, four first-class Cable Operators; single men: age not over 30 years. Must have good references. Three-year contract: first-class passage out and home. Good prospects.—Apply ALL AMERICA CABLES, Room 137, Bush House, Aldwych, W.C.2.

BRADFORD EDUCATION COMMITTEE.

TECHNICAL COLLEGE.

APPLICATIONS are invited for appointment as ASSISTANT LECTURER IN ELECTRICAL ENGINEERING in the College. Salary according to the Burnham Scale, which is from £186 to £480 per annum. Commencing salary according to qualifications and experience.

Further particulars of the appointment and forms of application may be obtained from the Director of Education, Town Hall, Bradford, and completed forms should be returned to the Principal of the College not later than July 10th, 1929.

THOS. BOYCE,
Director of Education.

COUNTY BOROUGH OF WEST HAM.

APPOINTMENT OF ELECTRICAL ENGINEER AND MANAGER.

THE Council of the County Borough of West Ham invite applications for the position of ENGINEER and MANAGER of their ELECTRICITY UNDERTAKING.

Candidates must have had considerable experience in connection with large electricity supply undertakings, including sales and wiring departments, and a sound knowledge of the commercial management of such undertakings. He will be entirely responsible also for advising on and carrying out all extensions to plant and mains, and such other duties as are appropriate to the management of an electricity undertaking. The successful candidate will be required to devote his whole time to the duties of the office.

The salary will be at the rate of £1 750 per annum, with advancement to the appropriate grade of the A.M.E.E. scale in operation at the end of two years' satisfactory service. Housing accommodation, on terms, is available if desired. Canvassing is strictly prohibited.

The appointment will be subject to the provisions of the Local Government and Other Officers' Superannuation Act, and to a medical examination for the purposes of that Act, and the statutory contributions to the Superannuation Fund will be deducted from the salary.

Applications, on forms which may be obtained from the undersigned, accompanied by copies of three recent testimonials, must be returned not later than 12 noon on Saturday, 13th July, 1929.

GEORGE E. HILLEARY,
Town Clerk.

Town Hall, West Ham.
27th June, 1929.

ENGINEERS.—Information unobtainable elsewhere concerning all professional examinations and enabling you to recognise the qualification that will most benefit YOU, such as:
A.M.I.E.E., A.M.I.Mech.E., A.M.I.A.E., A.M.Inst.B.E.,
Radio Association, C. and G., B.Sc. London Univ., etc.,
together with nearly 200 Courses—the widest selection of Engineering Correspondence Courses in the world—are in the
MAGNIFICENT NEW 112 PAGE BOOK,
"THE ENGINEER'S GUIDE TO SUCCESS."
This great book is available to you just at a time when a revolutionary change in promotion conditions has taken place throughout engineering—a change that gives to engineers the greatest chance they ever have had to attain to worth-while posts and equally worth-while pay. Get this Book—the Key to certain advancement in modern-day engineering—write NOW for FREE copy.

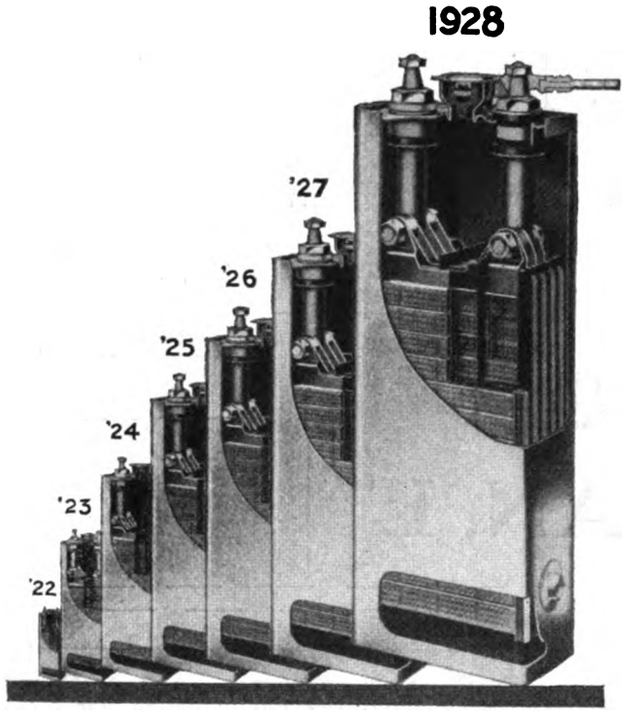
FURTHER PROGRESS



THE above pictures are proportional to the sale of "NIFE" Batteries during the years indicated. Covering a period of general trade depression, they speak more eloquently than words of the position which the "NIFE" Cell has gained throughout the electric traction industry. Clever salesmanship may sell an inferior article for a time, but only sterling quality can ensure consistent progress. May we send you particulars and so help to

REDUCE YOUR BATTERY COSTS!

Current Transformer and Type H.H. "Translay" Relay shown pictorially.

Safeguarding—

For Electrical Feeders or Apparatus

With the object of overcoming the difficulties experienced under modern conditions with the older methods of Feeder and Apparatus Protection, a new "Metrovick" system has been developed with apparatus known as the—

'Translay' Protective Gear

The diagram reproduced in this announcement shows the wiring of similar "Translay" Relays at each end of a Feeder. The chief advantages are—

(1) Ordinary Current Transformers are used
(2) Pilot wires of small size only required.
(3) Sheathing is unnecessary.
(4) Independently adjustable phase-fault and earth-fault settings can be provided.
(5) Increased stability in times of surge.
(6) Leakage settings well below Full Load and lower than Phase-fault settings.
(7) Bushing type Current Transformers are suitable.
(8) Pilot wire voltage about 100 volts only
(9) Relays have high torque and operate with small current in Pilot wires.
(10) The "Translay" system has proved satisfactory where other systems have failed.

Send your specific enquiries.

THEY ARE NICKELOID EVERLASTING BLOCKS

WILL STAND A SEVEN MILLION RUN

"SEE how clear and sharp the printing is—illustrating our goods to perfection. That's what I call getting real selling-power into illustrations. And the blocks used were not new—we had used them several times before. They were made by *Nickeloid* and treated with their special *Cormil* finish for durability. This process not only makes blocks good for anything up to seven million impressions, but makes them immune from scratches and other minor damages and from corrosion, and also makes for cleaner, sharper printing. You see how economical it is—we can use these blocks over and over again instead of continually having to order new blocks of the same subject. I want you to send all our block-making orders to *Nickeloid* in future—it will mean better catalogues and literature for us. And whenever a block is likely to be wanted for several things, stipulate the *Cormil* finish."

BENN BOOKS FOR THE ELECTRICAL ENGINEER

INSULATED ELECTRIC CABLES

C. J. Beaver, M.I.E.E. **36s. net.**

deals with Materials and Design. The contents are: Development of electric cables—materials used in the manufacture of cables—conducting materials—insulating materials—protective and preservative materials—Design: Nomenclature and mechanical principles—conductors—di-electrics—factors in voltage rating-sheaths. Part II, on Manufacture and Testing, and Part III, on Installation, will be published shortly at approximately 35s. net each.

ELECTRICAL MEASURING INSTRUMENTS

C. V. Drysdale, D.Sc. and A. C. Jolley, A.M.I.E.E. Two parts. **55s. net each.**

unquestionably ranks as the standard work on a subject of vital importance to every electrical engineer. Part I, which includes 365 illustrations, treats of commercial indicating instruments; dynometers; hot wire instruments; electrostatic instruments. Part II, with 437 illustrations, deals with induction instruments, supply meters, and auxiliary apparatus.

Part III, on steady current laboratory instruments, is now in active preparation.

ELECTRICAL HANDLING OF MATERIALS

H. H. Broughton, M.I.E.E. **4 vols.**

is an authoritative manual on the design, construction, and application of cranes, conveyors, hoists, and elevators. Volume I deals with electrical equipment, 231 illustrations and 35 tables, 25s. net; volume II with structural work, 388 illustrations and 59 tables, 25s. net; volume III with electric cranes, 300 illustrations and 65 tables, 50s. net; volume IV with machinery and methods, 279 illustrations and 67 tables, 50s. net.

ELECTRIC WINDERS

H. H. Broughton, M.I.E.E. **52s. 6d. net.**

is the first comprehensive treatise on a highly important branch of electrical engineering. The book contains 287 illustrations and over 100 tables, and the contents include: mechanics of the simple hoist—electrical equipment—rating of electrical machinery—cylindrical drum winders—inclined shafts—compound shafts—conical drums—bicylindro-conical drums—effect of drum profile on performance—flywheel load equalisers—wire ropes—mechanical equipment—gearing—constants for design—power supply—typical winders.

ELECTRIC SWITCH AND CONTROLLING GEAR

C. C. Garrard, M.I.E.E. **63s. net.**

has now been issued in a third edition, entirely rewritten and greatly enlarged to include many new developments. This book by Mr. Garrard is admittedly the standard work on the design, manufacture, and use of switchgear and switchboards in central stations, factories, and mines.

RADIO ENGINEERING

E. B. Wedmore and J. H. Reyner. **15s. net.**

makes an extensive and detailed survey of the subject, including among the contents: Radio calculations and measurements—tuning and radiation—thermionic valves—radio transmitters—radio receiving apparatus—design of masts and aerials—telegraphy—telephony—mathematical and miscellaneous tables—list of integrals—electrical, mechanical, and physical tables.

ELECTRO-FARMING

R. Borlase Matthews, M.I.E.E. **25s. net.**

fully and clearly expounds the very great possibilities of electricity in the sphere of agriculture. The author has himself used electrical power, with highly satisfactory results, on his own estate, and he here puts his own experience at the service of both the engineer and the farmer.

The Electrician Annual Tables of ELECTRICITY UNDERTAKINGS

42nd Edition

is an absolutely indispensable reference book for Engineers, Manufacturers, Contractors, Exporters and all concerned with the great electrical industry. The new edition has been very carefully revised and brought completely up-to-date, whilst all towns, parishes and even rural districts receiving supply are now included in the Index. Full particulars are given of 800 British and over 1,300 Colonial and Foreign Electricity Supply Undertakings and Colonial and Foreign Electric Railways and Tramways.

Particulars of the Undertakings include the Population, Number of Consumers, Date Supply Commenced, Owners, Engineers, System, Mains and Distributors, Generating and Transmission Voltages, Consumers' Voltages, Public Lamps, Motors connected, Maximum Load recorded, Total Connections, Steam Raising Plant, Oil Burning Apparatus, Generating Sets, Fuel, Converting Plant, Price per Unit for Lighting, Power, Heating and Cooking, Traction, Vehicle Charging, etc., etc.

"A wonderful reference book."—*Liverpool Courier*.

"World-famous . . . . particularly valuable to every electrical manufacturer and trader who is concerned with export business."—*Electricity*.

"Bringing to one's finger tips the latest information of electrical undertakings all over the world."—*The Star*.

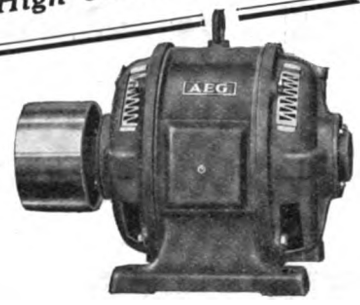
Double-Cage Motors TYPE AVDD

Low starting current
High starting torque



Its advantages over slip ring Motors

Simpler construction, no slip-ring or brush-lifting and short circuiting device, smaller weight and smaller dimensions, erroneous switching operations at starting impossible, simple control, greater reliability in service, better running conditions as regards efficiency and power factor; no alteration of the torque in jerks, path of torque curve independent of the skill of the operator; greater freedom as to choice of site of erection

Other Important Features:

1. Frame accurately machined and jig drilled.
2. The end shields are exact duplicates.
3. Low temperature rise even on frequent starting.
4. Top ventilation ducts provided with perforated sheet metal covers.
5. Dust-proof enclosed ball bearings.
6. End shields easily dismantled; the ball bearing need not be removed.
7. Heavily reinforced end shields with channel arms give maximum support to bearings and rotor. End shields afford adequate protection for the windings without interfering with efficient ventilation.

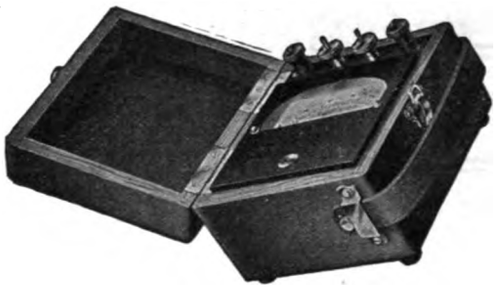
Ideal FOR CHECKING CONSUMERS LOADS!

Size only
4¾" x 5¼" x 3½"
Very light weight: from 2½ lbs.



SMALL PORTABLE PRECISION INSTRUMENTS

KNIFE-EDGE POINTER
EXTERNAL ZERO ADJUSTMENT
ACCURACY: ± ½ of a scale division

MOVING COIL: D.C. only:

AMMETERS: 2 internal ranges up to 30 amps.
VOLTMETERS: 2 internal ranges up to 240 volts.
OHMMETERS: ranges from 10 to 500,000 ohms.

DYNAMOMETER: D.C. & A.C.

AMMETERS: up to 12.5 amps.
VOLTMETERS: up to 600 volts.
WATTMETERS: up to 25 amps., 600 volts.

On request, 3 instruments in common leather case, size only 5½ in. × 6 in. × 11 in.
